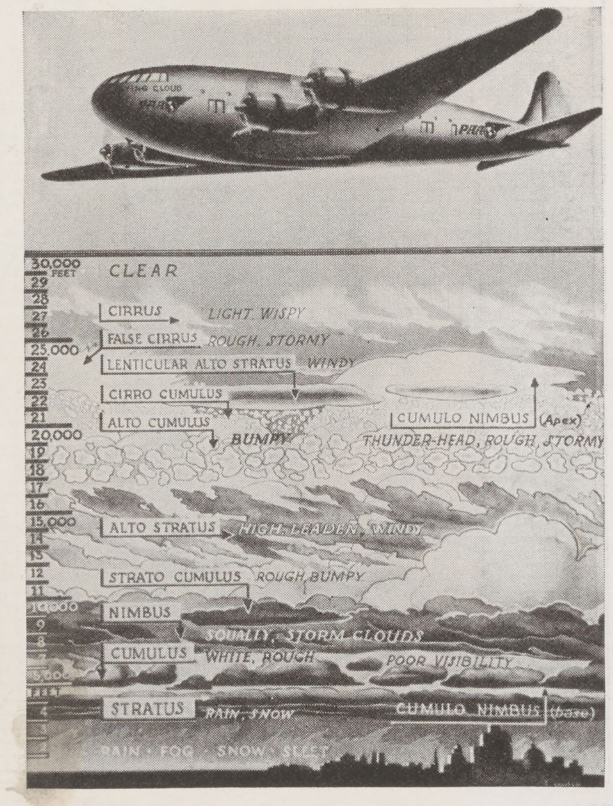
Single row Wright GR-1820 Cyclones are intended to power this airplane. Named the "Excalibur" the plane will top 300 m.p.h. with a cruising speed of 262 m.p.h. with 30 passengers, a ton of mail and crew of six on board. Turn the payload into bombs and give the crew machine guns and you have a good eye-opener for any early morning bombing raid. Weighing 40,000 pounds the airplane has a cruising range of 1500 miles . . . and if one of Hitler's cronies should blow one of the engines off, the ship will still be able to fly at around 200 m.p.h. in a hurry-scurry trip back to the home base. But Pan-American has no feud with Hitler as yet; it will be the Andes that will be bothersome in her case. The Model 44 has its best cruising speed at 19,000 feet, and Pan-American will have most troubles in flying the ships at high altitudes and also of convincing the sun-worn natives that her planes are not comets from heaven,

(Continued on page 48)



The new Pan-American Boeing Strato-Clipper, Flying Cloud; the first supercharged, sealed-cabin air transport. It will operate in the stratosphere above turbulent weather. The chart shows the various types of clouds and the resulting weather at all levels up to the "weather free" area above 30,000 feet

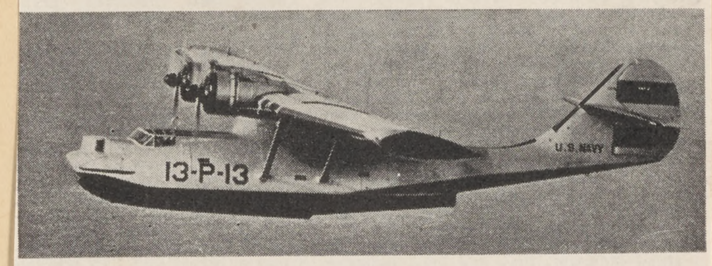
Bombers

1. The Boeing Bomber B-15, the "Super Fortress," weighing over 30 tons, with four 1,000 h.p. Pratt & Whitney Wasps, is 8 tons bigger than B-17.
2. The Bell BG-1 is an experimental scout-dive bomber, built for the United States Marine Corps by Bell Aircraft Corp. of Buffalo, N. Y.
3. The Boeing Bomber B-17, often called the "Flying Fortress," is powered with four Wright Cyclone engines, delivering 4,000 h.p. at take-off.
4. The Bellanca Model 28-110 Fighter Bomber is powered with one Pratt & Whitney Twin Wasp rated at 1100 h.p., at 2700 r.p.m. at 8,000 ft.
5. The Consolidated Aircraft Corporation's PBY-2, twin-engined flying boat and patrol bomber. This airplane was built for the United States Navy.
6. The XPB2Y-1, a Consolidated product, is a four-engined patrol bomber—the biggest and one of the most secret of the Navy's aerial weapons.
7. The Curtiss SBC-4, a dive-bomber, powered with one 1,000 h.p. Wright Cyclone, is the latest Naval aircraft, designed for use aboard the carriers.
8. The Lockheed XC-35 is the experimental stratosphere plane developed for the Army Air Corps by Lockheed Aircraft for high altitude combat.
9. The Douglas 8A-3P is an attack bomber, developed by the company's El Segundo Division. Powered with a Wright Cyclone engine of 860 h.p.
10. The Douglas TBD-1 is a torpedo bomber, with retracting undercarriage, built for the Navy. This airplane is now in general service in the Navy.

Western Flying April '40

Consolidated Aircraft Corp.
Lindbergh Field, San Diego, Calif.



PBY-4 (U. S. Navy) **Patrol Bomber**

TYPE: 5-9- place, closed, flying boat, monoplane.
DIMENSIONS: Length, 65 ft. 1.75 in. Height, 17 ft. 11 in. Span, 104 ft.
AREAS: Wing (incl. ailerons), 1400 sq. ft.
WEIGHTS: Gross weight loaded, 27,413 lbs. Wing loading, 19.3 lbs. per sq. ft. Power loading, 11.4 lbs. per h.p.
POWER PLANT: 2 P&W Twin Wasps, geared. Engine limits, (maximum except takeoff) 1050 h.p. each at 7800 ft., 2550 r.p.m.
PERFORMANCE: Placard speeds: level flight (high speed), 199 m.p.h.; cruising speed, 179 m.p.h.; stalling speed (landing), 69 m.p.h. Climb at sea level, 920 ft. 1st min. Usable ceiling, 24,000 ft. Maximum range 4000 mi.
CONSTRUCTION: Wings, aluminum alloy, stressed skin, Z-bar stiffeners, fabric covered ailerons and trailing edges. Fuselage, monocoque, aluminum alloy construction, smooth skin, re-inforced with Z bars. Empennage, stressed skin, aluminum alloy, fabric covered movable surfaces.
STANDARD EQUIPMENT: Instruments, sensitive altimeters, engine pressure gauge units, carb. temp. gauges, manifold pres. gauge, clock, airspeed ind., thermocouples, oil temp. gauges, ammeters, direct gyro, Gyro horizon and pilot, elec. tach., fuel gauges. Trimming tabs on rudder and elevators. Other equipment, shock mounted instrument panels, batteries, fire extinguishers, flares, starters.
REMARKS: Other data restricted.

XPBY-5A (U. S. Navy) **Amphibian Patrol Bomber**

TYPE: 5-9 place, closed, amphibion, monoplane.
DIMENSIONS: Length, 65 ft. 1¾ in. Height, 19 ft. 9 in. Span, 104 ft.
AREAS: Wing (incl. ailerons) 1400 sq. ft.
WEIGHTS: Gross weight loaded, 27,413 normal lbs., 30,500 lbs. (provisional.) Wing loading, 19.6 lbs. per sq. ft. Power loading, 11.4 lbs per h.p.
POWER PLANT: 2 P&W R-1830-S1C3G. Engine limits, (maximum except takeoff) 1050 h.p. each at 2550 r.p.m. Maximum of 1200 h.p. each available for takeoff.
PERFORMANCE: Placard speeds: level flight (high speed), 199 m.p.h. at 7,800 ft.; cruising speed, 179 m.p.h. at 7,800 ft., stalling speed (landing), 69 m.p.h. Climb at sea level, 920 ft. 1st min. Service ceiling, 24,000 ft. Maximum range 4,000 mi.
REMARKS: Basically the Model 28 twin-engined flying boat, with addition of amphibion gear, suitably incorporated in the structure. Landing gear is of the tricycle type with a single wheel forward and two aft.

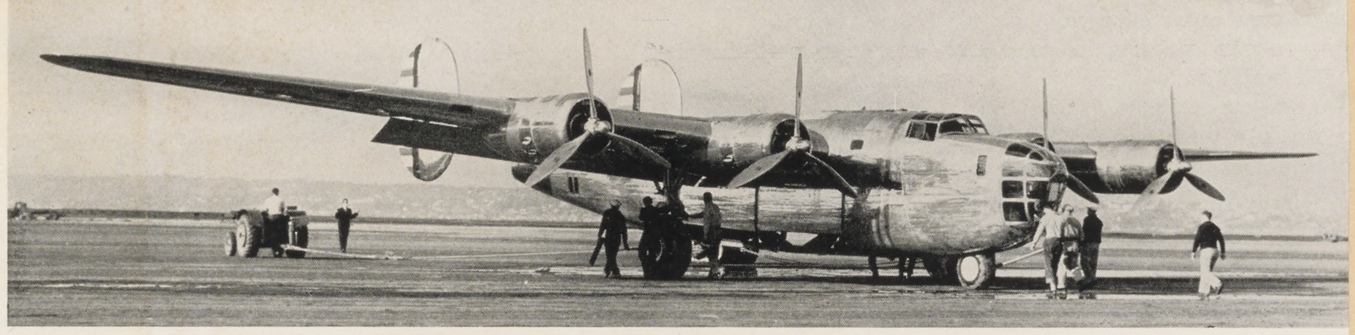
Continued from First Page

viding their own funds but apparently can have ready access to Government funds if they so elect.

The Lockheed building program provides for immedate erection of 18 additional buildings with a floor area of 520,000 square feet. Vega Airplane has started construction work on its new factory at Burbank, Calif., which is expected to be completed in October at a cost of probably $3,500,000. The plant is on a site adjoining the Union Air Terminal.

Climatic conditions and character of buildings which fit the needs of Southern California manufacturers enable construction of new facilities here in considerably less time than is attainable in many other sections of the country. In the recent past, major additional units have been completed anywhere from three to six months after plans were drawn up and the go-ahead signal was given. Ground was first broken for the new Vega plant the latter part of July, and it is anticipated that facilities will be available the latter part of next October.



U. S. ARMY AIR CORPS XB-24 FOUR-ENGINED BOMBARDMENT AIRPLANE, BUILT BY CONSOLIDATED AIRCRAFT CORPORATION

A High-Wing, All-Metal Airplane, Powered by Pratt & Whitney 18-Cylinder Twin-Row Radial Air-Cooled Engines, Each of 1,200 h-p. The Propellers are Hamilton Standard 3-Bladed Hydromatic Constant Speed Types, 12 Feet in Diameter. Gross Weight of Plane is About 40,000 Pounds; Wing Span, 110 Feet; Length of Fuselage, 64 Feet; Overall Height, 19 Feet. Tactical Requirements are for Crew of 6 to 9, Depending upon Mission. Speed More Than 300 m.p.h., Range About 3,000 Miles, Can Carry About Four Tons of Bombs

US AIR SERVICES - MARCH 1940

American Aviation for May 1, 1940

New York-Rome Line Recommended for American Export Air Lines

CAA Examiner Leasure Finds Need for More Atlantic Service; Sees National Defense Benefits; England, France Applications Dismissed Without Prejudice Because of Neutrality Act

Entrance of American Export Airlines into the trans-Atlantic picture with a mail-passenger-property route from New York or Baltimore to Rome via Lisbon and Barcelona was recommended in a proposed report issued Apr. 19 by CAA Examiner C. Edward Leasure.

It was also recommended that Export's applications for routes between the U. S. and England, the Irish Free State and France be dismissed without prejudice, in view of the President's proclamation under the Neutrality Act.

Temporary mail-property service between the U. S. and Rome via Horta, Lisbon and Barcelona, which Export proposed to inaugurate with a twin-engined Consolidated flying boat, is not required by the public convenience and necessity, Leasure said.

Subject to a showing of the availability of the necessary landing rights, Export is fit, willing and able to perform the proposed transportation, the report stated. Export's witnesses testified at the hearing that the company has such rights in Italy. Designation of Charleston and Norfolk as alternate U. S. termini is not necessary, the report added, explaining that the company could land at those points under emergency conditions without a certificate.

The report, one of the most important issued since establishment of the CAA, found that additional air service between the U. S. and Europe is required by the public convenience and necessity, and added that the facilities of Pan American Airways, the present carrier, are inadequate for the business available at present. Pan Am and its affiliates "control practically all American flag foreign air transportation," the report noted.

Pan American intervened in the Export hearing, strongly opposing entrance of Export into trans-Atlantic air service. The intervener claimed that it can furnish all necessary service at less cost than Export, and that it will have intense competition from foreign carriers.

"It cannot be denied that at the present time the intervener enjoys a practical monopoly over ocean air travel and, that even when foreign carriers commence operations, it will continue to monopolize these routes, including the north Atlantic, insofar as American competition is concerned," Leasure said.

"The record shows that there is sufficient demand, patronage, and commercial life to increase the services over the north Atlantic air transportation route; and all parties predict a rapid increase in these needs. In addition to the commercial advantages to be gained by American supremacy over this route the Authority must, under the Act, consider the advantages that will accrue to the national defense by the development of our oceanic air transportation systems. Admitting that the anticipated foreign competition would cause the intervener to be awake to all new developments in aviation, it would appear that the 'sound development of an air transportation system' would be accelerated by competition from an American carrier.

"It must be admitted that the European carriers would not permit us to utilize the benefits of their research and ingenuity; and our own aviation inventors and manufacturers would have greater incentive to encourage and develop their own research and resources with more than one carrier in the international air transport business.

"Competition does not necessarily mean duplication of service unless the field covered by a monopoly is completely served. It is true that where a territory is served by a utility which (1) has pioneered in the field, (2) is rendering efficient service, and (3) fulfilling adequately the duty which, as a public utility, it owes to the public, and the territory is so generally served that it may be said to have reached the point of saturation as regards the particular commodity in which the utility deals, then certainly the trend today is to protect the utility within such field; but when any one of these conditions is lacking, the public convenience may often be served by allowing competition to come in.

"There is no denying that the intervener pioneered the route in question here and that it is rendering efficient service within the limits of its facilities. However, it is obvious that at present its facilities are inadequate for the business available. Undoubtedly, the saturation point in available traffic is not yet reached and, if its own testimony can be relied upon, such a point is many years away. Futhermore, although this whole discussion is on the basis of north Atlantic traffic generally it must be remembered that the territory to be served by the eastern termini is almost unlimited."

Regarding cost, Leasure pointed out that Export concedes that Pan Am "should be able to furnish two additional frequencies at a lower cost than the applicant can furnish its initial frequencies. The applicant further concedes that the proposed new services would mean an additional heavy annual expenditure by the government. The comparative cost of operation of additional trans-Atlantic air transportation by the applicant and the intervener, and the additional expense to the government, are factors which, while not controlling, must be considered in relation to the public interest to be served." The report said that in this connection it should be noted that in the Pan Am trans-Atlantic certificate case, in which the CAA held that the public convenience and necessity required the service now operated by PAA, no reference was made to the question of the probable cost of the service.

"The applicant submits that the failure of the Authority to grant its application would be tantamount to forever closing the door to competition by any American air carrier over the north Atlantic route," Leasure's 76-page report said. "The applicant and its parent company, American Export Lines Inc., expended large sums of money in its most exhaustive planning for its entrance into the trans-Atlantic air transportation business. The applicant contends that if its request is denied at this time, it will be an absolute deterrent to the entrance of American capital into a similar venture in the next few years. There is no question that an adverse decision by the Authority will cause investors to hesitate before risking their money in any subsequently proposed competitive trans-Atlantic air carrier."

In finding mail-property service with the Consolidated boat not required, Leasure stated that the cost of operating such fortnightly trips would be in excess of $1,000,000 per year. Inasmuch as the primary object of such trips would be the training of personnel, he said that such object "could be better effectuated if the developmental flights were not restricted to the necessity of meeting schedule requirements." Export proposes to operate its mail-passenger-property service, which will be non-stop between New York and Lisbon, with Sikorsky S44 four-engined flying boats.

Export had also asked approval of acquisition of control of the airline by the steamship company, but Leasure found such approval not necessary. The airline, he said, will have the benefit of the steamship company's traffic organization, meteorologists, etc. "It is concluded . . . that the relationship of the steamship company to the applicant does not restrain competition and will promote the public interest," he stated.

OUR EXPANDING UNIVERSE

PROGRESS IN SCIENCE INTERPRETED BY WILLIAM S. BARTON

THE scientist is a man who has the fun of seeing the world through magic spectacles. He possesses the ability all of us have of admiring nature as it appears to us through our unaided eyes and other senses. But he is unique in having half a dozen or more kinds of magic spectacles, each of which reveals an exciting picture of creation which is denied to nonscientific or primitive folk.

A scientist, for example, who puts on his astronomical "specs," views the universe on its grandest scale. He sees himself as a sub-microscopic point being rolled and plunged in twenty directions at once about a limitless sea of space and time punctuated by fireworks. But let him don the glasses of physics and chemistry. Now he sees for the first time that what appear to be solid walls, trees and rocks aren't solid at all. Even the atoms and molecules composing them consist for the most part of empty space. And one reason air and the rocks appear so different to the naked eye is that in rocks each molecule is tied down to a definite position by invisible electric glue.

In fact the scientist now sees that the infinite variety of all the objects we can see and sense by touch is made possible by only one thing. The variety of materials in our environment result only from the infinite variety of ways in which atoms and molecules can be joined together. It is this which explains why iron and cement don't look alike or exhibit the same properties.

Why is iron heavier than wood or human flesh? The answer relates to the difference between the various kinds of atoms and molecules. A molecule usually consists of a union of two or more atoms. But the metals such as iron contain no molecules, only atoms. And atoms stick closer together than molecules. The reason organic substances weigh less than iron is that the former consist of molecules so complicated that each contains hundreds of assorted atoms.

Bricks of identical shapes can be packed more tightly than those of assorted shapes. Protein molecules are so complicated that protein would look almost like lace through the magic spectacles. It can't help being relatively light in weight.

Just as atoms join forces to form molecules, the latter "club together" to form crystals which in turn contribute beauty and variety to material creation.

FRED C. BRUECK PICTURED EXAMINING HUGE QUARTZ CRYSTAL

Weighing sixty-three pounds and costing $1500, a crystal of pure quartz believed to be the largest and finest ever obtained arrived in the United States last week. Brought by mule pack from the diamond section of Brazil, it is said by experts to look like a twenty-five-pound cake of clear ice and to surpass any museum piece in quality. But it will never be placed in a museum.

Before long, its owner, Bausch & Lomb Co., will cut it up into lenses and prisms for use in spectrographs and other scientific optical devices. Some small fragment eventually may make it possible with the combined use of a spectrograph and telescope to discover definitely whether or not the universe actually is expanding. Another fragment may, in a microscope, further disclose the secret of life.

The crystal is solid matter in its most perfectly developed and naturally organized condition. Each molecule in quartz consists of one atom of silicon and two atoms of oxygen, but quartz would not be or look like quartz were it not for the fact that its smallest crystal unit consists of just three such molecules. The huge Bausch & Lomb crystal consists of billions upon billions of these little crystals. But just as a pattern may be repeated over and over again in a rug the pattern of the tiny crystal is reproduced again and again to form a crystal large enough for the human eye to admire. A failure in this analogy, of course, is that whereas the pattern on the rug covers a relatively flat surface the crystal pattern is repeated in three dimensions.

Quartz, it may surprise some persons, is the most abundant mineral in the earth's crust. Its colored varieties include amethyst, onyx, occidental emerald and sapphire.

AMERICAN boys can still aspire to make fortunes, it is indicated by the success of two Iowa country "bumpkins," John and Gerhard Albers. They lived on a farm miles away from any source of electrical power, so rigged up a home-made power plant to supply "juice" to their radio set. Their first electric "plant" consisted only of an automobile generator attached to a windmill and gears borrowed from their father's cream separator. That was three years ago. They devised a more efficient propeller than the windmill provided and finding whittling propellers was too slow for volume production designed a machine for shaping the propellers automatically. Now the brothers are reported to be selling more than 2000 wind-electric plants a month to remote farms in every State. The plants, if used where the wind blows, are said to be powerful enough to light house and barns, operate farm machinery and household electric appliances.

STRENUOUS athletic activities have no bad effect on the heart, in the opinion of Dr. E. L. Cooper of the University of Sydney, Australia, the magazine Science reports. Assisted by other scientists, Dr. Cooper examined a series of oarsmen from universities and colleges before and after going into training, after training and before and after racing. The investigators, as a result of these and similar examinations of bicycle riders and squash players, were unable to detect any permanent change to the heart as a result of training for or taking part in sports.

They concluded that even extreme physical effort such as the final spurt at the end of an exhausting two-mile crew race does no damage to the heart.

STARTING with his hour glasses, sundials, and ranging to the modern master electric clocks kept accurate by radio time signals, man has given free reign to his ingenuity and imagination in devising time-keeping instruments.

Writing in "Telephony," E. K. Gann reports that Morocco boasts a flower pot clock. The clock's "works" consist of twelve flowering pots and twelve rafters, the latter protruding from the side of an old residence. Every hour a servant places a flower pot on one of the rafters. By noon, every rafter end supports one pot. Then, all the pots are removed until 1 p.m., when the first pot of the next time cycle is placed on the first hour rafter.

For years, it is said, P. T. Barnum intrigued the American public with a freak clock. Although the clock kept time, no visible connection was between the works and the dial. Now the secret is announced by the Hayden Planetarium, New York City, where the clock has been exhibited.

"Two clever devices," writes H. S. Federer, "make possible the working of the mystery clock which was built with a few others similar to it about 1823. The apparently single glass rod between the face and works, is really two rods, one within the other, the inner one geared to the works and turned by them. Second, the innocent-looking front of the dial is really two-faced! The numerals are on one dial, and in back of that is another dial, to which is fastened the single hand of the clock, which, however, appears to be connected in orthodox fashion with the front dial. As the inner dial revolves, turning with the works, it carries with it the fixed hand, which thus points to the correct hour and minute."

Clocks are now being made without faces, the Reader's Digest reports. To tell time, a button must be pressed, whereupon, by means of a phonograph attachment, the clock calls out the correct time.

In "The Old Clock Book" is an account of a clock, the hands of which cast shadows on the ceiling of a hospital in such a way as to permit patients to tell the time without moving their heads.

THE modern horse is not yet ready to join his five-toed precursor as an extinct species to be remembered only through fossil bones. On the first of this year there were more than 196,000 horses and 38,000 mules either working or munching lush grass in California. The total value of these 234,000 animals was almost $25,000,000, or three times the amount of money invested in this State's hogs. The United States now has more than $1,500,000,000 worth of horses and mules or something like 15,000,000 of the supposedly vanishing animals. Perhaps Henry Ford should attend to his knitting.

C. H. Howell of the University of California college of agriculture says California horse breeders could compete to better advantage with the machine age by supplementing pasturage with the feeding of more oats during weaned colts' first winters.

COAST AIRCRAFT DUE TO EXPAND

Major Extensions Await Only Clarification of Federal Fiscal Programs

CURRENT STATUS VIEWED

LOS ANGELES—Practically all the major Pacific Coast aircraft plants are viewing seriously plant expansion to meet governmental needs for airplanes, and in several instances plans have already been drawn up for new plant facilities on a scale that will dwarf any previous efforts.

While the expediency of these larger plants has been realized for some time, that the expansion plans have not been put into effect already is due to a disposition to await final word from Washington on developments which will show these companies clearly just where they will stand in this respect. Details on methods of financing, allowances for plant amortization and other pertinent subjects await clarification. On the matter of financing, several plants here have inquired and been informed that ample funds will be forthcoming, presumably from the RFC.

Plants East of Rockies Considered

At least two of the Pacific Coast plants, North American Aviation and Consolidated Aircraft Corp. of San Diego are considering seriously almost immediate erection of branch plants east of the Rocky Mountains. This is in line with Government views on decentralization of the aircraft industry, 60% of which is now located on the Pacific Coast. Both Douglas Aircraft and Lockheed have in mind or have already started ambitious programs for major plant expansion confined to Southern California.

In the Southern California area, also, Vultee Aircraft, Inc., is now engaged in a $3,000,000 expansion program which will increase manufacturing floor space to 800,000 square feet from 331,000 square feet. Contingent upon pending orders, Vultee could easily expand further if the need arose by adding another unit. Vultee's ultra modern plant was designed with this in mind. Northrop Aircraft, Inc., has plans in mind contingent upon pending orders for doubling its present 175,000 square feet capacity.

North American Aviation

North American Aviation, Inc., with its single plant at Inglewood, within the Los Angeles city limits, is seriously considering an expansion move which comprises a new huge plant probably at Dallas, Texas.

Consolidated Aircraft, which at San Diego has one of the largest Pacific Coast plants with a floor area of 1,900,000 square feet, is considering plans for a plant in Texas, considerably larger than its present single plant. As a large part of its output is in flying boats, a logical site would be Houston, Texas, which offers ready access to water.

Douglas Aircraft Co., Inc., with two plants in Southern California, main plant at Santa Monica and the El Segundo (Inglewood) branch, is understood to be planning another huge plant either at its present sites or in some nearby Southern California community which offers large labor supplies.

Lockheed Aircraft Corp. and its subsidiary, Vega Airplane Co., already have started an ambitious expansion program which will entail an expenditure of $5,500,000. So far, these units have gone ahead with plans for expansion pro-

Continued on Sixth Page, Column 5

COAST AIRCRAFT DUE TO EXPAND

Continued from First Page

viding their own funds but apparently can have ready access to Government funds if they so elect.

The Lockheed building program provides for immedate erection of 18 additional buildings with a floor area of 520,000 square feet. Vega Airplane has started construction work on its new factory at Burbank, Calif., which is expected to be completed in October at a cost of probably $3,500,000. The plant is on a site adjoining the Union Air Terminal.

Climatic conditions and character of buildings which fit the needs of Southern California manufacturers enable construction of new facilities here in considerably less time than is attainable in many other sections of the country. In the recent past, major additional units have been completed anywhere from three to six months after plans were drawn up and the go-ahead signal was given. Ground was first broken for the new Vega plant the latter part of July, and it is anticipated that facilities will be available the latter part of next October.

New York-Rome Line Recommended for American Export Air Lines

CAA Examiner Leasure Finds Need for More Atlantic Service; Sees National Defense Benefits; England, France Applications Dismissed Without Prejudice Because of Neutrality Act

Entrance of American Export Airlines into the trans-Atlantic picture with a mail-passenger-property route from New York or Baltimore to Rome via Lisbon and Barcelona was recommended in a proposed report issued Apr. 19 by CAA Examiner C. Edward Leasure.

It was also recommended that Export's applications for routes between the U. S. and England, the Irish Free State and France be dismissed without prejudice, in view of the President's proclamation under the Neutrality Act.

Temporary mail-property service between the U. S. and Rome via Horta, Lisbon and Barcelona, which Export proposed to inaugurate with a twin-engined Consolidated flying boat, is not required by the public convenience and necessity, Leasure said.

Subject to a showing of the availability of the necessary landing rights, Export is fit, willing and able to perform the proposed transportation, the report stated. Export's witnesses testified at the hearing that the company has such rights in Italy. Designation of Charleston and Norfolk as alternate U. S. termini is not necessary, the report added, explaining that the company could land at those points under emergency conditions without a certificate.

The report, one of the most important issued since establishment of the CAA, found that additional air service between the U. S. and Europe is required by the public convenience and necessity, and added that the facilities of Pan American Airways, the present carrier, are inadequate for the business available at present. Pan Am and its affiliates "control practically all American flag foreign air transportation," the report noted.

Pan American intervened in the Export hearing, strongly opposing entrance of Export into trans-Atlantic air service. The intervener claimed that it can furnish all necessary service at less cost than Export, and that it will have intense competition from foreign carriers.

"It cannot be denied that at the present time the intervener enjoys a practical monopoly over ocean air travel and, that even when foreign carriers commence operations, it will continue to monopolize these routes, including the north Atlantic, insofar as American competition is concerned," Leasure said.

"The record shows that there is sufficient demand, patronage, and commercial life to increase the services over the north Atlantic air transportation route; and all parties predict a rapid increase in these needs. In addition to the commercial advantages to be gained by American supremacy over this route the Authority must, under the Act, consider the advantages that will accrue to the national defense by the development of our oceanic air transportation systems. Admitting that the anticipated foreign competition would cause the intervener to be awake to all new developments in aviation, it would appear that the 'sound development of an air transportation system' would be accelerated by competition from an American carrier.

"It must be admitted that the European carriers would not permit us to utilize the benefits of their research and ingenuity; and our own aviation inventors and manufacturers would have greater incentive to encourage and develop their own research and resources with more than one carrier in the international air transport business.

"Competition does not necessarily mean duplication of service unless the field covered by a monopoly is completely served. It is true that where a territory is served by a utility which (1) has pioneered in the field, (2) is rendering efficient service, and (3) fulfilling adequately the duty which, as a public utility, it owes to the public, and the territory is so generally served that it may be said to have reached the point of saturation as regards the particular commodity in which the utility deals, then certainly the trend today is to protect the utility within such field; but when any one of these conditions is lacking, the public convenience may often be served by allowing competition to come in.

"There is no denying that the intervener pioneered the route in question here and that it is rendering efficient service within the limits of its facilities. However, it is obvious that at present its facilities are inadequate for the business available. Undoubtedly, the saturation point in available traffic is not yet reached and, if its own testimony can be relied upon, such a point is many years away. Futhermore, although this whole discussion is on the basis of north Atlantic traffic generally it must be remembered that the territory to be served by the eastern termini is almost unlimited."

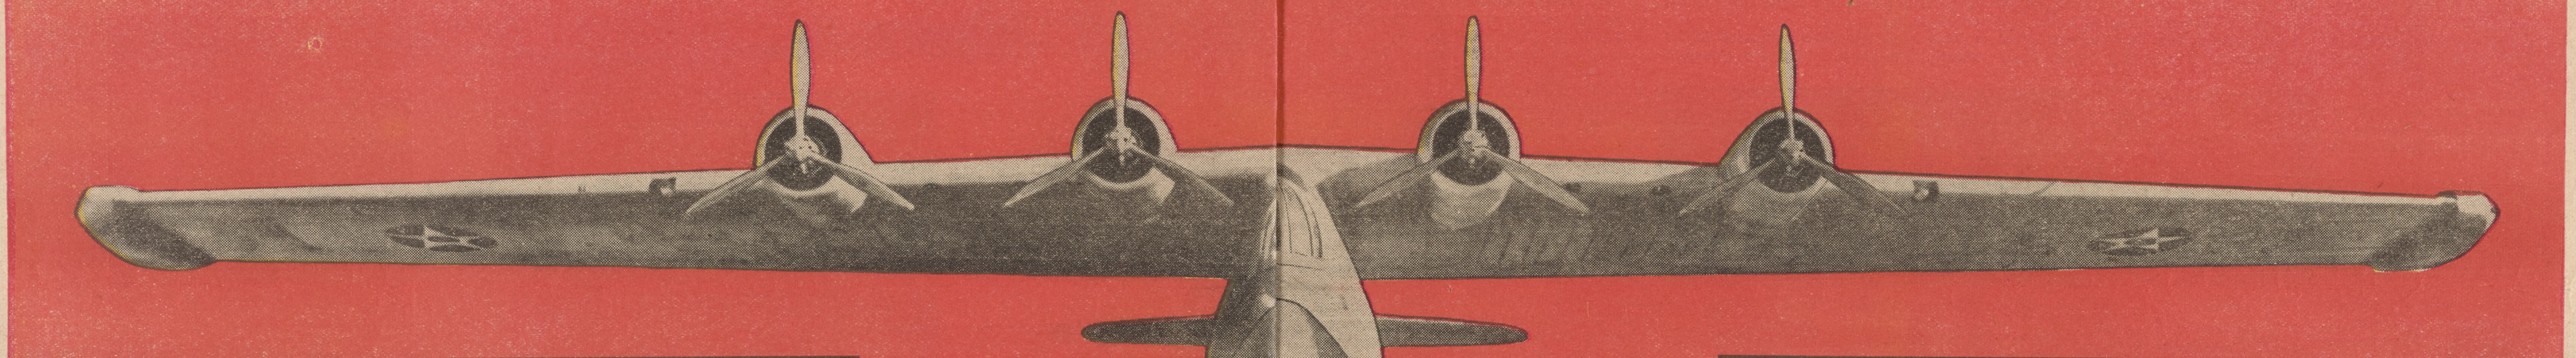
Regarding cost, Leasure pointed out that Export concedes that Pan Am "should be able to furnish two additional frequencies at a lower cost than the applicant can furnish its initial frequencies. The applicant further concedes that the proposed new services would mean an additional heavy annual expenditure by the government. The comparative cost of operation of additional trans-Atlantic air transportation by the applicant and the intervener, and the additional expense to the government, are factors which, while not controlling, must be considered in relation to the public interest to be served." The report said that in this connection it should be noted that in the Pan Am trans-Atlantic certificate case, in which the CAA held that the public convenience and necessity required the service now operated by PAA, no reference was made to the question of the probable cost of the service.

"The applicant submits that the failure of the Authority to grant its application would be tantamount to forever closing the door to competition by any American air carrier over the north Atlantic route," Leasure's 76-page report said. "The applicant and its parent company, American Export Lines Inc., expended large sums of money in its most exhaustive planning for its entrance into the trans-Atlantic air transportation business. The applicant contends that if its request is denied at this time, it will be an absolute deterrent to the entrance of American capital into a similar venture in the next few years. There is no question that an adverse decision by the Authority will cause investors to hesitate before risking their money in any subsequently proposed competitive trans-Atlantic air carrier."

In finding mail-property service with the Consolidated boat not required, Leasure stated that the cost of operating such fortnightly trips would be in excess of $1,000,000 per year. Inasmuch as the primary object of such trips would be the training of personnel, he said that such object "could be better effectuated if the developmental flights were not restricted to the necessity of meeting schedule requirements." Export proposes to operate its mail-passenger-property service, which will be non-stop between New York and Lisbon, with Sikorsky S44 four-engined flying boats.

Export had also asked approval of acquisition of control of the airline by the steamship company, but Leasure found such approval not necessary. The airline, he said, will have the benefit of the steamship company's traffic organization, meteorologists, etc. "It is concluded . . . that the relationship of the steamship company to the applicant does not restrain competition and will promote the public interest," he stated.

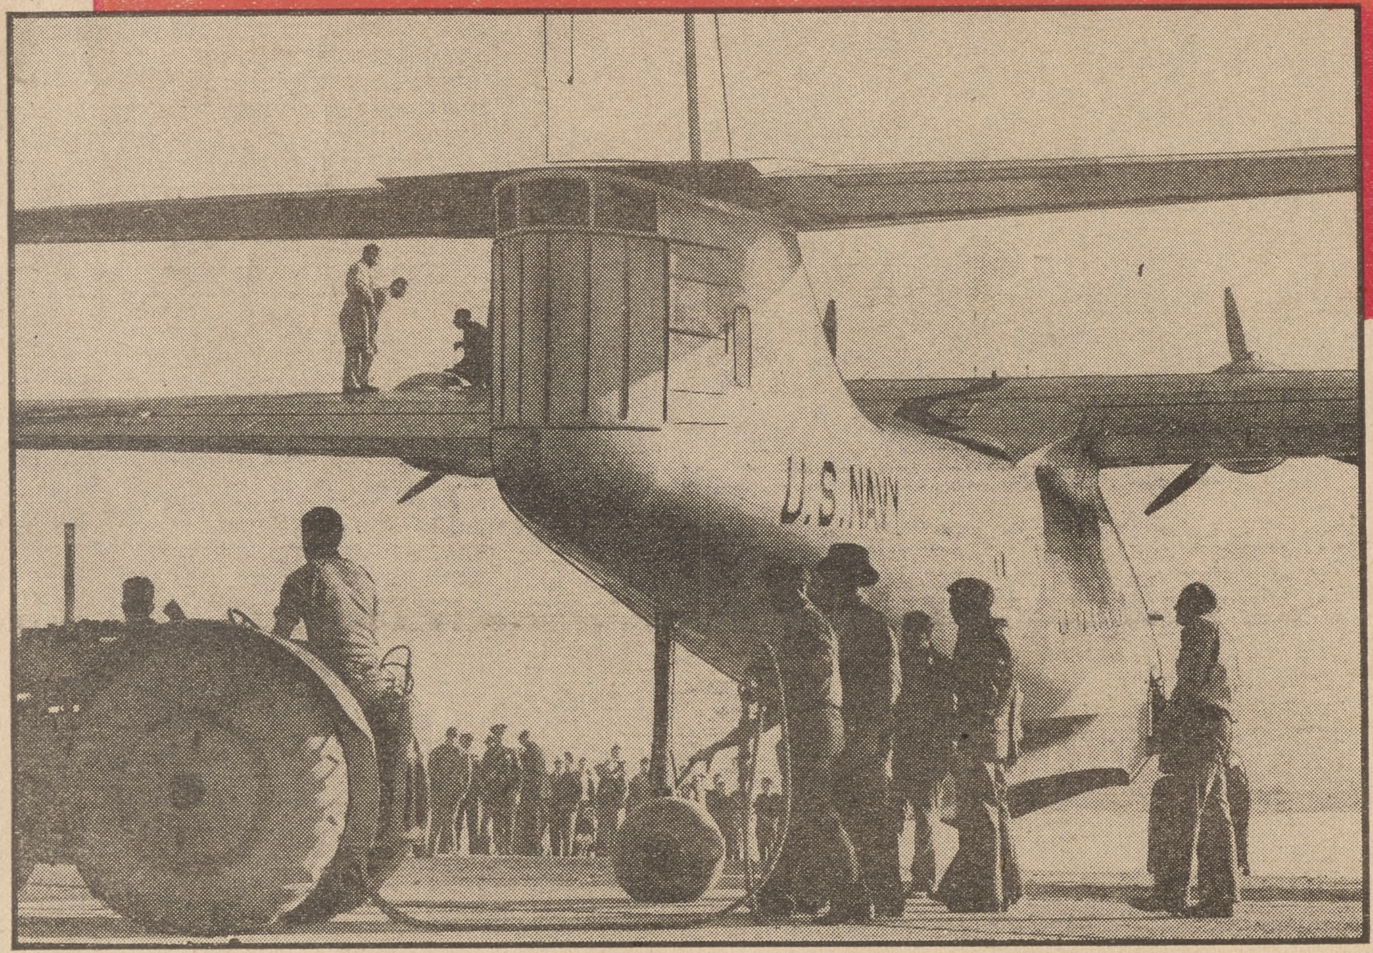
WHEN OUR NAVY "Fences" THE PACIFIC



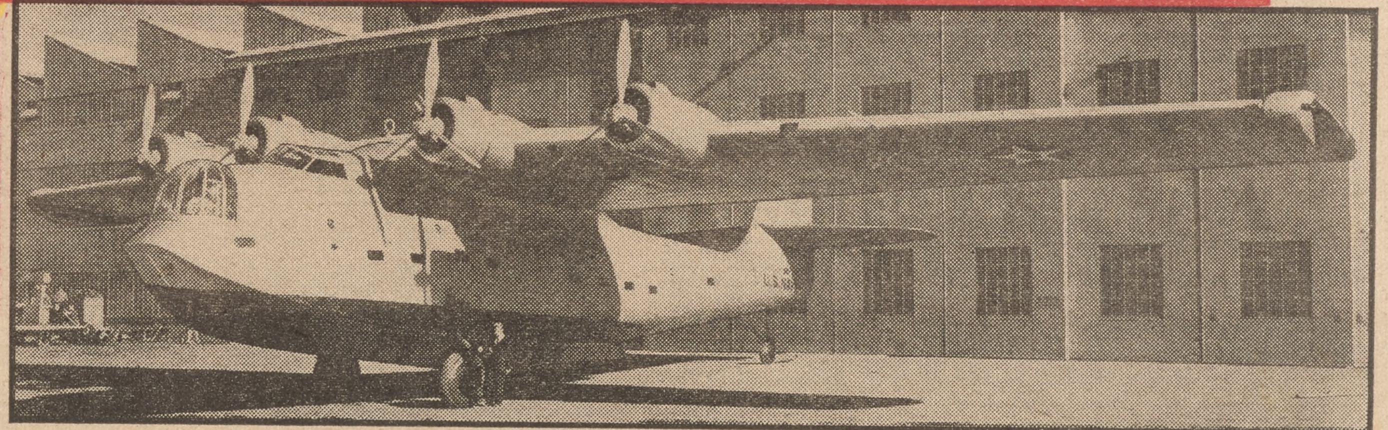
THE XPB2Y-1 WHICH WILL GRAND THE RADIUS OF THE UNITED STATES NAVY PATROL WINGS MAKE THE "FENCE" PRACTICAL

Under construction n"fence" will provide the nation with an ever-rility for information and security. Exact detalosely guarded, but the objective was recenbsed before the House Naval Affairs Co—and now to you

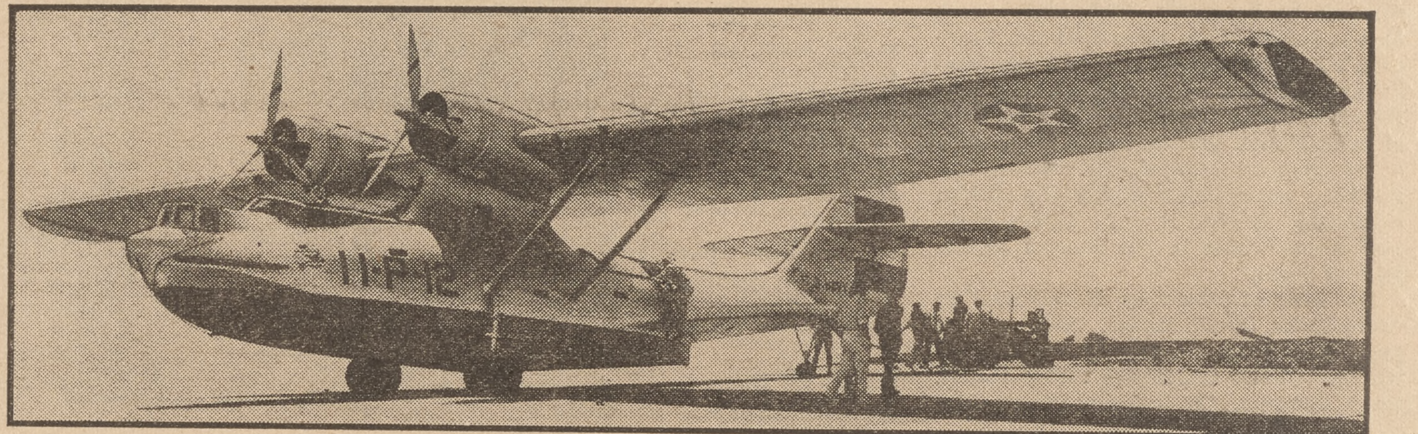
BY WA DRAKE



TAIL VIEW OF THE NEW SHIP, SHOWING TURRET BUILT INTO HUGE CRAFT



ANOTHER VIEW OF THE HUGE $1,000,000 FORTRESS FOR THE NAVY



FORERUNNER OF THE NEW PLANES, THE TWO-MOTORED PBY-2 WHICH HAS PERFORMED BRILLIANTLY FOR THE NAVY

AN 8000-mile "fence" down the center of the Pacific, to provide the nation with an ever-ready facility for information and security, is being quietly built by the Navy.

Briefly, it will consist of bases for both military and commercial seaplanes along this far-flung line; with special attention being focused on facilities to be constructed along its center, at Midway, Wake and Canton islands.

Although exact details are being closely guarded by the Navy, the objective was recently disclosed by Admiral William D. Leahy, Chief of Naval Operations. In testimony before the House Naval Affairs Committee, Admiral Leahy made the following succinct explanation of America's new mid-Pacific frontier:

"It is impossible for anybody to say where the line of defense is going to be. We have a line shown on the map which we are going to cover in in order to obtain information of the enemy.

"It is not a line of defense. The line of defense may be much closer to our own shores than that; it may be beyond that, but that is a line where we expect to obtain sufficient information upon which to base our operations."

The most significant thing about this plan is that it comprises a program which can—in the observable future, at least—be successfully executed, in either peace or war, by just one agency on the face of the earth—the United States Navy.

That is because the Navy has expended ten years of tireless, well-directed effort in the development of the long-range patrol flying boat, together with the perfection of a doctrine for the operation of this type of plane under the most arduous conditions.

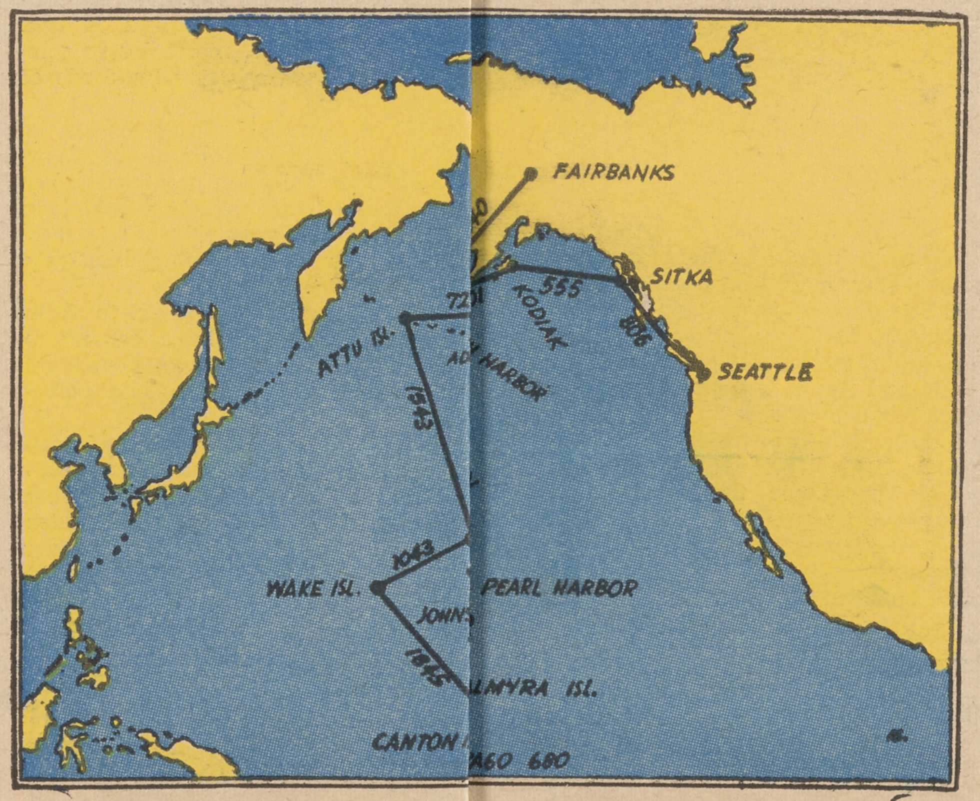
The result is that today the United States Fleet has some 200 huge bimotored flying boats in the five wings of the Scouting Force patrol squadrons; each plane capable of transoceanic flights in excess of 3000 miles. These big air cruisers, carrying and sustaining seven-man crews, are likewise able to land and take off in midocean in any but the most boisterous weather.

THEIR pilots have been schooled and indoctrinated in exact transoceanic navigation. They have proved their efficiency in this respect in the recent numerous mass flights from San Diego to Hawaii and to Panama, and from Seattle to Alaska, all completed without mishap and exactly on schedule. Likewise, the squadrons have maintained constant radio communication with distant bases during these flights.

It is this great aerial patrol force, unequaled in world aviation, that is already prepared to take over the constant patrol of the Pacific if and when danger of war appears. To those familiar with the accomplishments of the patrol squadrons in recent maneuvers it is inconceivable that an enemy naval force of consequence could enter an area under their patrol without being observed and reported.

As indicated by the accompanying chart, the Navy's gigantic "fence" of air observation bases would begin at the Sand Point base near Seattle and continue out and down the center of the Pacific as follows: 806 miles north to Sitka, where an operating base has been in operation for a year; 555 miles across the Gulf of Alaska to Kodiak Island, where $5,000,000 is to be expended for a similar fleet air base; 600 miles down the Alaskan Peninsula to the naval base at Dutch Harbor; thence through the Aleutian island chain to westernmost Attu Island, 729 air miles west of Dutch Harbor.

From Attu, or more properly, Dutch Harbor, the "fence" will run south 1653 miles to Midway Island. At this mid-Pacific atoll, already under development as a station on the California-China route of Pan American Airways, the War Department is preparing to expend more than $1,000,000 to build a breakwater and seaplane basin for the Navy. Before this is published, the Navy transport Sirius will have departed San Francisco for Midway with the Army expedition, headed by Lieut. Henry L. Hille, Jr., Corps of Engineers.



SKETCH SHOWING HYPOTHETICAL LINL BE FORMED WHEN 'FENCE' IS COMPLETE

West of Midway 1034 miles lies Wake Island, where a similar seaplane harbor will be constructed after completion of the Midway project. The next vital "post" in the line is Canton Island, 1845 miles southeast of Wake. From Canton Island, recently annexed to the United States by President Roosevelt's executive order, the line runs 680 miles south to its southern terminus, the magnificent natural harbor at Pago Pago, American Samoa.

Incidentally, it is observed that the line from Wake to Canton Island runs directly in front of the Japanese-mandated Marshall Islands, which, observers believe, would be used by Japan as points d'appui in any trans-Pacific naval expedition.

THE great fleet base at Pearl Harbor, Hawaii, where the bulk of the Navy's transoceanic aerial patrol force is already stationed, would of course play a vital role in this Pacific reconnaissance plan. In fact, Pearl Harbor would most likely prove the keystone of the entire scheme. As indicated on the chart, the squadrons from Pearl Harbor could operate to the south and westward via intermediate bases at Johnston Island and Palmyra Island.

In the remote possibility that enemy air or surface forces did slip by this line unobserved, either to the south or north, there remain strong secondary safeguards. At Fairbanks, 840 miles northeast of Dutch Harbor, the Army is building its primary Alaskan air base. At Panama, the three squadrons of Patrol Wing Three are on station. Their 3000-mile scouting line to the westward could easily be extended, to meet the Pearl Harbor radius, by seaplane tenders.

Pearl Harbor will be the center of a gigantic circle, with a 1500-mile radius, which would be kept under constant patrol by both Army and Navy scouting and bombing squadrons. In addition, air patrols maintaining scouting lines far off the Pacific Coast would operate from Navy bases at San Diego, San Pedro, San Francisco Bay and Puget Sound, from Army airdromes at March Field, San Francisco and Spokane. Finally, there would be the United States Fleet itself, with its hordes of carrier-based aircraft, plus the air and surface scouting of its cruisers and their planes, its destroyers and submarines.

Actually, this "aerial line of observation" plan is only in its infancy. All of the Navy's mass flight records of the past several years have been established by the Consolidated two-motored "PBY" flying boats. These are remarkable planes, but their brilliant performance has already been eclipsed by another Consolidated product, the giant four-motored "XPB2Y-1," now completing rigid Navy tests at San Diego.

This $1,000,000 air-borne cruiser, powered with four 1050-horsepower motors, has a gross weight in excess of 60,000 pounds and an extreme range of nearly 5000 miles. Her two decks contain complete living and sleeping quarters for a crew of twelve, plus two auxiliary engines for supplying current for both lighting and a complex radio equipment.

But, although the "XPB2Y-1" will greatly expand the radius of the Navy patrol wings, she herself is soon to be dwarfed by the Boeing Clippers to be used in trans-Pacific and trans-Atlantic routes by Pan American Airways.

AND the Navy is planning even bigger flying cruisers. When the "XPB2Y-1" was designed the 1050 horsepower motors were the highest-powered engines available. Today, the 1600-horsepower motor is here and the 3000-horsepower plant is in sight. This additional power and advances in design and construction practice promise seaplanes whose size and inherent strength will definitely eliminate existing restrictions of operating radius and seaworthiness of hulls.

Observers regard the scheme of aerial observation bases as the greatest advance in Pacific naval strategy since selection of Pearl Harbor as a naval operating stronghold. Development of the plan was not possible, however, until Japan abrogated the London Naval Treaty of 1936.

COAST AIRCRAFT DUE TO EXPAND

Major Extensions Await Only Clarification of Federal Fiscal Programs

CURRENT STATUS VIEWED

LOS ANGELES—Practically all the major Pacific Coast aircraft plants are viewing seriously plant expansion to meet governmental needs for airplanes, and in several instances plans have already been drawn up for new plant facilities on a scale that will dwarf any previous efforts.

While the expediency of these larger plants has been realized for some time, that the expansion plans have not been put into effect already is due to a disposition to await final word from Washington on developments which will show these companies clearly just where they will stand in this respect. Details on methods of financing, allowances for plant amortization and other pertinent subjects await clarification. On the matter of financing, several plants here have inquired and been informed that ample funds will be forthcoming, presumably from the RFC.

Plants East of Rockies Considered

At least two of the Pacific Coast plants, North American Aviation and Consolidated Aircraft Corp. of San Diego are considering seriously almost immediate erection of branch plants east of the Rocky Mountains. This is in line with Government views on decentralization of the aircraft industry, 60% of which is now located on the Pacific Coast. Both Douglas Aircraft and Lockheed have in mind or have already started ambitious programs for major plant expansion confined to Southern California.

In the Southern California area, also, Vultee Aircraft, Inc., is now engaged in a $3,000,000 expansion program which will increase manufacturing floor space to 800,000 square feet from 331,000 square feet. Contingent upon pending orders, Vultee could easily expand further if the need arose by adding another unit. Vultee's ultra modern plant was designed with this in mind. Northrop Aircraft, Inc., has plans in mind contingent upon pending orders for doubling its present 175,000 square feet capacity.

North American Aviation

North American Aviation, Inc., with its single plant at Inglewood, within the Los Angeles city limits, is seriously considering an expansion move which comprises a new huge plant probably at Dallas, Texas.

Consolidated Aircraft, which at San Diego has one of the largest Pacific Coast plants with a floor area of 1,900,000 square feet, is considering plans for a plant in Texas, considerably larger than its present single plant. As a large part of its output is in flying boats, a logical site would be Houston, Texas, which offers ready access to water.

Douglas Aircraft Co., Inc., with two plants in Southern California, main plant at Santa Monica and the El Segundo (Inglewood) branch, is understood to be planning another huge plant either at its present sites or in some nearby Southern California community which offers large labor supplies.

Lockheed Aircraft Corp. and its subsidiary, Vega Airplane Co., already have started an ambitious expansion program which will entail an expenditure of $5,500,000. So far, these units have gone ahead with plans for expansion pro-

Continued on Sixth Page, Column 5

COAST AIRCRAFT DUE TO EXPAND

Continued from First Page

viding their own funds but apparently can have ready access to Government funds if they so elect.

The Lockheed building program provides for immedate erection of 18 additional buildings with a floor area of 520,000 square feet. Vega Airplane has started construction work on its new factory at Burbank, Calif., which is expected to be completed in October at a cost of probably $3,500,000. The plant is on a site adjoining the Union Air Terminal.

Climatic conditions and character of buildings which fit the needs of Southern California manufacturers enable construction of new facilities here in considerably less time than is attainable in many other sections of the country. In the recent past, major additional units have been completed anywhere from three to six months after plans were drawn up and the go-ahead signal was given. Ground was first broken for the new Vega plant the latter part of July, and it is anticipated that facilities will be available the latter part of next October.

New York-Rome Line Recommended for American Export Air Lines

CAA Examiner Leasure Finds Need for More Atlantic Service; Sees National Defense Benefits; England, France Applications Dismissed Without Prejudice Because of Neutrality Act

Entrance of American Export Airlines into the trans-Atlantic picture with a mail-passenger-property route from New York or Baltimore to Rome via Lisbon and Barcelona was recommended in a proposed report issued Apr. 19 by CAA Examiner C. Edward Leasure.

It was also recommended that Export's applications for routes between the U. S. and England, the Irish Free State and France be dismissed without prejudice, in view of the President's proclamation under the Neutrality Act.

Temporary mail-property service between the U. S. and Rome via Horta, Lisbon and Barcelona, which Export proposed to inaugurate with a twin-engined Consolidated flying boat, is not required by the public convenience and necessity, Leasure said.

Subject to a showing of the availability of the necessary landing rights, Export is fit, willing and able to perform the proposed transportation, the report stated. Export's witnesses testified at the hearing that the company has such rights in Italy. Designation of Charleston and Norfolk as alternate U. S. termini is not necessary, the report added, explaining that the company could land at those points under emergency conditions without a certificate.

The report, one of the most important issued since establishment of the CAA, found that additional air service between the U. S. and Europe is required by the public convenience and necessity, and added that the facilities of Pan American Airways, the present carrier, are inadequate for the business available at present. Pan Am and its affiliates "control practically all American flag foreign air transportation," the report noted.

Pan American intervened in the Export hearing, strongly opposing entrance of Export into trans-Atlantic air service. The intervener claimed that it can furnish all necessary service at less cost than Export, and that it will have intense competition from foreign carriers.

"It cannot be denied that at the present time the intervener enjoys a practical monopoly over ocean air travel and, that even when foreign carriers commence operations, it will continue to monopolize these routes, including the north Atlantic, insofar as American competition is concerned," Leasure said.

"The record shows that there is sufficient demand, patronage, and commercial life to increase the services over the north Atlantic air transportation route; and all parties predict a rapid increase in these needs. In addition to the commercial advantages to be gained by American supremacy over this route the Authority must, under the Act, consider the advantages that will accrue to the national defense by the development of our oceanic air transportation systems. Admitting that the anticipated foreign competition would cause the intervener to be awake to all new developments in aviation, it would appear that the 'sound development of an air transportation system' would be accelerated by competition from an American carrier.

"It must be admitted that the European carriers would not permit us to utilize the benefits of their research and ingenuity; and our own aviation inventors and manufacturers would have greater incentive to encourage and develop their own research and resources with more than one carrier in the international air transport business.

"Competition does not necessarily mean duplication of service unless the field covered by a monopoly is completely served. It is true that where a territory is served by a utility which (1) has pioneered in the field, (2) is rendering efficient service, and (3) fulfilling adequately the duty which, as a public utility, it owes to the public, and the territory is so generally served that it may be said to have reached the point of saturation as regards the particular commodity in which the utility deals, then certainly the trend today is to protect the utility within such field; but when any one of these conditions is lacking, the public convenience may often be served by allowing competition to come in.

"There is no denying that the intervener pioneered the route in question here and that it is rendering efficient service within the limits of its facilities. However, it is obvious that at present its facilities are inadequate for the business available. Undoubtedly, the saturation point in available traffic is not yet reached and, if its own testimony can be relied upon, such a point is many years away. Futhermore, although this whole discussion is on the basis of north Atlantic traffic generally it must be remembered that the territory to be served by the eastern termini is almost unlimited."

Regarding cost, Leasure pointed out that Export concedes that Pan Am "should be able to furnish two additional frequencies at a lower cost than the applicant can furnish its initial frequencies. The applicant further concedes that the proposed new services would mean an additional heavy annual expenditure by the government. The comparative cost of operation of additional trans-Atlantic air transportation by the applicant and the intervener, and the additional expense to the government, are factors which, while not controlling, must be considered in relation to the public interest to be served." The report said that in this connection it should be noted that in the Pan Am trans-Atlantic certificate case, in which the CAA held that the public convenience and necessity required the service now operated by PAA, no reference was made to the question of the probable cost of the service.

"The applicant submits that the failure of the Authority to grant its application would be tantamount to forever closing the door to competition by any American air carrier over the north Atlantic route," Leasure's 76-page report said. "The applicant and its parent company, American Export Lines Inc., expended large sums of money in its most exhaustive planning for its entrance into the trans-Atlantic air transportation business. The applicant contends that if its request is denied at this time, it will be an absolute deterrent to the entrance of American capital into a similar venture in the next few years. There is no question that an adverse decision by the Authority will cause investors to hesitate before risking their money in any subsequently proposed competitive trans-Atlantic air carrier."

In finding mail-property service with the Consolidated boat not required, Leasure stated that the cost of operating such fortnightly trips would be in excess of $1,000,000 per year. Inasmuch as the primary object of such trips would be the training of personnel, he said that such object "could be better effectuated if the developmental flights were not restricted to the necessity of meeting schedule requirements." Export proposes to operate its mail-passenger-property service, which will be non-stop between New York and Lisbon, with Sikorsky S44 four-engined flying boats.

Export had also asked approval of acquisition of control of the airline by the steamship company, but Leasure found such approval not necessary. The airline, he said, will have the benefit of the steamship company's traffic organization, meteorologists, etc. "It is concluded . . . that the relationship of the steamship company to the applicant does not restrain competition and will promote the public interest," he stated.

STRANGE ABODE

Continued from Page Seven

of nine watches concealed within the walls of the home is the key to the music.

The mechanism is simple. He took an ordinary watch, removed the hands and substituted a cam. A pendulum is released every half an hour by the cam. This permits a wire lever to contact a mercury vial. This in turn forms a contact which starts a blower in the basement and the flutes play.

The instruments carved of wood by Dr. Nixon play three tunes, "Waters of Minnetonka," the "Indian Love Call" and "O Sole Mio."

Other watches in the walls with cam arrangements instead of hands form contacts which cause musical notes to come from hidden places. One set of notes is an exact reproduction of the singing of a canary. Another is that of a mocking bird. Several of these are arranged to play every twenty minutes. Another watch completes an electrical contact which causes a music box to run and play the tunes hidden within its mechanism. The box is one the doctor has adapted to his own whims.

A FEW years ago Dr. Nixon was listening to an organ concert. He was so thrilled by the voluminous music that he decided he must have an organ in his house. There was one small room which would be ideal for a small organ. Next day he started out to buy one. Nothing but a good one would do. Such organs are expensive. They cost much more than he could afford to pay. So Dr. Nixon trudged to the public library, obtained all the available textbooks on the art of organ building and made one himself.

Today the mighty pipes from which the fine music comes occupy a major part of the basement. This organ built by the doctor is the marvel of San Francisco's leading organists who declare that its delicate tone is unsurpassed by professional work. By installing a number of microphones and an ingenious system of mechanical control, Dr. Nixon has fixed the organ so it will play at a spoken command. To shut it off he pushes a pin into a small hole in the floor of an adjoining room.

His love of beauty is reflected in every room in the house. Although all you see on the outside is dull-looking window shades which are rarely raised, the windows on the inside are framed by rich drapes and curtains. The sills and casings are beautiful wood carvings.

The walls and ceilings of each room are a series of panel carvings, either of rosewood, walnut or mahogany, giving them a museum beauty, in some effects somber, yet cathedral-like in tone.

Connoisseurs have become excited at the doors in his mystery house. They are exquisite portraits of wood design entirely handmade. The doctor applied sculptural ability to the fashioning of gargoyle heads in several rooms. One of these he calls Bluebeard. It is on the door leading from the organ room to the entrance hall.

This head has discs concealed in its mouth. The voice, acting on a platinum point, forms a contact with the discs. This turns on electricity which sets gears to working and the door opens or closes at your command. There are also two beautiful reproductions in bronze of Parthenon friezes, another accomplishment of the doctor. Even the floors are inlaid in a delicate pattern design.

In the hallway is a disappearing hat rack. He did not want a row of hats to disturb the beauty of line in the panel carvings so he arranged a rack that folds back out of sight into the wall with a simple turn of a couple of hinges.

Near this rack is a telephone concealed behind a panel. When the bell rings, the clapper releases a miniature mouse trap and completes an electrical circuit that sounds buzzers in distant rooms.

HIS drive for beautiful surroundings is deeply reflected in his Death Valley room. Hanging on one wall is a beautiful and huge panoramic painting of the famous desert. A fountain plays in the center of the room among rocks and sand brought from Death Valley. Two other large paintings decorate the walls. One is of Yosemite Valley, the other of a woman.

The accomplishments of this man are not confined to these ingenious arrangements. If his house needs wiring he does it himself, for he is a qualified electrician. He has complete knowledge of architecture and building construction and also does his own remodeling. If he is ill he treats himself for he has mastered medicine. He can also compound his own prescriptions for he has a thorough knowledge of pharmacy. These are some of the trades he has followed during his life. Shipbuilding was another.

He quite often entertains friends in the haunted house on Saturday evenings. A favorite form of entertainment is to prove to them that the hand is faster than the eye. He is an accomplished magician, having been on the stage entertaining with magic when a young man.

When asked why the exterior of his home is in such startling contrast to the interior he declares there are several reasons. First, he lives within the house and it is there he wishes his beauty. Second, he does not want the house to be too attractive for it attracts enough people now who bother him and keep him from his work.

His principal reason for leaving the outside weather-beaten, he says, is because "no haunted house has a fresh coat of paint."

Lighting

A NEW vista is opening in the field of artificial lighting as a result of bombarding fluorescent powders with ultraviolet rays.

Cool light is thus being produced which duplicates all the pastel tints of the rainbow. It is announced by the General Electric laboratories that these new lumiline lamps provide hitherto unobtainable tints of colored light with as much as 120 times the illumination which could be produced by filament lamps of the same color. And the latest fluorescent lamps not only consume less current, but generate next to no heat.

The Weekly PUZZLE

ACROSS

1—Presses firmly together
8—A traverse fortification to protect from a rear attack
15—East Indian coasting vessel
22—To dispose in order
23—Indulge in too much food
24—Kind of shellfish
25—To make ready
26—Perceive by the senses
27—Directed toward the side
28—A little island
29—Small lizards
31—Accomplished
32—In a canted position, as a boat
34—Closing period of life
35—Forces the air noisily through the nostrils
37—Possessive case of she
39—An African
41—The flight of Mahomet from Mecca
43—People of Asia
44—Beggarly
45—Overpowered by emotion
47—Ruling chiefs in certain parts of India
48—Irish Gaelic
49—Any fragrant ointment
51—Those who satisfy the appetite
53—An idol of the Antillean Indians: var.
54—Feminine personal name
56—East Indian split pulse
58—Arbitrate
60—Machine for glazing
63—A nest: rare
65—Pear-shaped vessels fitting into each other
69—Winglike part
70—Binds
71—Bishop's crown
73—British peninsula of Arabia
74—Falsehood
75—Thick woolen twilled stuff
77—Pieces of spun yarn for fastening sails
79—Wooden pins
80—Mahometan governors
81—Soaked through
82—Neckcloth
84—Cover with wax
85—Was like another thing
86—Prelate highest in rank in a nation
87—Feminine personal name
88—A motion forward
90—Portentous
91—Volcanic scoria
92—Little child
93—Transparent case protecting a light
95—Friction
96—Suppliers of food
98—Indifferent to pain
102—Crafty
104—To anoint
105—Foreign quarter of Constantinople
108—Near the back
110—Birds of prey
112—Implements used in mining
116—Asserts formally
118—A thrusting sword
120—Small piece of ground
121—East Indian cereal grass
122—Smaller
124—Border
125—Disconsolate
126—To reenact
127—Adopted son of Mahomet
128—One who takes notes
130—Turkish landowner
132—A drink of wine, hot water, sugar
134—Jutting rock
135—A plastic product of cotton-fiber used for sizing
137—Ironical
140—Cause to function
142—Went into
143—Recluse
144—Signifies
145—Elects again
146—Made hard
147—Long, wooden seats

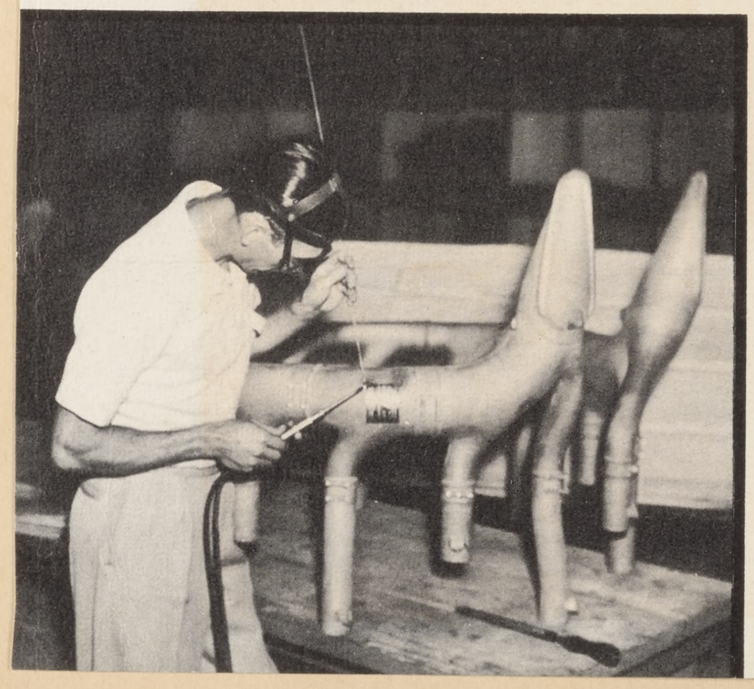
been in supplies for installation in military aircraft, but it is significant that in the last year 23% of the total sales were for commercial purposes. While prepared to do its part in making the United States self-sufficient from a military and naval standpoint, Solar officials have set their sights on a long-range program designed to assure virtually uninterrupted output of its products; this to be accomplished through diversification, already begun. By so doing, Solar is confident that its position will be strong enough to meet any readjustments necessitated by changing world conditions.

First steps have been taken in this direction. The company holds an exclusive license to manufacture and distribute Airmax Exhaust Type Cabin Heating Systems. In the last year another type of heating installation known as the Airmax Central Heating System was developed in the company's laboratories. Sales of both types have reached encouraging proportions. Further diversification of products is contemplated through other licenses secured from owners of patents applicable to aircraft. Research in these new fields is being conducted by Solar technicians.

Additions to its plant, under construction and projected, will give the company 35,700 sq. ft. of new floor space for a total of 112,000 sq. ft. Larger quarters are required by the engineering, research and pattern departments, while provision is being made for the new development department.

Established in 1927, destinies of Solar Aircraft Co. have been directed by Edmund T. Price, president. As an example of Solar's progress, for the fiscal year ending in 1936, net sales were $224,024; for the last corresponding period the figure was $1,065,672 (double that of a year ago). Unfilled orders at the close of the last fiscal year were $932,190, compared to $301,979 for the same period in 1939. Despite shipments which have been averaging more than $100,000 for months, an unbroken stream of orders has sent the backlog well past the $1,000,000 mark. Moreover, contracts under negotiation will, when signed, place another million dollars on the books. Further attesting the company's strong position is the fact that it has registered a net profit for the eighth consecutive year. » »

Lon E. Wheeler, Solar vice-president, welded up the 5000th manifold.



CONSOLIDATED AIRCRAFT CORPORATION

THE tremendous expansion program currently being completed at Consolidated Aircraft Corporation gives San Diego the distinction of having the largest integrated covered and uncovered aircraft manufacturing plant in America. Consolidated's manufacturing space, exclusive of field, ramp and railroad sidings, now occupies over 1,910,000 square feet of area—an 87 percent increase over the previous figure. The company holds an option on adjacent land equal to an added 50 percent of this area, and plans exist for its potential use.

This expansion brings Consolidated into full step with the national defense program. Operating as of July 1 with a backlog in excess of $70,000,000, it had contracts for additional work under negotiation which, if accepted, would build orders on hand to well over $100,000,000.

Working in three shifts, and employing more than 7000 skilled workmen, Consolidated's huge plant utilizes all the latest features of aircraft plant design. The plant now extends for a half mile along Pacific Highway, and the new Final Assembly building at the north end of the plant is more than a city block in size.

A new four-engined land bomber, designated by the Army as the XB-24, marks the company's re-entry into the land plane manufacturing field, breaking a virtual specialization which has brought Consolidated the distinction of being the world's largest manufacturer of flying boats. Data on the big 20-ton ship have been kept well in hand by the War Department. The first flight pictures of it were not released until May, at which time the plane was undergoing final tests.

The powerful new XB-24 is a full cantilever, all metal plane, powered with four Pratt and Whitney 14-cylinder twin row radial air-cooled engines rated at 1200 h.p. each, giving the plane 4800 available horsepower in flight to hurtle it through the air. The propellers are Hamilton Standards of the 3-bladed hydromatic constant speed type, 12 feet in diameter.

Tactical requirements are for a crew of from 6 to 9 persons, depending upon the mission to be performed. The fuselage is equipped with hatches and windows in the nose, tail, turtle-deck, back and bottom. The landing gear is of the tricycle type with single wheel forward. This retracts into the fuselage. The rear, or main landing wheels retract into the wing wells.

While the performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb-carrying capacity of approximately 4 tons." » »

Remarkable BOAT

By HAROLD KEEN

★

The U. S. Navy has about 225 PBY's and is expected to order more in the form of the latest PBY-5.

THE world's most remarkable flying boat is an American product—the creation of an American concern's inventive genius, engineering skill and manufacturing efficiency. Snow and ice fields of the Arctic, the uncharted airways over the Indian Ocean, the peaks and plains of America, and the brooding majesty of a mountain-imprisoned lake 11,500 feet above the sea in an equatorial wilderness have known this rugged lord of the skies.

Little more than four years have elapsed since the Consolidated PBY-type seaplane emerged from the experimental stage and stood acceptable to the United States Navy. In that period, its utility as a scouting instrument has been so dramatically demonstrated that this country now can be said to possess a chain of outposts along a defense frontier 2,000 miles from its own shores or those of any of its possessions.

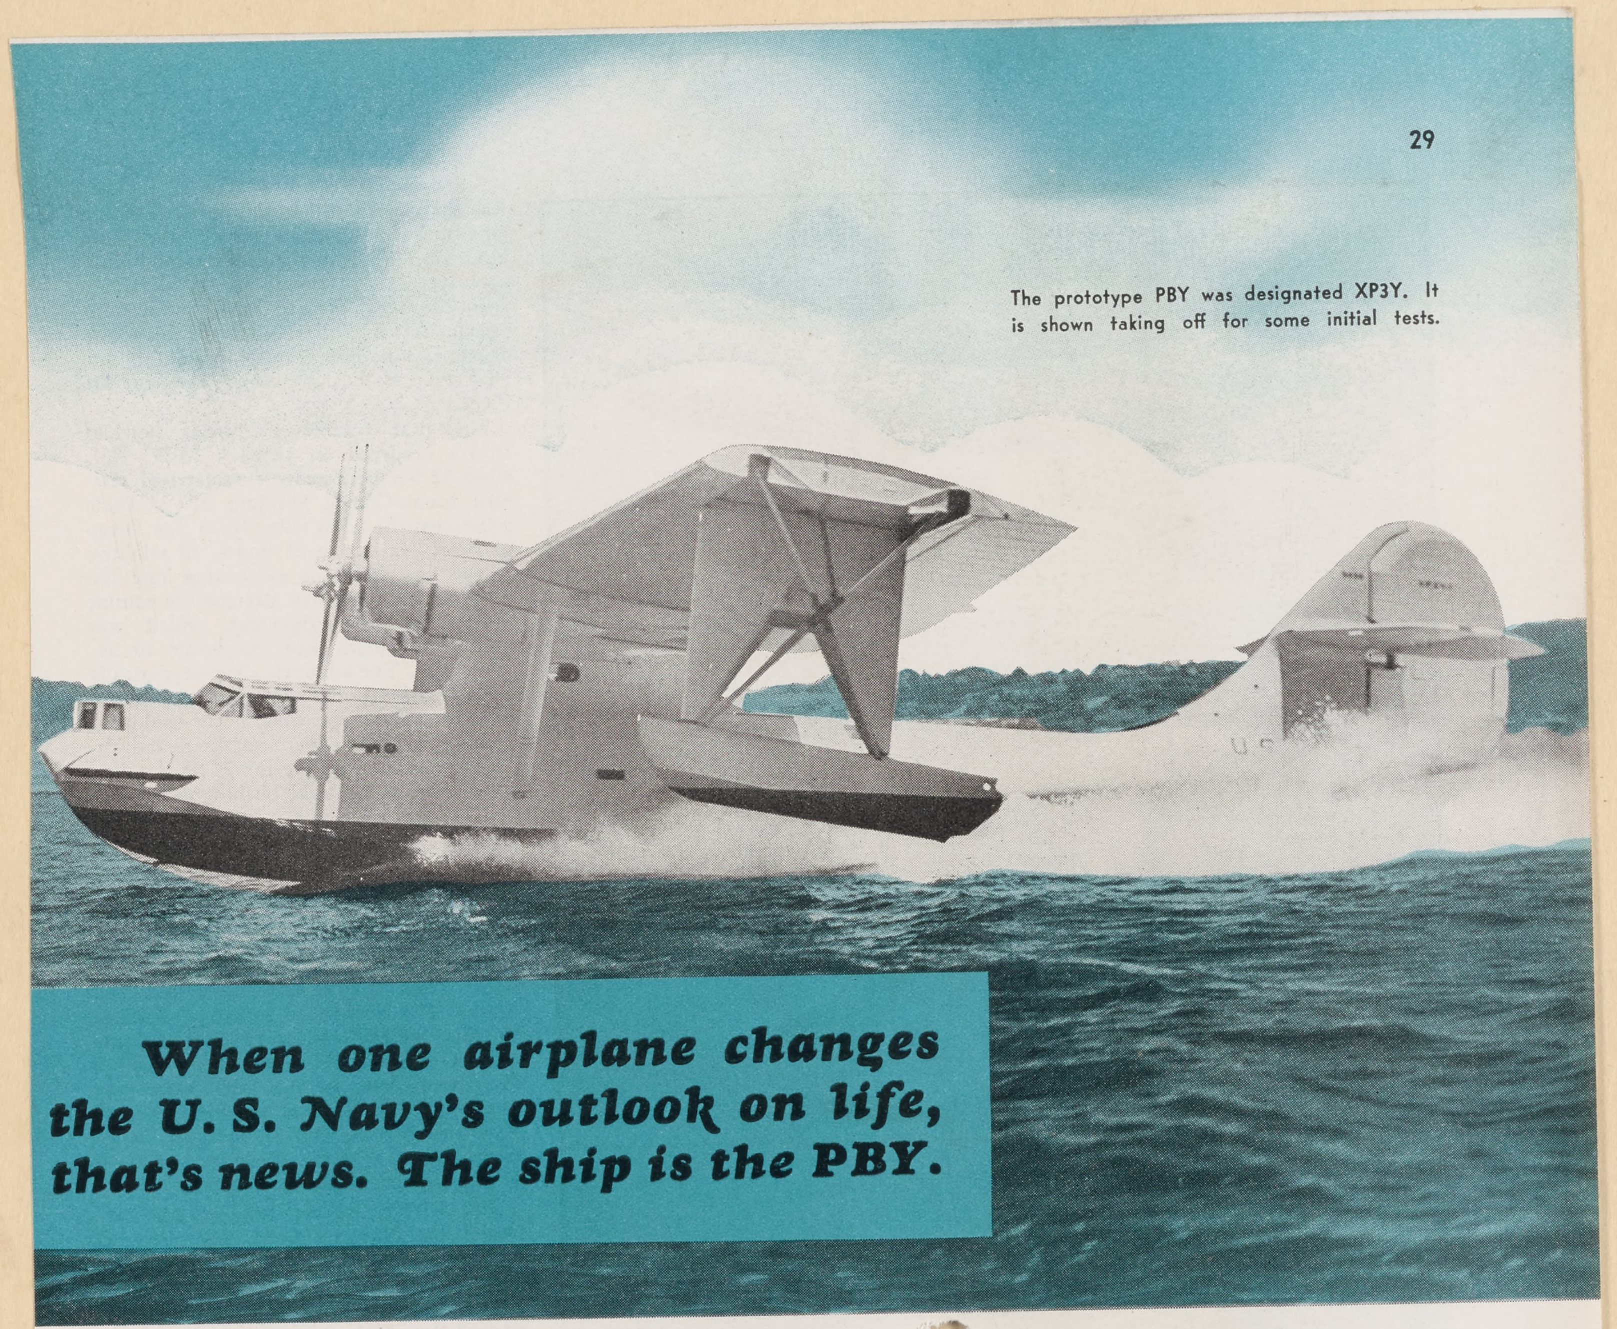
Outposts in the ocean? Yes, they're out there and none the less effective because they don't *seem* to exist. For, if the time comes that they must be occupied, whole fleets of PBY's will hover above the outermost line of defense to spot the enemy and will range the trackless thousands of square miles to the rear, back toward the visible bases on land.

These 13-ton craft won't have to be sent out merely to locate and then run for cover. With giant bombs or torpedoes secured to the 104-foot wing, they can deliver mighty deadly wallops. Well aware of the versatility, the reliable performance and the longevity of the PBY, the Navy has in operation more than 200 and before this is published will have ordered a substantial increase to this long-range sky armada. The PBY, after a thorough, extensive trial, has been adopted as the keystone of American aerial intelligence, to which is entrusted the obtaining of information on hostile Fleet movements long before enemy warships could be seen from American waterfronts. With U. S. naval strategy essentially that of engaging the enemy many miles from our territory, the role of the PBY has become a vital one, indeed.

Non-stop mass flights across great oceans and between far-distant bases have been made to appear so simple by the Navy's present-day patrol bombers that it is difficult to realize the first of such feats was accomplished only six years ago. In January, 1934, half a dozen P2Y's, sesquiplane predecessors of the PBY, commanded by Lieut.-Comm. Knefler McGinnis, took off from San Francisco harbor in an event of epochal importance. They were headed for Pearl Harbor, Hawaii—an unprecedented attempt which was authorized only after the Navy had probed completely the planes' long-range capabilities. Material failure could prove fatal. No stopping-off points existed between San Francisco and Hawaii. Faith in the P2Y's was rewarded and a new era in Naval aviation launched when the intrepid flyers landed at Pearl Harbor 24 hours, 56 minutes later, without mishap or untoward incident. The big flying boat had come of age. The P2Y now was in demand, not only here but abroad. They were sold to Colombia, Argentina and even one to Japan.

I. M. Laddon

H. L. Mandolf



The prototype PBY was designated XP3Y. It is shown taking off for some initial tests.

When one airplane changes the U. S. Navy's outlook on life, that's news. The ship is the PBY.

All the outstanding characteristics of this series were merged with unique new features in engineering of the PBY. An Austrian-born engineer, Henry Ikarus Mandolf—he is a graduate of the Austrian Naval Academy and now a loyal American citizen—conceived the important "disappearing pontoon" which helped increase the efficiency of the PBY's to such an extent they became comparable in load carrying and cruising speed to the much larger, four-engined transoceanic clippers. The pontoons were designed to retract outward and form the wing tip of the bomber in flight, thus reducing drag and improving the effective aspect ratio of the wing.

A further contribution to the PBY's great performance characteristics was the location of the fuel tanks, which were built integrally with the wing, allowing for large gasoline capacity at a minimum of additional structure weight which would be entailed by separate tanks. The entire hull, thus, is available for crew, passengers and cargo.

The Model 28—Consolidated's designation for the PBY—has exceeded 190 m.p.h. top speed, has a maximum range of 4,200 miles, a service ceiling of 29,200 feet, can climb to 15,000 feet in 13.4 minutes and requires less than a minute for full-load take-off. Russell Rogers, chi[illegible]ot of Richard Archbold's airboat "Guba"—a commercial version of the PBY—who is considered one of the world's greatest large airboat aviators, has been known to lift his craft off the water in 20 seconds.

Full cantilever tail and stressed skin monoplane wing were innovations in a seaplane of this size when introduced, with resounding success, by the PBY.

Approximately 225 of these high-performance craft, at about $150,000 each, have been delivered to the Navy. Since acceptance of the PBY in 1936, its achievements have amazed the world—not primarily because of the distance or duration of flights, but because of the never-failing dependability of the planes, the lack of incident that characterized each new lengthy journey and the ease with which vast areas of land, as well as water, were spanned. Forerunner of all these flights

Below is the Consolidated company's production line. Eight PBY's are shown.

Remarkable Boat

(Continued from page 30)

minutes (the present record) was required by 15 PBY's led by the same Lieutenant-Commander LaHache last June. And Coco Solo, 3,087 miles away, has been reached from San Diego in only 22 hours, 20 minutes, by a 14-plane squadron. These feats by no means exhaust the admirable potentialities of the PBY-type.

Fletcher Pratt, the eminent Naval expert, is authority for the astounding, virtually unbelievable revelation that a PBY, in the 1939 Caribbean maneuvers, remained in the air *three days continuously,* traveling 15,000 miles as it kept on the tail of the "enemy" fleet. Just how this was accomplished has not been disclosed, officially or unofficially, as the PBY's 1,700-gallon gasoline capacity allows a non-stop range of only 4,200 miles. Were extra tanks installed in the hull? Was the working crew reduced to save weight? The Navy has not confirmed this sensational report, but if any element of truth exists in it, startling are the possibilities of day-and-night scouting thousands of miles from the United States.

Meanwhile, a private citizen—the wealthy Standard Oil heir, Richard Archbold—and the flight crew of his $250,000 "Guba", showed the Navy what terrific punishment its patrol planes will take under the most severe flying conditions conceivable and in widely varying climes. Archbold and his chief pilot, Russ Rogers, were the first to fly non-stop across the United States in a seaplane. This was done in the "Guba" on June 24-25, 1937—from San Diego to New York, 2,700 miles, in 17 hours, 3 minutes. And, to prove this could be made as much a routine as the Navy's ocean hops, Archbold did it again the following December—San Diego to Miami, 2,300 miles, in 14 hours, 10 minutes. He did it still a third time, again to Miami, on Feb. 26, 1938, in the creditable time of 12 hours, 35 minutes.

After due consideration of these performances, the Navy decided they were not mere stunts and had tremendous tactical value. They sent one of their own ships across—not quite as far, but nevertheless on a transcontinental trip, from San Diego to Pensacola. This has been done several times since with individual PBY's, the Navy having yet to risk a mass flight of seaplanes across the nation.

Aviation experts will tell you this is not as hazardous as it appears at first. There are plenty of sufficiently large water bodies to accommodate a PBY in an emergency during a transcontinental crossing. These water bodies, they will assure you, are closer together than emergency landing fields capable of harboring today's giant transports or Army bombers.

All this was done by Mr. Archbold in the same "Guba". There have been two "Gubas" (the name is native Papuan for "Sudden Storm"), with the first one purchased by the Russian government for Sir Hubert Wilkins shortly after the initial cross-country trip to New York in 1937. In this craft and with the Archbold flight crew, Wilkins searched for the Russian ace, Levanevsky, and his lost shipmates in the polar regions north of Latitude 80. The manner in which this airboat performed again found keen interest among Navy officials. Nineteen thousand miles were covered in flights of tremendous non-stop distances. To the 1,700 gallons of gas contained in the wings were added a large quantity in drums carried within the hull. This, in addition to the bulky supplies and equipment and the heavy drag of ice coatings on wings and tail surfaces, at times put the boat to tests possibly more severe than any ever administered under normal operating conditions.

A startling sample of the PBY-type's versatility was again afforded by Archbold, in the second "Guba", acquired after he disposed of Number One to the Soviet Union. This ship, perhaps the most famous privately-owned airplane in the world, has an amazing record of "firsts" to its credit. In its use as a transport for an American Museum of Natural History expedition in Netherlands New Guinea, and as a survey ship for a new commercial route planned by the Australian government, it accomplished the following:

1. First to fly from Guam to Netherlands New Guinea, 1,900 miles.
2. First to operate from a lake 11,500 feet above sea level (Lake Habbema in Netherlands New Guinea), where dozens of landings and take-offs were made in rarefied air that deprived the two 1,000 h.p. Pratt & Whitney engines of almost half their power.
3. First airboat to span the Australian continent non-stop, 2,200 miles from Sydney to Port Hedland.
4. First airboat to cross the Indian Ocean, 5,400 miles from Port Hedland to Mombasa, Africa, on a survey flight for the Australian government to demonstrate feasibility of a new commercial air route.

AERO FIRE PREVENTION

It is proper and wise that airplane fire risks be faced squarely, their causes studied and precautions taken to minimize them. The Aero Insurance Underwriters have made a careful study of air safety, particularly relating to fire and fire hazards. Jerome Lederer, Chief Engineer of the Aero Insurance Underwriters, brings the findings of their study to the readers of POPULAR AVIATION. Don't miss this informative article in the

APRIL ISSUE

POPULAR AVIATION

ON SALE MARCH 10

(Continued from page 80)

5. First to fly from the west coast of Africa to the Virgin Islands, making it holder of the world's record for non-stop over-water flying, 3,300 miles on this jump.
6. First airboat to circumnavigate the globe the longest way—25,000 miles—with San Diego as the starting and ending point.

When Russ Rogers and company returned to San Diego last July they stepped out of the "Guba" and into another Model 28, with markings of the British Royal Air Force on its wing and hull. In this they demonstrated to the United States Navy another stunning possibility—easily accomplished flights of bombers across the Atlantic between Europe and the North American continent. They took the PBY replica, which the English government bought for experimental purposes with a view to possible large-scale production, from San Diego to Buffalo, N. Y., then to Botwood, Newfoundland, and finally directly across to Felixstowe, marine aircraft experimental establishment of the Royal Air Force on the North Sea.

That gave the Navy experts plenty of food for thought, not only as to the ability of the PBY. A horde of bombers flying in the opposite direction could no longer be considered as pure fancy. There is irony in the sale of a PBY to England. Glowering at Great Britain from the other side of the diplomatic fence is Russia which also boasts not only a PBY but a complete set of plans and tools for the mass production of these airboats. In 1937, Consolidated sent a corps of 10 engineers to Taganrog, Russia, on the Sea of Azov, where the technique of American manufacturing was introduced at a huge plant. Preceding the technicians were a complete PBY, parts for another and the design and tools. The enigmatic Russians claimed the ships were to be used for commercial, cargo-carrying purposes. Yes, it was all done with the consent of the U. S. Navy, whose strategists are well aware of the fact that Alaska is not too comfortably distant from Siberia.

The Atlantic was transversed half a dozen times last summer by another Model 28, purchased by American Export Airlines for survey flights preparatory to establishing a regular service.

American aviation knows no more glorious chapter than the military and commercial saga of the PBY-type flying boat. And from it greater developments have sprung. There is the mighty four-engined XPB2Y-1, several of which are under construction for the Navy, and the experimental twin-motored (2,000 h.p. Wright *Cyclones* each, the largest ever installed in a plane) Model 31, said to be the fastest and longest-range airboat in the world.

But engineers are looking beyond these, to the other side of the horizon, where the flying wing is awaiting practical application. As for the airplane of tomorrow, based on proved principles of design and construction, the PBY's chief engineer, I. M. Laddon, has this to say:

"It will carry up to 300 passengers with baggage, mail and baggage, or mail and express and have a range sufficient to cross any ocean or continent with a safe reserve of fuel. Flying at well over 300 m.p.h. in the stratosphere where ideal conditions for smooth, fast flight exist, the passenger will find a modern expression of the fundamental urge to travel, in keeping with an age of speed."

END

It Takes Headlines

(Continued from page 53)

tion announced some ground schools in the Wisconsin vocational schools, the W.C.A.C. wrote the district NYA supervisor offering corps members as volunteer speakers and equipment for part time use. That also got publicity and it was a worthy public service.

When the Community Chest drive starts let your organization offer a couple of planes to fly signs over the city. Organize a speakers bureau and let the various civic clubs know that the emminent attorney, Joe Doakes, is a member of the Whoosis Aviation club and he'll be glad to talk free at one of their noon luncheons. Send your speakers before high school and grade school assemblies, to Boy Scout and Girl Scout meetings, down to the Y.M.C.A. You'll be amazed how gladly they will be received.

If possible, get an unusual twist on your normal activities. That makes for news. For example, the W.C.A.C. planned a navigation race from Milwaukee to Kohler, Wis., back to West Bend, Wis., and then into the Curtiss-Wright airport at Milwaukee. Normally that would have been worth maybe two paragraphs in the newspapers—one to announce the race was to be held, another telling the winners. Some wise member of the corps remembered the state and nation was wrought up over the dual Thanksgivings; one on November 23 for FDR, the other on November 30 for the Republican governors.

So the group announced a Turkey Day race to be held the Sunday before Thanksgiving the First with turkeys, geese, ducks and chickens (all donated) for prizes and got themselves a couple of good feature stories.

At the annual hobby show in Milwaukee's huge auditorium, the same organization carted a small plane from an airport through the downtown streets, set it up along with other things as an exhibit and kept someone on duty to explain controls, struts and whatnot to the thousands who saw the hobby show.

The possibilities for legitimate publicity for your aviation organization are bounded only by your imagination and the worthwhileness of your activities. But remember—only *good* publicity is news.

END

Government Sailplane

THE first sailplane ever to be ordered directly by the U. S. Government recently was delivered to a Government soaring school project at Cassidy Lake, Michigan. The sailplane was completed 19 days after the order was received, although the order itself called for 30-day delivery. The ship was built by the Bowlus Sailplane Company, San Fernando, Cal.

South Wales Post 7/5/40

BRITAIN IS BUYING 9,500 PLANES FROM UNITED STATES: 3,000 HAVE BEEN SENT

From Our Own Correspondent

NEW YORK, Sunday.

NEARLY half of the American planes delivered to the Allies to date are training machines unsuited for use at the front, it is revealed.

The fact that 1,188 North American (Harvard) trainers have been delivered to Britain and 524 to France, from a total of 2,827 of this type ordered, indicates that future deliveries will consist of a far larger proportion of fighter planes of various categories.

Detailed figures of Allied plane purchases in the United States are now available for the first time

Until now only the value of the orders placed in this country has been made public, while the information about deliveries has been of the vaguest.

HALF DELIVERED

It can now be said that Britain, by taking over the French orders, holds contracts for 9,512 American planes, of a total value of over £250,000,000.

Nearly half of these planes have been delivered to Allied agents here, and about 3,000 have been shipped to Europe. French orders, taken over by Britain, total 4,934 planes, of which 1,858 have been delivered and an unknown number shipped, leaving 3,076 which will be diverted to Britain.

Of planes ordered by Britain alone, 2,028 have been delivered and 3,886 are to come.

Total figures can be shown as follows:

North American (Harvard) trainers, 2,837; Curtiss pursuits, 1,900; Lockheed (Hudson) bombers, 1,860; Douglas bombers, 1,335; Martin bombers, 870; Bell Air Cobras, 240; Brewster fighters, 250; Consolidated flying-boats, 96; Grumman fighters, 84; Vought-Sikorsky dive-bombers, 40.

The arrival here of Mr. Harold James, of the British Ministry of Aircraft Production, who expressed the hope that American manufacturers would be able to speed-up production to the point of delivering 5,000 planes monthly, is taken as an indication that even larger British orders are in prospect.

South Wales Post 7/5/40

AMERICAN AIRCRAFT

SOME TYPES IN USE IN THIS COUNTRY

A few types of military aircraft from the United States have already become familiar in this country through their use in the air services of the Allies.

Probably the best known are the Lockheed Hudson reconnaissance aircraft adopted early in the war by the R.A.F. Coastal Command, and the Curtiss Hawk 75A fighters of the French Armee de l'Air. Both are straightforward designs whose features are strength and power of manœuvre rather than high speed.

But there are a number of other types of U.S.A. aircraft not yet so well known, some of which are rather less conventional in appearance and design, and which may have interesting possibilities in war.

Among the two-motor fighters is a single-seat 400 m.p.h.-plus machine with superfine streamlining, the Lockheed P-38. A characteristic feature is the way in which the two engine-nacelles are extended to form the tail units, and a central fuselage dispensed with. The motors are 1,250 h.p. Allisons, an in-line type of liquid-cooled engine reminiscent of the Rolls-Royce Merlin. Allison is a relatively new name in U.S.A. engines, and the type is now fitted to a number of America's newest fighters.

Another interesting American is the Bell Airacobra—a single-seat fighter for which a speed of over 400 miles an hour is also claimed. In silhoutte not unlike the British Spitfire, it is unique among contemporary aircraft in mounting the engine amidships, behind the pilot, and driving the airscrew by a long extension shaft. Another Bell product is the two-motor, multi-seat Airacuda, in which the propellers are fitted behind the wings. Forward extensions of the engine nacelles are used to house gunners.

A more conventional type of single-seat fighter from which a high performance may be expected is the Curtiss P.40. This sturdily built fighter, designed for the U.S. Army, is also powered with a single 1,250 h.p. Allison motor. The latest version is known as the P.40.D. The wing span, 37-ft. 4-in., is just a little more than that of the Spitfire. Another interesting design is the little, high-powered Vultee Vanguard. Although only a single-seater with a wing span of 36-ft., it houses a 1,600 h.p. Pratt and Whitney motor under its cowling. For fleet work the Americans have a useful four-gun fighter in the Brewster F2A-1. This has an air-cooled Wright Cyclone motor of 800 h.p. Its short chubby fuselage and stiff wings give it a distinctive appearance, rather like a flying barrel.

ARMAMENT OF THE FIGHTERS

Not much information has been released about the armament of these new fighters. In general U.S.A. aircraft are less heavily armed than their British counterparts, but it may be remembered that the fire power of the Curtiss Hawks supplied to the French Air Force was increased to meet modern war requirements.

America's new-type bombers include a number of fast, medium-sized two-motor types with a useful range. Some are fitted with diving brakes and other devices for close attack duty and are known as attack-bombers. The Douglas B-23 is an interesting example of American bomber design. Fitted with two Wright Cyclone motors it is claimed to have a speed of 375 miles an hour. This is some seventy-five miles an hour faster than the British Blenheim, a somewhat comparable type. An earlier type of Douglas, the DB-7, has much the same characteristics but a lower performance. Its wing span of 60-ft. is about midway between that of the Bristol Blenheim and the Handley Page Hampden.

Another good U.S.A. bomber is the Glenn-Martin 167-W, which has seen considerable service with the French Air Force. Not so fast as the new Douglas—315 miles an hour is about the maximum it can do—it is nevertheless a generally useful type, being designed not only for bombing, but also for fighting, reconnaissance and ground attack work.

Besides fighters and bombers America also produces a number of trainer aircraft and flying boats. The North America Harvard trainer was one of the first U.S. aircraft to fly the R.A.F. colours, several hundred having been bought before the war. So far no flying boats have been in service with the R.A.F. except for experimental purposes. Among the American flying-boats those constructed by the Consolidated concern are perhaps the most well known.

Northern Evening Dispatch 7/9/40

PLANE OUTPUT IN U.S.A.

Speeding Up On Pacific Coast

LOS ANGELES, Thursday.

Most of the 50,000 planes which President Roosevelt wants America to produce will be manufactured at factories along the Pacific coast. Sixty per cent. of the country's aircraft is now being produced at these West Coast factories, and they are now engaged on plans to double or treble their capacity.

A census by the Vultee Aircraft Company shows that the production facilities of seven leading manufacturers will be increased by 70 per cent. by 1941, and the Vultee Company has announced that its own production will be doubled. The Douglas and Lockheed Aircraft companies have both announced expansion programmes.

The seven companies announced in the census, were not named, but are presumed to include the Boeing Aircraft Company of Seattle, Consolidated Aircraft of San Diego, and the North American Aircraft Company of Los Angeles, in addition to the Vultee, Douglas and Lockheed companies.

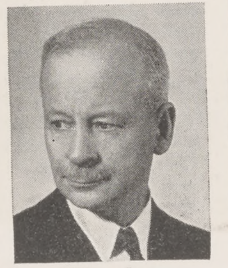
The expansion programme undertaken by these companies will cost £5,000,000.

More than 40,000 men are working on aircraft production, while the South Californian plants alone have accumulated orders for more than £100,000,000, which must be filled before starting on the new expansion programme.—British United Prss.

EDUCATOR JOINS UNITED

Prof. William A. Wheatley Is Line's New Director of School and College Relations

Prof. William A. Wheatley, former professor of education and guidance at State Teachers College, Edinboro, Pa., has been appointed director of school and college relations for United Air Lines, it was announced on Apr. 2 by Harold Crary, vice-president of traffic. Prof. Wheatley's son, William B. Wheatley, is chief test pilot for Consolidated Aircraft Corp.



Wheatley

Importance of air transportation, economically, civically and vocationally, is expanding so rapidly that United felt the need of adding an educator to its executive staff, Crary said. Prof. Wheatley is a co-author of two high school textbooks, "Occupations" and "Building Character and Personality."

BENBOUGH NOTE TO N. Y. MAYOR ABOARD GUBA

7/10/40

Greetings from Mayor P. J. Benbough, of San Diego, to Mayor Fiorella LaGuardia, of New York, were to be aboard Richard Archbold's Consolidated flying boat Guba when it took off for Port Washington, Long Island, at 2 p.m. today.

The flight originally was scheduled to begin yesterday, but was delayed on instructions from Archbold in New York, who notified the crew members by telephone that the navy, which is interested in the non-stop, overland flight, was planning a reception for them at Floyd Bennett airport.

Benbough's greetings follow:

Dear Mr. Mayor:

It gives me great happiness to take this occasion to send greetings to you, the mayor of the world's greatest city, from the city which encompasses the largest naval base on the Pacific coast.

The records held by the "Guba," and the remarkable flights made by the navy long-range patrol boats, of which the "Guba" is a counterpart, not only testify to the splendid ships flown by the navy but demonstrate how these "flying battleships" could span a great continent in a few hours to confound an enemy on either coast should the need arise.

It is my hope that this flight of Richard Archbold's famous ship will do its share to convince Americans that many more such flying boats, as well as additional military and naval equipment provide the safest way to preserve our democracy.

(Signed) P. J. BENBOUGH.

The trip was expected to require 17 hours. Crew members were Russell Rogers, chief pilot; Douglas Kelley, co-pilot; Stephen Barrinka, flight engineer; Harold Ramm, radioman, and Hector Nicholson, assistant flight engineer.

American Export Announces Plans

Trans-Atlantic air service to carry mail and express between New York and Lisbon, Portugal, will be established by American Export Airlines, Inc., within 60 days and a new non-stop New York-Lisbon passenger service will be begun next year.

This was announced today by J. E. Slater, executive vice president of the company, following the granting by the Civil Aeronautics Board of temporary certificates of public convenience and necessity in a decision in which it held that continued monopoly of the trans-Atlantic airways by Pan American is not in the public interest.

The mail-express service will be started with a Consolidated Model 28 twin-engined monoplane which made three successful round-trip survey flights across the Atlantic last summer. Plans call for two round-trips monthly with Horta, the Azores, as an intermediate stop.

The non-stop passenger service, which also will carry mail and express, will be provided by three S-44 Vought-Sikorsky flying boats, the commercial version of the Navy's flying dreadnaughts, which are being built by the United Aircraft Corporation. The proposed schedule calls for two round-trips a week.

U.S. 'Tremendous Boost' for R.A.F.

In about two months Britain's air strength will be "tremendously boosted" by United States planes of all descriptions—especially bombers—Major V. Bertrandias, vice-president of the Douglas Aircraft Company, said at Toronto.

The Consolidated Aircraft Company's big B 24 bomber—first of a fleet of long-range four-motored planes which, it is reported, is to be delivered to Great Britain—has been given its first test.

Officials of the company declined to say how many of the planes will be delivered to the R.A.F.

The bomber, with wingspan of 110ft., carries four tons of bombs and a crew of nine at a top speed of about 300 miles an hour.

Its cruising radius is 3,000 miles.—Associated Press and Exchange.

Wiltshire News 7/13/40

AMERICAN AIRCRAFT

SOME TYPES IN USE IN THIS COUNTRY

A few types of military aircraft from the United States have already become familiar in this country through their use in the air services of the Allies.

Probably the best known are the Lockheed Hudson reconnaissance aircraft adopted early in the war by the R.A.F. Coastal Command, and the Curtiss Hawk 75A fighters of the French Armee de l'Air. Both are straightforward designs whose features are strength and power of manœuvre rather than high speed.

But there are a number of other types of U.S.A. aircraft not yet so well known, some of which are rather less conventional in appearance and design, and which may have interesting possibilities in war.

Among the two-motor fighters is a single-seat 400 m.p.h.-plus machine with superfine streamlining, the Lockheed P-38. A characteristic feature is the way in which the two engine-nacelles are extended to form the tail units, and a central fuselage dispensed with. The motors are 1,250 h.p. Allisons, an in-line type of liquid-cooled engine reminiscent of the Rolls-Royce Merlin. Allison is a relatively new name in U.S.A. engines, and the type is now fitted to a number of America's newest fighters.

Another interesting American is the Bell Airacobra—a single-seat fighter for which a speed of over 400 miles an hour is also claimed. In silhoutte not unlike the British Spitfire, it is unique among contemporary aircraft in mounting the engine amidships, behind the pilot, and driving the airscrew by a long extension shaft. Another Bell product is the two-motor, multi-seat Airacuda, in which the propellers are fitted behind the wings. Forward extensions of the engine nacelles are used to house gunners.

A more conventional type of single-seat fighter from which a high performance may be expected is the Curtiss P.40. This sturdily built fighter, designed for the U.S. Army, is also powered with a single 1,250 h.p. Allison motor. The latest version is known as the P.40.D. The wing span, 37-ft. 4-in., is just a little more than that of the Spitfire. Another interesting design is the little, high-powered Vultee Vanguard. Although only a single-seater with a wing span of 36-ft., it houses a 1,600 h.p. Pratt and Whitney motor under its cowling. For fleet work the Americans have a useful four-gun fighter in the Brewster F2A-1. This has an air-cooled Wright Cyclone motor of 800 h.p. Its short chubby fuselage and stiff wings give it a distinctive appearance, rather like a flying barrel.

ARMAMENT OF THE FIGHTERS

Not much information has been released about the armament of these new fighters. In general U.S.A. aircraft are less heavily armed than their British counterparts, but it may be remembered that the fire power of the Curtiss Hawks supplied to the French Air Force was increased to meet modern war requirements.

America's new-type bombers include a number of fast, medium-sized two-motor types with a useful range. Some are fitted with diving brakes and other devices for close attack duty and are known as attack-bombers. The Douglas B-23 is an interesting example of American bomber design. Fitted with two Wright Cyclone motors it is claimed to have a speed of 375 miles an hour. This is some seventy-five miles an hour faster than the British Blenheim, a somewhat comparable type. An earlier type of Douglas, the DB-7, has much the same characteristics but a lower performance. Its wing span of 60-ft. is about midway between that of the Bristol Blenheim and the Handley Page Hampden.

Another good U.S.A. bomber is the Glenn-Martin 167-W, which has seen considerable service with the French Air Force. Not so fast as the new Douglas—315 miles an hour is about the maximum it can do—it is nevertheless a generally useful type, being designed not only for bombing, but also for fighting, reconnaissance and ground attack work.

Besides fighters and bombers America also produces a number of trainer aircraft and flying boats. The North America Harvard trainer was one of the first U.S. aircraft to fly the R.A.F. colours, several hundred having been bought before the war. So far no flying boats have been in service with the R.A.F. except for experimental purposes. Among the American flying-boats those constructed by the Consolidated concern are perhaps the most well known.

HERE'S SOME HEARTENING NEWS FOR DOUBTERS

U.S. Air Armada Hustle-Up

SUPER-PLANES TAKE WING OVER BRITAIN

By WILLIAM COURTENAY, "SUNDAY SUN" AIR CORRESPONDENT

THERE ARE MANY HEARTENING FEATURES IN A REVIEW OF THE AIR ARMADA WHICH AMERICA IS RUSHING TO THE AID OF BRITAIN.

ALREADY SUPER-AIRCRAFT ARE ARRIVING IN THIS COUNTRY, ARE UNLOADED, ASSEMBLED, AND IN MANY CASES TAKE THE AIR WITHIN FIVE HOURS OF THEIR ARRIVAL.

By next spring the invasion of American aircraft will be in full flood, and these 10,000 machines, plus others which will follow, will help to redress the balance of numbers against the foe.

Twenty thousand aero engines are on order

of the way down the fuselage to protect the tail from attack.

They have proved most effective against German bombers.

They have been flying 400 miles from their home bases, over Norway, have shot down enemy aircraft, and have defended themselves from air attack. They are now being used on bomber duties and have considerably augmented our bomber fleets.

The new Douglas twin-engined bomber, reputed to have a top speed of 330 m.p.h., figures among our orders. Up to 1,335 are on order and, in addition, 870 Martin bombers are due to come over.

Also, we are buying 240 of the Bell Airacobra fighters, which have the engine amidships in the fuselage, a propeller shaft to the nose for the airscrew, and fly at 400 m.p.h.

The long range Consolidated flying boats, of which one flew from San Francisco to Felixstowe will also be seen. There are nearly 100 on order

WITH A RANGE OF 4,000 MILES, WITH RETRACTABLE WING-TIP FLEETS, AND A SPEED OF OVER 200 M.P.H., THEY WILL SCOUR THE WIDE ATLANTIC AND THE WHOLE OF THE ARCTIC TO DEAL WITH SUBMARINES AND ATTEMPTS BY THE GERMAN NAVY TO BREAK OUT FROM ITS IMPRISONMENT IN NORTH SEA HARBOURS.

Raids by isolated aircraft, writes the "Sunday Sun" Military Correspondent, may in favourable circumstances, as in the Spanish civil war, achieve considerable material damage.

Even in those favourable conditions—which do not exist here—they cannot paralyse industry or cause casualties which will affect the morale of a population, whose faith in its cause remains intact.

The only grave effect small air raids could have would be if they were sufficiently frequent and widespread to keep a large number of people every night from bed.

INVASION BOGY RECEDES

This they have not been, and evidence suggests that they will not be allowed to become so.

The battle of the South-East Coast has a far wider significance than any other air encounter, well though our air defences have so far emerged from all tests imposed on them.

In order to effect a successful invasion of this country the enemy must have one of two things—sea power or air power.

He must not only be able to land a force, but also to maintain communications adequate for its supply and reinforcement.

The Nazis' sea power has—at any rate since the actions at Oran and Dakar—not been sufficient for their purpose. Was their air power?

With their admitted superiority in numbers, this was a question which seemed to admit of a good deal of doubt.

There are various ways in which air power might conceivably be used to cover an invasion.

A channel for boats or barges might be made by the dropping of magnetic mines, the invaders being protected by escorting aircraft, or

The seizure of a landing-ground by parachutists might be followed by the arrival of large aircraft, carrying troops and equipment including artillery and light tanks.

With an air force so alert and so capable of dealing with large air formations as the R.A.F., however, the escorting aircraft in the one case, the troop-carrying a material-carrying craft in the other would certainly suffer.

WHILE RECENT OPERATIONS HAVE NOT BEEN SENSATIONAL, THE LESSONS LEARNED FROM THEM MAKE THE SPECTRE OF INVASION DEFINITELY LESS GRIM THAN WHEN IT FIRST CONFRONTED US.

PLANE OUTPUT IN UNITED STATES

Speeding Up on the Pacific Coast

MOST of the 50,000 planes which President Roosevelt wants America to produce will be manufactured at factories along the Pacific coast, says a British United Press message from Los Angeles.

Sixty per cent. of the country's aircraft is now being produced at these West Coast factories, and they are now engaged on plans to double or treble their capacity.

A census by the Vultee Aircraft Company shows that the production facilities of seven leading manufacturers will be increased by 70 per cent. by 1941, and the Vultee Company has announced that its own production would be doubled.

The Douglas and Lockheed Aircraft companies have both announced expansion programmes.

The seven companies announced in the census were not named, but are presumed to include the Boeing Aircraft Company of Seattle, Consolidated Aircraft of San Diego, and the North American Aircraft Company of Los Angeles, in addition to the Vultee, Douglas and Lockheed companies.

The expansion programme undertaken by these companies will cost £5,000,000.

More than 40,000 men are working on aircraft production, while the southern Californian plants alone have accumulated orders for more than £100,000,000, which must be filled before starting on the new expansion programme.

UNITED STATES AIRCRAFT

'PLANES USED BY BRITAIN

A few types of military aircraft from the United States have already become familiar in this country through their use in the air Services of the Allies. Probably the best known are the Lockheed Hudson reconnaissance aircraft adopted early in the war by the R.A.F. Coastal Command, and the Curtiss Hawk 75 A fighters of the French Armée de l'Air. Both are straightforward designs whose features are strength and power of manœuvre rather than high speed.

But there are a number of other types of U.S.A. aircraft not yet so well known, some of [illegible] silhouette not unlike the British Spitfire, it is unique among contemporary aircraft in mounting the engine amidships, behind the pilot, and driving the airscrew by a long extension shaft.

CONVENTIONAL TYPE

Another Bell product is the two-motor, multi-seat Airacuda, in which the propellers are fitted behind the wings. Forward extensions of the engine nacelles are used to house gunners.

A more conventional type of single-seat fighter from which a high performance may be expected is the Curtiss P.40. This sturdily built fighter, designed for the United States Army, is also powered with a single 1250 h.p. Allison motor. The latest version is known as the P.40D. The wing span, 37ft. 4in., is just a little more than that of the Spitfire.

Another interesting design is the little, high-powered Vultee Vanguard. Although only a single-seater with a wing span of 36ft., it houses a 1600 h.p. Pratt and Whitney motor under its cowling. For fleet work the Americans have a useful four-gun fighter in the Brewster F2A-1. This has an air-cooled Wright Cyclone motor of 800 h.p. Its short, chubby fuselage and stiff wings give it a distinctive appearance, rather like a flying barrel.

Not much information has been released about the armament of these new fighters. In general, U.S.A. aircraft are less heavily armed than their British counterparts, but it may be remembered that the fire-power of the Curtiss Hawks supplied to the French Air Force was increased to meet modern war requirements.

NEW BOMBERS

America's new-type bombers include a number of fast, medium-sized two-motor types with a useful range. Some are fitted with diving brakes and other devices for close attack duty, and are known as attack-bombers. The Douglas B-23 is an interesting example of American bomber design. Fitted with two Wright Cyclone motors, it is claimed to have a speed of 375 m.p.h. This is some 75 m.p.h. faster than the British Blenheim, a somewhat comparable type. An earlier type of Douglas, the DB-7 has much the same characteristics but a lower performance. Its wing span of 60 feet is about midway between that of the Bristol Blenheim and the Handley Page Hampden.

Another good U.S.A. bomber is the Glenn-Martin 167-W, which has seen considerable service with the French Air Force. Not so fast as the new Douglas—315 m.p.h. is about the maximum it can do—it is nevertheless a generally useful type, being designed not only for bombing but also for fighting, reconnaissance, and ground-attack work.

Besides fighters and bombers, America also produces a number of trainer aircraft and flying-boats. The North America Harvard trainer was one of the first United States aircraft to fly the R.A.F. colours—several hundred having been bought before the war. So far no flying-boats have been in service with the R.A.F. except for experimental purposes. Among the American flying-boats those constructed by the Consolidated concern are perhaps the most well known.

Water Supply Urgent, Says Consair Official

Increased housing facilities, approval of San Vicente reservoir and water distribution bonds at the Nov. 5 election and adequate sewage disposal facilities are three major needs in San Diego if proposed vast industrial expansion is to be encouraged here, Maj. Edgar N. Gott, Consolidated Aircraft Corp., vice president, told chamber of commerce directors yesterday. Other problems needing solution, such as traffic congestion, were mentioned by the official.

After lauding the chamber of commerce, city officials, county officers and the community's citizens for their cooperation to date, Gott delved into a discussion of "added responsibilities which the community must meet" if it is to enjoy benefits of a great industrial growth.

HUGE PAYROLL CITED

"Our firm," Gott declared, "is not inclined to add to our facilities except in San Diego, provided this community can lend the facilities demanded by an expansion program.

"Our plant employs 11,500 men now," he said, "and by July, 1941, it is probable that 30,000 will be employed. This means an approximate $1,000,000 weekly payroll for San Diego, but to get it, certain things must be done."

Commenting on the housing problem, Gott said that the navy department now has this "under its wing" with every indication pointing to a solution of it.

WATER NEED STRESSED

On the question of water, Gott declared that "self preservation demands that San Diego's citizens vote for the increased water supply to be provided by construction of San Vicente dam and for the $1,300,000 water distribution system.

Gott warned that unless the bonds do win a favorable vote "industry will be forced to go elsewhere."

Maj. T. C. Macaulay, chamber secretary-manager, informed Gott that every problem mentioned in his discussion is being accorded attention by the chamber of commerce, the navy department, city and council officials and others that "an adequate solution of each should be obtained."

Aeronautique Canadienne July 1940

"America at Work"

NEWS OF THE MONTH

Consolidated Bomber Undergoes Tests

The new Consolidated Model 32 four engined land bomber is now undergoing tests at San Diego. Release data on this new plane for the U. S. Army Air Corps has been kept well in hand by the War Department as heretofore only a few ground pictures have been officially permitted.

Designated by the Army as the XB-24, the plane marks Consolidated Aircraft Corporation's re-entry into the land plane manufacturing field, breaking a virtual specialization which has brought Consolidated the distinction of being the world's largest manufacturer of flying boats. The years of valuable experience garnered from the building of thousands of smaller land planes, and the advanced manufacturing methods evolved in the production of large flying boats, have been poured into this powerful new land plane for our armed forces.

The Model 32 is a full cantilever, all metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 h.p. each, giving the plane 4,800 available horsepower in flight to hurtle it thru the air. The propellers are Hamilton Standards of the 3-bladed hydromatic constant speed type, 12 feet in diameter. Fowler flaps extend inboard of the ailerons in the wing of high aspect ratio, with the engine nacelles mounted flush with the upper surface of the center section.

The approximate gross weight of the airplane is 40,000 lbs; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from 6 to 9 persons, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with single wheel forward. This retracts into the fuselage. The rear, or main landing wheels retract into the wing wells.

While the performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons."

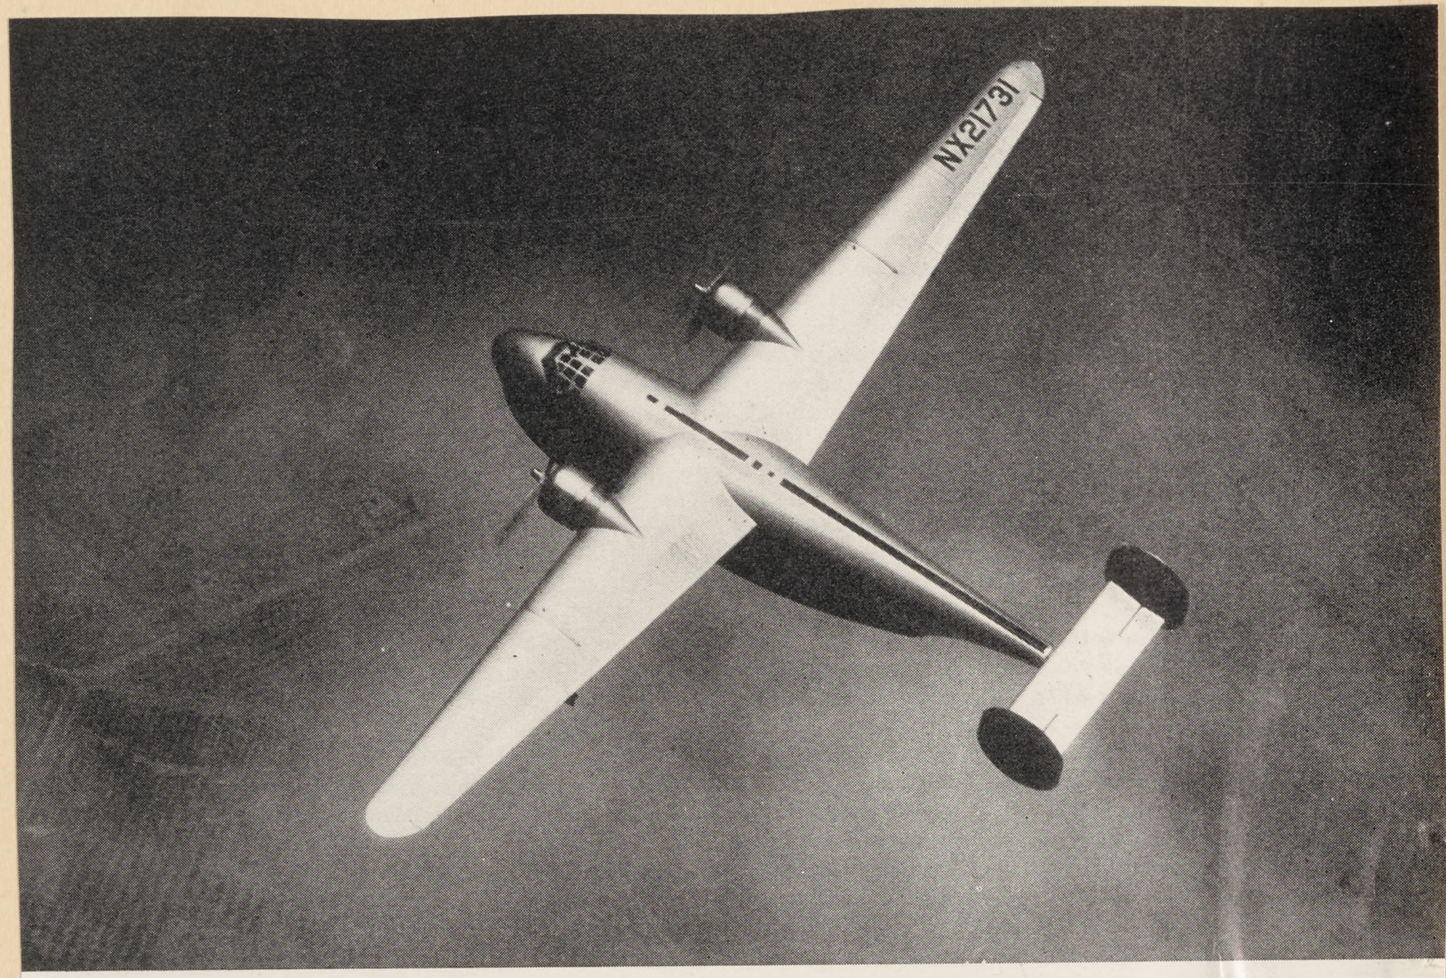
UNION 8/22-40

Consair Employment Hits New High of 9485

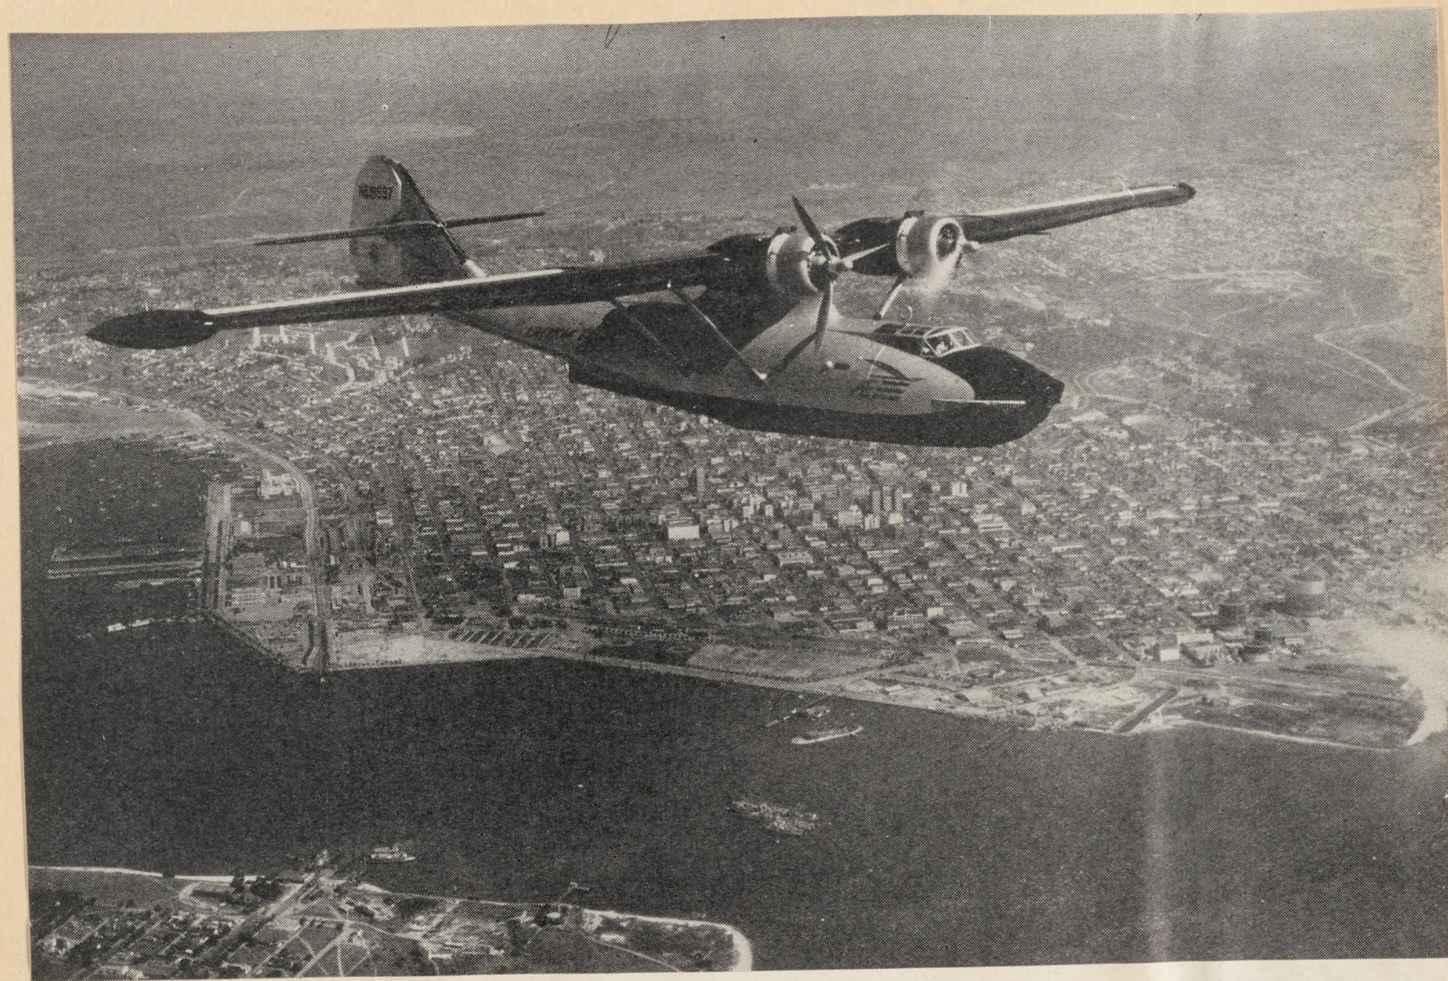
With a backlog in excess of $120,000,000, employment at Consolidated Aircraft Corp. yesterday reached an all-time high of 9485, it was reported at the municipal airport plant. Hundreds of men are yet to be employed in the new huge final assembly building and other new additions to the factory which will be officially dedicated Sept. 2.

For a conference with Consolidated officials Maj. Gen. Henry H. Arnold, chief of the army air corps, and William S. Knudson, production chief national defense commission, are expected here this afternoon or early tomorrow from Washington. Gen. Arnold and Knudson are in Los Angeles inspecting aircraft factories in that area.

Aeronautique Canadienne - July 1940



The Consolidated Aircraft Model 31 twin engined flying boat as seen from above in flight. The span and narrowness of the 'perfect wing' may be easily seen.



The Model 28 twin engined Consolidated Flying boat which was built for the American Export Airline for use in surveying trans-Atlantic flying routes. The feathering propeller operation is here being tested on the right engine, while the plane maintains flight on one engine.

"Guba" Records

A recapitulation of the around-the-world flight of the Consolidated "Guba" flown by Richard Archbold, shows that the following records were established:

1. The first airplane to fly around the world at its greatest diameter.
2. The longest over-ocean non-stop flight by a flying boat, Dakar to St. Thomas, Virgin Islands, 3300 miles.
3. The first flying boat to fly around the world.
4. The first airplane to cross the Indian Ocean from Australia to Africa.
5. The first flying boat to fly across Africa.
6. The first flying boat to fly across Australia.

During the time Archbold operated the Guba in New Guinea, more than 500 hours were flown under extremely primitive operating and service conditions, transporting hundreds of thousands of pounds of supplies and hundreds of people to various points in the interior.

AIRCRAFT NEWS

New Airplane Plant Pushed

7/25/40

DALLAS—It is announced that the Hall-Aluminum Aircraft Copr. will construct an 8,000,000 plant here for the manufacture of warplanes—both bombers and pursuit planes. Employment will be given to approximately 5000 persons.

The new industry will be devoted largely to filling orders sublet to it by Consolidated Aircraft Corp. of San Diego, Cal., it was stated.

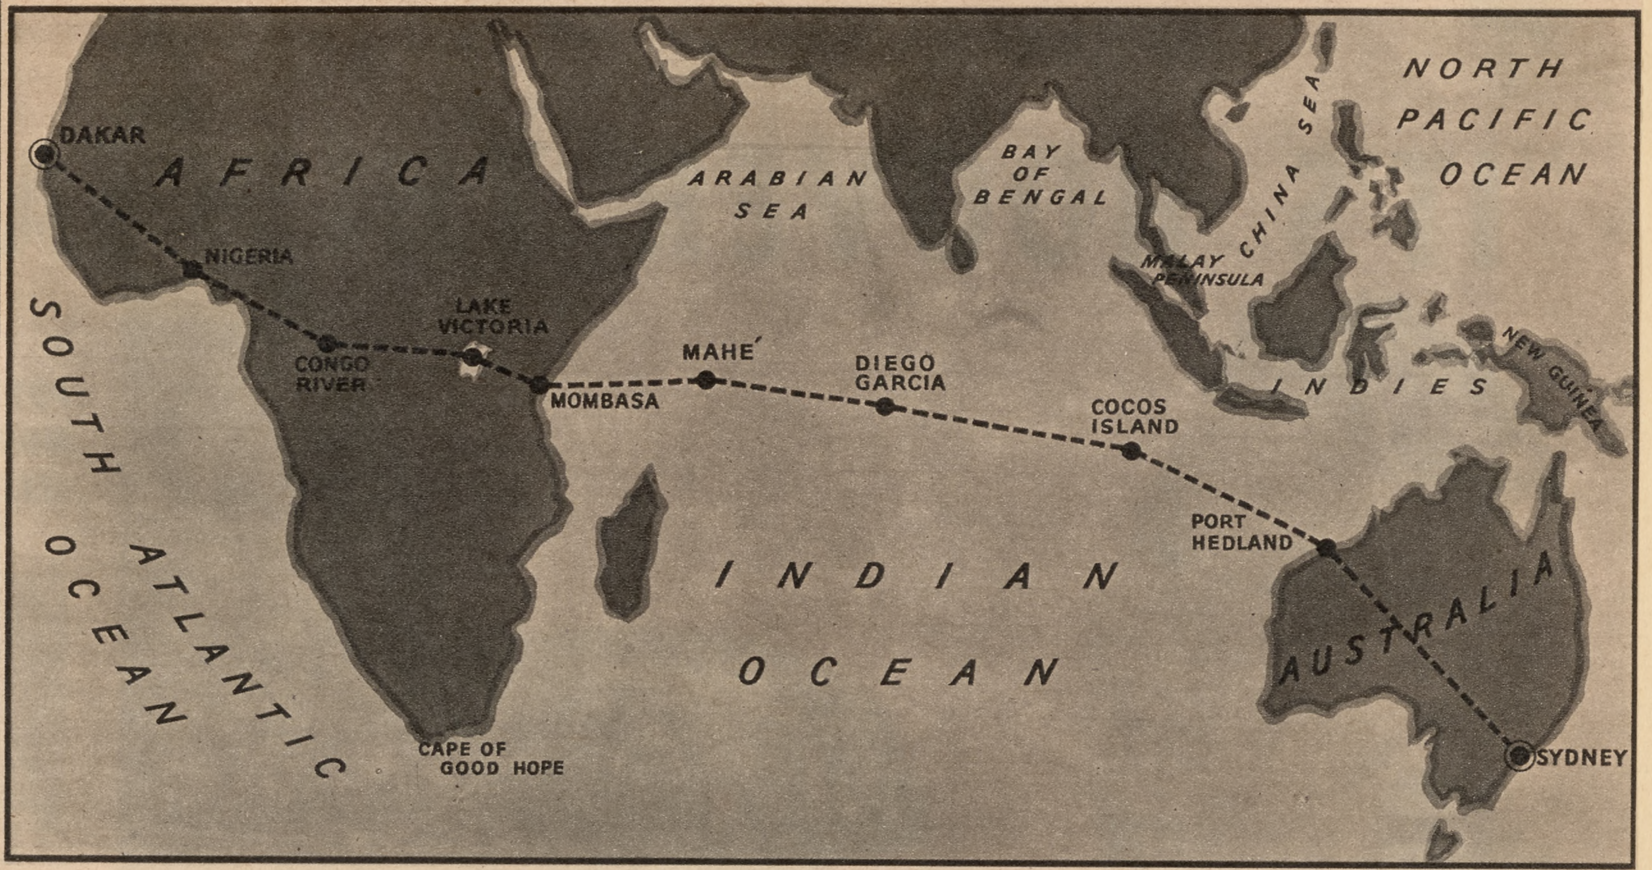
Land, water and other facilities for testing the planes here have been granted.

Plans for the new plant will be finished soon and the first units completed and production started in six to eight months.

Los Angeles Times Sunday Magazine "This Week" July 1940

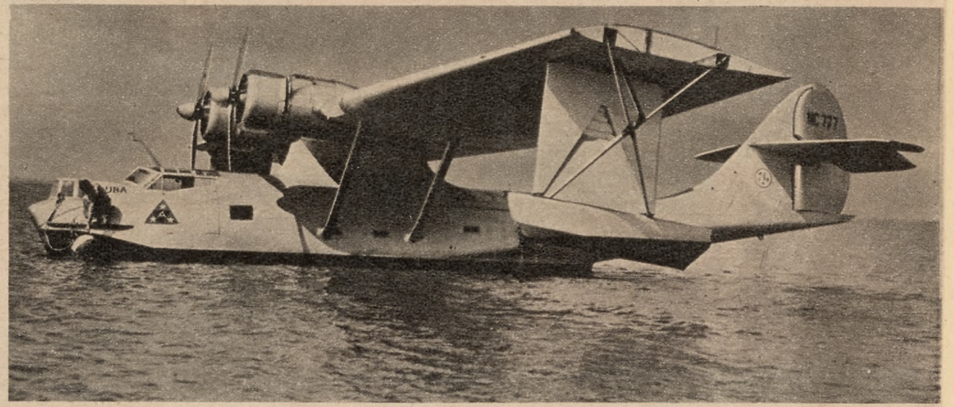
TRAIL BLAZER

Acme



There was an ocean that no one had ever flown before — he flew it. There was a vast jungle that no white man had ever entered — he explored it. Yet few people have even heard of Richard Archbold — publicity scares him!

by Lowell Thomas



Wide World

Richard Archbold and the strategic route that he opened up for Britain in his giant "Guba" plane

ON THE banks of the Gila River in Arizona there is an expedition afield whose leader is as remarkable as any of the fauna he is investigating. In the first place, you would not expect to find a rich man's son exploring the Arizona desert to scrutinize the private lives of its mammals. In the second place it is unusual, in these days, to find an explorer who is not only merely modest but so reticent about his achievements that he actually dodges reporters.

The man I am talking about is young Richard Archbold, and I will lay a bet that a huge number of readers do not know or remember that he has made three voyages of exploration to New Guinea, that he added a new chapter to the history of aviation by flying around the world at its greatest diameter (which was what Amelia Earhart had dreamed of doing) or that he was the first to fly across the Indian Ocean. The last he tackled in the summer of 1939 at the request of Australia's war-wary air ministry, who wished to establish an alternate route to England that would be entirely over Allied soil. Archbold proved the route feasible — a service that proved invaluable to Britain, when war came — and in doing so, he established six separate records.

He has created still another record by getting less publicity than any other living explorer or aviator. And that, I submit, stamps him as pretty remarkable. There have been a few other great travelers — but only a few — with a predilection for silence.

As a child, the "toys" Dick Archbold preferred were cameras and microscopes. What he did with them could hardly have been child's play, since he was making experiments for the Lumière and Agfa firms in color photography and photomicrography when he was only twelve years old.

From this early propensity of his, you might picture to yourself a pale, anemic young student forever poring over a desk. On the contrary, the Archbold lad was and is strong, healthy and, like Kipling's Elephant's Child, of an insatiable curiosity. He attended a prep school in Arizona — not one of the gilded, fashionable kind. For diversion he went off on pack trips into the desert, hunting fossils and exploring caves.

Archbold did not go through college or university in the ordinary way. The explanation he offers is that nobody could read his handwriting and, besides, he had some trouble making up deficiencies in English courses. I suspect a young man so far advanced in mathematics and the sciences would have been excessively bored by campus life anyway. But, though he never enrolled as a freshman anywhere, and acquired most of his higher education from tutors, Archbold took special postgraduate courses at Columbia in biology and comparative anatomy.

Conqueror of Mountains

AS HE grew up he became keen on mountaineering. By the time he was twenty-two he had clambered up all the difficult peaks in the United States and then went on to scale the most hazardous in the Monte Rosa, the Bernese Oberland in Switzerland, and the district around Mont Blanc.

With these accomplishments under his belt he was ready for serious work in the field of exploration. He did not try to begin at the top all at once by dint of his money. He went at the job of equipping himself methodically, starting in as a subordinate. His first voyage of scientific exploration was to Madagascar, where he remained from 1929 to 1931 as assistant mammalogist and photographer to a zoological mission.

By 1933 Archbold had joined the staff of the American Museum of Natural History and become Research Associate in Mammalogy. In collaboration with other scientists he had written several monographs on new species of mammals. To make work easier for himself and others he compiled a bibliography on the mammals of Australasia, a formidable job; it is considered one of the most complete in the scientific world.

The first expedition he took out as leader was to the British part of New Guinea in 1933, where it obtained valuable specimens. But Archbold was dissatisfied. He had not penetrated as far as he wanted because of the tremendous difficulties of transport in New Guinea. Going by foot, it takes a large safari months to march a hundred miles. The country's interior is separated from the seacoast by mountain ranges that are covered with almost impenetrable jungle, the clearings inhabited by head-hunters. An airplane, decided Archbold, was a necessity for thorough scientific discovery in those Papuan wilds.

He returned to the States, studied all types of aircraft and bought the one best suited to his needs. The plane would be used to transport the expedition and all its supplies from the coast to the interior. But it was necessary also to establish a regular service of supply, so Archbold devised a method of dropping food and other necessities down on the camps by parachute.

By 1936 he was ready and took his second expedition to New Guinea. Using Port Moresby for a base, he took his men to a point six hundred miles inland up the Black River, in a region theretofore uninvestigated by white men, let alone scientists. They had collected a mass of invaluable specimens when disaster swept down in the shape of one of the sudden storms that afflict those latitudes. The natives call them *gubas*. It did not strike the camp itself but it completely wrecked the plane as it lay at anchor in the seeming safety of Port Moresby harbor.

The plight of the expedition was perilous. The only way of returning to the coast and safety was to build rafts and float down the Black River. Bringing that outfit back to civilization was a job to try the mettle of a great leader of men. Archbold had to win a race not only against the elements and the dangers of an uncharted stream but also against a rapidly shrinking food supply. He did it, and not a man was lost or even seriously injured. What's more, he salvaged every case of specimens.

As soon as he had returned to the States he started getting ready for his third attack on the Papuan wilderness. Disaster had given him experience and knowledge. Your real explorer does not believe in hazard for excitement's sake. Archbold declares that adventure is frequently the consequence of incompetence, carelessness or ignorance. This time he bought himself a twin-engined bomber such as the United States Navy uses. He thumbed his nose at superstition by christening her Guba in memory of the guba that had destroyed his amphibian at Port Moresby. He replaced her bombing apparatus with equipment of his own design for dropping provisions by parachute, and with navigation instruments. As just one test of the plane, he flew her from San Diego to New York — the first nonstop crossing of the American continent by a flying boat.

When he was almost ready to leave, the world was stunned by a calamity. Sigismund Levanevsky and his companions were reported lost in the Arctic in an attempt to fly from Moscow to New York. The Soviet government engaged Sir Hubert Wilkins to find them, but the only available craft stout enough for those prolonged polar flights was the Guba. Archbold relinquished her for Sir Hubert's rescue mission.

In a few months he had another Guba, and began to put her through exhaustive test flights. His principal camp in New Guinea was to be on the shore of Lake Habbema, 11,500 feet above sea level. So he needed to be sure the Guba would be able to lift a payload of 23,700 pounds at that altitude. Archbold's tests convinced him the plane would do this — and how well he calculated we shall see shortly.

Flight Over the Pacific

THE Guba took off from San Diego for New Guinea on June 2, 1938, and made Honolulu, the first stop, in eighteen hours. From there, fighting their way through ice when they were directly over the equator, they flew to Hollandia in Dutch New Guinea, making only one stop on the way — at Wake Island. Archbold's was the first scientific expedition on a big scale to explore the Dutch half of that huge island. It was infested with head-hunters, so the government of the Netherlands Indies supplied an escort of ninety soldiers, as well as a party of Dutch scientists, to have a share in the investigation and its results.

At this stage of the game, the important question was: had Archbold's weight tests at

They were in San Diego twelve thousand miles away! But we were the jumpiest crowd you ever saw. We got onto the water at the lake, all right, but then came a bunch of questions. What would happen when we rowed ashore? We had heard plenty about the head-hunters and, as we hadn't made friends with them, how could we know what the reception committee would have for us?"

Crucial Tests

THE short of it was that they lightened ship at first and made tests to see whether she would make an emergency take-off at that altitude. She made it, one test after another. At the last trial the Guba lifted 25,500 pounds gross weight off the surface of Lake Habbema — just 1,800 pounds more than Archbold calculated after his tests on Lake Tahoe.

That rescue force camped on the bank of the Idenburg River never was needed. Not once was there any difficulty getting the Guba off the surface of the lake, nor was the main body of scientists or any of the smaller parties ever in danger of being marooned. Archbold made no fewer than 168 flights, and the company obtained literally thousands of animals, birds and plants, many of which, upon examination, turned out to be entirely new to biologists.

Even more colorful was a discovery made by Archbold in most unexpected fashion. He was flying up a valley of the Balim River, a valley that had never been mapped, apparently quite unknown to cartographers. To the astonishment of the leader and his companions he espied beneath him miles of terraces, held up by stone retaining walls, with gardens ditched as though they had been laid out by a surveyor. In New Guinea this was extraordinary. Such signs of cultivation as had been seen before were crude clearings in the forest, rough, weedy patches. When they descended they came upon the tribe that had made those gardens, a tribe new to the ken of civilized man. They proved to be a peaceable lot, which was fortunate, since they numbered some 60,000.

"They had wrested those gardens from the forest," said Archbold, "and it was the more amazing when you consider their tools. The trees they had felled with stone axes, for plows and cultivators they used heavy wooden sticks. Good farmers they are, with a sound understanding of drainage and soil conservation. They also turned out to be good engineers. They had

demonstrate flights over the Indian Ocean were practical, there would be an airway from Australia to England over Allied territory all the way.

The idea struck the American as not only a sporting proposition but a serious venture. So, having completed his work in New Guinea, he took off from Sydney in the Guba on June 3, 1939. Captain P. G. Taylor went along as observer for the Commonwealth government. The first stage was a nonstop flight across the Australian continent to Port Hedland, from whence he took off immediately for the Cocos Islands. The Guba reached there June 7, and six days later took off on the longest stage of the flight, heading for the tiny island of Diego Garcia, whither the British Admiralty had sent the cruiser H.M.S. Manchester. Archbold was in constant touch with the man-of-war by radio and alighted on the water alongside her after a flight of thirteen hours. He proved to have been dead on his course all the time. His next hop was to Mahé in the Seychelles and the final stage was from Mahé to Mombasa on the Kenya coast, where the Guba arrived June 21, eighteen days out from Sydney. They had established beyond doubt that the route across the Indian Ocean was quite practicable.

Perfect Trip

FROM Mombasa, Archbold continued his flight around the world at its largest diameter. His voyage across Africa was entirely without incident — a demonstration of perfect preparation. He was at Kisumu on Lake Victoria by June 22, Coquilhatville on the Congo River June 24, Lagos in Nigeria on June 25, and reached Dakar June 26.

From Dakar he wanted to try a nonstop flight to New York but, receiving unsatisfactory weather reports, stopped at St. Thomas in the Virgin Islands. He flew the distance, 3,160 statute miles, in 19 hours, 33 minutes. Leaving St. Thomas July 1, he arrived in New York on the same day, landed at Floyd Bennett field, and was immediately rushed over to the World's Fair, together with all his crew. There they had a triumphant reception but, except for a paper he read later before the New York Academy of Sciences, it was Archbold's only public appearance after such a succession of exploits.

In addition to his other accomplishments, Richard Archbold and a collaborator have obtained basic patents on a new sextant by the use of which a navigator can make an instantaneous reading of his position with approximate accuracy.

UNITED STATES AIRCRAFT

'PLANES USED BY BRITAIN

A few types of military aircraft from the United States have already become familiar in this country through their use in the air Services of the Allies. Probably the best known are the Lockheed Hudson reconnaissance aircraft adopted early in the war by the R.A.F. Coastal Command, and the Curtiss Hawk 75 A fighters of the French Armée de l'Air. Both are straightforward designs whose features are strength and power of manœuvre rather than high speed.

But there are a number of other types of U.S.A. aircraft not yet so well known, some of [illegible] silhouette not unlike the British Spitfire, it is unique among contemporary aircraft in mounting the engine amidships, behind the pilot, and driving the airscrew by a long extension shaft.

CONVENTIONAL TYPE

Another Bell product is the two-motor, multi-seat Airacuda, in which the propellers are fitted behind the wings. Forward extensions of the engine nacelles are used to house gunners.

A more conventional type of single-seat fighter from which a high performance may be expected is the Curtiss P.40. This sturdily built fighter, designed for the United States Army, is also powered with a single 1250 h.p. Allison motor. The latest version is known as the P.40D. The wing span, 37ft. 4in., is just a little more than that of the Spitfire.

Another interesting design is the little, high-powered Vultee Vanguard. Although only a single-seater with a wing span of 36ft., it houses a 1600 h.p. Pratt and Whitney motor under its cowling. For fleet work the Americans have a useful four-gun fighter in the Brewster F2A-1. This has an air-cooled Wright Cyclone motor of 800 h.p. Its short, chubby fuselage and stiff wings give it a distinctive appearance, rather like a flying barrel.

Not much information has been released about the armament of these new fighters. In general, U.S.A. aircraft are less heavily armed than their British counterparts, but it may be remembered that the firepower of the Curtiss Hawks supplied to the French Air Force was increased to meet modern war requirements.

NEW BOMBERS

America's new-type bombers include a number of fast, medium-sized two-motor types with a useful range. Some are fitted with diving brakes and other devices for close attack duty, and are known as attack-bombers. The Douglas B-23 is an interesting example of American bomber design. Fitted with two Wright Cyclone motors, it is claimed to have a speed of 375 m.p.h. This is some 75 m.p.h. faster than the British Blenheim, a somewhat comparable type. An earlier type of Douglas, the DB-7 has much the same characteristics but a lower performance. Its wing span of 60 feet is about midway between that of the Bristol Blenheim and the Handley Page Hampden.

Another good U.S.A. bomber is the Glenn-Martin 167-W, which has seen considerable service with the French Air Force. Not so fast as the new Douglas—315 m.p.h. is about the maximum it can do—it is nevertheless a generally useful type, being designed not only for bombing but also for fighting, reconnaissance, and ground-attack work.

Besides fighters and bombers, America also produces a number of trainer aircraft and flying-boats. The North America Harvard trainer was one of the first United States aircraft to fly the R.A.F. colours—several hundred having been bought before the war. So far no flying-boats have been in service with the R.A.F. except for experimental purposes. Among the American flying-boats those constructed by the Consolidated concern are perhaps the most well known.

Water Supply Urgent, Says Consair Official

Increased housing facilities, approval of San Vicente reservoir and water distribution bonds at the Nov. 5 election and adequate sewage disposal facilities are three major needs in San Diego if proposed vast industrial expansion is to be encouraged here, Maj. Edgar N. Gott, Consolidated Aircraft Corp., vice president, told chamber of commerce directors yesterday. Other problems needing solution, such as traffic congestion, were mentioned by the official.

After lauding the chamber of commerce, city officials, county officers and the community's citizens for their cooperation to date, Gott delved into a discussion of "added responsibilities which the community must meet" if it is to enjoy benefits of a great industrial growth.

HUGE PAYROLL CITED

"Our firm," Gott declared, "is not inclined to add to our facilities except in San Diego, provided this community can lend the facilities demanded by an expansion program.

"Our plant employs 11,500 men now," he said, "and by July, 1941, it is probable that 30,000 will be employed. This means an approximate $1,000,000 weekly payroll for San Diego, but to get it, certain things must be done."

Commenting on the housing problem, Gott said that the navy department now has this "under its wing" with every indication pointing to a solution of it.

WATER NEED STRESSED

On the question of water, Gott declared that "self preservation demands that San Diego's citizens vote for the increased water supply to be provided by construction of San Vicente dam and for the $1,300,000 water distribution system.

Gott warned that unless the bonds do win a favorable vote "industry will be forced to go elsewhere."

Maj. T. C. Macaulay, chamber secretary-manager, informed Gott that every problem mentioned in his discussion is being accorded attention by the chamber of commerce, the navy department, city and council officials and others that "an adequate solution of each should be obtained."

"Guba" Records

A recapitulation of the around-the-world flight of the Consolidated "Guba" flown by Richard Archbold, shows that the following records were established:

1. The first airplane to fly around the world at its greatest diameter.
2. The longest over-ocean non-stop flight by a flying boat, Dakar to St. Thomas, Virgin Islands, 3300 miles.
3. The first flying boat to fly around the world.
4. The first airplane to cross the Indian Ocean from Australia to Africa.
5. The first flying boat to fly across Africa.
6. The first flying boat to fly across Australia.

During the time Archbold operated the Guba in New Guinea, more than 500 hours were flown under extremely primitive operating and service conditions, transporting hundreds of thousands of pounds of supplies and hundreds of people to various points in the interior.

"America at Work"

NEWS OF THE MONTH

Consolidated Bomber Undergoes Tests

The new Consolidated Model 32 four engined land bomber is now undergoing tests at San Diego. Release data on this new plane for the U. S. Army Air Corps has been kept well in hand by the War Department as heretofore only a few ground pictures have been officially permitted.

Designated by the Army as the XB-24, the plane marks Consolidated Aircraft Corporation's re-entry into the land plane manufacturing field, breaking a virtual specialization which has brought Consolidated the distinction of being the world's largest manufacturer of flying boats. The years of valuable experience garnered from the building of thousands of smaller land planes, and the advanced manufacturing methods evolved in the production of large flying boats, have been poured into this powerful new land plane for our armed forces.

The Model 32 is a full cantilever, all metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 h.p. each, giving the plane 4,800 available horsepower in flight to hurtle it thru the air. The propellers are Hamilton Standards of the 3-bladed hydromatic constant speed type, 12 feet in diameter. Fowler flaps extend inboard of the ailerons in the wing of high aspect ratio, with the engine nacelles mounted flush with the upper surface of the center section.

The approximate gross weight of the airplane is 40,000 lbs; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from 6 to 9 persons, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with single wheel forward. This retracts into the fuselage. The rear, or main landing wheels retract into the wing wells.

While the performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons."

AIRCRAFT NEWS

New Airplane Plant Pushed

7/25/40

DALLAS—It is announced that the Hall-Aluminum Aircraft Copr. will construct an 8,000,000 plant here for the manufacture of warplanes—both bombers and pursuit planes. Employment will be given to approximately 5000 persons.

The new industry will be devoted largely to filling orders sublet to it by Consolidated Aircraft Corp. of San Diego, Cal., it was stated.

Land, water and other facilities for testing the planes here have been granted.

Plans for the new plant will be finished soon and the first units completed and production started in six to eight months.

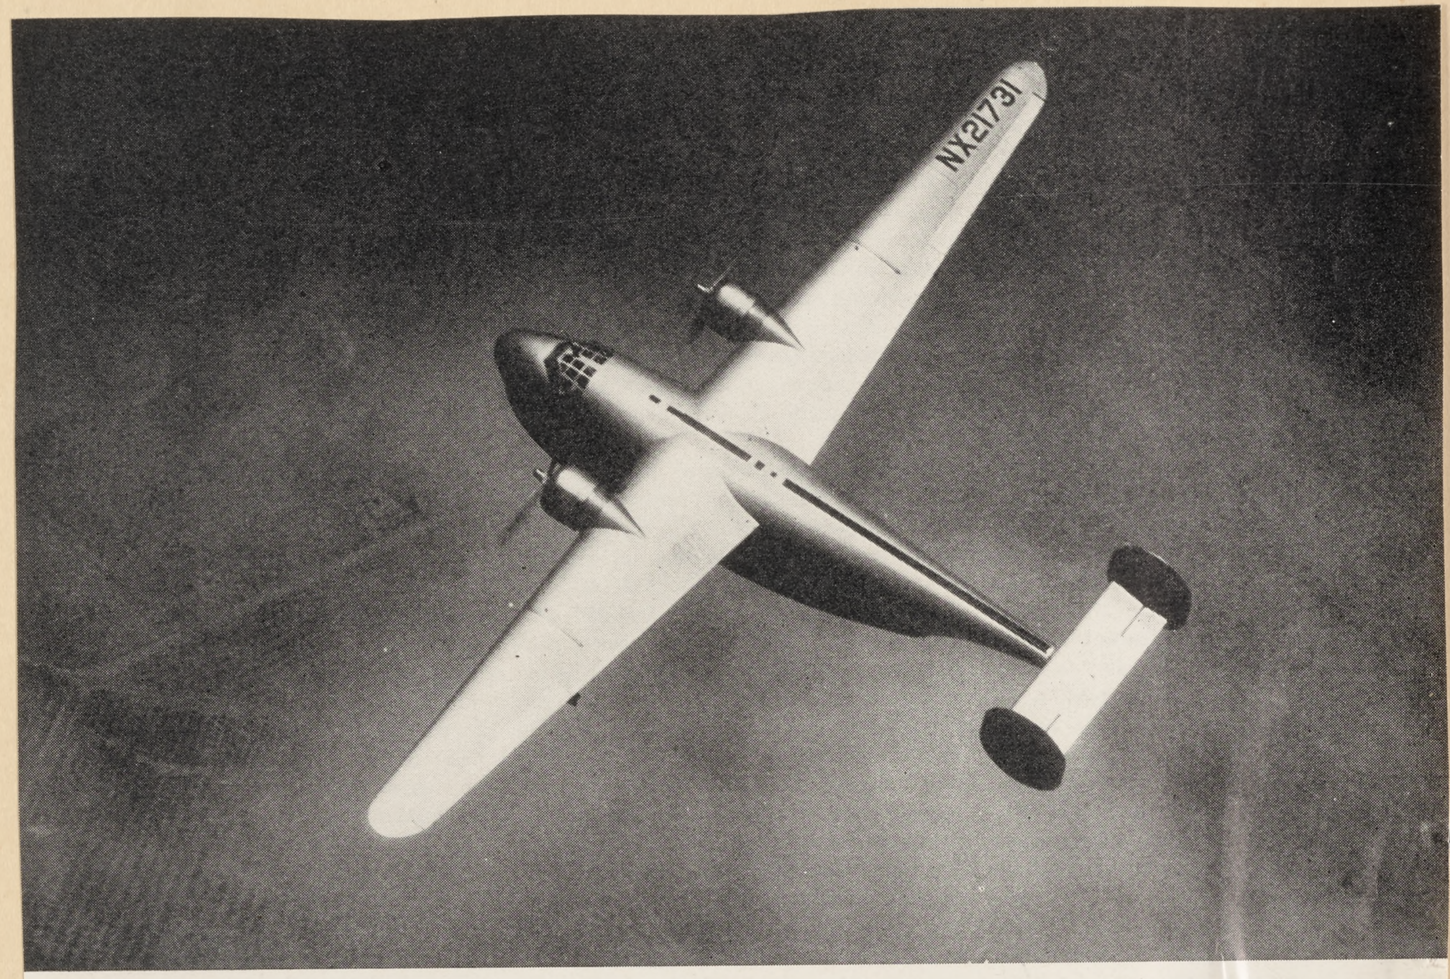
UNION 8/22-40

Consair Employment Hits New High of 9485

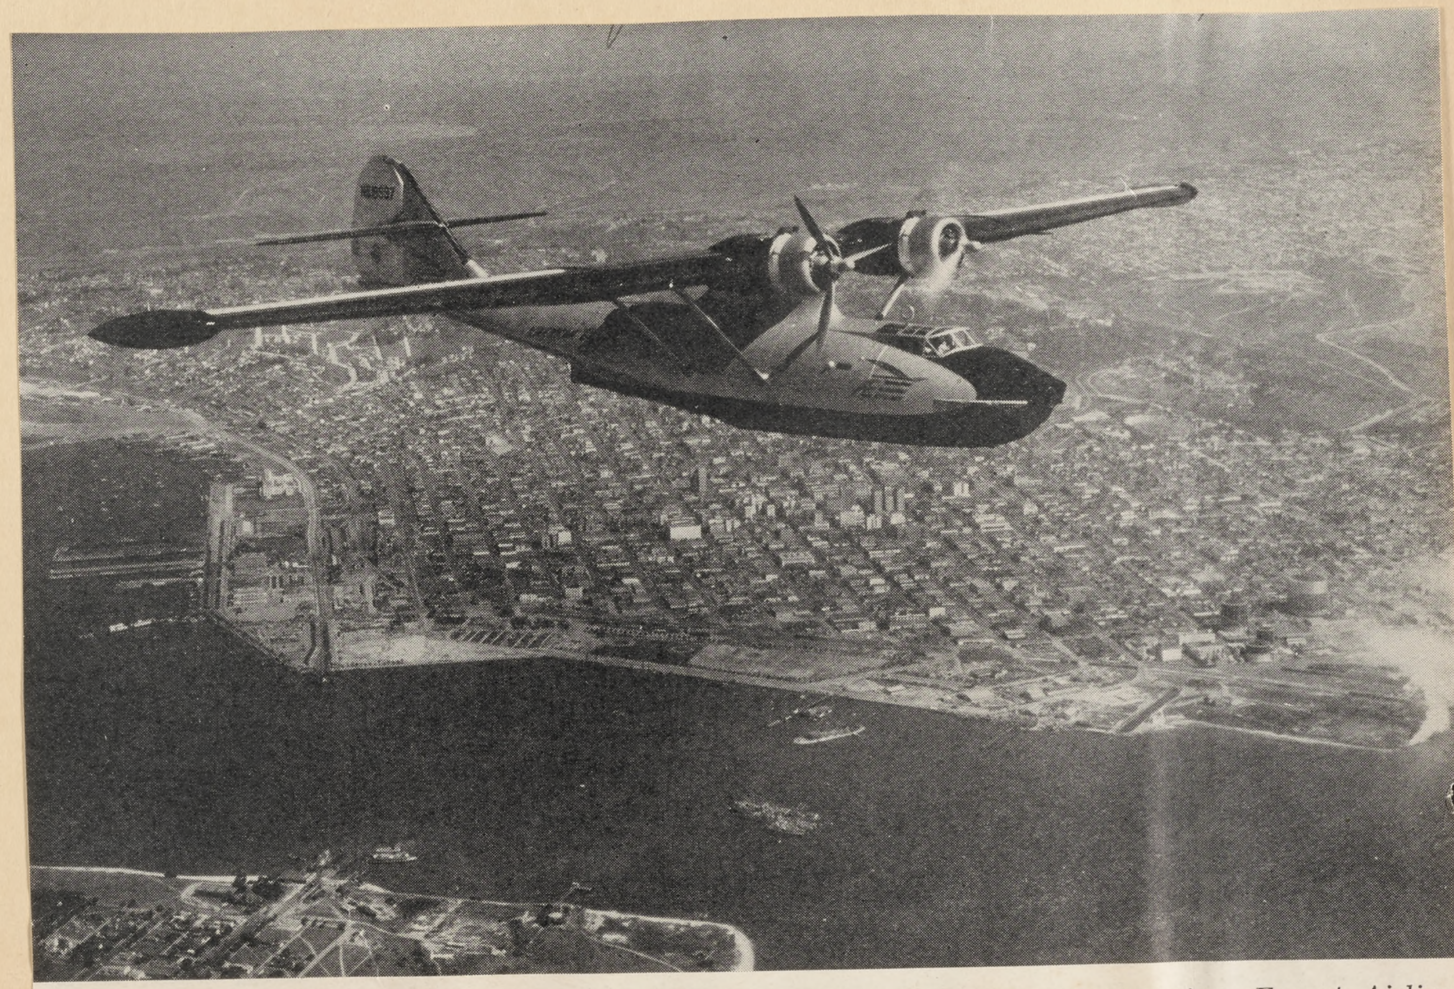
With a backlog in excess of $120,000,000, employment at Consolidated Aircraft Corp. yesterday reached an all-time high of 9485, it was reported at the municipal airport plant. Hundreds of men are yet to be employed in the new huge final assembly building and other new additions to the factory which will be officially dedicated Sept. 2.

For a conference with Consolidated officials Maj. Gen. Henry H. Arnold, chief of the army air corps, and William S. Knudson, production chief national defense commission, are expected here this afternoon or early tomorrow from Washington. Gen. Arnold and Knudson are in Los Angeles inspecting aircraft factories in that area.

Aeronautique Canadienne - July 1940



The Consolidated Aircraft Model 31 twin engined flying boat as seen from above in flight. The span and narrowness of the 'perfect wing' may be easily seen.



The Model 28 twin engined Consolidated Flying boat which was built for the American Export Airline for use in surveying trans-Atlantic flying routes. The feathering propeller operation is here being tested on the right engine, while the plane maintains flight on one engine.

Wide World

Richard Archbold and the strategic route that he opened up for Britain in his giant "Guba" plane

There was an ocean that no one had ever flown before — he flew it. There was a vast jungle that no white man had ever entered — he explored it. Yet few people have even heard of Richard Archbold — publicity scares him!

by Lowell Thomas

On the banks of the Gila River in Arizona there is an expedition afield whose leader is as remarkable as any of the fauna he is investigating. In the first place, you would not expect to find a rich man's son exploring the Arizona desert to scrutinize the private lives of its mammals. In the second place it is unusual, in these days, to find an explorer who is not only merely modest but so reticent about his achievements that he actually dodges reporters.

The man I am talking about is young Richard Archbold, and I will lay a bet that a huge number of readers do not know or remember that he has made three voyages of exploration to New Guinea, that he added a new chapter to the history of aviation by flying around the world at its greatest diameter (which was what Amelia Earhart had dreamed of doing) or that he was the first to fly across the Indian Ocean. The last he tackled in the summer of 1939 at the request of Australia's war-wary air ministry, who wished to establish an alternate route to England that would be entirely over Allied soil. Archbold proved the route feasible — a service that proved invaluable to Britain, when war came — and in doing so, he established six separate records.

He has created still another record by getting less publicity than any other living explorer or aviator. And that, I submit, stamps him as pretty remarkable. There have been a few other great travelers — but only a few — with a predilection for silence.

As a child, the "toys" Dick Archbold preferred were cameras and microscopes. What he did with them could hardly have been child's play, since he was making experiments for the Lumière and Agfa firms in color photography and photomicrography when he was only twelve years old.

From this early propensity of his, you might picture to yourself a pale, anemic young student forever poring over a desk. On the contrary, the Archbold lad was and is strong, healthy and, like Kipling's Elephant's Child, of an insatiable curiosity. He attended a prep school in Arizona — not one of the gilded, fashionable kind. For diversion he went off on pack trips into the desert, hunting fossils and exploring caves.

Archbold did not go through college or university in the ordinary way. The explanation he offers is that nobody could read his handwriting and, besides, he had some trouble making up deficiencies in English courses. I suspect a young man so far advanced in mathematics and the sciences would have been excessively bored by campus life anyway. But, though he never enrolled as a freshman anywhere, and acquired most of his higher education from tutors, Archbold took special postgraduate courses at Columbia in biology and comparative anatomy.

Conqueror of Mountains

As he grew up he became keen on mountaineering. By the time he was twenty-two he had clambered up all the difficult peaks in the United States and then went on to scale the most hazardous in the Monte Rosa, the Bernese Oberland in Switzerland, and the district around Mont Blanc.

With these accomplishments under his belt he was ready for serious work in the field of exploration. He did not try to begin at the top all at once by dint of his money. He went at the job of equipping himself methodically, starting in as a subordinate. His first voyage of scientific exploration was to Madagascar, where he remained from 1929 to 1931 as assistant mammalogist and photographer to a zoological mission.

By 1933 Archbold had joined the staff of the American Museum of Natural History and become Research Associate in Mammalogy. In collaboration with other scientists he had written several monographs on new species of mammals. To make work easier for himself and others he compiled a bibliography on the mammals of Australasia, a formidable job; it is considered one of the most complete in the scientific world.

The first expedition he took out as leader was to the British part of New Guinea in 1933, where it obtained valuable specimens. But Archbold was dissatisfied. He had not penetrated as far as he wanted because of the tremendous difficulties of transport in New Guinea. Going by foot, it takes a large safari months to march a hundred miles. The country's interior is separated from the seacoast by mountain ranges that are covered with almost impenetrable jungle, the clearings inhabited by head-hunters. An airplane, decided Archbold, was a necessity for thorough scientific discovery in those Papuan wilds.

He returned to the States, studied all types of aircraft and bought the one best suited to his needs. The plane would be used to transport the expedition and all its supplies from the coast to the interior. But it was necessary also to establish a regular service of supply, so Archbold devised a method of dropping food and other necessities down on the camps by parachute.

By 1936 he was ready and took his second expedition to New Guinea. Using Port Moresby for a base, he took his men to a point six hundred miles inland up the Black River, in a region theretofore uninvestigated by white men, let alone scientists. They had collected a mass of invaluable specimens when disaster swept down in the shape of one of the sudden storms that afflict those latitudes. The natives call them *gubas*. It did not strike the camp itself but it completely wrecked the plane as it lay at anchor in the seeming safety of Port Moresby harbor.

The plight of the expedition was perilous. The only way of returning to the coast and safety was to build rafts and float down the Black River. Bringing that outfit back to civilization was a job to try the mettle of a great leader of men. Archbold had to win a race not only against the elements and the dangers of an uncharted stream but also against a rapidly shrinking food supply. He did it, and not a man was lost or even seriously injured. What's more, he salvaged every case of specimens.

As soon as he had returned to the States he started getting ready for his third attack on the Papuan wilderness. Disaster had given him experience and knowledge. Your real explorer does not believe in hazard for excitement's sake. Archbold declares that adventure is frequently the consequence of incompetence, carelessness or ignorance. This time he bought himself a twin-engined bomber such as the United States Navy uses. He thumbed his nose at superstition by christening her Guba in memory of the guba that had destroyed his amphibian at Port Moresby. He replaced her bombing apparatus with equipment of his own design for dropping provisions by parachute, and with navigation instruments. As just one test of the plane, he flew her from San Diego to New York — the first nonstop crossing of the American continent by a flying boat.

When he was almost ready to leave, the world was stunned by a calamity. Sigismund Levanevsky and his companions were reported lost in the Arctic in an attempt to fly from Moscow to New York. The Soviet government engaged Sir Hubert Wilkins to find them, but the only available craft stout enough for those prolonged polar flights was the Guba. Archbold relinquished her for Sir Hubert's rescue mission.

In a few months he had another Guba, and began to put her through exhaustive test flights. His principal camp in New Guinea was to be on the shore of Lake Habbema, 11,500 feet above sea level. So he needed to be sure the Guba would be able to lift a payload of 23,700 pounds at that altitude. Archbold's tests convinced him the plane would do this — and how well he calculated we shall see shortly.

Flight Over the Pacific

The Guba took off from San Diego for New Guinea on June 2, 1938, and made Honolulu, the first stop, in eighteen hours. From there, fighting their way through ice when they were directly over the equator, they flew to Hollandia in Dutch New Guinea, making only one stop on the way — at Wake Island. Archbold's was the first scientific expedition on a big scale to explore the Dutch half of that huge island. It was infested with head-hunters, so the government of the Netherlands Indies supplied an escort of ninety soldiers, as well as a party of Dutch scientists, to have a share in the investigation and its results.

At this stage of the game, the important question was: had Archbold's weight tests at Lake Tahoe been accurately calculated? The Guba not only had to carry a heavy load of men and supplies up to Lake Habbema, in the shadow of Mt. Wilhelmina, which towers 15,580 feet, but must also be able to bring them back. He first made several flights to a point on the Idenburg River, ferrying a detachment of soldiers and Dyak carriers. There they established a station from which a rescue party could march overland to Habbema in case the scientists were in danger or marooned. Then they started the Guba on her crucial flight to the lake.

(Continued on page 15)

"The people at the factory where she had been built told us there'd be no trouble," said the late Lon Yancey, then pilot of the expedition. "And of course there was no trouble — for the people at the factory! They were in San Diego twelve thousand miles away! But we were the jumpiest crowd you ever saw. We got onto the water at the lake, all right, but then came a bunch of questions. What would happen when we rowed ashore? We had heard plenty about the head-hunters and, as we hadn't made friends with them, how could we know what the reception committee would have for us?"

Crucial Tests

The short of it was that they lightened ship at first and made tests to see whether she would make an emergency take-off at that altitude. She made it, one test after another. At the last trial the Guba lifted 25,500 pounds gross weight off the surface of Lake Habbema — just 1,800 pounds more than Archbold calculated after his tests on Lake Tahoe.

That rescue force camped on the bank of the Idenburg River never was needed. Not once was there any difficulty getting the Guba off the surface of the lake, nor was the main body of scientists or any of the smaller parties ever in danger of being marooned. Archbold made no fewer than 168 flights, and the company obtained literally thousands of animals, birds and plants, many of which, upon examination, turned out to be entirely new to biologists.

Even more colorful was a discovery made by Archbold in most unexpected fashion. He was flying up a valley of the Balim River, a valley that had never been mapped, apparently quite unknown to cartographers. To the astonishment of the leader and his companions he espied beneath him miles of terraces, held up by stone retaining walls, with gardens ditched as though they had been laid out by a surveyor. In New Guinea this was extraordinary. Such signs of cultivation as had been seen before were crude clearings in the forest, rough, weedy patches. When they descended they came upon the tribe that had made those gardens, a tribe new to the ken of civilized man. They proved to be a peaceable lot, which was fortunate, since they numbered some 60,000.

"They had wrested those gardens from the forest," said Archbold, "and it was the more amazing when you consider their tools. The trees they had felled with stone axes, for plows and cultivators they used heavy wooden sticks. Good farmers they are, with a sound understanding of drainage and soil conservation. They also turned out to be good engineers. They had built a bridge across the Balim, made of limbs and branches of trees held together by rattan. We examined it carefully and found it had many tricks of modern suspension-bridge construction!"

It was on one of his flights to Australia in search of supplies that Archbold received the request from the Ministers of Civil Aviation to make a pioneer flight of a new route to England. The Australians wanted to be sure of having an alternate route in case the usual one by way of Singapore should become impossible in time of war. If Archbold could demonstrate that flights over the Indian Ocean were practical, there would be an airway from Australia to England over Allied territory all the way.

The idea struck the American as not only a sporting proposition but a serious venture. So, having completed his work in New Guinea, he took off from Sydney in the Guba on June 3, 1939. Captain P. G. Taylor went along as observer for the Commonwealth government. The first stage was a nonstop flight across the Australian continent to Port Hedland, from whence he took off immediately for the Cocos Islands. The Guba reached there June 7, and six days later took off on the longest stage of the flight, heading for the tiny island of Diego Garcia, whither the British Admiralty had sent the cruiser H.M.S. Manchester. Archbold was in constant touch with the man-of-war by radio and alighted on the water alongside her after a flight of thirteen hours. He proved to have been dead on his course all the time. His next hop was to Mahé in the Seychelles and the final stage was from Mahé to Mombasa on the Kenya coast, where the Guba arrived June 21, eighteen days out from Sydney. They had established beyond doubt that the route across the Indian Ocean was quite practicable.

Perfect Trip

From Mombasa, Archbold continued his flight around the world at its largest diameter. His voyage across Africa was entirely without incident — a demonstration of perfect preparation. He was at Kisumu on Lake Victoria by June 22, Coquilhatville on the Congo River June 24, Lagos in Nigeria on June 25, and reached Dakar June 26.

From Dakar he wanted to try a nonstop flight to New York but, receiving unsatisfactory weather reports, stopped at St. Thomas in the Virgin Islands. He flew the distance, 3,160 statute miles, in 19 hours, 33 minutes. Leaving St. Thomas July 1, he arrived in New York on the same day, landed at Floyd Bennett field, and was immediately rushed over to the World's Fair, together with all his crew. There they had a triumphant reception but, except for a paper he read later before the New York Academy of Sciences, it was Archbold's only public appearance after such a succession of exploits.

In addition to his other accomplishments, Richard Archbold and a collaborator have obtained basic patents on a new sextant by the use of which a navigator can make an instantaneous reading of his position with approximate accuracy.

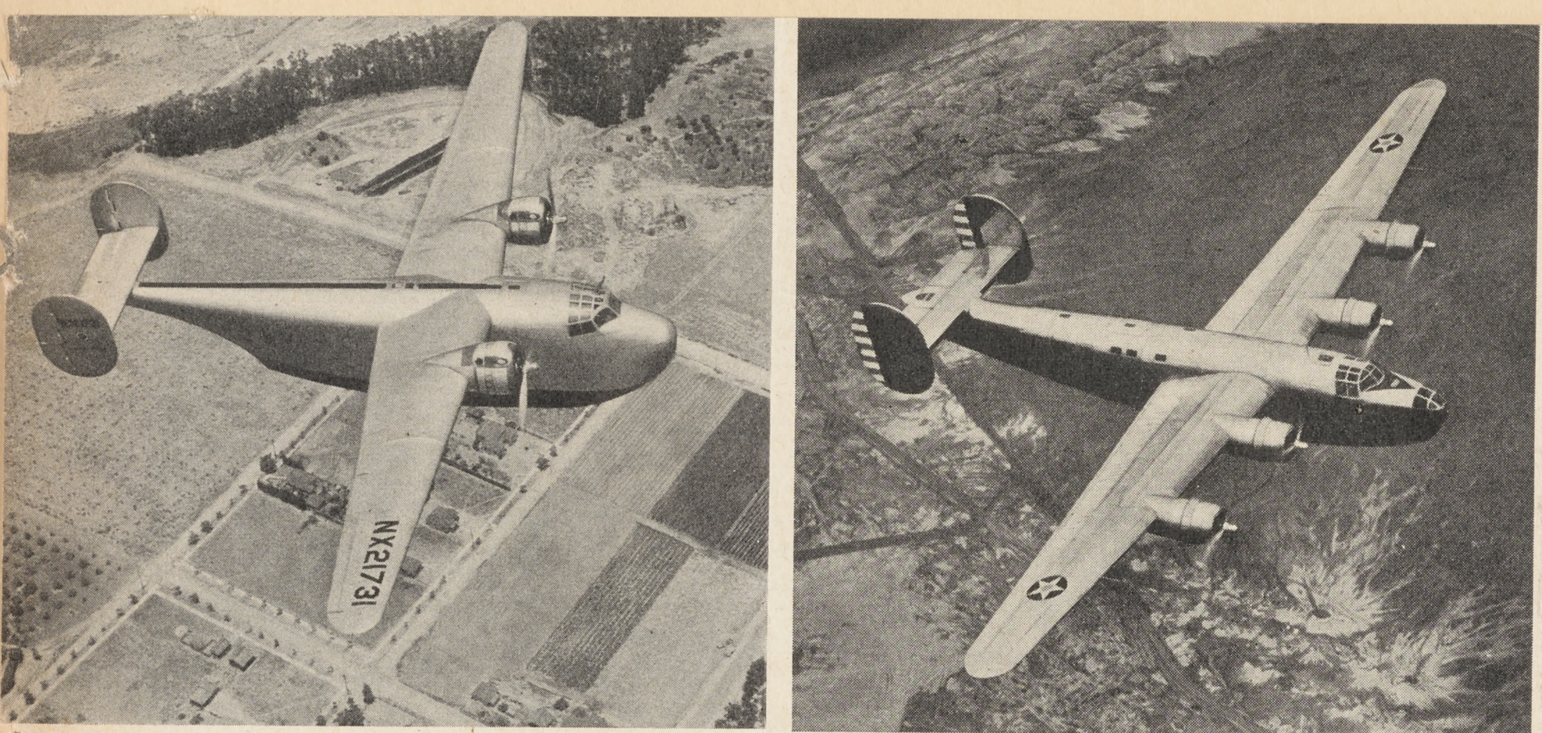
So much for his achievements. You never would gather even a faint idea of their scope and importance from Archbold himself. If you press him to give an account of his experiences he will tell them with all the color and vividness of a man reading from a telephone directory. But men like to be with him in a tough spot because they find him not only an imperturbable leader but a master of unforeseen situations.

His exterior is as singular as his character and talents. More than six feet tall, he has a copious head of black hair, bushy eyebrows and a black mustache. He apparently presses his clothes by crushing them into a bunch and throwing them into the corner. It is difficult to prevail upon him to wear a hat. When he is going somewhere he never walks but lopes, never rides on a train if an airplane is available.

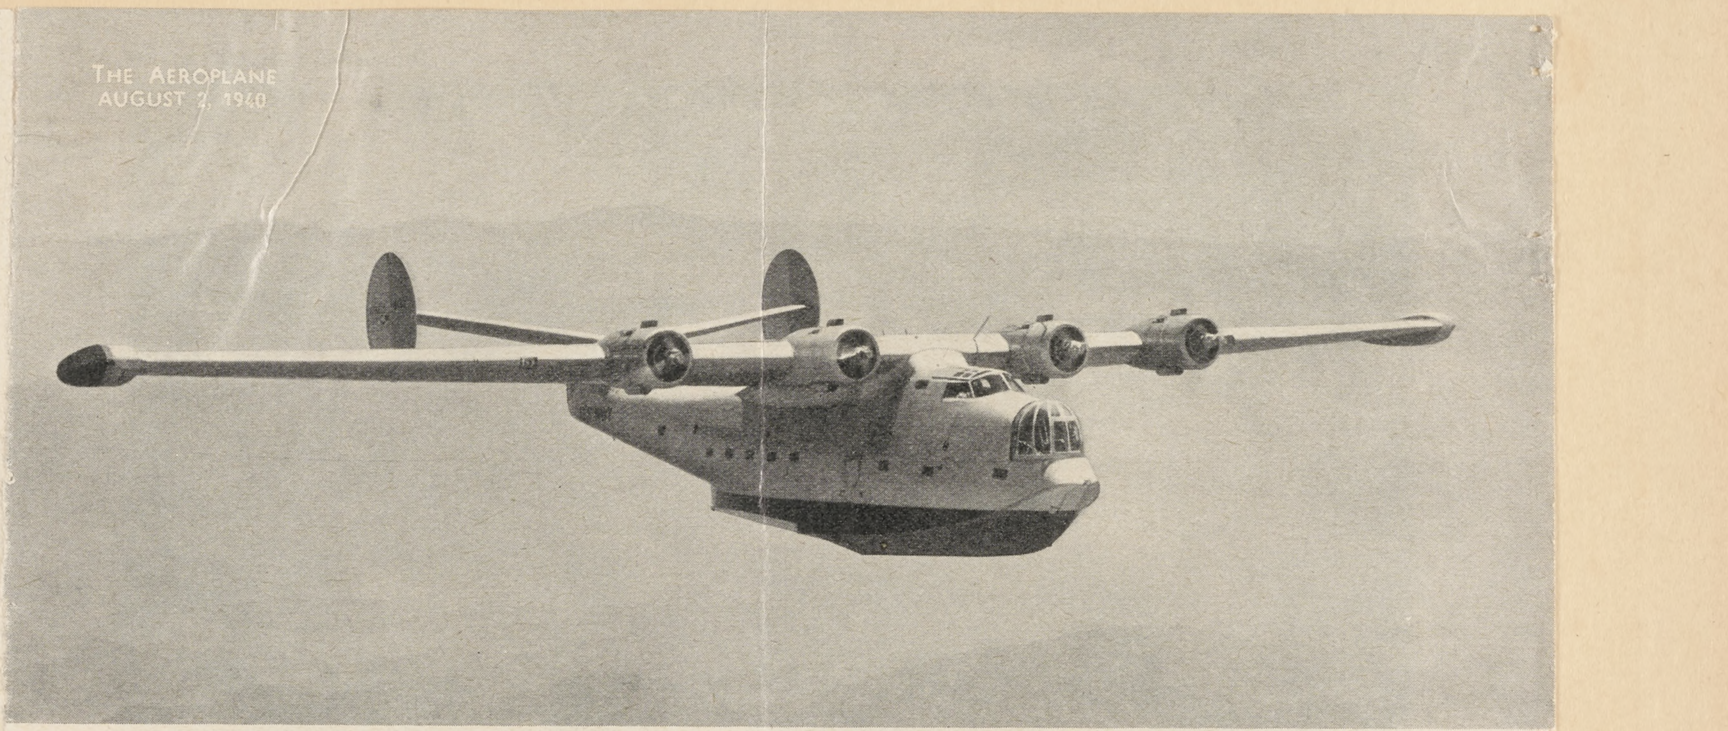
Upon his return from New Guinea and his flight around the world, he wanted to pitch in and make ready for a fourth expedition to the Papuan wilderness. But the war had broken out, making conditions too unsettled for exploration. He declined to stick around quietly awaiting developments, so he arranged his expedition to Arizona, advertising the Guba for sale.

"Since the situation in Europe is forcing scientists there to mark time," he said, "we in this country must carry on the work of advancing scientific knowledge more intensively than ever."

The End

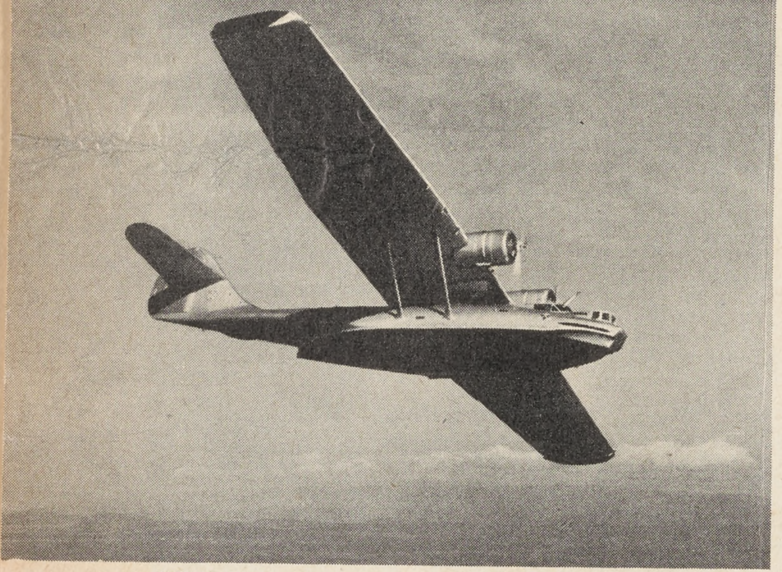


HIGH ASPECT RATIO.—Both the Consolidated Model 31 two-motor flying-boat (left) and the Consolidated Model 32 four-motor landplane bomber (right) have the same highly tapered "Davies" wing of exceptionally low drag. Both have outstanding performance. With two 2,000 h.p. Wright Duplex Cyclones, the Model 31 does nearly 300 m.p.h. and carries half its loaded weight of 50,000 lb. as disposable load. The Model 32, of which 120 are being supplied to the R.A.F., has a top speed of more than 300 m.p.h. on its four 1,200 h.p. Pratt and Whitney Twin Wasps.



THE AEROPLANE
AUGUST 2, 1940

A PATROL BOMBER.—The Consolidated Model 29 long-range patrol bomber supplied to the U.S. Navy. The four 1,050 h.p. Pratt and Whitney Twin Wasp motors give it a top speed of about 230 m.p.h. and it has a range of 4,000 miles cruising at about 200 m.p.h. A new version of this with a bigger hull, and a loaded weight of about 65,000 lb., is now in production for the U.S. Navy and may be ordered for the Royal Air Force. The photograph shows the wing-tip floats retracted to form end plates at the tips. This reduces the take-off run as well as increasing the cruising speed.



SUPPLIED TO THE R.A.F.—The Consolidated Model 28-5 (two 1,200 h.p. Pratt and Whitney Hornets), a large number of which are on order for the Coastal Command of the Royal Air Force. They will be delivered by air across the Atlantic.

CONSOLIDATING THE THIN WING

THIN WING SECTIONS are no mystery aerodynamically. But they have been something of a problem structurally since the size of aeroplanes has increased. The success of the aircraft produced recently by the Consolidated Aircraft Corporation has rested largely on the solution of that problem. Just as the geodetic system of Vickers presented the designer of the Wellesley with the high aspect ratio, so the Consolidated construction has yielded the wing of low drag which may also be given a high aspect ratio. The development is of importance and the illustrations on these pages show its first fruits.

Major Reuben Fleet, President and General Manager of the Consolidated Aircraft Corporation, has, since 1923, built up that concern from a small beginning until now at Lindbergh Field, San Diego, California, it is being expanded into the biggest single aircraft plant in the United States. When the extension is finished the works will occupy 1,910,000 square feet of covered and uncovered manufacturing space—the uncovered portion is made possible because in the Californian climate 30 per cent. of the manufacturing processes can be done out of doors. At present the Consolidated Corp. has $70,000,000 (£17,500,000) worth of unfulfilled orders on its books for Great Britain and for the expansion of the U.S. Naval Air Service.

The present and future prosperity of the Consolidated concern rests on four outstanding types of aeroplane.

The first is the Consolidated Model 28 (PBY-5), a two-motor flying-boat supplied in hundreds to the U.S. Navy and now being built for Great Britain. One boat of this type was flown non-stop across the Atlantic to Felixstowe in July, 1939, for delivery to the R.A.F. It has since been written-off but more will follow. The range is 4,000 miles at about 130 m.p.h.

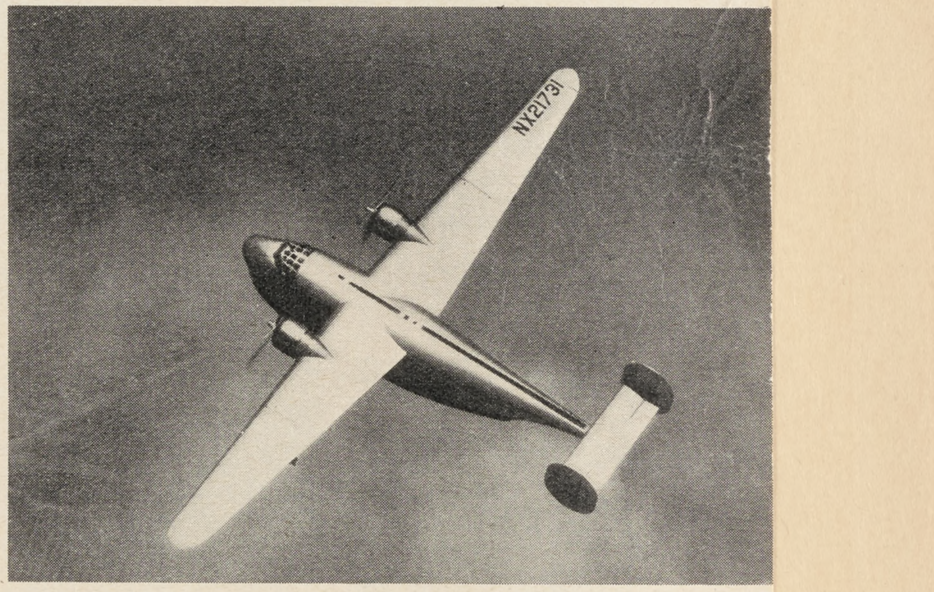
An interesting amphibian, the Model 28-5A XPBY-5A has been developed from the Model 28. It has a tricycle landing gear which can be retracted into the hull.

The second type of Consolidated flying-boat is the big Model 29 PB2Y-1 equipped with four Pratt and Whitney Twin Wasps. An enlarged version of this boat, the PB2Y-2, is in production for the U.S. Navy and may be for Great Britain.

The Consolidated Model 31 two-motor flying-boat is one of the World's most efficient aeroplanes and the biggest twin-engined seaplane in the World. It is also the World's fastest flying-boat with a top speed of nearly 300 m.p.h.

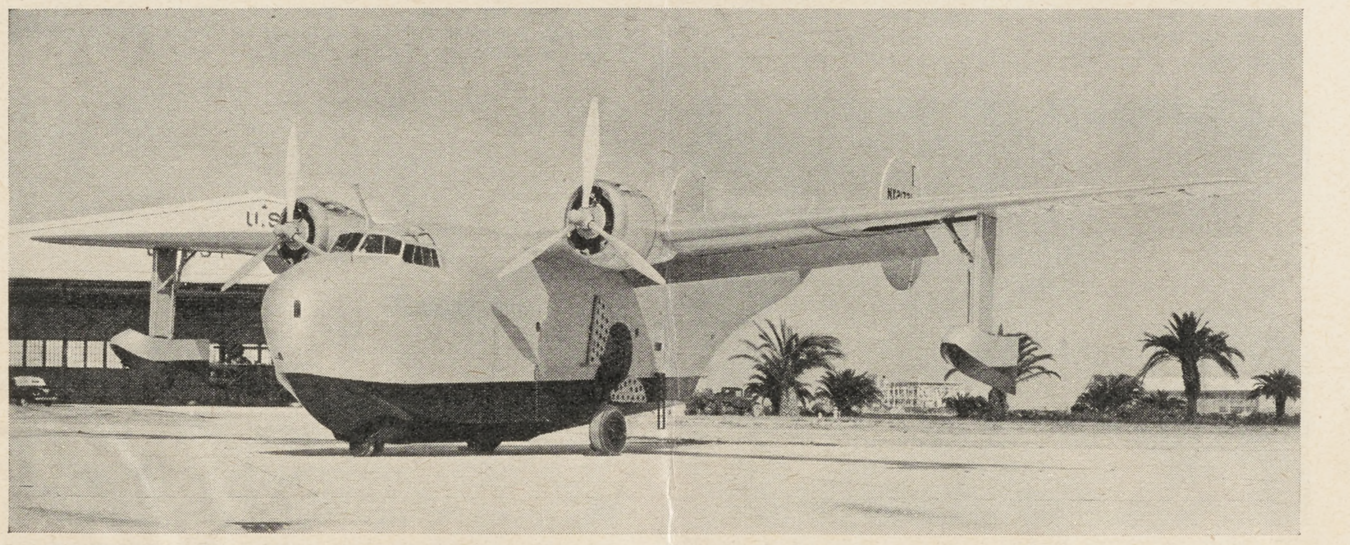
The latest Consolidated product is the Model 32 four-motor tricycle bomber which has a top speed of more than 300 m.p.h. France had ordered 120 of these before it was overwhelmed and they will now be supplied to Great Britain. As the wing of the four-motor Model 32 is the same as the two-motor Model 31 there is a possibility that a still higher performance may be gained by the substitution of two motors of about 2,000 h.p. each for the present installation of four 1,200 h.p. Cyclones.

The record of Consolidated aeroplanes in service is such that they can be expected to do well in the Royal Air Force. The Consolidated concern has been represented in this country for the past two years by Mr. John Millar of Aviation Corporates Ltd.



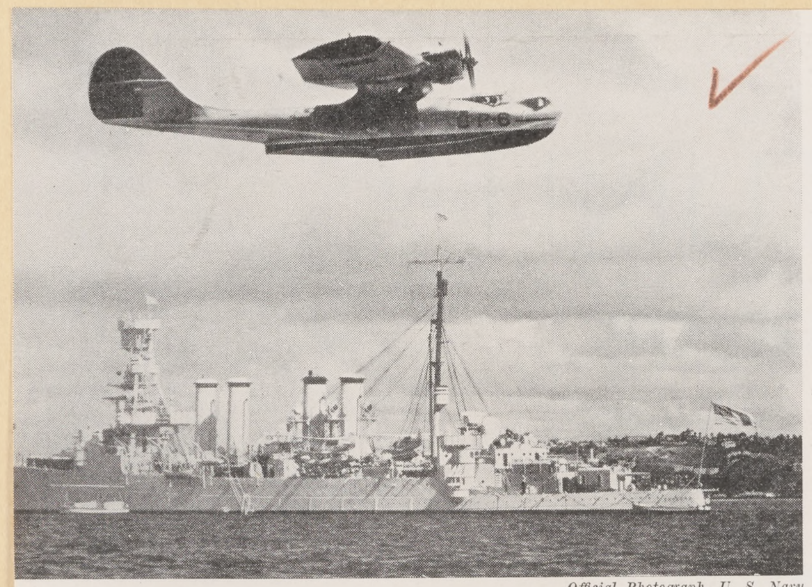
PLAN FORM.—The extraordinary wing of the Consolidated Model 31 is well shown in this photograph. It has an area of about 1,050 sq. ft., which gives a wing loading of more than 48 lb. per sq. ft. The Model 31 was designed and built in seven months.

AMPHIBIOUS.—The Consolidated Model 28-5a two-motor amphibian which, by virtue of its range and impartiality in alighting on sea or land, could be operated from anywhere to anywhere in the World, international politics permitting. The photograph shows the wing-tip floats in the extended position.



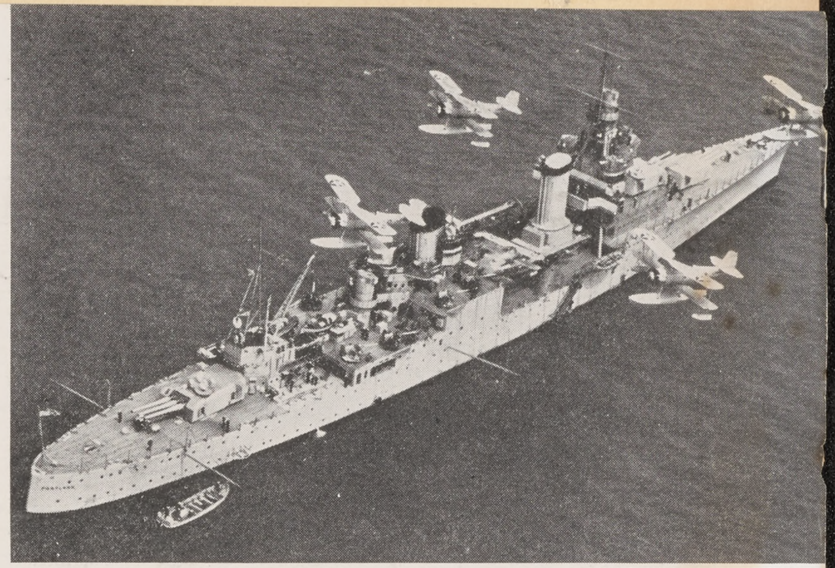
EFFICIENCY.—The Consolidated Model 31 flying-boat, one of the most efficient aeroplanes in the World. It is not an amphibian but has a retractable beaching chassis for ease of handling. The semi-retractable floats are shown in the extended position and so are the Fowler flaps.

RELATIONSHIP BETWEEN AIR POWER AND NAVAL FORCE



Official Photograph, U. S. Navy

Patrol Bomber over U. S. S. Concord.



Official Photograph, U. S. Navy

By Rear Admiral John H. Towers, U.S.N.

Chief, Bureau of Aeronautics

THE policy which governs the United States Navy also governs Naval Aviation. This encompassing policy is possible because Naval Aviation is as definitely a part of the Navy as your right arm is a part of you; its separation would be as crippling to the Navy as the loss of your arm to you.

The more or less continuing agitation for an independent or separate air force —independent of the Army and the Navy, separate to the extent of depriving those services of their present air arms—has been conducted before the Congress and in the press to such an extent that the arguments used have become very worn.

In setting forth the arguments in favor of a separate air force, the finger of finality is generally pointed to the countries which have such organizations — Great Britain, France, Italy, Germany. Upon even casual examination, we find that our situation is far different. The European powers have far more vulnerable frontiers than we. The present war has demonstrated that for them air attack may materialize in hours rather than in days or weeks.

The English Channel, once a safeguard controlled by British naval forces, may be crossed in a few minutes by hostile aircraft. France, whose borders abut on those of traditional enemies, finds her capital city and her great industrial centers now subject to overpowering air attacks. Italy, too, must be concerned by the possibility of devastating air raids.

Our Policy Based on Our Problems

Those responsible for the national security of those countries adopted separate air forces, or departments of air, by reason of the fact that their strategic situations appeared to demand it. The determination of their requirements was based on their own particular problems. Likewise, we have determined our needs — based on our problems. Our probable enemies include neither Canada nor Mexico, whose territories adjoin our own. No potential enemy can reach our shores except by way of the seas. Our overseas possessions — Puerto Rico, Canal Zone, the Philippines—must also be reached via the seas and, in addition, we, ourselves, must proceed by those routes in order to protect them. The only answer is the possession of sea power; a mobile fleet, adequately equipped in all branches, which includes a complete and powerful air arm and the necessary supporting shore establishment.

It is of great interest to note the attitude of Admiral of the Fleet Sir Roger Keyes in his speech delivered in the House of Commons on February 27, 1940. Sir Roger pointed out that he had been striving for years to regain for the Admiralty the right to develop naval aviation; to have aircraft designed which could carry out the functions required by the Navy in war; to train the necessary personnel and to operate those aircraft in wartime. His statement, made six months after the entry of Great Britain into the present European war, stated that because the government failed to provide the Navy with the air service that it needed to carry out its responsibilities, the price had been the lives of many men which otherwise would have been spared.

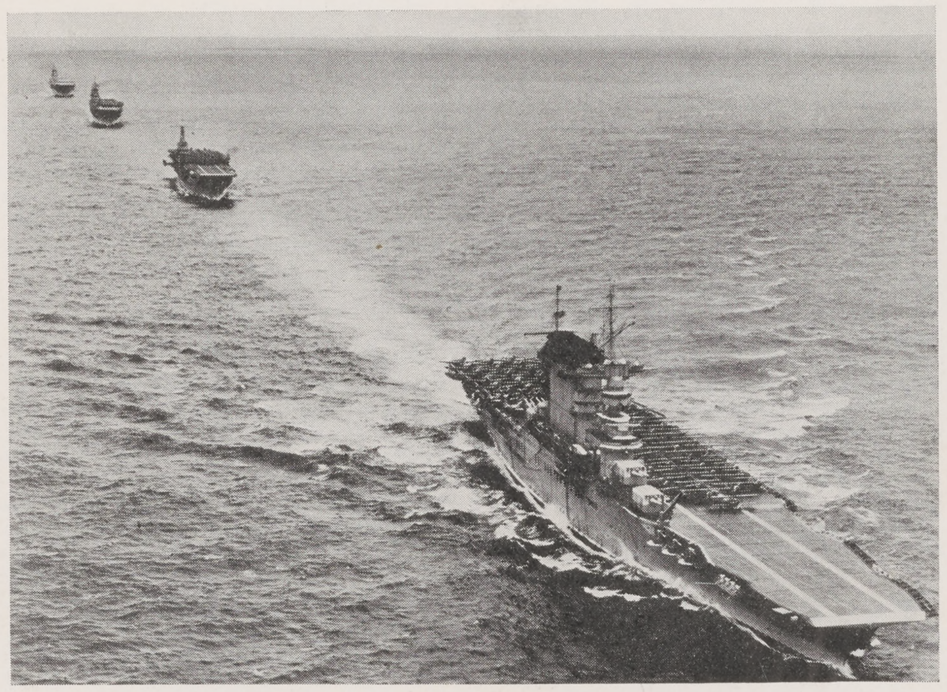
Separate Control A Basic Error

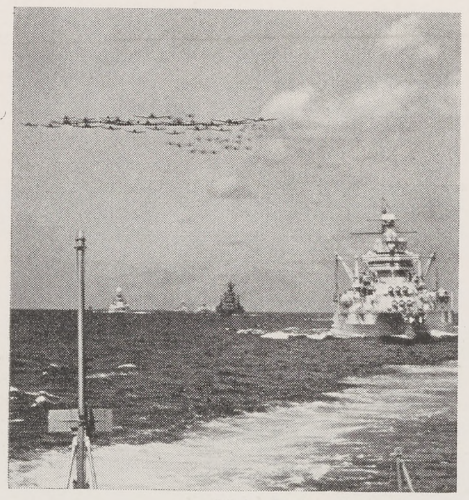
As far back as 1923, Lord Beatty, a great sea officer who bore the heaviest responsibilities in the last war and who had the insight to see what was likely to happen in the next war, said, referring to the working of the dual control of the fleet air arm: "This is no inter-service quarrel capable of compromise but a serious cause of reduced efficiency which time cannot correct, as it is due to a fundamental error in principle which no compromise can possibly bridge over."

The British Navy has no control over the nature of the aircraft employed, the strength of the squadrons, the training of the personnel, or even the operation of aircraft on which the Admiralty has to rely for information about enemy ships. Neither has the Navy any control over the aircraft which should be in a position to deliver attacks on enemy ships at sea immediately when they are located; nor other fighter aircraft which should be available at a moment's notice to attack enemy aircraft.

Four of the aircraft carriers are shown here. In the foreground U. S. S. Lexington, U. S. S. Ranger, U. S. S. Yorktown and U. S. S. Enterprise.

Official Photograph, U. S. Navy





Official Photograph, U. S. Navy

"United States Naval Aviation consists of all the aircraft units operating as component parts of the fleet."

For purposes of comparison, let us look at our own Navy and its aviation organization. It is not a separate force, but one which dovetails smoothly and efficiently into the organization of which it is a part. Its very functions are derived from the functions of the Navy; its capabilities and endeavors are directed toward the promotion of naval efficiency and the fulfillment of the basic policy.

The Bureau of Aeronautics is specifically charged with providing the best material that authorized funds can procure. In carrying out its material duties, the Bureau must consider both quantity and quality. It must ensure the maintenance of the full complement of airplanes for aircraft carriers, tenders, battleships, cruisers, the shore establishment, and the Fleet Marine Force. At the same time, it must develop the types of airplanes and appliances best suited for increased effectiveness of naval objectives. These steps are of vital importance if Naval Aviation is to assist in carrying the brunt of national defense—that of the first phases of operations in the preservation of our country's safety.

Mutual Dependence

That the developments in the art of war and in the international situation may change the composition of the Fleet and cause modification in the characteristics of both ship and aircraft is an accepted fact, but the underlying mutual dependence of one upon the other continues. Aircraft alone, or battleships, cruisers, destroyers, or submarines alone, are unable to carry out an adequate defense of this country, much less an effective offense. Taken together, however, in well-balanced proportions, they form the Fleet, which, supported by properly equipped and properly located shore bases, can do either assigned task.

United States Naval Aviation consists of all the aircraft units operating as component parts of the Fleet, plus the necessary supporting establishments such as training schools, overhaul and operating bases, and experimental facilities. The various types of aircraft of this aeronautic organization are divided and employed as follows:

(1) Four landplane squadrons of eighteen planes each are assigned to each of our six aircraft carriers. Each carrier group consists normally of one fighter squadron, two scout-bombing squadrons, and one torpedo-bombing squadron. These carrier groups comprise the principal air striking force of the Fleet.

(2) Each battleship carries three seaplanes, primarily for controlling the ship's long-range gunfire.

(3) Each cruiser carries four seaplanes, primarily for scouting and secondarily for controlling the ship's long-range gunfire.

(4) Twenty long-range patrol-bombing squadrons, operating from harbors of our continental and insular possessions and the Canal Zone, are used for long-range overseas scouting and heavy bombing. Because of their long range, these patrol squadrons are highly mobile; they can be shifted rapidly from one area to another, and from the West Coast to the Hawaiian Islands; from San Diego to Coco Solo in the Canal Zone; or from the East Coast to the West Coast. Advance operations by these squadrons are aided by the employment of ships called tenders, which carry gasoline and oil for servicing the planes operating far from their shore bases, and are equipped to carry out repairs and to provide facilities for messing and berthing the planes' crews.

(5) The Fleet Marine Force has nine squadrons trained to support the Marine Force wherever it may be employed. This force is also trained to operate from the aircraft carriers.

Time At Shore Bases

Airplanes in themselves are not capable of operating over the vast areas of the open sea for indefinite periods. For this reason no fleet operating in the various sea areas at great distances can be assured of the vital assistance afforded by airplanes unless that fleet provides within itself the means of basing, maintaining, and efficiently operating such airplanes. While this is an accomplished fact in our Navy, it has been determined that time spent at shore bases, primarily for purposes of economy, is most efficiently employed in the carrying out of gunnery training schedules and major overhauls. These land periods coincide with periods needed by the parent ships for repairs, provisioning, and fueling.

The Naval Aviation Shore Establishment, so necessary for the proper operation of the Fleet, may be divided into four general categories: Naval Air Stations, Naval Aviation Facilities, Naval Reserve Aviation Bases, and Temporary Naval Aviation Facilities in support of the neutrality patrol.

The foregoing is, briefly, a picture of the present set-up of Naval Aviation. It is based on the results of careful study in the past which are definitely supported by the demonstrations in the day-to-day conflicts now going on in Europe. Control of the sea is a vital factor under many circumstances, but control of the land is always vital. The inability of air forces ALONE to seize and hold territory is obvious. Every attack by planes must be followed immediately by the ground forces in order that the land may be ac-

Consolidated Aircraft, with a $70,000,000 backlog, has $15,000,000 more business on its book than total sales in the previous sixteen years of its existence. Full operations appear assured for more than two years. Nearly 50 percent of the backlog is in foreign orders.

Aviation July 1940

Swedlow Plastics Shares Offered

Public offering of 64,500 shares of capital stock in the Swedlow Aeroplastics Corp. was made early in July at an offering price of $1.25 per share. Proceeds were to be used for machinery and equipment, working capital and other purposes.

The company is to engage in the manufacture of products from acrylic (methyl methacrylate) resins, which are the plastics used, among other purposes, as substitutes for glass.

Officers and directors of the new company are Dave Swedlow, president and director; Lawrence Green, secretary-treasurer and director; Hall L. Hibbard, chief engineer of Lockheed Aircraft Corp., vice president and director; Wolfgang Klemperer, Douglas Aircraft, director; Richard W. Millar, president of Vultee Aircraft, director; John K. Northrop, president of Northrop Aircraft, director; Charles H. Van Dusen, vice president and works manager of Consolidated Aircraft at San Diego, director.

24 FLIGHT JULY 11, 1940

AMERICAN PRODUCTION

A Mid-June News-letter from a Correspondent in Washington

THIS letter is being written as the final act in France's present tragedy is unrolled. The Anglo-French Purchasing Board has not yet made any public statement regarding the disposition of the French part (slightly more than half) of the 1,600,000,000 dollars (£400,000,000) of Allied orders placed in the United States so far. Not much more than 250,000,000 dollars (£63,000,000) worth of equipment has yet been delivered, but informed sources are certain that remaining French contracts will be taken over by the British Purchasing Commission, unless an émigré Government is set up to carry on the war. If this happens, it is possible that the present form of the Anglo-French board will be continued.

As British readers undoubtedly know, buying has been proceeding at a greatly accelerated rate during the last five weeks. Contracts totalling some 600,000,000 dollars (£150,000,000) have been signed in that time, according to a statement by the purchasing group. Of the grand total spent to date, more than 1,000,000,000 dollars (£250,000,000) is for aircraft—8,500 of them.

The Anglo-French Purchasing Board says that more than 2,000 of these have already been shipped. Some 500 others (Hudsons, Hawk 75As and Harvards) were delivered before September 3. Another 500 await shipment. About 3,300 of the still-awaited 6,000 were ordered for France. Yet another source just opened up, of course, is Army and Navy air service equipment declared obsolete and traded in by the Government to the manufacturers for resale to Britain—a nice legal manœuvre which should show where American sympathies lie. Less than 200 Army and Navy machines have been turned over to Britain in that way at the time of writing. The release programme has slowed down in the last couple of days, either because shipping facilities for additional machines are not immediately available or until the uncertainty over the French surrender and its effect on the war is cleared up. But other aircraft will undoubtedly be made available shortly. Army types will predominate. The Navy is still the first line of American defence and its active squadrons will be the last to be stripped. The first aircraft released were Navy machines, but they were from reserve units whose personnel had, in any case, been called to serve as instructors in training schools.

Variety of Types

Just about every military type currently made in the United States is under order for England. Besides the types previously reported by this correspondent, England will shortly receive 120 Vultee Vanguards, originally ordered by Sweden, and 24 Northrop single-engined twin-float seaplanes intended for Norway. (John K. Northrop, one of America's most talented engineers, is back in the manufacturing field with his own company and several revolutionary ideas. Northrop's older company was absorbed by Douglas some years ago.) The Vanguard, an easily assembled fighter, does about 320 m.p.h. when powered with a Pratt and Whitney Twin Wasp C 14-cylinder air-cooled radial (1,200 h.p., take-off). A version powered with the Double Wasp (18 cylinders, 1,600 h.p., take-off) and capable of 370 m.p.h. was built for the Army, but the Army turned thumbs down.

The Purchasing Board has ordered (originally for French use) as many Douglas B-20 and Martin 167W attack bombers as can be built, up to 150 each a month. Most of the Douglases (15,000 lb. gross weight; two two-row Cyclones; 375 m.p.h. (?)) will be built in the Boeing (Seattle) and Consolidated (San Diego, Calif.) plants, as Douglas is not interested in further plant expansion. This is the first time a large-scale licensing arrangement has ever been made in the United States, and is a major step toward standardisation of the industry. Earlier Allied attempts to secure industry-wide standardisation on three models were unsuccessful. Martin will build all of the 167Ws—not nearly so speedy a type (16,000 lb.; two Twin Wasps; 315 m.p.h.).

Just three days before Marshal Pétain sued for an armistice the French mission signed for delivery of 120 Consolidated B-24s in 1941. These are the 20-ton four-engined (Twin Wasps) bombers with a speed of nearly 300 m.p.h. They are in the "flying fortress" class, but cannot be called that because Boeing had the forethought to register the title as a trade mark. Boeing, builders of the original "F.F." type, the B-17, are also building long-range high-speed machines to Allied orders. They are known as the B-17D model. Redesigned from the landing wheels up, the new B-17 is said to be good for 330 m.p.h. top speed. Both Consolidated and Boeing types are also on order for the Army, but the Army will wait. The French had also contracted for 110 four-engined Consolidated flying boats of the PB2Y-1 U.S. Navy model.

Two further items may be of some, though very small, comfort in these trying days. First, production of the Curtiss P-40D fighter is really under way at a good rate, and secondly, the Allison Engineering Company, whose V-1710-C6 twelve-cylinder diethylene-glycol-cooled engine has been so eagerly awaited, finally got production started two months ago in its first plant. A second plant, paid for by the Allies, is nearing useful work. But production of this engine still lags behind airframes designed to take it.

The only important new aircraft types to make their appearance in the last two months are the Grumman Skyrocket twin-engined fighter designed for aircraft carrier operation, and the Bell XFL-1, fleet fighter version of the Airacobra. The Skyrocket uses Twin Wasps (the prototype had Cyclones.—Ed.) and the Navy swears it will outpace Lockheed's Allison-powered P-38. No data are yet released. This type and single-engined Grumman and Brewster monoplanes (just over 300 m.p.h.) have been ordered by the Allies. Eighty Grumman F4-F3s were to go to France.

Rates of Production

Actual production of military aircraft (and the Allies are getting practically every one built) is now running at the rate of about 500 a month, with a good likelihood of reaching 700 or 800 monthly by the end of the summer. Deliveries have been consistently ahead of schedule, although almost the only large plant which is actually now working at all-out capacity is Douglas. Eighteen thousand men are employed around the clock at the Santa Monica factory in California. (A three-shift maximum of 17,000 is the designed capacity labour force.) At several plants this winter there were slight delays due to engine shortages, but this has been corrected.

The Wright Aeronautical Corporation the other day dedicated the fourth major engine plant addition to go into service in the United States since war began. Production is currently for over 1,000 engines a month and should pass 2,000 by the end of the year. Further expansion plans are liable to boost even this output.

At one other aircraft factory, an airscrew shortage was reported, but Curtiss now has about as large a plant as Hamilton Standard, and Hamilton Standard has grown mightily. At some plants visited recently by the writer aircraft were quite often being turned out faster than the Allies could take them away. Recent easing of flight delivery regulations under the Neutrality Act (non-stop into-Canada trips by American delivery pilots are now allowed) should at least get the machines as far as Canada's Atlantic ports.

This survey of American production as it affects the Allies would be incomplete without one final note: North America is reported to be building a single-engined fighter around that Allison W-shaped engine of 2,000 h.p. The new N.A. prototype has not flown yet. Will it be in the 500-mile-an-hour class? (No!—Ed.) More important, will it be ready in time?

Life July 1940

WEST COAST AIRCRAFT PLANTS, PREDICT U. S. WILL HAVE 5,500 PLANES BY APRI

↑ **In San Diego** they marched through vast hangars of Consolidated Aircraft Corp., where they inspected bombers and seaplanes. Here they pass a huge wing sectio with mountings for engine nacelles. Backlog of orders now exceeds $120,000,000. B April, General Arnold said, the Army would have 5.500 first-line fighting planes

Wall St. Journal 7-24-40

Cons. Aircraft Bookings

LOS ANGELES—Consolidated Aircraft Corp. in the six months ended June 30, 1940, booked $55,136,721 in new aircraft orders, increasing its total backlog at the end of the period to $96,870,008. Sales represented by products delivered and billed for the six months' period totaled $408,407. During the period the company was engaged primarily in making parts and subassemblies for airplanes which will be delivered commencing in August, this year, and continuing throughout 1941.

Union 7/30/40

British Buy Guba From·Archbold

NEW YORK, July 29 (U.P.)—Britain has purchased the seaplane Guba from Richard Archbold, explorer, it was understood today. The Guba, built in San Diego, was flown around the world in 1938.

The purchase was negotiated by Harold James, representative of the British ministry of aircraft production. The plane will be used to transport aluminum from the United States to England.

It was understood the plane would make semi-weekly trips to England, carrying 3½ tons of aluminum on each trip. Clyde Pangborn, long-distance flier, will command a crew of four.

The Guba now is at Port Washington, N. Y. It has a cruising range of 4000 miles and is a duplicate of the PBY long-range bombers used by the U. S. navy except that it carries no armament. Last month the Guba was flown from San Diego to Floyd Bennett field in Brooklyn in 15 hours, 49 minutes, a new transcontinental seaplane record.

PRINTED MATERIAL FOR THE MONTH
OF AUGUST, 1940

New Plane Factory To Be Opened Monday

SAN DIEGO—Consolidated Aircraft Corp.'s new factory, completed in a $2,000,000 expansion program this summer, will be dedicated at 2 p.m. Monday by Rear Admiral Charles Blakely, 11th Naval District commandant.

Maj. H. R. Fleet, Consolidated president, said because of lack of space to accommodate visitors, the dedication will not be an open house, but that invitations had been issued to State, county, city, Navy, Army, Marine Corps and Coast Guard officials.

Because of work under way in connection with the national defense program, cameras will not be allowed in the plant without government permission.

Tribune — 8/22/40

Will Build Again, Consair Decision

Further expansion of the Consolidated Aircraft Corp.'s extensive airplane construction plant here was disclosed today when plans were filed with the planning commission for a new building to cost $800,000. The new structure will be 200 feet wide by 1500 feet long and will occupy that portion of the corporation's lease west of Pacific highway and north of the last new structure to be completed, which is to be dedicated Sept. 2.

The plans were filed by E. L. Freeland, structural engineer. It is to be entirely of steel, with the latest improved mechanical and electrical equipment. Contract for the steel placement has been let to the National Iron Works, San Diego, said Freeland. Estimates for general construction are being prepared by B. O. Larson, local contractor. Test pilings for the foundation now are being driven and work on the superstructure will begin within a short time.

Approval Forecast

The plans were checked by the planning engineer today when they were taken to the building department. It was said they would be approved there later today, when a building permit would be issued.

The $800,000 will add materially to the city's August construction record, said Glenn Rick, planning engineer.

Freeland said the new building is to be equipped for construction of land planes alone, and that it would make room for employment of additional skilled workmen. The new structure also will add to the large acreage of structures built by the Consolidated Corp. since it began operation in San Diego several years ago, said Rick.

Air Plants Raise Building Permits

Un— 8/25/40

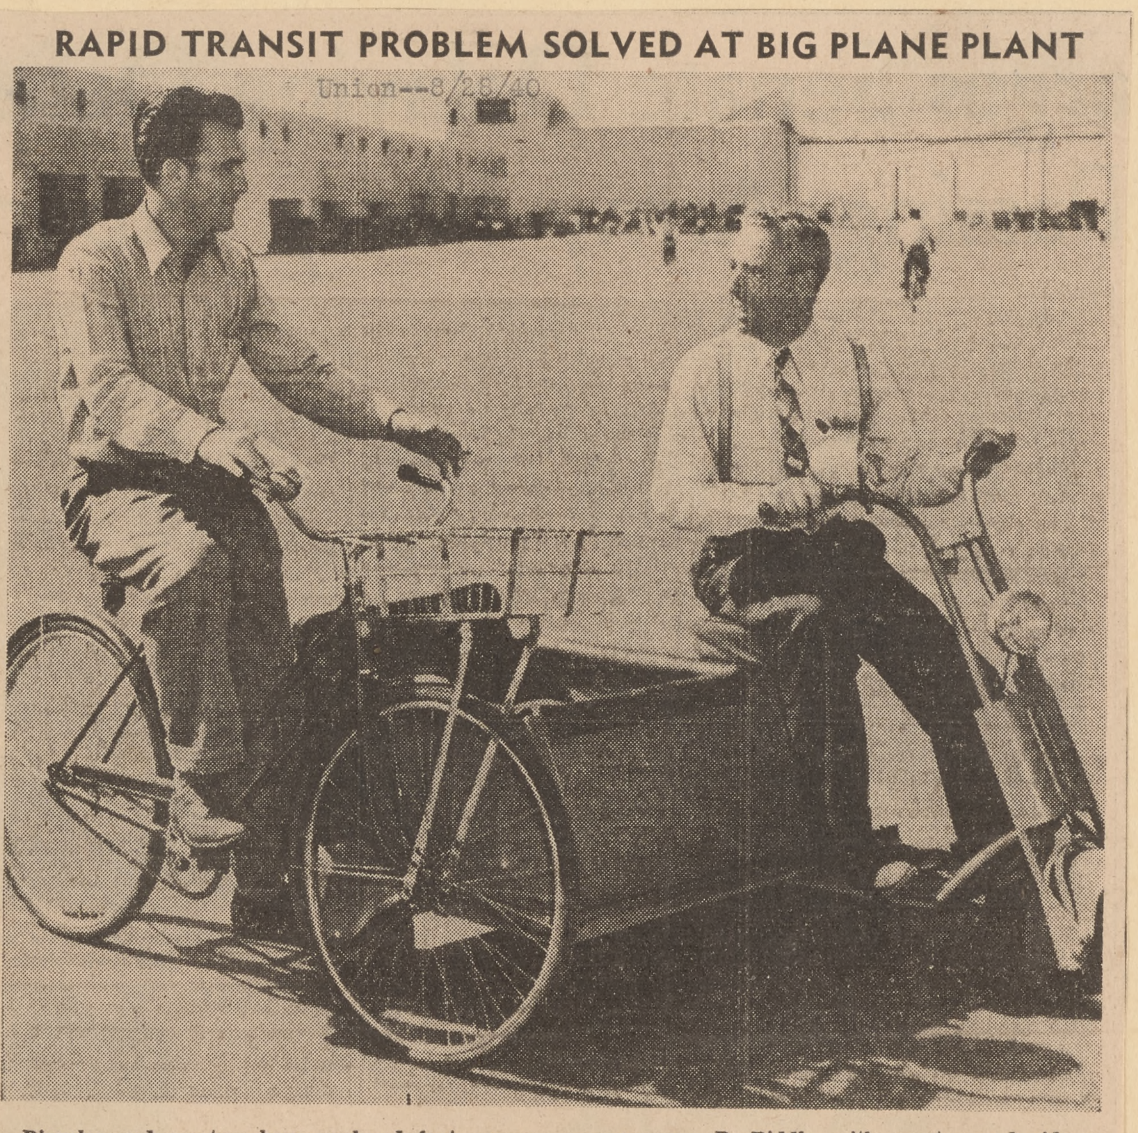
Permits for construction of an $800,000 unit at Consolidated Aircraft Corp.'s plant, a $1000 addition at the Solar Aircraft Co.'s factory and for a $21,250 church in East San Diego were issued by the city building department yesterday.

The new Consolidated unit, according to the permit, will be a single-story structure with a mezzanine floor, and will have a total of 300,000 square feet. Solar's addition will be 18 by 26 feet.

Seventh Day Adventist church obtained the $21,250 permit for a 7000-square-foot frame and stucco building on the northwest corner of Polk ave. and Illinois st. The improvement is to be erected on a 140 by 150 foot site.

RAPID TRANSIT PROBLEM SOLVED AT BIG PLANE PLANT

Union--8/28/40



Bicycles and scooters have replaced foot power and roller skates for Consolidated Aircraft Corp. messengers. R. Biddle with scooter and sidecar and Eddie Holmes on bicycle are ready for action.

* * *

CONSAIR PROVIDES BIKES, SCOOTERS FOR MESSENGERS

When Consolidated Aircraft Corp. built its San Diego plant five years ago, a number of messengers were employed to carry memoranda and supplies to the various plant units. A year later, the factory was enlarged and the messengers equipped themselves with roller skates on which to reach more speedily the distant parts of the big plant.

Then came the third enlargement and Consair expanded until now it stretches a full half-mile along Pa-

Meanwhile, plans for dedication of the latest plant addition were completed yesterday with Rear Adm. Charles Blakely, 11th Naval district commandant, named to preside. Due to lack of room, the public has not been invited but each employe may bring a guest, it was announced from the office of Maj. R. H. Fleet, Consair president. The ceremony will be held on the northwest side of the plant.

In addition to Adm. Blakely and state, city, county, army, navy, marine corps and coast guard officials, others present will be Rear Adm. A. B. Cook, aircraft scouting force commander; Maj. Gen. William P. Upshur, commanding Ft. Rosecrans, and Gen. F. D. Lackland, March field, representing the army air corps.

Union 8/17/40

Consair Gets Huge Contract

Award of a $14,861,342 war department contract for purchase of 54 four-engine bombing planes was acknowledged by Consolidated Aircraft Corp. yesterday.

The plane is said to be similar to those built and building at the San Diego factory under two previous contracts.

Orders for the Consolidated bombers include a $3,000,000 contract in April, 1939, and an $8,600,000 contract in August, 1939. The number of planes has been kept secret in previous announcements.

Consolidated Corp.'s backlog of army, navy and foreign government plane orders totals $132,000,000, according to unofficial estimates.

Requests for bids on materials have been issued on the new order although work has not yet started, it was reported here.

Date of delivery on the planes was not announced.

Also awarded yesterday was a $1,038,000 order for 100 training planes to the Fairchild Engine & Airplane Corp., Hagerstown, Md., The Associated Press reported from Washington, D. C.

The orders were the third of a group announced since congress voted $400,000,000 for 4200 additional army planes last June.

Union July 26-40

Coast Aircraft Backlogs Show Rapid Gains

SAN FRANCISCO, July 25 (A.P.) — California aircraft builders reported rapidly rising backlogs of unfilled orders today.

North American Aviation Corp. reported its books held $83,534,306 in orders June 30 compared with a little over $50,000,000 March 31.

Vultee Aircraft, Inc., incorporated in its present form late in 1939, had $14,494,744 orders on hand, Vice-President V. C. Schorelemmer said, reporting as of May 31. No comparison was available.

Solar Aircraft had $1,084,538 unfilled orders before receipt today of an additional $130,000 order for exhaust manifolds.

President J. H. Kindelberger of North American said his firm was negotiating for construction of a new plant. Consolidated net profit for the six months ended June 30 amounted to $2,367,638 compared with $2,781,682 in the first half of last year. Indicated June quarter profit was $1,846,979 after all charges including estimated income taxes.

First half sales of North American totaled $14,578,317 against $12,965,836 last year.

Consolidated Aircraft, with a $70,000,000 backlog, has $15,000,000 more business on its book than total sales in the previous sixteen years of its existence. Full operations appear assured for more than two years. Nearly 50 percent of the backlog is in foreign orders.

Swedlow Plastics Shares Offered

Public offering of 64,500 shares of capital stock in the Swedlow Aeroplastics Corp. was made early in July at an offering price of $1.25 per share. Proceeds were to be used for machinery and equipment, working capital and other purposes.

The company is to engage in the manufacture of products from acrylic (methyl methacrylate) resins, which are the plastics used, among other purposes, as substitutes for glass.

Officers and directors of the new company are Dave Swedlow, president and director; Lawrence Green, secretary-treasurer and director; Hall L. Hibbard, chief engineer of Lockheed Aircraft Corp., vice president and director; Wolfgang Klemperer, Douglas Aircraft, director; Richard W. Millar, president of Vultee Aircraft, director; John K. Northrop, president of Northrop Aircraft, director; Charles H. Van Dusen, vice president and works manager of Consolidated Aircraft at San Diego, director.

24 FLIGHT JULY 11, 1940

AMERICAN PRODUCTION

A Mid-June News-letter from a Correspondent in Washington

THIS letter is being written as the final act in France's present tragedy is unrolled. The Anglo-French Purchasing Board has not yet made any public statement regarding the disposition of the French part (slightly more than half) of the 1,600,000,000 dollars (£400,000,000) of Allied orders placed in the United States so far. Not much more than 250,000,000 dollars (£63,000,000) worth of equipment has yet been delivered, but informed sources are certain that remaining French contracts will be taken over by the British Purchasing Commission, unless an émigré Government is set up to carry on the war. If this happens, it is possible that the present form of the Anglo-French board will be continued.

As British readers undoubtedly know, buying has been proceeding at a greatly accelerated rate during the last five weeks. Contracts totalling some 600,000,000 dollars (£150,000,000) have been signed in that time, according to a statement by the purchasing group. Of the grand total spent to date, more than 1,000,000,000 dollars (£250,000,000) is for aircraft—8,500 of them.

The Anglo-French Purchasing Board says that more than 2,000 of these have already been shipped. Some 500 others (Hudsons, Hawk 75As and Harvards) were delivered before September 3. Another 500 await shipment. About 3,300 of the still-awaited 6,000 were ordered for France. Yet another source just opened up, of course, is Army and Navy air service equipment declared obsolete and traded in by the Government to the manufacturers for resale to Britain—a nice legal manœuvre which should show where American sympathies lie. Less than 200 Army and Navy machines have been turned over to Britain in that way at the time of writing. The release programme has slowed down in the last couple of days, either because shipping facilities for additional machines are not immediately available or until the uncertainty over the French surrender and its effect on the war is cleared up. But other aircraft will undoubtedly be made available shortly. Army types will predominate. The Navy is still the first line of American defence and its active squadrons will be the last to be stripped. The first aircraft released were Navy machines, but they were from reserve units whose personnel had, in any case, been called to serve as instructors in training schools.

Variety of Types

Just about every military type currently made in the United States is under order for England. Besides the types previously reported by this correspondent, England will shortly receive 120 Vultee Vanguards, originally ordered by Sweden, and 24 Northrop single-engined twin-float seaplanes intended for Norway. (John K. Northrop, one of America's most talented engineers, is back in the manufacturing field with his own company and several revolutionary ideas. Northrop's older company was absorbed by Douglas some years ago.) The Vanguard, an easily assembled fighter, does about 320 m.p.h. when powered with a Pratt and Whitney Twin Wasp C 14-cylinder air-cooled radial (1,200 h.p., take-off). A version powered with the Double Wasp (18 cylinders, 1,600 h.p., take-off) and capable of 370 m.p.h. was built for the Army, but the Army turned thumbs down.

The Purchasing Board has ordered (originally for French use) as many Douglas B-20 and Martin 167W attack bombers as can be built, up to 150 each a month. Most of the Douglases (15,000 lb. gross weight; two two-row Cyclones; 375 m.p.h. (?)) will be built in the Boeing (Seattle) and Consolidated (San Diego, Calif.) plants, as Douglas is not interested in further plant expansion. This is the first time a large-scale licensing arrangement has ever been made in the United States, and is a major step toward standardisation of the industry. Earlier Allied attempts to secure industry-wide standardisation on three models were unsuccessful. Martin will build all of the 167Ws—not nearly so speedy a type (16,000 lb.; two Twin Wasps; 315 m.p.h.).

Just three days before Marshal Pétain sued for an armistice the French mission signed for delivery of 120 Consolidated B-24s in 1941. These are the 20-ton four-engined (Twin Wasps) bombers with a speed of nearly 300 m.p.h. They are in the "flying fortress" class, but cannot be called that because Boeing had the forethought to register the title as a trade mark. Boeing, builders of the original "F.F." type, the B-17, are also building long-range high-speed machines to Allied orders. They are known as the B-17D model. Redesigned from the landing wheels up, the new B-17 is said to be good for 330 m.p.h. top speed. Both Consolidated and Boeing types are also on order for the Army, but the Army will wait. The French had also contracted for 110 four-engined Consolidated flying boats of the PB2Y-1 U.S. Navy model.

Two further items may be of some, though very small, comfort in these trying days. First, production of the Curtiss P-40D fighter is really under way at a good rate, and secondly, the Allison Engineering Company, whose V-1710-C6 twelve-cylinder diethylene-glycol-cooled engine has been so eagerly awaited, finally got production started two months ago in its first plant. A second plant, paid for by the Allies, is nearing useful work. But production of this engine still lags behind airframes designed to take it.

The only important new aircraft types to make their appearance in the last two months are the Grumman Skyrocket twin-engined fighter designed for aircraft carrier operation, and the Bell XFL-1, fleet fighter version of the Airacobra. The Skyrocket uses Twin Wasps (the prototype had Cyclones.—Ed.) and the Navy swears it will outpace Lockheed's Allison-powered P-38. No data are yet released. This type and single-engined Grumman and Brewster monoplanes (just over 300 m.p.h.) have been ordered by the Allies. Eighty Grumman F4-F3s were to go to France.

Rates of Production

Actual production of military aircraft (and the Allies are getting practically every one built) is now running at the rate of about 500 a month, with a good likelihood of reaching 700 or 800 monthly by the end of the summer. Deliveries have been consistently ahead of schedule, although almost the only large plant which is actually now working at all-out capacity is Douglas. Eighteen thousand men are employed around the clock at the Santa Monica factory in California. (A three-shift maximum of 17,000 is the designed capacity labour force.) At several plants this winter there were slight delays due to engine shortages, but this has been corrected.

The Wright Aeronautical Corporation the other day dedicated the fourth major engine plant addition to go into service in the United States since war began. Production is currently for over 1,000 engines a month and should pass 2,000 by the end of the year. Further expansion plans are liable to boost even this output.

At one other aircraft factory, an airscrew shortage was reported, but Curtiss now has about as large a plant as Hamilton Standard, and Hamilton Standard has grown mightily. At some plants visited recently by the writer aircraft were quite often being turned out faster than the Allies could take them away. Recent easing of flight delivery regulations under the Neutrality Act (non-stop into-Canada trips by American delivery pilots are now allowed) should at least get the machines as far as Canada's Atlantic ports.

This survey of American production as it affects the Allies would be incomplete without one final note: North America is reported to be building a single-engined fighter around that Allison W-shaped engine of 2,000 h.p. The new N.A. prototype has not flown yet. Will it be in the 500-mile-an-hour class? (No!—Ed.) More important, will it be ready in time?

Cons. Aircraft Bookings 7-24-40

LOS ANGELES—Consolidated Aircraft Corp. in the six months ended June 30, 1940, booked $55,136,721 in new aircraft orders, increasing its total backlog at the end of the period to $96,870,008. Sales represented by products delivered and billed for the six months' period totaled $408,407. During the period the company was engaged primarily in making parts and subassemblies for airplanes which will be delivered commencing in August, this year, and continuing throughout 1941.

DIVIDEND

Union 7/30/40

British Buy Guba From·Archbold

NEW YORK, July 29 (U.P.)—Britain has purchased the seaplane Guba from Richard Archbold, explorer, it was understood today. The Guba, built in San Diego, was flown around the world in 1938.

The purchase was negotiated by Harold James, representative of the British ministry of aircraft production. The plane will be used to transport aluminum from the United States to England.

It was understood the plane would make semi-weekly trips to England, carrying 3½ tons of aluminum on each trip. Clyde Pangborn, long-distance flier, will command a crew of four.

The Guba now is at Port Washington, N. Y. It has a cruising range of 4000 miles and is a duplicate of the PBY long-range bombers used by the U. S. navy except that it carries no armament. Last month the Guba was flown from San Diego to Floyd Bennett field in Brooklyn in 15 hours, 49 minutes, a new transcontinental seaplane record.

New Plane Factory To Be Opened Monday

SAN DIEGO—Consolidated Aircraft Corp.'s new factory, completed in a $2,000,000 expansion program this summer, will be dedicated at 2 p.m. Monday by Rear Admiral Charles Blakely, 11th Naval District commandant.

Maj. H. R. Fleet, Consolidated president, said because of lack of space to accommodate visitors, the dedication will not be an open house, but that invitations had been issued to State, county, city, Navy, Army, Marine Corps and Coast Guard officials.

Because of work under way in connection with the national defense program, cameras will not be allowed in the plant without government permission.

Air Plants Raise Building Permits

Un 8/25/40

Permits for construction of an $800,000 unit at Consolidated Aircraft Corp.'s plant, a $1000 addition at the Solar Aircraft Co.'s factory and for a $21,250 church in East San Diego were issued by the city building department yesterday.

The new Consolidated unit, according to the permit, will be a single-story structure with a mezzanine floor, and will have a total of 300,000 square feet. Solar's addition will be 18 by 26 feet.

Seventh Day Adventist church obtained the $21,250 permit for a 7000-square-foot frame and stucco building on the northwest corner of Polk ave. and Illinois st. The improvement is to be erected on a 140 by 150 foot site.

Tribune - 8/22/40

Will Build Again, Consair Decision

Further expansion of the Consolidated Aircraft Corp.'s extensive airplane construction plant here was disclosed today when plans were filed with the planning commission for a new building to cost $800,000. The new structure will be 200 feet wide by 1500 feet long and will occupy that portion of the corporation's lease west of Pacific highway and north of the last new structure to be completed, which is to be dedicated Sept. 2.

The plans were filed by E. L. Freeland, structural engineer. It is to be entirely of steel, with the latest improved mechanical and electrical equipment. Contract for the steel placement has been let to the National Iron Works, San Diego, said Freeland. Estimates for general construction are being prepared by B. O. Larson, local contractor. Test pilings for the foundation now are being driven and work on the superstructure will begin within a short time.

Approval Forecast

The plans were checked by the planning engineer today when they were taken to the building department. It was said they would be approved there later today, when a building permit would be issued.

The $800,000 will add materially to the city's August construction record, said Glenn Rick, planning engineer.

Freeland said the new building is to be equipped for construction of land planes alone, and that it would make room for employment of additional skilled workmen. The new structure also will add to the large acreage of structures built by the Consolidated Corp. since it began operation in San Diego several years ago, said Rick.

Union 8/17/40

Consair Gets Huge Contract

Award of a $14,861,342 war department contract for purchase of 54 four-engine bombing planes was acknowledged by Consolidated Aircraft Corp. yesterday.

The plane is said to be similar to those built and building at the San Diego factory under two previous contracts.

Orders for the Consolidated bombers include a $3,000,000 contract in April, 1939, and an $8,600,000 contract in August, 1939. The number of planes has been kept secret in previous announcements.

Consolidated Corp.'s backlog of army, navy and foreign government plane orders totals $132,000,000, according to unofficial estimates.

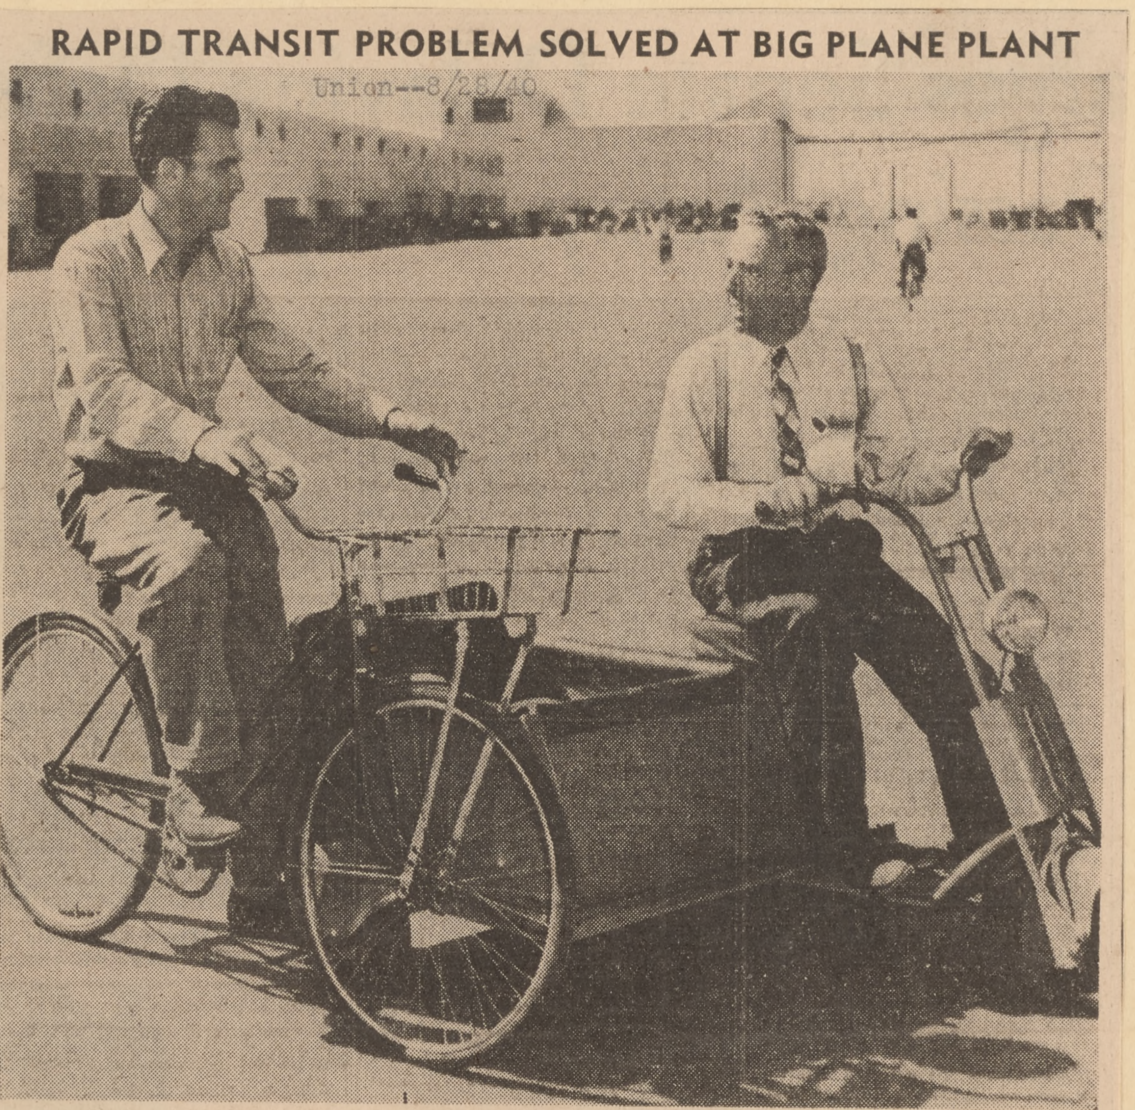
Requests for bids on materials have been issued on the new order although work has not yet started, it was reported here.

Date of delivery on the planes was not announced.

Also awarded yesterday was a $1,038,000 order for 100 training planes to the Fairchild Engine & Airplane Corp., Hagerstown, Md., The Associated Press reported from Washington, D. C.

The orders were the third of a group announced since congress voted $400,000,000 for 4200 additional army planes last June.

RAPID TRANSIT PROBLEM SOLVED AT BIG PLANE PLANT



Union--8/28/40

Bicycles and scooters have replaced foot power and roller skates for Consolidated Aircraft Corp. messengers. R. Biddle with scooter and sidecar and Eddie Holmes on bicycle are ready for action.

* * *

CONSAIR PROVIDES BIKES, SCOOTERS FOR MESSENGERS

When Consolidated Aircraft Corp. built its San Diego plant five years ago, a number of messengers were employed to carry memoranda and supplies to the various plant units. A year later, the factory was enlarged and the messengers equipped themselves with roller skates on which to reach more speedily the distant parts of the big plant.

Then came the third enlargement and Consair expanded until now it stretches a full half-mile along Pacific highway. The messengers had to speed their tempo and the roller skates were discarded in favor of bicycles. Recently, a fleet of gasoline propelled skooters with side cars was added. The huge plant yard where hundreds of workmen are employed, is dotted with speeding messengers, hastening parts and orders from one section to another.

The navy has awarded Consolidated Aircraft Corp. a contract for plane parts, The Associated Press reported from Washington. Amount involved is $34,112. Delivery date was not announced.

Consolidated employs 9500 workers with more being added daily. The monthly payroll is nearing the $2,000,000 mark and will exceed that amount by Jan. 1. Still further plant enlargement soon will be under way, officials announce.

Coast Aircraft Backlogs Show Rapid Gains

SAN FRANCISCO, July 25 (A.P.) — California aircraft builders reported rapidly rising backlogs of unfilled orders today.

North American Aviation Corp. reported its books held $83,534,306 in orders June 30 compared with a little over $50,000,000 March 31.

Vultee Aircraft, Inc., incorporated in its present form late in 1939, had $14,494,744 orders on hand, Vice-President V. C. Schorelemmer said, reporting as of May 31. No comparison was available.

Solar Aircraft had $1,084,538 unfilled orders before receipt today of an additional $130,000 order for exhaust manifolds.

President J. H. Kindelberger of North American said his firm was negotiating for construction of a new plant. Consolidated net profit for the six months ended June 30 amounted to $2,367,638 compared with $2,781,682 in the first half of last year. Indicated June quarter profit was $1,846,979 after all charges including estimated income taxes.

First half sales of North American totaled $14,578,317 against $12,965,836 last year.

Knudsen Due To Inspect S. D. Plane Plants

Tribune 8/21/40

After completing an inspection of plane manufacturing plants in the Los Angeles area, William S. Knudsen, production chief of the national defense commission, and Maj. Gen. Henry H. Arnold, army air corps chief, will fly here to inspect local establishments, it was reported at Los Angeles today.

The officials arrived at Los Angeles last night from Washington, D. C., aboard an army transport plane. Their inspection of Vultee, Northrop, North American, Douglas, Lockheed, Menasco and Kinner plants was expected to be completed tomorrow, when they will proceed here.

Checking on Expansion

In San Diego, it was expected that Knudsen and Arnold will visit the Consolidated, Ryan and Solar factories, all of which are engaged in turning out government defense orders. They may be accompanied by Brig. Gen. Jacob E. Fickel, assistant air corps chief, who was scheduled to arrive at Los Angeles today.

At Los Angeles, Knudsen said the object of his inspection was to determine the amount of expansion in the coast airplane industry and the class and types of planes being turned out, and stated that the national production scale has jumped from 250 planes a month in January to 900 a month now.

More than $2,000,000,000 in defense contracts has been let in six weeks, he said. Under defense appropriations made available last month by congress, he stated, 48 percent of army contracts and 75 percent of navy contracts have been let.

"To Spread Contracts"

"We want to spread these contracts—spread the work of building our national defenses," said Knudsen. "When we get all of the United States working toward our common goal, then we will make progress.

"As to shortage of skilled labor, we've heard about that and we expect to hear more about it. Wherever the skill is, the job will gravitate to that point. We must spread out the national defense program over the entire country to obtain maximum production and make everyone realize that he is working for the proper defense of the United States."

After completing their inspection here, Knudsen and Arnold will fly to Seattle to inspect plane-building facilities in that area before returning to Washington. Their tour will include visits to about half the plane factories in the country.

8/22/40- Tribune

KNUDSEN EXPECTED WITH ARMY CHIEFS FOR S.D. INSPECTION

William S. Knudsen, chairman of the national defense advisory board, and four high-ranking army air corps officers, are expected to arrive at San Diego late today for an inspection of the Consolidated Aircraft Corp. and Ryan Aeronautical Co. plants, The Associated Press reported from Los Angeles. In the party with Knudsen will be Maj. Gen. Henry H. Arnold, army air corps chief; Brig. Gen. Jacob E Fickel, assistant chief of the air corps; Col. M. S. Harmon, in charge of the advanced training school at Randolph field, San Antonio, Tex., and Maj. K. B. Wolfe, air corps chief of production engineers.

"These factories are booming and expanding under the accelerated program," said Knudsen after an inspection of aircraft factories in the Los Angeles area. "Their methods appear exceedingly efficient and their ships, I am assured, are second to none."

"Nation Needs Mechanics"

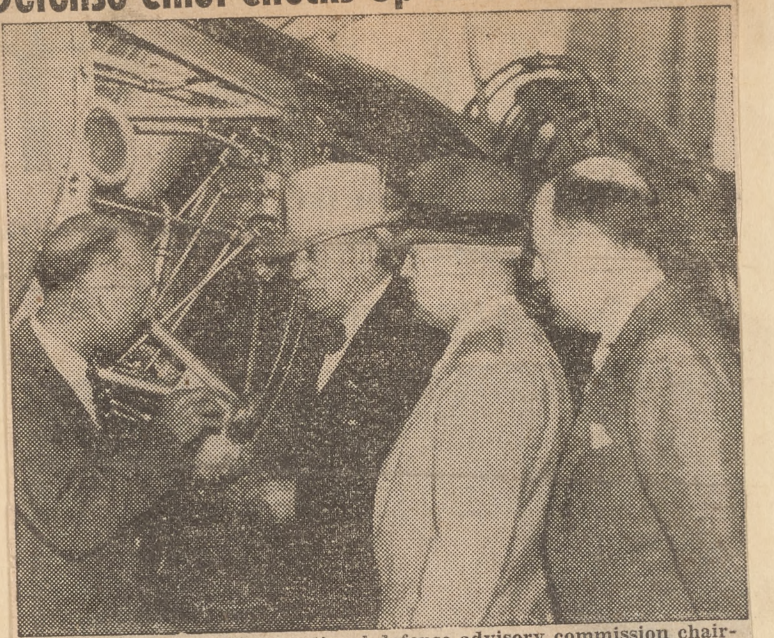
"The production of American aircraft factories is very encouraging," said Arnold. "Nevertheless, the factories will have to keep digging if they are to reach the production numbers set for the deadline next April 1."

Knudsen, Arnold and Wolfe visited the Vultee plant at Downey and the North American plant at Inglewood yesterday. They were to tour Douglas, Lockheed and Northrop plants before leaving for San Diego.

Fickel, who was accompanied by Harmon on a tour of air training schools at Los Angeles, declared that the nation "needs mechanics, more than we originally figured. I would say 26,000 mechanics will be needed, and well-trained ones."

Knudsen, according to United Press, disclosed that southern California factories are at work on 2100 military planes. He said the orders would be increased shortly to 4200 ships at a cost of $450,000,000. San Diego's Consolidated plant has a backlog of approximately $120,000,000, and now employs an all-time high of 9485.

Defense Chief Checks Up on Plane Plants



William S. Knudsen, national defense advisory commission chairman, and Maj. Gen. H. H. Arnold, chief of the army air corps, are shown looking over a Vultee plane under construction for the army as they began an aircraft inspection tour in Los Angeles. Left to right: Maj. K. B. Wolfe, army production engineer; Knudsen, Arnold and Richard W. Millar, Vultee president.

Defense Chairman Leaves for North

"They're big!"

This is the way tall, Danish-born William S. Knudsen, chairman of the national defense advisory commission, described San Diego airplane plants after a four-hour inspection yesterday.

Inside the Ryan and Consolidated plants, thenoted engineer, who rose from immigrant workman to leadership of General Motors before the government borrowed him to expediate defense preparation, was greatly interested. He was right at home along the assembly lines and made brisk, meaty suggestions on how plane construction could be aided.

AT RYAN PLANT

At the Ryan plant, which he inspected first after arriving at 10:22 in an army transport with Maj. Gen. H. H. Arnold, army air corps chief, he showed great interest in methods of applying metal surfacing to the small ships.

"Could you do it on bigger planes?" he asked, indicating his belief in the advantages of the methods used.

"We can and have," responded T. Claude Ryan, head of the plant.

"I want to talk some more with you," said Knudsen, and when the defense chief left at 2:30 for San Francisco, Ryan was a passenger.

SHIP LEAVES LINE

After leaving Ryan's plant he went over to Consolidated where, incidentally, the first production ship in months rolled off the assembly line yesterday. Consolidated has been tooling up and expanding its plant to prepare for fast production under its defense contract.

"You've got a wonderful plant," he told Maj. R. H. Fleet, head of Consolidated, as the inspection party traveled through the giant plant which soon is to be augmented by addition of almost nine more acres of buildings.

"It is interesting that in San Diego you seem to be building the biggest and smallest planes," Knudsen said, with a twinkle in his eye as he prepared to board

OFFICIAL PLEASED WITH EXPANSION PLAN PROGRESS

Expressing satisfaction over America's air expansion program, William S. Knudsen, chairman of the national defense advisory commission, arrived here aboard an army transport plane at 10:22 a.m. today, accompanied by Maj. Gen. Henry H. Arnold, chief of the army air corps. The two left at once for whirlwind inspections of the Ryan Aeronautical Co. and Consolidated Aircraft Corp. plants.

"We have seen about 70 percent of the aircraft factories in the United States since leaving Washington early this week," said Knudsen. "The remaining 30 percent are here and at Seattle, and we will inspect them before starting east."

Knudsen, tall and soft-spoken, intimated he would like to remain longer at San Diego, declaring, "this is a pretty good looking place." He and Arnold, scheduled to be back in Washington next week, were to depart this afternoon for Sacramento, going from there to Seattle.

Cooperation Cited

The two arrived here from Los Angeles, where they inspected aircraft plants yesterday and Wednesday. Knudsen said the factories are showing splendid cooperation in the government's need for more planes.

Touring the Consolidated plant at noon, Knudsen could not be reached for comment on an Associated Press dispatch from Pittsburgh which stated that the Pittsburgh commis-

DEDICATION SET FOR MONDAY AT CONSAIR PLANT

Consolidated Aircraft Corp.'s new factory, completed in an expansion program at the plant this summer, will be dedicated Monday at 2 p.m. by Rear Adm. Charles Blakely, commandant, 11th Naval district, it was announced at the office of Maj. R. H. Fleet, Consair president, today.

"Because of lack of space to accommodate visitors, the dedication will not be an open house," states the announcement. "However, each employe may bring one guest, and invitations have been issued to state, county, city, navy, army, marine corps and coast guard offiicals."

The dedication ceremony will be held at the northwest side of the plant. Visitors will not be allowed in the factory.

Others, in addition to Blakely and Fleet, who will be at the ceremony include Rear Adm. A. B. Cook, commander of aircraft, scouting force; Maj. Gen. William P. Upshur, commanding the fleet marine force and local marine corps base; Col. Peter Otteson, commanding Ft. Rosecrans, and Gen. F. D. Lackland, coming here from March field to represent the army air corps.

'IT'S BIG,' COMMENT BY KNUDSEN ON S. D. AIRCRAFT INDUSTRY

Tribune 8/23

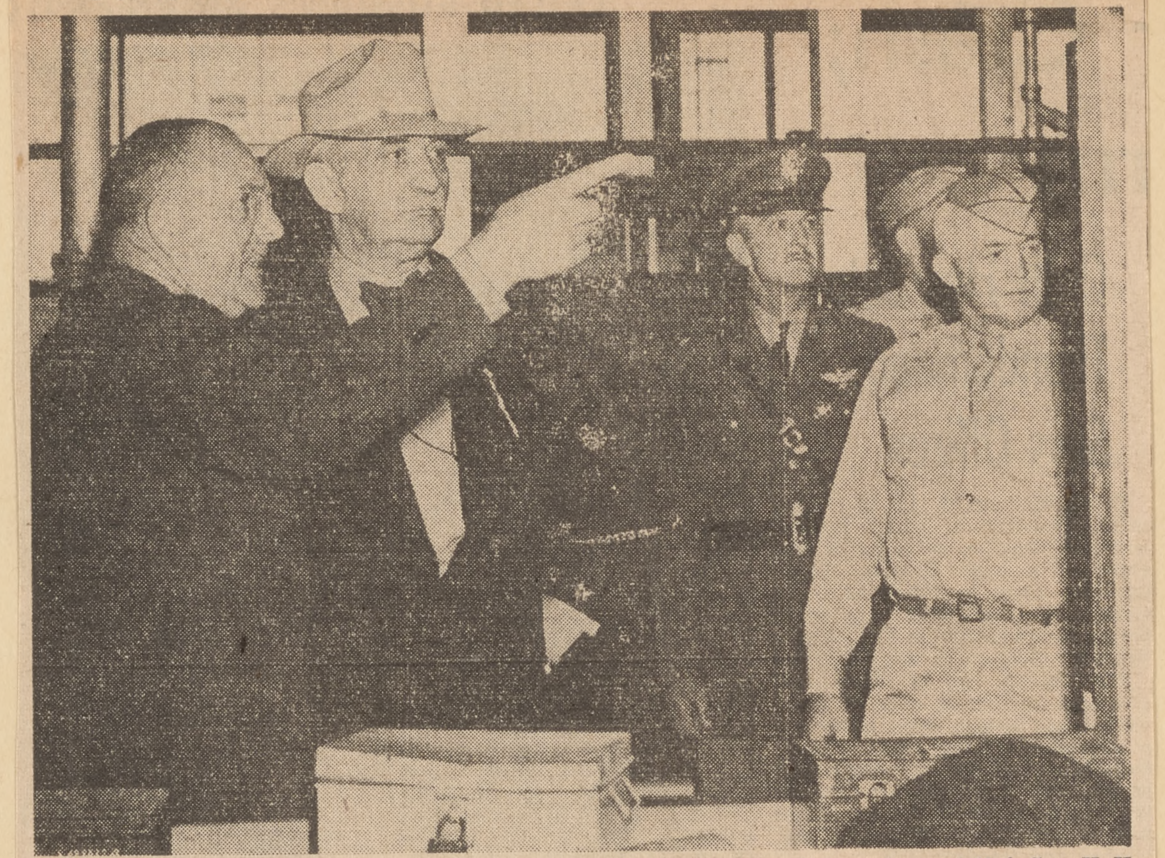
"It's big," was the terse comment offered this afternoon by William S. Knudsen, chairman of the national defense advisory commission, on San Diego's aircraft industry as he concluded an inspection of Consolidated Aircraft and Ryan Aeronautical Co. plants.

Accompanied by Maj. Gen. Henry H. Arnold, chief of the army air corps, the industrialist left at 2:30 for Sacramento. They were traveling by army air transport.

"A wonderful set of buildings and a beautiful plant," was Arnold's comment about Consolidated.

"I do not wish to make any comment until I get back to Washington and see the letter from Pittsburgh," Knudsen said concerning an Associated Press dispatch that the Pittsburgh commission for industrial expansion, contending the east offers the best sites for defense factories, had charged "political pressure" was being used to obtain government plants for nine midwestern states "unsuited to industry."

CONSAIR HEAD SHOWS GROUP SAN DIEGO 'BIG SHIP'



"Now there is one of our big ships," says Maj. R. H. Fleet, Consair head, to William S. Knudsen, chairman of the national defense council. Maj. E. R. McReynolds, aircraft inspector, and Maj. Gen. H. H. Arnold (right), army air corps head, also take a good look on a trip through Consolidated's factory.

CONSOLIDATED BACKLOG IN HUGE INCREASE

AIRCRAFT NEWS

SAN DIEGO.—Consolidated Aircraft Corporation's total of unfilled orders neared the $100,000,000 mark.

7/25/40

New contracts totaling more than $26,000,000 have been received since last May, when work on hand totaled $70,000,000, company officials disclosed.

Because of the "nature of conditions today" executives refused to divulge whether the latest orders for military planes are for foreign or domestic purchasers.

The current backlog, $96,870,000, is one of the highest in the nation's aircraft industry, and full speed in meeting it will be possible soon after August 1, when a $2,000,000 plant expansion program will be completed, it was stated.

Operations during the first six months of 1940 were limited to manufacture of parts and sub-assemblies for planes to go through final assembly for delivery later thi year and in 1941. Value of this work totaled only $408,407.

Almost 8000 employes are on the pay roll of San Diego's largest industry, with a peak of 10,000 anticipated this fall.

---

* * *

Knudsen Lauds Airplane Plants

(Continued from Page 1)

the army transport after his quick inspection.

"We've already seen 70 percent of the airplane plants in the country," he said before the local inspection. "When we get through here and at Seattle, we shall have seen all of them."

The visiting production chief expressed himself as greatly interested in processes and operations in the local plane plants. Asked to comment on reports that moves are afoot to build more plane plants in the middle of the country he said:

"They're already building factories there." He added that at the present juncture there hardly could be too many plants to expedite the rearming of America.

TOUR IN PLANE

Gen. Arnold and Knudsen are making their transcontinental inspection tour in a plane from Bolling field, piloted by Capt. E. H. Beebe. The visit to San Diego followed an inspection of plants in the Los Angeles vicinity.

Before reaching San Diego, Knudsen expressed belief that to get real production going, the number of types of planes might have to be descreased, The Associated Press reported.

Knudsen Arrives in S. F.

SAN FRANCISCO, Aug. 23 (A.P.)—William S. Knudsen, chairman of the national defense advisory committee, arrived in San Francisco tonight to inspect facilities in the bay region. He reserved comment on the defense situation. Accompanying Knudsen was Maj. Gen. Henry A. Arnold, chief of the army air corps. They will proceed from here to Seattle.

Manchester Evening News 9/12/40

SOON YOU MAY SEE THESE

American Planes in Our Skies

Says

Frederick Tomlinson

IT is not long since some experts were moaning about the advantages this war would give to commercial aviation in America. We were told that our starved commercial lines would become emaciated while those in the U.S.A. with all the great facilities for technical development behind them would fatten ready to kill all markets as soon as European peace was restored.

Now we hear no comments about passenger planes. No doubt the need for preparing for peace-time flying is as great as ever. But the over-riding importance of building up a great military aircraft industry in the United States has made the claims of civil flying appear unimportant

We want every plane we can buy—buy is the operative word at the moment—and there will be a time when Hitler and his merry gang will be made to realise that collaboration between the aircraft industries of two democracies can beat any opposition.

Rivalry Gone

AMERICA is new, big, alive and virile. Its aircraft industry has everything it needs—skilled engineers, abundant raw materials, clever technicians and drive. The time for rivalry between designers of planes and engines has gone.

One day the aviation history of this war will allow us to compare the relative merits of our own aircraft and those of the United States. For the time being we are content to know that every American plane brought here or flown to Canada is knocking one more nail in the inevitable coffin of the Nazis.

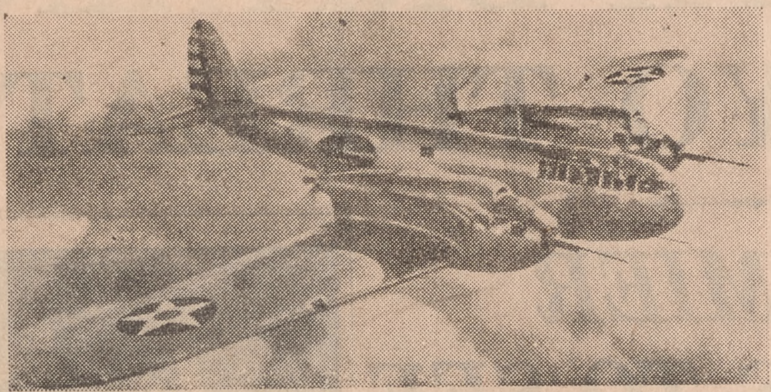
Lord Beaverbrook has told us he is budgeting for 3,000 planes a month from the United States. No doubt he will get them if he has set his mind on achieving this figure. But laymen must not run away with the idea that thousands of planes fit to out-fight the Nazi machines can be turned out every week in the United States just because it is a go-ahead country.

Too Many Fords

WHEN they analysed Henry Ford's idea for producing 1,000 aeroplanes a day experts here refused to take him seriously. They felt that even if he achieved his object the machines would make the pilots mere gun fodder for the enemy. They reminded him that there would have to be thousands of machine-guns produced every day; radio apparatus, oxygen masks, variable pitch propellers, and a dozen other adjuncts to modern military flying.

What we prefer the Americans to concentrate on is not mere numbers but quality. Our own experiences have shown the wisdom of that. We know that any plane with eight gun armament that can turn inside the enemy and withstand gun fire and air pressure stresses will win the fight.

Fortunately, America has names which the world's aircraft experts conjure with. There is Allison, Pratt and Whitney; Wright, Douglas, and so on. Their counterparts here are Rolls-Royce, Bristol, Saunders-Roe, Armstrong. While they are helping to establish Roosevelt's 50,000 machine air force they are paving the way to British aerial supremacy.



[By courtesy of "Jane's All the World's Aircraft."

The Bell XFM1 "Airacuda" Multi-gun Fighter

Their Machines

LET us analyse a few of the better - known American machines. The Harvard we all know as a training aircraft. The Hudson we know better because it has been used so often to destroy enemy shipping and oil tanks.

The miles flown by Hudsons over the North Sea and other seas could be calculated only by a battery of comptometers. With their 1,100 horse-power Wright "Cyclone" engines and their rear gun turrets away back almost against the twin rudders they have proved invaluable machines. Lockheed Hudsons of the Coastal Command—they are roughly the counterpart of our own Avro Ansons—located the Altmark. So far these machines have helped to destroy millions of gallons of precious Nazi fuel oil.

Perhaps the next best known American machine is the Curtiss Hawk fighter, which the unfortunate French airmen were given instead of home-produced fighters. I say unfortunate because the French aircraft industry was in such a pitiable state; not because the Hawk is a bad machine. Far from it. The French had to be convinced that it would catch a dive-bomber after it had gone into the dive before they placed an order.

With a Pratt and Whitney twin wasp engine this machine flies at 310 miles an hour and has an armament of six rifle-calibre machine-guns. Perhaps the Germans have taken over a good many of these machines. Yet we are scarcely likely to want any for ourselves. We prefer somewhat faster and more heavily armed aircraft, rather after the style of our own Hurricanes and Spitfires.

Yet we may be glad of the Curtiss Wright CW21, a lightly-armed single-seater fighter, which will climb to 20,000 feet in six minutes and has the highest ceiling of any fighter in the world—35,000 feet.

Reply to Messerschmitt

THE Bell "Airacobra," with its Allison engine of 1,100 horse power has probably had more varied publicity than any other American aircraft. It has the engine behind the pilot and drives the air-screw by an extension shaft. It carries several machine-guns and a cannon-gun, and one has good reason to believe that the first doubts about the efficiency of its somewhat unusual design have proved unfounded. But only those who have flown it can confirm whether it is the fastest and most deadly fighter the world has known. If it is we shall have it here.

The Messerschmitt 110 has had so much publicity that one is tempted to remind Goering that Bell, makers of the "Airacobra," are also the producers of the world's largest specialised twin-engine fighter aircraft, the "Airacuda." With its pusher propellers it seems to bristle with guns. For attacking bombers it would be a first-class machine, for there are both shell guns ("guns," I said, not "gun") and machine-guns too.

V.V.

ANOTHER American fighter in which our purchasing experts have no doubt been interested is the Vultee Vanguard, which is in the Spitfire speed class. This firm has visualised a twin-engine single seater fighter with at least four cannon-guns. But then America has for some time been interested in the 500-mile-an-hour fighter. One wonders whether she will be the first country to achieve it. If she is she will make the Heinkel HE113 and the new Messerschmitts one hears of look like cart-horses at a race meeting.

There are varied opinions about American bombers though some are undoubtedly splendidly efficient. The Boeing XB-15, a four-engined affair, is unquestionably good in its class, but it has been suggested that machines of such a size present too big a target to anti-aircraft gunners. "Sunderland" pilots do not seem to notice the point of this argument.

To answer the Dorniers, Heinkels, and Junkers we have several good bombers of our own. The Nazis have already good reason to remember the names of Whitley, Wellington, Bristol, and Hampden. But America, too, has not forgotten to develop bombing machines which are fast and heavily armed for their own or mutual protection.

There is the North American NA-40A, which has three gun positions behind the wings and carries a crew of seven. Those we are specially interested in, however, are the Douglas DB 7 with its tricycle under-carriage and the Martin 167, both of which were supplied to France. Perhaps the outstanding orders will be diverted here.

The Douglas, particularly, is reported to be a nice machine to handle. The Martin is a little larger than the Bristol Blenheim and slightly faster, and it carries six machine guns.

And Dive Bombers

THEN there are dive bombers about which much nonsense has been talked. Some of the American Vought dive bombers which were delivered to France have been used against us by the Germans. But if we want to buy none of these we can take our choice from the Bell, Brewster, Curtiss, and Douglas factories in the United States.

The Brewster dive bomber has the fastest level speed of the American specialised diving aircraft, but since experts consider it admirable when design will limit a vertical dive to about 250 miles an hour the slower Bell, Curtiss, and Douglas productions must be interesting our professional buyers. The greatest level flight speed of the infamous Junkers JU87, by the way, is reported to be only 240 miles an hour.

Although we have the utmost faith in our own Sunderland and Saro Lerwick flying boats (there are others, of course), America can help us to keep Nazi submarines in their proper place with several types of marine aircraft. The American Consolidated PBY flying boat is nearly nine feet shorter in span than the Sunderland, but has an almost exactly similar maximum speed. The new Consolidated 31 has engines which develop 2,000 horse power each for the take off.

Expanding Industry

AMERICA can help us, too, with trainers and military transports, and if we are helping her to build up one of the finest and most modern aircraft industries the world is ever likely to see we must realise that every dollar we spend is helping us as well as the United States.

This article, of course, cannot pretend to do more than sketch an outline of the help the United States is giving and will continue to give. But we may be assured that Hitler's thoughts are not pleasant when he hears how rapidly the American industry is being expanded.

Flight - 8/1/40

Transatlantic Deliveries

THE Canadian paper *Commercial Aviation,* in its June number, draws attention to what must be always at the back of our Air Ministry's mind as an alternative method of delivery to shipping from America to England—that is, flying the Atlantic.

"And while Blitzkrieg and counter-Blitzkrieg eat into both Germany's and Britain's supply of 'planes, the Empire is holding an ace in the hole which may be used before the summer is out—mass transatlantic flight deliveries.

"Any doubt as to the possibilities of such deliveries may be dispelled now that Britain has occupied Iceland. The lonely [but it has a population of 100,000. —Ed.] Arctic island can now be used as a refuelling base by the British, although all five bomber types now in production for the Allies in the United States are capable of flying from Newfoundland to Ireland non-stop."

Being able to land and refuel at Iceland is some help, but it does not shorten the distance by any very great fraction. It reduces the 2,000-odd miles between Botwood and Foynes by about 300, at the expense of increasing the total distance to England. The five types spoken about are given as the Consolidated 28-5 flying boat, the Douglas DB-7 attack bomber, the Douglas B-20, also given as an attack bomber (or should this be the B-23?), the Lockheed Hudson and the Martin 167W. (The Martin ordered by France had the model number 167F.) All the types mentioned could not fly the Atlantic with standard tankage, but they could be specially tanked up for the occasion.

We agree with what is said on the subject of the greatest difficulty. "Biggest problem the Allies will face in the high-speed transatlantic shipment will be the securing of pilots with adequate experience. American pilots may be hired as 'ferrymen' similar to the many who have been hired as instructors under the Empire Air Training Plan. Their work would violate no American law."

THE MINISTRY OF AIRCRAFT PRODUCTION has purchased a large privately-owned seaplane in New York in which 3½-ton cargoes of aluminium will be transported from the United States to Great Britain twice a week.

Flight - 7/23/40

Ferrying Across the Atlantic

CAPN. A. S. WILCOCKSON, who is in charge of the Atlantic Division of the Airways Corporation, is to supervise arrangements which are being made to fly American bombers and flying-boats for the R.A.F. across the Atlantic. With Capn. D. C. Bennett and Mr. Ian Ross of the Airways Corporation, and Wing Commander Griffiths Powell, Capn. Wilcockson arrived in Canada last week. The Airways Corporation pilots have been lent to the Ministry of Aircraft Production for the scheme.

The first delivery flight of bombers is expected to be made this month. Reports from America suggest that American pilots may help in this ferry work and that fees of £250 to "several thousand dollars" may be offered to them for each trip. Another suggestion is that the crews should be flown back to Canada in British long-range bombers, which would naturally save time. The main difficulty in ferrying across the Atlantic in any great numbers is the lack of trained Atlantic crews.

Canadian crews are to be trained and it is believed that flights may be continued during the Winter whenever the weather is suitable. The types to be flown across are said to include the Lockheed bombers and Consolidated flying-boats.

Dr. Archbold's Consolidated Model 28 flying-boat "Guba" is reported to have been bought by the Ministry of Aircraft Production and may be used over the Atlantic. It has a range of more than 3,000 miles with nearly a ton of payload. Thus it should be able to fly the Atlantic from the U.S.A. with mails and urgent freight and return with crews which had ferried bombers across.

An interesting point is likely to be raised over the position of Ireland should a bomber be forced to land there during its crossing. Presumably it and its crew would have to be interned.

Britain buys "Atlantic ferry"

£50,000 flying boat

NEW YORK, Sunday.—The price the British Purchasing Commission paid for the flying-boat Guba, owned by Mr Richard Archbold, is believed to be £50,000. The plane is a replica of the American Navy's "Flying Fortress."

Mr Archbold said he presumed the Guba would be used for ferrying metals across the Atlantic.

The "flying laboratory" in which Mr Howard Hughes, the millionaire film producer, made a record round-the-world dash two years ago, arrived here last night for shipment to Britain. It has also been bought by the British Purchasing Commission.—A.P.

---

to the Science Museum in South Kensington. They saw photographs of aeroplanes flown before the War of 1914, aeroplanes flown during the two decades of uncertain peace, and aeroplanes which are now engaged in mortal conflict. Only a few visitors, perhaps, found their way to an A.R.P. screen which hid "the first aeroplane of history." This was the machine which the Wright Brothers flew over Kittyhawk in 1903. The Wright Brothers entertained no thoughts of war. The aeroplane was, in fact, flown for the first time over the North American Continent, where not a single fortress or defence barrier separates the subjects of the King in Canada from the republican citizens of the United States. Civil aviation was to narrow the frontiers of the world. Citizens were to travel from one country to another speedily and without inconvenience. Ambitious young men adopted the career of civil air pilots. They were in Brussels at one hour and at Cologne or Prague at another. Between the civil air pilots of Europe there developed a friendliness and understanding which seemed to foreshadow a new Europe in which the people lived in harmony with each other. Undoubtedly civil aviation was one of the principal agencies for peace, but it was not powerful enough to exorcise the spectre of war in the air.

Progress Before the War

Less than two months after the signing of the Munich Agreement Sir Kingsley Wood told the House of Commons that Imperial Airways and British Airways were to be merged in a statutory Corporation. The period between November, 1938, and September, 1939, was hectic but marked by substantial gains to civil aviation. It presented, for one thing, the panorama of British aircraft crossing Europe to Warsaw and Budapest and flying over many countries, British and other, on their way to Durban, Sydney, and Hongkong. Last August, when the clouds of war were gathering over Poland, the flying-boat Caribou made the inaugural flight of the British North Atlantic air mail service between Great Britain, Eire, Newfoundland, Canada, and the United States. The flying-boat Aotearoa left Southampton Water on her delivery flight to New Zealand. A new air service was begun between Great Britain, Norway, Sweden, and Finland. British civil aircraft were carrying His Majesty's mails to some 40 countries. The penny-halfpenny "all-up" air mail was strengthening the bonds of trade and friendship between the various parts of the Empire. The demand for passenger accommodation was increasing. Civil aviation had, in fact, become a commonplace of life.

These gains, however, were wrested at a time of particular strain. Munich had become a landmark in war preparedness. We had to meet a potential foe whose supremacy in the air was as yet unchallenged. The Air Ministry necessarily obtained a priority in deliveries. Recruiting for the Royal Air Force became more insistent. Aircraft, spare parts, and pilots for civil aviation were harder to come by.

Services Suspended

The outbreak of war brought necessary limitations in service. At first all the Continental services, except the new one to Helsinki, were suspended. The "all-up" air mail charges disappeared. But the companies, having placed their aircraft at the disposal of the Air Ministry, assumed two major and important duties. The first was to keep open the air communications between Great Britain and the countries of the British Empire. The second was to fulfil special charter duties for the Air Ministry.

Navigational difficulties were immediately increased. Meteorological services were restricted. Ships were silenced and unable to give weather reports. Many restrictions were imposed throughout the war zone. Aircraft designed for flying at great heights were henceforth compelled to keep below the clouds. Night flying in the war zone was forbidden, and at certain airports it was not possible for overhauling and repairs to be done after dusk. Delays were inevitable. In the face of these difficulties, however, the British North Atlantic service continued to operate until the 16 scheduled flights were completed. The officers and crews of the North Atlantic division were confident that they had added an important chapter to oceanic flying. On the last flight from Foynes to Botwood in the autumn of 1939 a new record of 13 hours was set up for the crossing.

Some months were to pass before the war entered its totalitarian phase. So long as Italy retained her status of non-belligerency British civil flying-boats could cross her territory. Day after day British civil aircraft were flying over countries where no Service machines could follow them. Their regular flights helped to "show the flag" in non-British countries and to maintain confidence in those owing allegiance to the British Crown. Among their passengers were many whose activities promoted British export trade. The demand for passenger accommodation was soon unprecedented; there was general relief when, a few weeks after the war had begun,

Tribune 7/24/40

NO JOBS, WARNING TO UNSKILLED BY AIRCRAFT PLANTS

With a federal-state program for the training of thousands for naional defense taking form rapidly, a double-barreled warning was issued today to unskilled workers against a "job stampede" to California's major defense industry — aircraft manufacturing, The International News Service reported from San Francisco. Consolidated Aircraft Corp., San Diego, is among the firms listed where announcement has been made that unskilled men can not get work.

"The aircraft industry, which is centered in Southern California, is continuing to add new employes from all parts of the state," reported the Aircraft Information Bureau, of San Francisco.

"But these employes are all skilled craftsmen, trained in such trades as aluminum and alloy welding, precision machine work, loft work, jig making, etc.

"We are advised by leading aircraft plants—Consolidated, Douglas, Lockheed, North American, Northrop and Vultee—that it is utterly useless for men without proper training to seek jobs there."

This was supported by the San Francisco office of the state department of employment which in the past year has placed more than 100 skilled workers from the bay area in aircraft jobs.

UNION 8/23

Consair to Build 8-Acre Addition

Test piles for an $800,000 addition to Consolidated Aircraft Corp.'s plant were being driven yesterday as plans for the building which, factory officials said, will be rushed to completion, were approved at the city planning commission's office.

Floor space in the new structure, according to Harry Haelsig, asistant city planning engineer, will cover 8 1-3 acres to make the building the largest, in this respect, in San Diego.

The addition, he said, will be 200 feet wide and 1500 feet long. The roof will be of the saw-tooth type with its highest elevations 41 feet from the ground.

At the factory, executives were guarded in their statements, but said that work "will be started as soon as possible and will be rushed to completion." Asked whether the building will be used exclusively to construct land planes, they said it will be used "to fill orders for both the army and navy." The structure is to be of the steel-frame type.

2 British Fliers Expected Here On 'Ferry' Duty

Union 8/6/40

Organizing a transatlantic system for delivering bombers from west coast aircraft plants to Britain, two British Royal Air force pilots were in Los Angeles yesterday and were expected to visit San Diego.

The pilots, Capt. Donald C. T. Bennett, transatlantic flier, and Capt. R. H. Page, left New York Sunday by plane, The Associated Press reported.

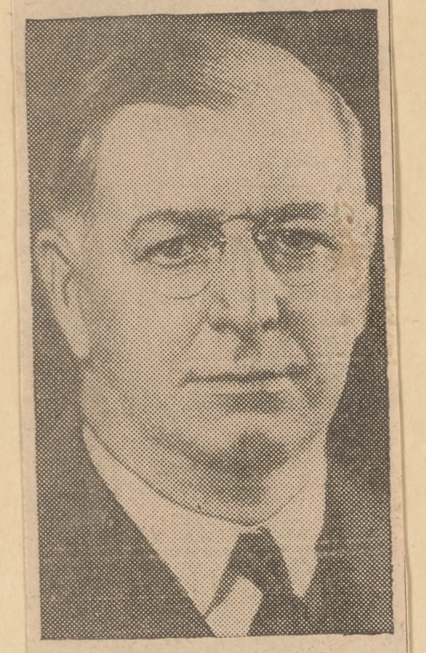
Informed that the pilots were in southern California, a Consolidated Aircraft Corp. official indicated that the San Diego firm "knew of a plan to fly ships to Britain."

At Lockheed Aircraft plant, Los Angeles, the pilots said they would be in southern California for 10 days.

The two, employed by the British Imperial airways as civil pilots, were assigned to the British aircraft production ministry to develop a transatlantic plane-ferrying system. They said American neutrality laws prohibited American pilots from participating in such a service and that they were "only in the market for Canadian pilots."

Union 9/14/40

Plans Inspection



COL. FRANK KNOX
. . . navy secretary, will fly from Honolulu to San Diego.

* * *

Navy Secretary To Fly Here

Knox Due Sept. 16 After Hawaii Tour

Col. Frank Knox, secretary of the navy, will visit San Diego Sept. 16.

In the first long overwater flight ever made by a navy secretary, Col. Knox will leave San Francisco Thursday aboard the flagplane of Rear Adm. Arthur B. Cook, commander of the scouting force aircraft and the navy's fleet patrol wings. He will leave Hawaii for San Diego in the San Diego-built 4-motored bomber Sept. 15.

Accompanying Col. Knox on the 10,000-mile inspection trip will be Adm. Cook, Col. William J. Donovan, who recently completed a special tour of duty in England for the navy department; Capt. M. L. Deyo, aid, and John O'Keefe, special assistant.

TO BOARD CARRIER

Col. Knox will leave Manchester, N. H., his summer home, tomorrow for California, The Associated Press reported yesterday. His plane will take off from San Francisco bay for Honolulu Thursday afternoon, arriving at Pearl Harbor Friday morning.

After an inspection of Pearl Harbor naval base, one of the most strongly fortified in the world, Col. Knox will board the aircraft carrier Enterprise, temporary flagship of Adm. J. O. Richardson, U. S. fleet commander, for five days' manuvers at sea with the fleet. The Enterprise will sail from Pearl Harbor Sept. 9 and return Sept. 14.

The navy's chief executive will leave Pearl Harbor the afternoon of Sept. 15, arriving here the following morning. He is scheduled to inspect naval activities at Long Beach and San Pedro Sept. 17, leaving the same day by plane for Washington.

FOUR-MOTORED PLANE

The four-motored plane in which the navy's chief executive will fly to the crossroads of the Pacific and return was delivered to the navy by Consolidated Aircraft Corp. last year. For the last several months it has been used at North Island in training personnel in airboat flying. It has a speed in excess of 150 miles an hour and is equipped for flying at high altitudes.

The course followed by Pan American Airways clippers will be flown by Col. Knox' plane in the flight from San Francisco to Hawaii. From Honolulu to San Diego the route will be that traversed by navy patrol wing bombers.

Tribune 8/17/40

Award Contract For 56 Bombers

Consolidated Aircraft Corp., of San Diego, has been awarded a contract for $14,861,342 for the purchase of 56 four-engine bombing planes, by the war department, it was announced today from Washington in dispatches of The Associated Press.

This is one of two contracts awarded, the other going to the Fairchild Engine & Airplane Corp., of Hagerstown, Md., for $1,038,000 for 100 training planes.

According to officials of the local concern, the order signed by war department officials today is in exercise of a contract already existing.

Work on the new assignment has not yet started, it was said, although requests for bids on materials to be used, have been issued.

The war department did not announce the date on which delivery of either group of planes is to be expected.

The orders were the third of a group announced since congress voted $400,000,000 for approximately 4200 additional army planes last June, the dispatches stated.

Union 7/29/40

U.S. Asks Speed On Big Bombers

Consair to Rush Craft for Navy

Word that the navy department has requested Consolidated Aircraft Corp. to rush construction on a squadron of 30-ton four-engined long-range patrol bombers was received here yesterday from Washington.

The huge airboats will be the first squadron of their design to be delivered to the navy and if found satisfactory, will supplant the PBY twin-motored bombers in service with the fleet patrol wings. Six are to be delivered to Patrol Squadron 12 at North island this fall. They will be under command of Comdr. S. B. Cooke.

5000-MILE RANGE

The new offshore patrol bombers have a cruising range of 5000 miles, carrying a crew of nine and several tons of bombs. They have a speed in excess of 200 miles an hour and are rated as the fastest aircraft of their type in the world.

The first four-motored plane built for the navy by Consair was completed and tested last year. For a time it was employed by Rear Adm. Arthur B. Cook, commander of scouting forces aircraft, as his aerial flagship. In recent months it has been used by Patrol Squadron 12 in the training of pilots and crews.

49,494 STUDY FLYING

The United Press reported from Washington the civil aeronautics board announced that on June 30 there were 49,494 students enrolled in various phases of its pilot training program designed to produce 50,000 civilian pilots by next June 30.

The board said 32,000 students are in ground schools and that 17,494 more were taking courses in the civilian pilot training program. In addition 1000 civilian instructors are taking courses to refresh their flight experiences.

The CAB said that almost 16,000 student pilots will have completed both ground and flight training by September.

Sept 16th 1940-

avy Welcome

Here 2 Days After Flight From Hawaii

Will Inspect Bases

SECY. FRANK KNOX

BULLETIN

Secy. of the Navy Knox arrived in San Diego at 10:30 a.m. today, landing in the harbor after an overnight flight from Hawaii in the Consolidated four-motored bomber flagship of Rear Adm. A. B. Cook.

Col. Frank Knox, secretary of the navy, was expected to arrive at San Diego soon after 10 a.m. today by plane from Honolulu for a two-day stay, during which time he will inspect local naval establishments, confer with boat builders on plans for constructing high-speed small craft for the navy, and be feted at a city-chamber of commerce dinner at 7 p.m. today at the Hotel del Coronado.

Knox, who flew from San Francisco to Honolulu Sept. 6, made the flight aboard the four-motored Consolidated-built bomber flagplane of Rear Adm. Arthur B. Cook, commander of aircraft scouting force. The plane took off from Honolulu at 7:01 p.m. yesterday for San Diego.

With the secretary were Cook, Capt. M. L. Deyo, Knox's aid; John F. O'Keefe, his personal secretary; Col. W. F. Donovan, World war officer with the A.E.F. "Fighting 69th" regiment, and Lt. Thomas E. Gillespie, of San Diego, pilot. Second pilot was Ens. John A. Ferguson, U. S. N. R., of Coronado.

From the Naval Air station Knox is to go to the destroyer base and naval hospital. Other places to be inspected are the Marine corps base, Camp Elliott, naval training station and Consolidated Aircraft Corp.

When Knox left Hawaii, he was quoted by The United Press as saying he found Hawaiian bases, both army and navy, "in very good shape."

Reservations for the civic dinner to be given the secretary will be taken at the chamber of commerce up to noon today. From San Diego, Knox is to go to San Pedro and thence to Washington, D. C. Knox, appointed secretary of the navy June 20 by President Roosevelt, was a "Rough Rider" of Spanish-American war days and a close friend of the late "Teddy" Roosevelt.

Knox was born Jan. 1, 1874. At the age of 11, in Grand Rapids, Mich., he earned $1.25 a week delivering a morning paper. An afternoon paper route brought him another dollar.

He quit school at the age of 15 to take a job as shipping clerk's helper at $5 a week, and at 19 had risen to a salesman for a wholesale book and stationery firm at $15 a week. In the panic of 1893, Knox lost his job. He returned to school and went on to college.

In the Spanish-American war, Knox, through a friend, met Lt. Col. Theodore Roosevelt and asked for a chance to join the denim-clad, hard-riding crowd of cowboys, plainsmen and college athletes who made up the "Rough Riders." In the advance upon Santiago and the famous storming of San Juan hill, Knox lost a strand of hair when a bullet clipped through his hat.

Throughout the Cuban campaign, Knox had been building the newspaper career that carried him upward through the years as owner and publisher of some of the most famous progressive papers in the United States. His experiences with the "Rough Riders" were read avidly by the hometown folks of Grand Rapids, where they appeared under the caption, "Pictures of Life with the Cowboys and Swells."

The first paper Knox owned was a weekly paper published at Sault Ste. Marie. He backed Col. Roosevelt for the Bull Moose ticket in 1912. Disappointed when Roosevelt lost, Knox began the groundwork of a paper at Manchester, N. H., which prospered under his direction.

Slackers Blasted

In World war days Knox blasted slackers and those who sought to escape the draft. He enlisted as a private in the First New Hampshire infantry after he was turned down for duty in the officers' training camp because the camp quota was filled. In France he was a major and saw action at many points of action.

Knox tok over operation of the Chicago Daily News in 1931. He became Republican candidate for the vice presidency in June, 1936.

As secretary of the navy, Knox succeeded Charles Edison, who resigned to enter politics in New Jersey. Just before he was nominated secretary of the navy, he outlined a six-point defense program for the United States, as follows:

1—Increased help for Great Britain through the sale of planes and munitions.

2—Control of the Atlantic for the United States, either through cooperation with Britain or the building of the world's largest fleet.

3—United States protection of the entire western hemisphere.

4—Development of plane and submarine bases from the Arctic to the Antarctic.

5—Formation of the world's most powerful air fleet and development of the world's greatest aviation production capacity.

6—Compulsory military training.

CONSAIR SETS 50-HOUR WEEK; AWARD COMBAT PLANE ORDER

(Continued from Page 1)

manufacturers. Other major contracts are reported to be in preliminary stages.

A commission spokesman said that William Knudsen, defense production chief, would try to "sell" the manufacturers on his view that they need not hesitate now to undertake necessary plant expansions. Knudsen expressed confidence last week that the industry could attain an annual production rate of 25,000 military planes by July 1, 1942.

EXPANSION DELAYED

Manufacturers have been reported to be hanging back until congress approves proposed legislation allowing them, for tax purposes, to write off plant expansions within five years' time. Their argument has been that, otherwise, a sudden cessation of the defense emergency might catch them with a heavy load of unamortized expansion debts.

Attending the meeting yesterday were Knudsen, his deputy commissioner, John D. Biggers; Dr. George J. Meade, head of Knudsen's aeronautical section, and representatives of the Lockheed, Boeing, Martin, Consolidated, North American and Douglas aircraft firms.

The army was reported reliably to be scaling down pending orders to the present level of production capacity in the belief that plant expansions needed for larger orders might be delayed indefinitely.

REPORTS ASKED

There was a growing conviction in army and industry circles that congress might wait until after the November election to enact the defense tax policy change.

After five hours' discussion, the industry representatives agreed to report back individually on their ability to expand production capacity and their views on the tax-amortization problem.

Considerable floor space is being added to the aircraft industry, but with money provided by British government orders. Without the British-bought expansions, the industry now has capaciy for roughly 10,000 military planes a year.

The new combat plane contracts reported by the commission yesterday will be divided as follows: Consolidated Aircraft Corp., San Diego, $16,361,342; Boeing Aircraft Co., Seattle, $31,871,349; Boeing Airplane Co., Wichita, $2,041,947; and the 'Staerman division of Boeing Airplane at Wichita, $5,713,389. Aircraft and engine contracts cleared between June 6 and July 17, the commission said, totaled nearly $85,000,000, some of which have been awarded.

Union 7/31/40

Consair Plans 50-Hour Week

Big Combat Plane Contract Awarded

Consolidated Aircraft Corp. pointed to a new high speed in production yesterday with a 50-hour five-day week starting Monday.

Indicating pressure on the giant San Diego plant and its 8400 employes was the announcement of a $16,316,342 combat plane contract awarded to Consolidated yesterday, The Associated Press reported from Washington, D. C.

ON 6-DAY SCHEDULE

Currently, the plant is under a six-day, 48-hour week.

The five-day, 50-hour week will be worked in two shifts instead of three as at present. Under labor union agreement, the firm will pay time and one half for overtime above 40 hours' work each week. The plant will be closed Saturdays and Sundays.

At Washington, the new contract awaited signature of Consolidated representatives as defense commission representatives sought an agreement from six major plane manufacturers to proceed with pending army-navy contracts without waiting for congressional action on defense tax policy.

ENGINES ORDERED

At least $55,988,027 in new military aircraft awards, in addition to some engine contracts, were reported by the commission to have been cleared between June 6 and July 17, but not yet signed by the

So. Cal. Plane Firm Gets Big Govt. Order

WASHINGTON.—The War Department announced the award of contracts for $15,899,642 worth of training and bombing airplanes.

Most of the contracts—$14,861,342 worth—are with the Consolidated Aircraft Corp., San Diego, for 56 four-engined bombing planes.

The remaining $1,038,300 worth of contracts will provide 100 training planes to the Fairchild Engine and Aircraft Corp., Hagerstown, Md.

Secretary Henry L. Stimson recently told a Congressional committee that the department had been able to sign contracts for only 33 out of 4000 planes provided in a $400,000,000 appropriation for 1941.

Flight - 8/1/40

Transatlantic Deliveries

THE Canadian paper *Commercial Aviation*, in its June number, draws attention to what must be always at the back of our Air Ministry's mind as an alternative method of delivery to shipping from America to England—that is, flying the Atlantic.

"And while Blitzkrieg and counter-Blitzkrieg eat into both Germany's and Britain's supply of 'planes, the Empire is holding an ace in the hole which may be used before the summer is out—mass transatlantic flight deliveries.

"Any doubt as to the possibilities of such deliveries may be dispelled now that Britain has occupied Iceland. The lonely [but it has a population of 100,000.—ED.] Arctic island can now be used as a refuelling base by the British, although all five bomber types now in production for the Allies in the United States are capable of flying from Newfoundland to Ireland non-stop."

Being able to land and refuel at Iceland is some help, but it does not shorten the distance by any very great fraction. It reduces the 2,000-odd miles between Botwood and Foynes by about 300, at the expense of increasing the total distance to England. The five types spoken about are given as the Consolidated 28-5 flying boat, the Douglas DB-7 attack bomber, the Douglas B-20, also given as an attack bomber (or should this be the B-23?), the Lockheed Hudson and the Martin 167W. (The Martin ordered by France had the model number 167F.) All the types mentioned could not fly the Atlantic with standard tankage, but they could be specially tanked up for the occasion.

We agree with what is said on the subject of the greatest difficulty. "Biggest problem the Allies will face in the high-speed transatlantic shipment will be the securing of pilots with adequate experience. American pilots may be hired as 'ferrymen' similar to the many who have been hired as instructors under the Empire Air Training Plan. Their work would violate no American law."

Flight - 7/23/40

Ferrying Across the Atlantic

CAPN. A. S. WILCOCKSON, who is in charge of the Atlantic Division of the Airways Corporation, is to supervise arrangements which are being made to fly American bombers and flying-boats for the R.A.F. across the Atlantic. With Capn. D. C. Bennett and Mr. Ian Ross of the Airways Corporation, and Wing Commander Griffiths Powell, Capn. Wilcockson arrived in Canada last week. The Airways Corporation pilots have been lent to the Ministry of Aircraft Production for the scheme.

The first delivery flight of bombers is expected to be made this month. Reports from America suggest that American pilots may help in this ferry work and that fees of £250 to "several thousand dollars" may be offered to them for each trip. Another suggestion is that the crews should be flown back to Canada in British long-range bombers, which would naturally save time. The main difficulty in ferrying across the Atlantic in any great numbers is the lack of trained Atlantic crews.

Canadian crews are to be trained and it is believed that flights may be continued during the Winter whenever the weather is suitable. The types to be flown across are said to include the Lockheed bombers and Consolidated flying-boats.

Dr. Archbold's Consolidated Model 28 flying-boat "Guba" is reported to have been bought by the Ministry of Aircraft Production and may be used over the Atlantic. It has a range of more than 3,000 miles with nearly a ton of payload. Thus it should be able to fly the Atlantic from the U.S.A. with mails and urgent freight and return with crews which had ferried bombers across.

An interesting point is likely to be raised over the position of Ireland should a bomber be forced to land there during its crossing. Presumably it and its crew would have to be interned.

Kittyhawk in 1903. The Wright Brothers entertained no thoughts of war. The aeroplane was, in fact, flown for the first time over the North American Continent, where not a single fortress or defence barrier separates the subjects of the King in Canada from the republican citizens of the United States. Civil aviation was to narrow the frontiers of the world. Citizens were to travel from one country to another speedily and without inconvenience. Ambitious young men adopted the career of civil air pilots. They were in Brussels at one hour and at Cologne or Prague at another. Between the civil air pilots of Europe there developed a friendliness and understanding which seemed to foreshadow a new Europe in which the people lived in harmony with each other. Undoubtedly civil aviation was one of the principal agencies for peace, but it was not powerful enough to exorcise the spectre of war in the air.

Progress Before the War

Less than two months after the signing of the Munich Agreement Sir Kingsley Wood told the House of Commons that Imperial Airways and British Airways were to be merged in a statutory Corporation. The period between November, 1938, and September, 1939, was hectic but marked by substantial gains to civil aviation. It presented, for one thing, the panorama of British aircraft crossing Europe to Warsaw and Budapest and flying over many countries, British and other, on their way to Durban, Sydney, and Hongkong. Last August, when the clouds of war were gathering over Poland, the flying-boat Caribou made the inaugural flight of the British North Atlantic air mail service between Great Britain, Eire, Newfoundland, Canada, and the United States. The flying-boat Aotearoa left Southampton Water on her delivery flight to New Zealand. A new air service was begun between Great Britain, Norway, Sweden, and Finland. British civil aircraft were carrying His Majesty's mails to some 40 countries. The penny-halfpenny "all-up" air mail was strengthening the bonds of trade and friendship between the various parts of the Empire. The demand for passenger accommodation was increasing. Civil aviation had, in fact, become a commonplace of life.

These gains, however, were wrested at a time of particular strain. Munich had become a landmark in war preparedness. We had to meet a potential foe whose supremacy in the air was as yet unchallenged. The Air Ministry necessarily obtained a priority in deliveries. Recruiting for the Royal Air Force became more insistent. Aircraft, spare parts, and pilots for civil aviation were harder to come by.

Services Suspended

The outbreak of war brought necessary limitations in service. At first all the Continental services, except the new one to Helsinki, were suspended. The "all-up" air mail charges disappeared. But the companies, having placed their aircraft at the disposal of the Air Ministry, assumed two major and important duties. The first was to keep open the air communications between Great Britain and the countries of the British Empire. The second was to fulfil special charter duties for the Air Ministry.

Navigational difficulties were immediately increased. Meteorological services were restricted. Ships were silenced and unable to give weather reports. Many restrictions were imposed throughout the war zone. Aircraft designed for flying at great heights were henceforth compelled to keep below the clouds. Night flying in the war zone was forbidden,

NO JOBS, WARNING TO UNSKILLED BY AIRCRAFT PLANTS

With a federal-state program for the training of thousands for naional defense taking form rapidly, a double-barreled warning was issued today to unskilled workers against a "job stampede" to California's major defense industry — aircraft manufacturing, The International News Service reported from San Francisco. Consolidated Aircraft Corp., San Diego, is among the firms listed where announcement has been made that unskilled men can not get work.

"The aircraft industry, which is centered in Southern California, is continuing to add new employes from all parts of the state," reported the Aircraft Information Bureau, of San Francisco.

"But these employes are all skilled craftsmen, trained in such trades as aluminum and alloy welding, precision machine work, loft work, jig making, etc.

"We are advised by leading aircraft plants—Consolidated, Douglas, Lockheed, North American, Northrop and Vultee—that it is utterly useless for men without proper training to seek jobs there."

This was supported by the San Francisco office of the state department of employment which in the past year has placed more than 100 skilled workers from the bay area in aircraft jobs.

Britain buys "Atlantic ferry"

£50,000 flying boat

NEW YORK, Sunday.—The price the British Purchasing Commission paid for the flying-boat Guba, owned by Mr Richard Archbold, is believed to be £50,000. The plane is a replica of the American Navy's "Flying Fortress."

Mr Archbold said he presumed the Guba would be used for ferrying metals across the Atlantic.

The "flying laboratory" in which Mr Howard Hughes, the millionaire film producer, made a record round-the-world dash two years ago, arrived here last night for shipment to Britain. It has also been bought by the British Purchasing Commission.—A.P.

UNION 8/23

Consair to Build 8-Acre Addition

Test piles for an $800,000 addition to Consolidated Aircraft Corp.'s plant were being driven yesterday as plans for the building which, factory officials said, will be rushed to completion, were approved at the city planning commission's office.

Floor space in the new structure, according to Harry Haelsig, asistant city planning engineer, will cover 8 1-3 acres to make the building the largest, in this respect, in San Diego.

The addition, he said, will be 200 feet wide and 1500 feet long. The roof will be of the saw-tooth type with its highest elevations 41 feet from the ground.

At the factory, executives were guarded in their statements, but said that work "will be started as soon as possible and will be rushed to completion." Asked whether the building will be used exclusively to construct land planes, they said it will be used "to fill orders for both the army and navy." The structure is to be of the steel-frame type.

2 British Fliers Expected Here On 'Ferry' Duty

Union 8/6/40

Organizing a transatlantic system for delivering bombers from west coast aircraft plants to Britain, two British Royal Air force pilots were in Los Angeles yesterday and were expected to visit San Diego.

The pilots, Capt. Donald C. T. Bennett, transatlantic flier, and Capt. R. H. Page, left New York Sunday by plane, The Associated Press reported.

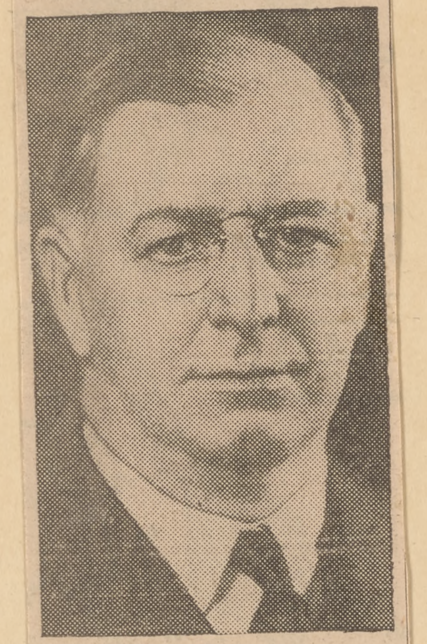
Informed that the pilots were in southern California, a Consolidated Aircraft Corp. official indicated that the San Diego firm "knew of a plan to fly ships to Britain."

At Lockheed Aircraft plant, Los Angeles, the pilots said they would be in southern California for 10 days.

The two, employed by the British Imperial airways as civil pilots, were assigned to the British aircraft production ministry to develop a transatlantic plane-ferrying system. They said American neutrality laws prohibited American pilots from participating in such a service and that they were "only in the market for Canadian pilots."

Union 9/14/40

Plans Inspection



COL. FRANK KNOX
. . . navy secretary, will fly from Honolulu to San Diego.

* * *

Navy Secretary To Fly Here

Knox Due Sept. 16 After Hawaii Tour

Col. Frank Knox, secretary of the navy, will visit San Diego Sept. 16.

In the first long overwater flight ever made by a navy secretary, Col. Knox will leave San Francisco Thursday aboard the flagplane of Rear Adm. Arthur B. Cook, commander of the scouting force aircraft and the navy's fleet patrol wings. He will leave Hawaii for San Diego in the San Diego-built 4-motored bomber Sept. 15.

Accompanying Col. Knox on the 10,000-mile inspection trip will be Adm. Cook, Col. William J. Donovan, who recently completed a special tour of duty in England for the navy department; Capt. M. L. Deyo, aid, and John O'Keefe, special assistant.

TO BOARD CARRIER

Col. Knox will leave Manchester, N. H., his summer home, tomorrow for California, The Associated Press reported yesterday. His plane will take off from San Francisco bay for Honolulu Thursday afternoon, arriving at Pearl Harbor Friday morning.

After an inspection of Pearl Harbor naval base, one of the most strongly fortified in the world, Col. Knox will board the aircraft carrier Enterprise, temporary flagship of Adm. J. O. Richardson, U. S. fleet commander, for five days' manuvers at sea with the fleet. The Enterprise will sail from Pearl Harbor Sept. 9 and return Sept. 14.

The navy's chief executive will leave Pearl Harbor the afternoon of Sept. 15, arriving here the following morning. He is scheduled to inspect naval activities at Long Beach and San Pedro Sept. 17, leaving the same day by plane for Washington.

FOUR-MOTORED PLANE

The four-motored plane in which the navy's chief executive will fly to the crossroads of the Pacific and return was delivered to the navy by Consolidated Aircraft Corp. last year. For the last several months it has been used at North Island in training personnel in airboat flying. It has a speed in excess of 150 miles an hour and is equipped for flying at high altitudes.

The course followed by Pan American Airways clippers will be flown by Col. Knox' plane in the flight from San Francisco to Hawaii. From Honolulu to San Diego the route will be that traversed by navy patrol wing bombers.

Tribune 8/17/40

Award Contract For 56 Bombers

Consolidated Aircraft Corp., of San Diego, has been awarded a contract for $14,861,342 for the purchase of 56 four-engine bombing planes, by the war department, it was announced today from Washington in dispatches of The Associated Press.

This is one of two contracts awarded, the other going to the Fairchild Engine & Airplane Corp., of Hagerstown, Md., for $1,038,000 for 100 training planes.

According to officials of the local concern, the order signed by war department officials today is in exercise of a contract already existing.

Work on the new assignment has not yet started, it was said, although requests for bids on materials to be used, have been issued.

The war department did not announce the date on which delivery of either group of planes is to be expected.

The orders were the third of a group announced since congress voted $400,000,000 for approximately 4200 additional army planes last June, the dispatches stated.

Union 7/29/40

U.S. Asks Speed On Big Bombers

Consair to Rush Craft for Navy

Word that the navy department has requested Consolidated Aircraft Corp. to rush construction on a squadron of 30-ton four-engined long-range patrol bombers was received here yesterday from Washington.

The huge airboats will be the first squadron of their design to be delivered to the navy and if found satisfactory, will supplant the PBY twin-motored bombers in service with the fleet patrol wings. Six are to be delivered to Patrol Squadron 12 at North island this fall. They will be under command of Comdr. S. B. Cooke.

5000-MILE RANGE

The new offshore patrol bombers have a cruising range of 5000 miles, carrying a crew of nine and several tons of bombs. They have a speed in excess of 200 miles an hour and are rated as the fastest aircraft of their type in the world.

The first four-motored plane built for the navy by Consair was completed and tested last year. For a time it was employed by Rear Adm. Arthur B. Cook, commander of scouting forces aircraft, as his aerial flagship. In recent months it has been used by Patrol Squadron 12 in the training of pilots and crews.

49,494 STUDY FLYING

The United Press reported from Washington the civil aeronautics board announced that on June 30 there were 49,494 students enrolled in various phases of its pilot training program designed to produce 50,000 civilian pilots by next June 30.

The board said 32,000 students are in ground schools and that 17,494 more were taking courses in the civilian pilot training program. In addition 1000 civilian instructors are taking courses to refresh their flight experiences.

The CAB said that almost 16,000 student pilots will have completed both ground and flight training by September.

Sept 16th 1940.

avy Welcome

Here 2 Days After Flight From Hawaii

Will Inspect Bases

SECY. FRANK KNOX

BULLETIN

Secy. of the Navy Knox arrived in San Diego at 10:30 a.m. today, landing in the harbor after an overnight flight from Hawaii in the Consolidated four-motored bomber flagship of Rear Adm. A. B. Cook.

Col. Frank Knox, secretary of the navy, was expected to arrive at San Diego soon after 10 a.m. today by plane from Honolulu for a two-day stay, during which time he will inspect local naval establishments, confer with boat builders on plans for constructing high-speed small craft for the navy, and be feted at a city-chamber of commerce dinner at 7 p.m. today at the Hotel del Coronado.

Knox, who flew from San Francisco to Honolulu Sept. 6, made the flight aboard the four-motored Consolidated-built bomber flagplane of Rear Adm. Arthur B. Cook, commander of aircraft scouting force. The plane took off from Honolulu at 7:01 p.m. yesterday for San Diego.

With the secretary were Cook, Capt. M. L. Deyo, Knox's aid; John F. O'Keefe, his personal secretary; Col. W. F. Donovan, World war officer with the A.E.F. "Fighting 69th" regiment, and Lt. Thomas E. Gillespie, of San Diego, pilot. Second pilot was Ens. John A. Ferguson, U. S. N. R., of Coronado.

From the Naval Air station Knox is to go to the destroyer base and naval hospital. Other places to be inspected are the Marine corps base, Camp Elliott, naval training station and Consolidated Aircraft Corp.

When Knox left Hawaii, he was quoted by The United Press as saying he found Hawaiian bases, both army and navy, "in very good shape."

Reservations for the civic dinner to be given the secretary will be taken at the chamber of commerce up to noon today. From San Diego, Knox is to go to San Pedro and thence to Washington, D. C. Knox, appointed secretary of the navy June 20 by President Roosevelt, was a "Rough Rider" of Spanish-American war days and a close friend of the late "Teddy" Roosevelt.

Knox was born Jan. 1, 1874. At the age of 11, in Grand Rapids, Mich., he earned $1.25 a week delivering a morning paper. An afternoon paper route brought him another dollar.

He quit school at the age of 15 to take a job as shipping clerk's helper at $5 a week, and at 19 had risen to a salesman for a wholesale book and stationery firm at $15 a week. In the panic of 1893, Knox lost his job. He returned to school and went on to college.

In the Spanish-American war, Knox, through a friend, met Lt. Col. Theodore Roosevelt and asked for a chance to join the denim-clad, hard-riding crowd of cowboys, plainsmen and college athletes who made up the "Rough Riders." In the advance upon Santiago and the famous storming of San Juan hill, Knox lost a strand of hair when a bullet clipped through his hat.

Throughout the Cuban campaign, Knox had been building the newspaper career that carried him upward through the years as owner and publisher of some of the most famous progressive papers in the United States. His experiences with the "Rough Riders" were read avidly by the hometown folks of Grand Rapids, where they appeared under the caption, "Pictures of Life with the Cowboys and Swells."

The first paper Knox owned was a weekly paper published at Sault Ste. Marie. He backed Col. Roosevelt for the Bull Moose ticket in 1912. Disappointed when Roosevelt lost, Knox began the groundwork of a paper at Manchester, N. H., which prospered under his direction.

Slackers Blasted

In World war days Knox blasted slackers and those who sought to escape the draft. He enlisted as a private in the First New Hampshire infantry after he was turned down for duty in the officers' training camp because the camp quota was filled. In France he was a major and saw action at many points of action.

Knox tok over operation of the Chicago Daily News in 1931. He became Republican candidate for the vice presidency in June, 1936.

As secretary of the navy, Knox succeeded Charles Edison, who resigned to enter politics in New Jersey. Just before he was nominated secretary of the navy, he outlined a six-point defense program for the United States, as follows:

1—Increased help for Great Britain through the sale of planes and munitions.

2—Control of the Atlantic for the United States, either through cooperation with Britain or the building of the world's largest fleet.

3—United States protection of the entire western hemisphere.

4—Development of plane and submarine bases from the Arctic to the Antarctic.

5—Formation of the world's most powerful air fleet and development of the world's greatest aviation production capacity.

6—Compulsory military training.

CONSAIR SETS 50-HOUR WEEK; AWARD COMBAT PLANE ORDER

(Continued from Page 1)

manufacturers. Other major contracts are reported to be in preliminary stages.

A commission spokesman said that William Knudsen, defense production chief, would try to "sell" the manufacturers on his view that they need not hesitate now to undertake necessary plant expansions. Knudsen expressed confidence last week that the industry could attain an annual production rate of 25,000 military planes by July 1, 1942.

EXPANSION DELAYED

Manufacturers have been reported to be hanging back until congress approves proposed legislation allowing them, for tax purposes, to write off plant expansions within five years' time. Their argument has been that, otherwise, a sudden cessation of the defense emergency might catch them with a heavy load of unamortized expansion debts.

Attending the meeting yesterday were Knudsen, his deputy commissioner, John D. Biggers; Dr. George J. Meade, head of Knudsen's aeronautical section, and representatives of the Lockheed, Boeing, Martin, Consolidated, North American and Douglas aircraft firms.

The army was reported reliably to be scaling down pending orders to the present level of production capacity in the belief that plant expansions needed for larger orders might be delayed indefinitely.

REPORTS ASKED

There was a growing conviction in army and industry circles that congress might wait until after the November election to enact the defense tax policy change.

After five hours' discussion, the industry representatives agreed to report back individually on their ability to expand production capacity and their views on the tax-amortization problem.

Considerable floor space is being added to the aircraft industry, but with money provided by British government orders. Without the British-bought expansions, the industry now has capaciy for roughly 10,000 military planes a year.

The new combat plane contracts reported by the commission yesterday will be divided as follows: Consolidated Aircraft Corp., San Diego, $16,361,342; Boeing Aircraft Co., Seattle, $31,871,349; Boeing Airplane Co., Wichita, $2,041,947; and the 'Staerman division of Boeing Airplane at Wichita, $5,713,389. Aircraft and engine contracts cleared between June 6 and July 17, the commission said, totaled nearly $85,000,000, some of which have been awarded.

Union 7/31/40

Consair Plans 50-Hour Week

Big Combat Plane Contract Awarded

Consolidated Aircraft Corp. pointed to a new high speed in production yesterday with a 50-hour five-day week starting Monday.

Indicating pressure on the giant San Diego plant and its 8400 employes was the announcement of a $16,316,342 combat plane contract awarded to Consolidated yesterday, The Associated Press reported from Washington, D. C.

ON 6-DAY SCHEDULE

Currently, the plant is under a six-day, 48-hour week.

The five-day, 50-hour week will be worked in two shifts instead of three as at present. Under labor union agreement, the firm will pay time and one half for overtime above 40 hours' work each week. The plant will be closed Saturdays and Sundays.

At Washington, the new contract awaited signature of Consolidated representatives as defense commission representatives sought an agreement from six major plane manufacturers to proceed with pending army-navy contracts without waiting for congressional action on defense tax policy.

ENGINES ORDERED

At least $55,988,027 in new military aircraft awards, in addition to some engine contracts, were reported by the commission to have been cleared between June 6 and July 17, but not yet signed by the

Aircraft News 8/22/40

So. Cal. Plane Firm Gets Big Govt. Order

WASHINGTON.—The War Department announced the award of contracts for $15,899,642 worth of training and bombing airplanes.

Most of the contracts—$14,861,342 worth—are with the Consolidated Aircraft Corp., San Diego, for 56 four-engined bombing planes.

The remaining $1,038,300 worth of contracts will provide 100 training planes to the Fairchild Engine and Aircraft Corp., Hagerstown, Md.

Secretary Henry L. Stimson recently told a Congressional committee that the department had been able to sign contracts for only 33 out of 4000 planes provided in a $400,000,000 appropriation for 1941.

J. Inventor Iakes 'Pancake' Plane Motor

By TED McKENNA

The U. S. air corps travels with gasoline engines but soon it may be soaring to new heights with "pancakes."

In San Diego a man has made a hobby of designing and building aircraft engines that may do away with the present type of aircraft motors.

J. L. (Bill) Weaver, Consolidated Aircraft Corp. inspector, has designed and built a radically new pancake type engine, which derives its name from its general flat appearance.

Eight years ago Weaver started as a hobby the creation of an engine of his own design, with the intention of trying to develop one with fewer parts and more power. He believes he has reached that goal with the present creation, which he calls his "masterpiece." All the work was done in his garage workshop.

HAS NOVEL FEATURES

The motor, now completed, gives one the impression of a Flash Gordon creation. It has many novel features, and if tests show the same promising performance as indicated by a single cylinder model, one may expect something new in weight-horsepower ratio. It is a geared, air-cooled, two-cycle, four-cylindered, horizontal opposed type. Two cylinders fire simultaneously from opposite ends of the crank shaft. Since the crank shaft is only five inches long, a more rigid construction is possible, and the firing order of the cylinders makes for what Weaver calls ideal performance in dynamic balance.

The engine weighs 115 pounds, and is designed to develop 100 horsepower at 3600 revolutions a minute at 30,000 feet. This is accomplished by the super-charging action of a cylinder superimposed on the firing cylinder. The construction of the mechanism that regulates this charging action can not be divulged at this time.

OIL SYSTEM SIMPLIFIED

Some of the features Weaver has incorporated in his "masterpiece" are cylinders that never wear out of round, a streamlined oiling system that requires neither oil pumps nor lines and permits the lubricant to remain clean and pure for the life of the motor, thus minimizing frequent overhaul and adjustments.

This type of power unit, Weaver said, with its compact flat shape, facilitates mounting directly into the wing section. This permits the wing itself to act as the engine cowling. Mounting of large present-day radial engines on the loading edge of wings has always given designers much trouble with reference to perfect streamlining. This is due to the interference with the smooth flow of air over the wing, which not only causes loss of lift but sets up a drag that acts much the same as a brake. This, coupled with the head resistance set up by the present design of motors, gives the pancake type many advantages.

MADE FOR LIGHT CRAFT

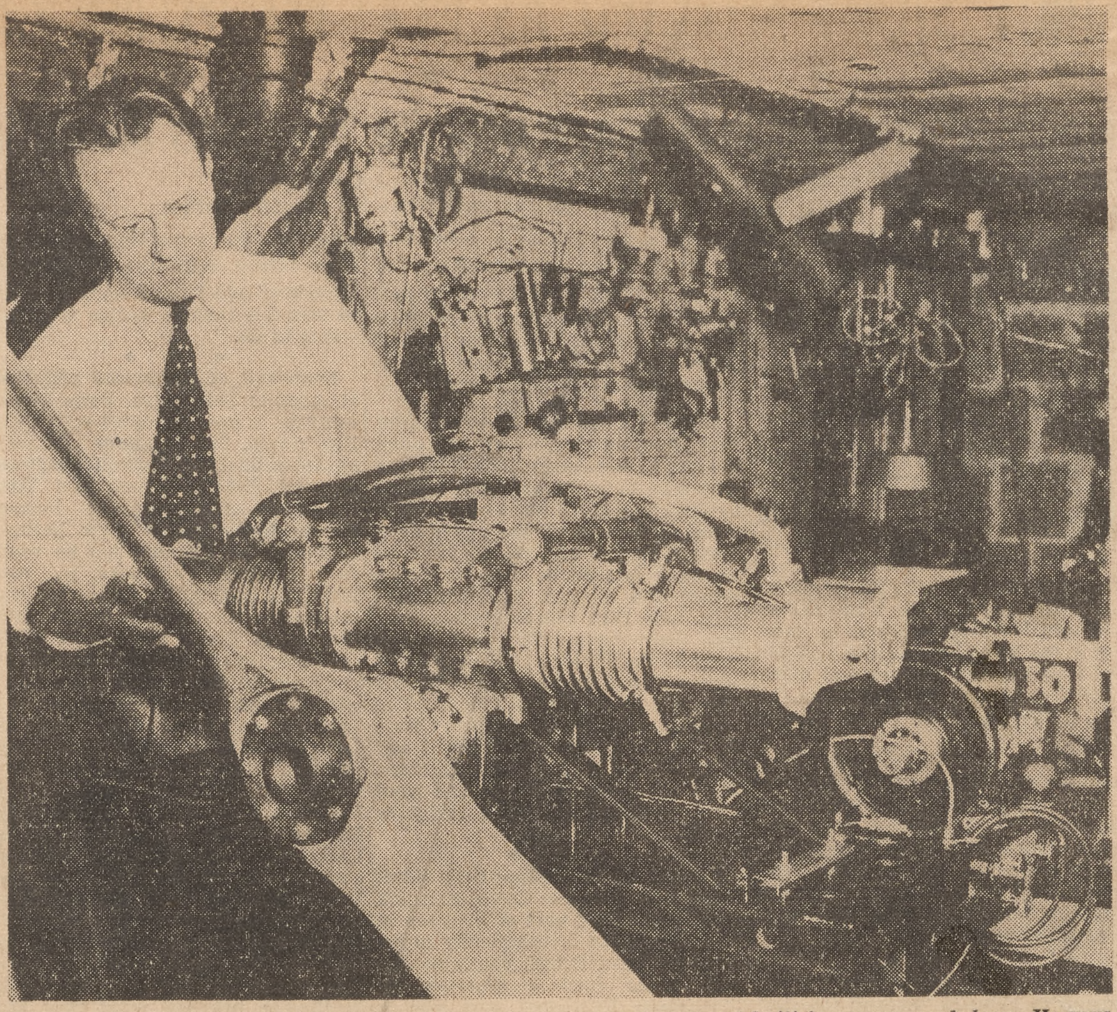
This four-cylinder model, Weaver said, would be ideal for light planes, but is so constructed that with the addition of more cylinders and an increase in the compression ratio it could be installed in large planes.

Weaver believes he has worked out the problem of dynamic balance, or vibration, which has always troubled engineers, to a smoothness that will give a plane the effect of continuous gliding.

By developing a new casting technique, Weaver has succeeded in binding two different metals to construct the cylinder. He claims that this technique and the elimination of many parts will make possible the manufacture of this engine for half the cost of the type now in use.

Union — 7/27/40

ENGINE MAY REVOLUTIONIZE AIRCRAFT CONSTRUCTION



J. L. Weaver, Consolidated Aircraft Corp. inspector, is shown with his "pancake" plane engine which he designed and built in garage workshop. He says it may replace present aircraft motor types.

Marine Base, Navy Station Curb Watering to Insure Home Supply

While city officials struggled to maintain water pressures in the Mission Hills-Loma Portal-Pt. Loma districts, Fred Rhodes, city manager, announced yesterday that Marine base and Naval Training station executives have agreed to order immediate discontinuance of all daytime irrigation at the two large reservations.

Meantime, Fred Pyle, city hydraulic engineer, said everything possible is being done to maintain water service and pressure, but made it clear that if curtailment of water use at the two government establishments doesn't aid materially, it probably will be necessary to place some restriction on irrigation by private consumers.

The condition became acute Wednesday, said Rhodes, when homes in some parts of Pt. Loma were without water for five hours. Yesterday, he said, there was no service interruption, although pressures were down.

Pyle described the Naval Training station and the Marine base as the two largest consumers in the lowlands between Mission Hills and Pt. Loma, and expressed belief that limiting of watering at the bases to between 10 p.m. and 6 a.m. will be a big help.

Back of the difficulty, said Rhodes, is a pressing need for improvements of the water distribution system. He and Pyle emphasized that there is an abundance of water, but that growth of the city has bounded ahead of water-main extensions and enlargements.

As explained by Pyle, water is piped to a reservoir on Chatsworth blvd. from the University Heights reservoir. Pumps then lift the water from the Chatsworth reservoir to a tank on Pt. Loma, which serves the higher places on that promontory. When consumption is heavy in Mission Hills and the flats below, insufficient water reaches the Chatsworth reservoir to make it possible to fill the Pt. Loma tank, which goes dry.

FUTURE RELIEF SEEN

Some relief—but not this summer—will be provided when the Upas st. pipe line is extended from

the people of San Diego agree this project is logically the next water development which should be undertaken," Marston said.

SAN VICENTE URGED

Heilbron emphasized that the "vision of San Diegans years ago in approving funds for construction of our present water facilities has led to the rapid growth and development enjoyed by our community. Without that vision," he said, "we would not have a city such as we have today."

"It is essential and absolutely necessary," he continued, "that we develop additional water facilities. The San Vicente project is the first logical step toward that development."

Frank Forward, chamber president, pledged aid of the chamber to steps taken toward winning a favorable decision on the proposed project.

Industry Draft Bill Halts Plant Expansion Of 'Vast' Scope by Consolidated Aircraft

N. Y. Times 9/3/40

By The Associated Press.

SAN DIEGO, Calif., Sept. 2—Major Reuben H. Fleet, president of the Consolidated Aircraft Corporation, said today that announcement of "vast future expansion was being withheld because of a Senate bill authorizing conscription of industry."

Speaking at the dedication of a $2,500,000 adidtion to the company's plant, he warned against nationalization of the aircraft industry, citing the failure in France.

He expressed confidence that the industry could supply the planes needed not only to protect America from attack but to carry the war to any attacking enemy.

The announcement which was being withheld because of the Senate measure, he stated, covered expansion "here or in Texas." He declined to discuss the type of expansion planned or the possible site in Texas.

"We planned announcement today of further extensive plant expansions," he declared, "but the bill recently passed by the Senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our government makes us hesitate, much as we have been striving with all our might as a private enterprise to do our bit.

"Nationalization of her aircraft industry by France was so disastrous that that country's production fell down terribly, and even though she frantically resorted to foreign help at exorbitant expense, she collapsed as a nation and probably never will recover.

"We hope our government will not make this mistake, which would be the beginning of labor regimentation, the emasculation of labor unions, which our President has stated cannot strike against the government, and the end in this country of free enterprise."

Decision to withhold announcement of the future expansion will not affect that part of an enlargement program now under way and for which contracts have been awarded, Major Fleet added.

UNION 8/23

U. S. Building New Air Giant

LOS ANGELES, Aug. 22 (A.P.)—Maj. Gen. Henry H. Arnold, chief of the army air corps, revealed today that a bomber nearing completion in the Douglas plant is not only the biggest plane ever built but that it will be able to fly from New York to Europe and back to Los Angeles non-stop.

The plane, which will be in the air this fall, said Lt. Col. C. E. Bradshaw, army air corps officer

Maj. Gen. Arnold and William S. Knudsen, chairman of the national defense advisory committee, are expected to arrive here at 9:30 this morning, continuing their inspection tour of aircraft factories in the southland. It is expected the party, which includes several ranking army officials, will visit Consolidated, Ryan and Solar plants.

in charge of its construction, is powered with four 2000-horsepower engines, the largest ever built.

Its wing spread is 212 feet and it is 112 feet long. Its tail assembly is larger than the ordinary commercial plane.

The plane will have a gasoline capacity of 11,000 gallons. It will carry bigger cannon than any airplane in the world, but Bradshaw said the exact armament details are secret. The plane will require a crew of 10.

The huge fighter has been under secret construction for four years.

Earlier today, Arnold displayed the world's fastest military airplane —the Lockheed interceptor—to William S. Knudsen, chairman of the national defense advisory committee, and told for the first time its performance figures.

Its speed, said Arnold, is 460 miles an hour at two-thirds throttle, but more than 500 m.p.h. "wide open." "The world's fastest," he added.

Its range is 1100 miles; rate of climb, 4000 feet per minute; armament, one rapid-fire cannon shooting a one-pound shell, and four machine guns.

5 Plane Firms Spur Defense

'Build First, Talk Of Profits Later'

WASHINGTON, Aug. 20 (A.P.)—Presidents of five airplane manufacturing companies said in a statement tonight that they were "ready to build airplanes first and talk about profits afterward," and that in the last 10 weeks they had made large expenditures to prepare for increased production for national defense.

The statement was issued by Donald W. Douglas of the Douglas Aircraft Co., Robert E. Gross of the Lockheed Aircraft Co., P. G. Johnson of the Boeing Airplane Co., and R. W. Millar of Vultee Aircraft, Inc.

CONSAIR INCLUDED

"Later the name R. H. Fleet, president of Consolidated Aircraft Corp., was added to the statement."

"In the present national defense emergency, aircraft manufacturers have offered and will continue to give the government of the United States every resource and facility at their command," they said.

"In spite of many obstacles and lack of proper legislation, we have gone ahead with preparations for increasing our production to meet the current challenge to America and build up aerial defense.

ADD 21,000 EMPLOYES

"In the last 10 weeks members of the industry have actually purchased on their own responsibility more than $100,000,000 worth of materials for future use and have spent or contracted obligations for more than $50,000,000 in additional plant facilities, machinery and equipment, and have added to their payrolls 21,000 new employes.

"Certainly this is far from standing still."

WASHINGTON, Aug. 20—A joint statement, issued tonight by the heads of the Douglas, Lockheed, Consolidated, Boeing and Vultee aircraft companies, declared that the aircraft industry was "ready to build airplanes first and talk about profits afterward."

"In spite of many obstacles and lack of proper legislation, we have gone ahead with preparations for increasing our production to meet the current challenge to America and build up aerial defense so vital to our national security," they said. "In this we have had the help of the Army, the Navy, the National Defense Advisory Commission and many other branches of the government.

"In the last ten weeks members of the industry have actually purchased on their own responsibility more than $100,000,000 worth of materials for future use and have spent or contracted obligations for more than $50,000,000 in additional plant facilities, machinery and equipment, and have added to their payrolls 21,000 new employes.

"If additional time can be saved, some companies are prepared to build and finance emergency expansions themselves while in other cases where the amounts involved are extremely large we are prepared to recommend that the government build and own during the period of the present emergency sufficient additional plants immediately required for our national defense program, and that these manufacturers be given the task of operating these emergency plants under any fair and reasonable arrangement approved by the government and consistent with free American traditions and institutions and conducive to efficiency and economy."

The statement was signed by Donald W. Douglas, president of the Douglas Aircraft Company; R. H. Fleet, president of the Consolidated Aircraft Corporation; Robert E. Gross, president of the Lockheed Aircraft Company; P. G. Johnson, president of the Boeing Airplane Company, and Richard Millar, president of Vultee Aircraft, Inc.

BIG CONTRACT TO CONSAIR

$14,861,342 For 56 U. S. Giant Bombers

Consolidated Aircraft Corp., of San Diego, has been awarded a contract for $14,861,342 for the purchase of 56 four-engine bombing planes, by the war department, it was announced today from Washington in dispatches of The Associated Press.

One of Two Orders

This is one of two contracts awarded, the other going to the Fairchild Engine & Airplane Corp., of Hagerstown, Md., for $1,038,000 for 100 training planes.

According to officials of the local concern, the order signed by war department officials today is in exercise of a contract already existing.

Work on the new assignment has not yet started, it was said, although requests for bids on materials to be used, have been issued.

The war department did not announce the date on which delivery of either group of planes is to be expected.

The orders were the third of a group announced since congress voted $400,000,000 for approximately 4200 additional army planes last June, the dispatches stated.

Plant Draft Proposal Holds Up Expansion Plan

SEES MISTAKE—Maj. Reuben Fleet, head of Consolidated Aircraft at San Diego, scored wealth conscription measure yesterday at dedication of new addition to plant.

SAN DIEGO, Sept. 2.—Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., today denounced the Senate's "wealth conscription" legislation authorizing "peacetime commandeering of industrial plants" if the latter's operations fail to please any high government officials.

Announcement of "vast future expansion is being withheld because of the Senate measure," Maj. Fleet said. He said the announcement proposed to cover expansion "here or in Texas" but decined to amplify his statement as to the type of expansion planned or the possible site in Texas.

FRANCE'S MISTAKE

Speaking to thousands who attended dedication of Consolidated's new $2,500,000 plant expansion, he expressed hope that the United States government does not make the mistake of France, where "nationalization of the aircraft industry was so disastrous."

Maj. Fleet saw in the Senate bill "the beginning of labor regimentation, the emasculation of labor unions which our President has stated cannot strike against the government and the end in this country of free men and free enterprise."

FURTHER ADDITION

He disclosed Consolidated's new backlog as $132,000,000 and declared that only the industrial draft legislation made him hesitate to announce officially a contemplated $2,500,000 further addition to a factory which already is the largest within one fenced-in-area of the country.

The crowd heard Rear-Admiral Charles A. Blakely, 11th Naval District commandant, formally dedicate the plant addition. Other addresses were given by Brig. Gen. Frank D. Lackland, wing commander, March Field; Maj. Gen. W. P. Upshur, commander Fleet Marine Force, and Col. Peter H. Ottosen, commander, Ft. Rosecrans.

Aircraft Leaders Doing Part in National Defense

CARL S. KELTY

Reaffirming declarations of the positive ability and strong desire on the part of the aircraft manufacturing industry to support and help speed the national defense program, Robert E. Gross, president of Lockheed Aircraft Corporation, yesterday emphasized unequivocally that the industry can undertake and accomplish the task. He remarked that this is the only organized activity that can accomplish the task and do it within a reasonable time. The statement of Mr. Gross was made in the course of comment on the result of Lockheed's operations during the first half of 1940, reported in another column. Since the beginning of the defense program Mr. Gross, in conjunction with other leaders of the aviation industry, has been outspoken in stating that the cause for national defense can best be furthered by "getting the facilities first and talking about the orders and profits later." He declared yesterday the recent acts of the National Defense Council was very constructive for the aircraft companies in devising and proposing programs to insure rapid delivery of existing and prospective orders for the U. S. Government.

* * *

How the Lockheed Corporation met the situation and went ahead to forestall delay when the actual signing of contracts for these orders was held up somewhat, was explained by Mr. Gross. The delay was occasioned, he observed, by uncertainty as to how the emergency plants involved were to be financed.

"Notwithstanding this, and with the conviction that this uncertainty would be presently clarified," Mr. Gross said," the Lockeed company went ahead with the vast expansion program necessary.

"We have purchased materials since early June totaling $12,000,000. Plant and buildings ordered and under construction for Lockheed and its subsidiary, Vega Airplane Company, exceed $6,000,000. Several thousand new employees have been added to the payroll bringing the total to over 12,000."

* * *

Mr. Gross pointed out the logic of this program has been borne out by a sequence of developments during the last 72 hours, since at the very moment of the issuance of its half-year report Lockheed was closing with the War Department one of the large orders which are so vital to defense.

The order, totaling approximately $30,000,000, was announced by Secretary Stimson in Washington and was for the latest Lockheed twin-engined interceptor fighters—ships of the type on which William Knudsen and Major General Henry Arnold put their stamp of approval when visiting the plant last week. The plane was characterized as the highest performer of its type in existence.

With its negotiations with the Government finished, its order signed and its personnel and plant already expanded, "Lockheed," said Mr. Gross, "will bend every ounce of its energy and strength to getting the job done."

* * *

That Lockheed is looking far ahead was evidenced by the statement made by Mr. Gross in his report to the stockholders that the company is conducting through the good offices of the California Institute of Technology novel courses designed to adapt large numbers of graduate engineers to the aircraft industry. Furthermore, the management is steadfastly adhering to its policy of keeping in the forefront of the commercial and nonmilitary aviation fields, in which interest continues to increase. In order to fortify its technical progress, Lockheed is building one of the largest and most modern private wind tunnels in this country.

* * *

Dedicating a $2,000,000 addition to the Consolidated Aircraft Corporation plant in San Diego which has just been completed and placed in operation, Major R. H. Fleet, president of the corporation, said yesterday he had hoped simultaneously to announce an additional expansion program to fit in with rearmament needs.

"The proposed Federal legislation permitting the Government to commandeer industrial plants makes us hesitate," Major Fleet said.

He expressed the view that the nationalization of the aircraft industry by France played a most important contributing role in the collapse of that country.

Major Fleet also announced acquisition by Consolidated Aircraft by purchase of the Hall Aluminum Corporation of Bristol, Conn., which will construct an aluminum plant at Dallas, Tex.

The Sun News-Pictorial

FULL REQUIREMENT

VICTORIA – AUSTRALIA

BIG ORDER MEETS AIR SCHEME AND HOME DEFENCE NEEDS

6/7/40

EXPLAINING the £2,032,000 aircraft order decided by War Cabinet, the Prime Minister (Mr. Menzies) said last night that the De Havilland Tiger Moth was the standard elementary training aircraft in use by the R.A.A.F. The additional 300 now being ordered would provide the full requirements of the Empire Air Scheme, as well as of Australia's home defence units.

THE design of the Wackett trainer is of composite wood and tubular steel construction, and as these materials can be readily obtained from local sources, production can be started without delay.

The machine will be provided with a 175 horse power Scareb engine to be obtained from the United States. Supplies of engines will be available in time to meet airframe production.

Mr. Menzies said the Empire flying boats, with which No. 11 Squadron was at present equipped would, on the advice of the air authorities, be replaced with the least possible delay by the purchase of seven P.B.Y.5 flying boats from the United States.

Guba Service Type

THESE machines, which are the most suitable type available at short notice, are produced by the Consolidated Aircraft Corporation of U.S.A. Similar types are at present giving satisfactory service with the Coastal Command of the R.A.F.

They are the service version of the Guba machine, which recently visited Australia and later flew over the Indian Ocean.

Use For New Wackett Trainer

THE new Wackett advanced trainer would be used for some of the work for which the Wirraways were originally intended, the Minister for Air (Mr. Fairbairn) said last night.

The Wirraways, in turn, would be employed for the advanced training which would have been done in the Fairey Battles, delivery of which had been delayed.

The Wackett machine, said Mr. Fairbairn, was designed as an advanced elementary trainer.

Wing Commander Wackett had also designed a twin-engined bomber, which could be made from the same materials as the Wirraway. If it proved successful there would be, on the completion of Wirraway orders, a switch over to the bomber so that there would be no cessation of work at the aircraft factory.

"There is no doubt about the suitability of the Guba type flying boats," added Mr. Fairbairn. "They are magnificent long range machines."

.D. Inventor ..akes 'Pancake' Plane Motor

By TED McKENNA

The U. S. air corps travels with gasoline engines but soon it may be soaring to new heights with "pancakes."

In San Diego a man has made a hobby of designing and building aircraft engines that may do away with the present type of aircraft motors.

J. L. (Bill) Weaver, Consolidated Aircraft Corp. inspector, has designed and built a radically new pancake type engine, which derives its name from its general flat appearance.

Eight years ago Weaver started as a hobby the creation of an engine of his own design, with the intention of trying to develop one with fewer parts and more power. He believes he has reached that goal with the present creation, which he calls his "masterpiece." All the work was done in his garage workshop.

HAS NOVEL FEATURES

The motor, now completed, gives one the impression of a Flash Gordon creation. It has many novel features, and if tests show the same promising performance as indicated by a single cylinder model, one may expect something new in weight-horsepower ratio. It is a geared, air-cooled, two-cycle, four-cylindered, horizontal opposed type. Two cylinders fire simultaneously from opposite ends of the crank shaft. Since the crank shaft is only five inches long, a more rigid construction is possible, and the firing order of the cylinders makes for what Weaver calls ideal performance in dynamic balance.

The engine weighs 115 pounds, and is designed to develop 100 horsepower at 3600 revolutions a minute at 30,000 feet. This is accomplished by the super-charging action of a cylinder superimposed on the firing cylinder. The construction of the mechanism that regulates this charging action can not be divulged at this time.

OIL SYSTEM SIMPLIFIED

Some of the features Weaver has incorporated in his "masterpiece" are cylinders that never wear out of round, a streamlined oiling system that requires neither oil pumps nor lines and permits the lubricant to remain clean and pure for the life of the motor, thus minimizing frequent overhaul and adjustments.

This type of power unit, Weaver said, with its compact flat shape, facilitates mounting directly into the wing section. This permits the wing itself to act as the engine cowling. Mounting of large present-day radial engines on the loading edge of wings has always given designers much trouble with reference to perfect streamlining. This is due to the interference with the smooth flow of air over the wing, which not only causes loss of lift but sets up a drag that acts much the same as a brake. This, coupled with the head resistance set up by the present design of motors, gives the pancake type many advantages.

MADE FOR LIGHT CRAFT

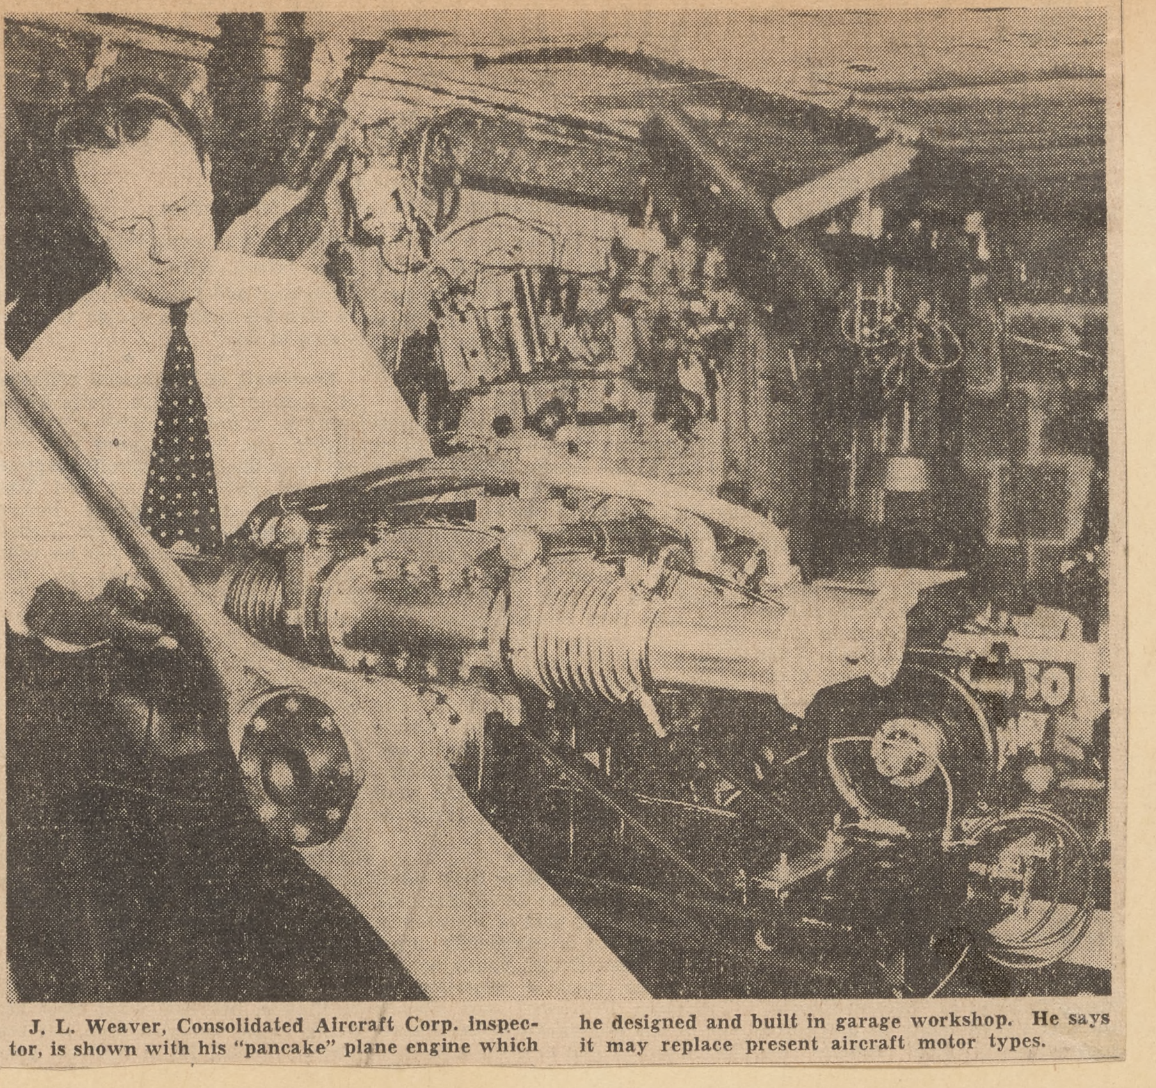
This four-cylinder model, Weaver said, would be ideal for light planes, but is so constructed that with the addition of more cylinders and an increase in the compression ratio it could be installed in large planes.

Weaver believes he has worked out the problem of dynamic balance, or vibration, which has always troubled engineers, to a smoothness that will give a plane the effect of continuous gliding.

By developing a new casting technique, Weaver has succeeded in binding two different metals to construct the cylinder. He claims that this technique and the elimination of many parts will make possible the manufacture of this engine for half the cost of the type now in use.

Union - 7/27/40

ENGINE MAY REVOLUTIONIZE AIRCRAFT CONSTRUCTION



J. L. Weaver, Consolidated Aircraft Corp. inspector, is shown with his "pancake" plane engine which he designed and built in garage workshop. He says it may replace present aircraft motor types.

UNION 8/23

U. S. Building New Air Giant

LOS ANGELES, Aug. 22 (A.P.)—Maj. Gen. Henry H. Arnold, chief of the army air corps, revealed today that a bomber nearing completion in the Douglas plant is not only the biggest plane ever built but that it will be able to fly from New York to Europe and back to Los Angeles non-stop.

The plane, which will be in the air this fall, said Lt. Col. C. E. Bradshaw, army air corps officer in charge of its construction, is powered with four 2000-horsepower engines, the largest ever built.

Maj. Gen. Arnold and William S. Knudsen, chairman of the national defense advisory committee, are expected to arrive here at 9:30 this morning, continuing their inspection tour of aircraft factories in the southland. It is expected the party, which includes several ranking army officials, will visit Consolidated, Ryan and Solar plants.

Its wing spread is 212 feet and it is 112 feet long. Its tail assembly is larger than the ordinary commercial plane.

The plane will have a gasoline capacity of 11,000 gallons. It will carry bigger cannon than any airplane in the world, but Bradshaw said the exact armament details are secret. The plane will require a crew of 10.

The huge fighter has been under secret construction for four years.

Earlier today, Arnold displayed the world's fastest military airplane—the Lockheed interceptor—to William S. Knudsen, chairman of the national defense advisory committee, and told for the first time its performance figures.

Its speed, said Arnold, is 460 miles an hour at two-thirds throttle, but more than 500 m.p.h. "wide open." "The world's fastest," he added.

Its range is 1100 miles; rate of climb, 4000 feet per minute; armament, one rapid-fire cannon shooting a one-pound shell, and four machine guns.

AIRCRAFT PLANT POLICE PUT ON THEIR NEW UNIFORMS

Resplendent new uniforms were provided for Consolidated aircraft plant police for the first time yesterday. The force was distinguished in the new togs that will keep them separate from workers. Maintaining watch on workmen and visitors in the plant, the men operate in a "cooperative manner."

Union - 8/10/40

Marine Base, Navy Station Curb Watering to Insure Home Supply

While city officials struggled to maintain water pressures in the Mission Hills-Loma Portal-Pt. Loma districts, Fred Rhodes, city manager, announced yesterday that Marine base and Naval Training station executives have agreed to order immediate discontinuance of all daytime irrigation at the two large reservations.

Meantime, Fred Pyle, city hydraulic engineer, said everything possible is being done to maintain water service and pressure, but made it clear that if curtailment of water use at the two government establishments doesn't aid materially, it probably will be necessary to place some restriction on irrigation by private consumers.

The condition became acute Wednesday, said Rhodes, when homes in some parts of Pt. Loma were without water for five hours. Yesterday, he said, there was no service interruption, although pressures were down.

Pyle described the Naval Training station and the Marine base as the two largest consumers in the lowlands between Mission Hills and Pt. Loma, and expressed belief that limiting of watering at the bases to between 10 p.m. and 6 a.m. will be a big help.

Back of the difficulty, said Rhodes, is a pressing need for improvements of the water distribution system. He and Pyle emphasized that there is an abundance of water, but that growth of the city has bounded ahead of water-main extensions and enlargements.

As explained by Pyle, water is piped to a reservoir on Chatsworth blvd. from the University Heights reservoir. Pumps then lift the water from the Chatsworth reservoir to a tank on Pt. Loma, which serves the higher places on that promontory. When consumption is heavy in Mission Hills and the flats below, insufficient water reaches the Chatsworth reservoir to make it possible to fill the Pt. Loma tank, which goes dry.

FUTURE RELIEF SEEN

Some relief—but not this summer—will be provided when the Upas st. pipe line is extended from Fifth ave. to Pacific highway, said Pyle. The city council Tuesday will open bids for laying this pipe.

Six contractors, said Pyle, have taken out specifications which call for the trenching and placing of 6250 feet of 24-inch pipe within 130 days after the contract is signed. The job, excluding cost of the pipe, which the city has ordered, is expected to cost about $40,000, said the engineer.

Early this year, a 36-inch line was laid along Upas st. from Thirtieth st. to Fifth ave., and the new trunk is to be a continuation of the main, which cost $125,000.

BETTER THAN LAST YEAR

Some improvement in water pressures in the Mission Hills-Hillcrest district, as compared to last summer, has been provided since the first link of the Upas st. line was put in use, Pyle said. A year ago it was necessary to discontinue all daytime watering in Balboa park to help bolster pressures in Mission Hills.

On another front, chamber of commerce directors pointed to the accelerated national defense program as a contributing factor to inadequacy of the water distribution system in some parts of the city, and voiced accord with a proposal to invite government financial aid in remedying the "acute situation."

Maj. Edgar N. Gott, chamber director and vice president, Consolidated Aircraft Corp., said that "the tremendous increased acceleration of the national defense program in San Diego with its resultant increased demand for additional water merits consideration of the suggestion that federal assistance be sought." Gott emphasized that the increased defense activities embody vast improvements at the shore establishments here and in industries manufacturing vital defense materials such as aircraft.

PRESSURE DECREASED

"The Consolidated plant has seen an increase from 1100 employes a year ago to 8800 today with indications pointing to this number being increased to 15,000," Gott said.

After hearing a review of San Diego's water needs as explained by Fred Heilbron, city water commission chairman; Pyle, Ewart Goodwin, chamber water committee chairman, and Arthur Marston, business and civic leader, chamber directors were agreed that construction of San Vicente dam constitutes the next logical water development project.

Robert Lindsay, city treasurer, said that the city could vote a $3.000,000 bond issue and arrange for its retirement and payment of interest without necessitating a tax increase. He emphasized that money can be borrowed cheaply, one of the major factors favorable to approval of the issue. It has been estimated by financial leaders, Lindsay said, that a 3 percent interest rate for the bonds was a conservative estimate.

"The majority vote obtained for construction of the San Vicente dam at a previous election indicates that the people of San Diego agree this project is logically the next water development which should be undertaken," Marston said.

SAN VICENTE URGED

Heilbron emphasized that the "vision of San Diegans years ago in approving funds for construction of our present water facilities has led to the rapid growth and development enjoyed by our community. Without that vision," he said, "we would not have a city such as we have today."

"It is essential and absolutely necessary," he continued, "that we develop additional water facilities. The San Vicente project is the first logical step toward that development."

Frank Forward, chamber president, pledged aid of the chamber to steps taken toward winning a favorable decision on the proposed project.

Five Aircraft Companies Give Pledge 'to Build Planes First,' Talk Rewards Later

✓

Special to THE NEW YORK TIMES.

WASHINGTON, Aug. 20—A joint statement, issued tonight by the heads of the Douglas, Lockheed, Consolidated, Boeing and Vultee aircraft companies, declared that the aircraft industry was "ready to build airplanes first and talk about profits afterward."

"In spite of many obstacles and lack of proper legislation, we have gone ahead with preparations for increasing our production to meet the current challenge to America and build up aerial defense so vital to our national security," they said. "In this we have had the help of the Army, the Navy, the National Defense Advisory Commission and many other branches of the government.

"In the last ten weeks members of the industry have actually purchased on their own responsibility more than $100,000,000 worth of materials for future use and have spent or contracted obligations for more than $50,000,000 in additional plant facilities, machinery and equipment, and have added to their payrolls 21,000 new employes.

"If additional time can be saved, some companies are prepared to build and finance emergency expansions themselves while in other cases where the amounts involved are extremely large we are prepared to recommend that the government build and own during the period of the present emergency sufficient additional plants immediately required for our national defense program, and that these manufacturers be given the task of operating these emergency plants under any fair and reasonable arrangement approved by the government and consistent with free American traditions and institutions and conducive to efficiency and economy."

The statement was signed by Donald W. Douglas, president of the Douglas Aircraft Company; R. H. Fleet, president of the Consolidated Aircraft Corporation; Robert E. Gross, president of the Lockheed Aircraft Company; P. G. Johnson, president of the Boeing Airplane Company, and Richard Millar, president of Vultee Aircraft, Inc.

Industry Draft Bill Halts Plant Expansion Of 'Vast' Scope by Consolidated Aircraft

N.Y. Times 9/3/40

By The Associated Press.

SAN DIEGO, Calif., Sept. 2—Major Reuben H. Fleet, president of the Consolidated Aircraft Corporation, said today that announcement of "vast future expansion was being withheld because of a Senate bill authorizing conscription of industry."

Speaking at the dedication of a $2,500,000 adidtion to the company's plant, he warned against nationalization of the aircraft industry, citing the failure in France.

He expressed confidence that the industry could supply the planes needed not only to protect America from attack but to carry the war to any attacking enemy.

The announcement which was being withheld because of the Senate measure, he stated, covered expansion "here or in Texas." He declined to discuss the type of expansion planned or the possible site in Texas.

"We planned announcement today of further extensive plant expansions," he declared, "but the bill recently passed by the Senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our government makes us hesitate, much as we have been striving with all our might as a private enterprise to do our bit.

"Nationalization of her aircraft industry by France was so disastrous that that country's production fell down terribly, and even though she frantically resorted to foreign help at exorbitant expense, she collapsed as a nation and probably never will recover.

"We hope our government will not make this mistake, which would be the beginning of labor regimentation, the emasculation of labor unions, which our President has stated cannot strike against the government, and the end in this country of free enterprise."

Decision to withhold announcement of the future expansion will not affect that part of an enlargement program now under way and for which contracts have been awarded, Major Fleet added.

BIG CONTRACT TO CONSAIR

$14,861,342 For 56 U. S. Giant Bombers

Consolidated Aircraft Corp., of San Diego, has been awarded a contract for $14,861,342 for the purchase of 56 four-engine bombing planes, by the war department, it was announced today from Washington in dispatches of The Associated Press.

One of Two Orders

This is one of two contracts awarded, the other going to the Fairchild Engine & Airplane Corp., of Hagerstown, Md., for $1,038,000 for 100 training planes.

According to officials of the local concern, the order signed by war department officials today is in exercise of a contract already existing.

Work on the new assignment has not yet started, it was said, although requests for bids on materials to be used, have been issued.

The war department did not announce the date on which delivery of either group of planes is to be expected.

The orders were the third of a group announced since congress voted $400,000,000 for approximately 4200 additional army planes last June, the dispatches stated.

Industry Draft Bill Halts Plant Expansion Of 'Vast' Scope by Consolidated Aircraft

Plant Draft Proposal Holds Up Expansion Plan

SEES MISTAKE—Maj. Reuben Fleet, head of Consolidated Aircraft at San Diego, scored wealth conscription measure yesterday at dedication of new addition to plant.

SAN DIEGO, Sept. 2.—Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., today denounced the Senate's "wealth conscription" legislation authorizing "peacetime commandeering of industrial plants" if the latter's operations fail to please any high government officials.

Announcement of "vast future expansion is being withheld because of the Senate measure," Maj. Fleet said. He said the announcement proposed to cover expansion "here or in Texas" but decined to amplify his statement as to the type of expansion planned or the possible site in Texas.

FRANCE'S MISTAKE

Speaking to thousands who attended dedication of Consolidated's new $2,500,000 plant expansion, he expressed hope that the United States government does not make the mistake of France, where "nationalization of the aircraft industry was so disastrous."

Maj. Fleet saw in the Senate bill "the beginning of labor regimentation, the emasculation of labor unions which our President has stated cannot strike against the government and the end in this country of free men and free enterprise."

FURTHER ADDITION

He disclosed Consolidated's new backlog as $132,000,000 and declared that only the industrial draft legislation made him hesitate to announce officially a contemplated $2,500,000 further addition to a factory which already is the largest within one fenced-in-area of the country.

The crowd heard Rear-Admiral Charles A. Blakely, 11th Naval District commandant, formally dedicate the plant addition. Other addresses were given by Brig. Gen. Frank D. Lackland, wing commander, March Field; Maj. Gen. W. P. Upshur, commander Fleet Marine Force, and Col. Peter H. Ottosen, commander, Ft. Rosecrans.

Aircraft Leaders Doing Part in National Defense

CARL S. KELTY

Reaffirming declarations of the positive ability and strong desire on the part of the aircraft manufacturing industry to support and help speed the national defense program, Robert E. Gross, president of Lockheed Aircraft Corporation, yesterday emphasized unequivocally that the industry can undertake and accomplish the task. He remarked that this is the only organized activity that can accomplish the task and do it within a reasonable time. The statement of Mr. Gross was made in the course of comment on the result of Lockheed's operations during the first half of 1940, reported in another column. Since the beginning of the defense program Mr. Gross, in conjunction with other leaders of the aviation industry, has been outspoken in stating that the cause for national defense can best be furthered by "getting the facilities first and talking about the orders and profits later." He declared yesterday the recent acts of the National Defense Council was very constructive for the aircraft companies in devising and proposing programs to insure rapid delivery of existing and prospective orders for the U. S. Government.

* * *

How the Lockheed Corporation met the situation and went ahead to forestall delay when the actual signing of contracts for these orders was held up somewhat, was explained by Mr. Gross. The delay was occasioned, he observed, by uncertainty as to how the emergency plants involved were to be financed.

"Notwithstanding this, and with the conviction that this uncertainty would be presently clarified," Mr. Gross said," the Lockeed company went ahead with the vast expansion program necessary.

"We have purchased materials since early June totaling $12,000,000. Plant and buildings ordered and under construction for Lockheed and its subsidiary, Vega Airplane Company, exceed $6,000,000. Several thousand new employees have been added to the payroll bringing the total to over 12,000."

* * *

Mr. Gross pointed out the logic of this program has been borne out by a sequence of developments during the last 72 hours, since at the very moment of the issuance of its half-year report Lockheed was closing with the War Department one of the large orders which are so vital to defense.

The order, totaling approximately $30,000,000, was announced by Secretary Stimson in Washington and was for the latest Lockheed twin-engined interceptor fighters—ships of the type on which William Knudsen and Major General Henry Arnold put their stamp of approval when visiting the plant last week. The plane was characterized as the highest performer of its type in existence.

With its negotiations with the Government finished, its order signed and its personnel and plant already expanded, "Lockheed," said Mr. Gross, "will bend every ounce of its energy and strength to getting the job done."

* * *

That Lockheed is looking far ahead was evidenced by the statement made by Mr. Gross in his report to the stockholders that the company is conducting through the good offices of the California Institute of Technology novel courses designed to adapt large numbers of graduate engineers to the aircraft industry. Furthermore, the management is steadfastly adhering to its policy of keeping in the forefront of the commercial and nonmilitary aviation fields, in which interest continues to increase. In order to fortify its technical progress, Lockheed is building one of the largest and most modern private wind tunnels in this country.

* * *

Dedicating a $2,000,000 addition to the Consolidated Aircraft Corporation plant in San Diego which has just been completed and placed in operation, Major R. H. Fleet, president of the corporation, said yesterday he had hoped simultaneously to announce an additional expansion program to fit in with rearmament needs.

"The proposed Federal legislation permitting the Government to commandeer industrial plants makes us hesitate," Major Fleet said.

He expressed the view that the nationalization of the aircraft industry by France played a most important contributing role in the collapse of that country.

Major Fleet also announced acquisition by Consolidated Aircraft by purchase of the Hall Aluminum Corporation of Bristol, Conn., which will construct an aluminum plant at Dallas, Tex.

The Sun News-Pictorial

FULL REQUIREMENT

VICTORIA - AUSTRALIA

BIG ORDER MEETS AIR SCHEME AND HOME DEFENCE NEEDS

6/7/40

EXPLAINING the £2,032,000 aircraft order decided by War Cabinet, the Prime Minister (Mr. Menzies) said last night that the De Havilland Tiger Moth was the standard elementary training aircraft in use by the R.A.A.F. The additional 300 now being ordered would provide the full requirements of the Empire Air Scheme, as well as of Australia's home defence units.

THE design of the Wackett trainer is of composite wood and tubular steel construction, and as these materials can be readily obtained from local sources, production can be started without delay.

The machine will be provided with a 175 horse power Scareb engine to be obtained from the United States. Supplies of engines will be available in time to meet airframe production.

Mr. Menzies said the Empire flying boats, with which No. 11 Squadron was at present equipped would, on the advice of the air authorities, be replaced with the least possible delay by the purchase of seven P.B.Y.5 flying boats from the United States.

Guba Service Type

THESE machines, which are the most suitable type available at short notice, are produced by the Consolidated Aircraft Corporation of U.S.A. Similar types are at present giving satisfactory service with the Coastal Command of the R.A.F.

They are the service version of the Guba machine, which recently visited Australia and later flew over the Indian Ocean.

Use For New Wackett Trainer

THE new Wackett advanced trainer would be used for some of the work for which the Wirraways were originally intended, the Minister for Air (Mr. Fairbairn) said last night.

The Wirraways, in turn, would be employed for the advanced training which would have been done in the Fairey Battles, delivery of which had been delayed.

The Wackett machine, said Mr. Fairbairn, was designed as an advanced elementary trainer.

Wing Commander Wackett had also designed a twin-engined bomber, which could be made from the same materials as the Wirraway. If it proved successful there would be, on the completion of Wirraway orders, a switch over to the bomber so that there would be no cessation of work at the aircraft factory.

"There is no doubt about the suitability of the Guba type flying boats," added Mr. Fairbairn. "They are magnificent long range machines."

U. S. NAVAL CHIEF PUTS STRESS ON AIR POWER

COMDR. J. T. MATHEWS SECY. FRANK KNOX REAR ADM. C. A. BLAKELY
. . . trading destroyers for bases was "a good deal."

* * *

U. S. TO MAKE AMERICAN LAKE OF CARIBBEAN, ASSERTS KNOX

Roosevelt Destroyer Deal, S. D. Planes Praised by Secretary on Arrival

By JERRY MacMULLEN

"The best defense against aircraft is other aircraft, although anti-aircraft fire is important. When we get St. Lucia, Antigua and the rest, it will have made an American lake of the Caribbean—and God help any enemy warcraft that get in, for they'll never get out." Thus Secretary Frank Knox last evening enlarged upon his statement—"it was a good deal"—in referring to the trade of 50 over-age destroyers to England, in return for bases along the Atlantic and the Spanish Main; it was a deal, he says, which has left this country far stronger than before.

INTERVIEWED BY PRESS

Sandwiched in between a busy afternoon of inspections and a dinner given in his honor by the city and the chamber of commerce, the secretary, who arrived yesterday forenoon by plane from Hawaii, found time to grant an interview to press representatives, in which he touched on national defense in many phases, as well as upon the time of the return of the U. S. fleet to the mainland from the Hawaiian area.

"Now that the appropriations for the work have been made," he said, "I am putting every ounce of energy into speeding things up. My job is to drive—drive—drive. We have none too much time; we started late.

AHEAD OF SCHEDULE

"My six days with the fleet in Hawaii revealed to me that the navy is in excellent condition. There is no doubt but what we have the best fleet in the world, in striking power, in personnel and in ability of command. The air arm of the fleet is very, very capable; of course, they have not yet received their new planes, but these are coming. When they get them, the present ones will be used for instruction at Pensacola,

U. S. TO MAKE AMERICAN LAKE OF CARIBBEAN, ASSERTS KNOX

(Continued From Page 1)

San Diego and the new training bases.

"Every phase of the naval expansion work is ahead of schedule. This is true all over the United States; they're working three shifts of men on a 48-hour week, generally with around 40 hours' overtime where it is required in some "bottle-neck.'

"There is no 'bottle-neck' in the aircraft engine production. Just before I left, we let the contract for 17,000 aircraft engines. Of course, they won't be finished tomorrow; it's a two-year program."

Apparently attaching little importance to the "draft industry" provision of the Burke-Wadsworth military training bill, the secretary pointed out the fact that the government had the same power as far back as 1917.

"It's a valuable power to have," he said, "but I hope I never shall have to use it—and I probably never will. Thus far we have had nothing but the finest cooperation from industry."

SHIPS RETURNING

Secretary Knox revealed that the U. S. fleet, now in Hawaiian waters, will return to the California ports in three groups of around 30 ships each, and each group will remain here two weeks for shore-leave and for overhaul. The first group—led by Adm. James O. Richardson, commander-in-chief of the U. S. fleet—was to leave Hawaii yesterday, he said.

The navy's chief revealed that he is not presently interested in either the Nicaraguan canal proposal or the plan to cut a second ship channel through the Coronado strand.

"So far as a second canal is concerned," he said, "I am much more interested in a second set of locks for the Panama canal, and this project already is under way. The new locks will be half a mile or so from the present ones. It will take much less time, and cost far less, than to build a second complete canal.

"I know nothing of the proposal to cut through the Coronado strand, and there are other things in which we are far more interested. That can wait."

AIR ONLY PANAMA PERIL

The only possible vulnerability of the Panama canal is by an air attack, the secretary said. He pictured as hopeless the plight of any naval force so rash as to come within range of the canal defense guns, and pointed out that a land attack, through the impenetrable jungles along the Canal Zone, would be out of the question.

Taking issue with statements attributed to him elsewhere that he had reported this country to be negotiating for bases at Cocos and in the Galapagos archipelago, he made it clear that the thing is merely in the stage of discussion, and that this discussion is only of an intra-departmental nature. He added that the United States has had nothing but "the most enthusiasic cooperation" from the countries controlling these islands.

HOPE FOR ENGLAND

Turning to the European situation, the secretary said that he thinks the danger of a successful invasion of England grows less with each day—that England is holding her own, if not actually gaining.

"One thing to remember," he said, "is that they are fighting over England. If an English plane is crippled and the pilot bails out, he lands in England, and the first thing you know he's up in another plane. If a German pilot bails out he lands in England—and goes to a concentration camp. An offensive force always suffers more than a defensive, and German losses have been much greater than British. I think England has better than a 50-50 chance. The British are good fliers—and so

but we just climbed up until we were over it, and sailed on, above the clouds. It was the same way coming back. We were up above the clouds, in the light of a beautiful full moon, with nothing in sight below us but moon-lighted banks of clouds."

Today the secretary will visit the Consolidated plant, where the big planes are made. He also will inspect the marine corps base, where a review—open to the public—will be made at 10:20 a.m. At 11 a.m. he will visit the training station, and soon after noon will take off in a land plane for San Pedro. Tonight he will be in Los Angeles, and tomorrow morning will take off for the flight back to Washington, D.C. Yesterday, he visited the Naval Air station, the hospital, marine combat range, aircraft shops, new site for the carrier-based plane hangars, and the destroyer base.

MET BY COMMANDANT

The secretary and his party were met at the Naval Air station by Rear Adm. Charles A. Blakely, commandant of the 11th naval district, and Comdr. James T. Mathews (CES), district public works officer; they were accompanied by Frank Forward, president of the chamber of commerce, T. C. Macaulay, executive secretary, and Howard Worth, chairman of the chamber's army and navy committee.

Accompanying the secretary on his trip are Capt. M. L. Deyo, his aid; Col. W. F. Donovan and John F. O'Keefe, his personal secretary. Rear Adm. A. B. Cook, commanding the scouting force aircraft, flew here with him.

Col. Donovan, a former member of the famous "Fighting 69th" regiment in France, was welcomed to San Diego by two other former members of the organization — Arthur George, 1515 Second ave., and John Hilton, of the board of equalization. A third San Diegan from the same "outfit" is James O'Connor, music teacher.

At the invitation of George, former commander of Joyce Kilmer chapter of the Rainbow division association, Donovan last night attended the chapter's local meeting, in the American Legion building. The "Fighting 69th" was a unit of that division.

SERVED WITH T. R.

At the age of 11, in Grand Rapids, Knox began a newspaper career as a paper boy at $1.25 a week. He left school at 15 to become a shipping clerk's helper, and later got into "the big money" — $15 a week —as a wholesale book and stationery salesman. Losing his job in the 1893 panic, he went back to school and later to college.

During the Spanish-American war he effected a transfer from his regiment to Lt. Col. Theodore Roosevelt's famed "Rough Riders," and was near death in the assault on San Juan hill when a Spanish bullet passed through his hat. Later he was to be one of Roosevelt's supporters in the "Bull Moose" campaign of 1912.

Knox' first newspaper of his own —he had been working toward a newspaper career even while serving in '98—was a weekly printed in Sault Ste. Marie. Later he transferred his activities to Manchester, N. H. His paper was a leader in blasting at slackers and draft evaders—and when he was turned down by the officers' reserve corps because of filled quotas he enlisted in the First New Hampshire infantry as a private. In France he became a major.

OPERATED DAILY NEWS

He took over operation of the Chicago Daily News in 1931, and in 1936 was Republican candidate for the vice presidency. Upon the resignation of Charles Edison as secretary of the navy a few months ago he was named to take his place.

Keenly interested in the publishing business, he "turned the tables" on his interviewers by quizzing them on local business conditions. Before the interview, the correspondents had "pooled" their questions, which were presented to him in typewritten form to save time. He went down the list, answering the queries and expanding upon those which opened additional trains of thought. A spirit of friendly cooperation with his interviewers was obvious throughout the conference.

Union 7/3/40

MILLIONS VOTED FOR PLANES, BUT BUILDING STILL HELD UP

By W. W. CHAPLIN

NEW YORK, Aug. 2 (I.N.S.)—Congress has made money available and the aviation industry is ready to begin production to meet the defense goal of 25,000 army and navy planes by July 1, 1942, but to date work has not been begun on one single fighting plane of this new emergency air fleet program, because of a major impasse, a survey of official sources and aircraft factories disclosed tonight.

The national defense commission has "cleared" $84,000,000 worth of contracts for fighting planes—that is, approved terms and prices and specifications—but they have all had to be sent back to the war department for re-writing to provide manufacturers with adequate guarantees against financial loss.

ONLY 1 CONTRACT DELIVERED

So far the only contract in the present air program which has been delivered to a manufacturer, permitting immediate commencement of production, is one for $900,000 worth of training planes to be built by the Cessna Aircraft Corp., of Wichita, Kan.

The bottleneck apparently chiefly responsible for holding up expansion of the fighting air arms is amortization and profit allowance.

Manufacturers insist that as originally drawn and cleared by the defense commission, the contracts for mass plane production might force the aviation companies into "industrial suicide," and subject them to post-war bankruptcy.

Since the 25,000 plane program was decided on, congress has appropriated or authorized expenditure of $688,459,297 for plane production and pending legislation permits expenditure of another $1,522,000,000 for that purpose. The $688,297 has been ready to use for more than a month but still has not been forced through the bottleneck and hence there is virtually no actual construction under way on the fighting planes to be built.

FDR DENIES RED TAPE

Existing laws and regulations do not permit a type of contract which the maufacturers feel gives them a fair chance of coming out even.

President Roosevelt said at his press conference today that governmental red tape was not responsible for slowing up the program, but manufacturers reply that it has been halted and that the cure lies with the government and congress.

As the situation now stands the treasury allows 10 years for amortization of plant expansion and the legal profit to the manufacturer in excess of cost is 12 percent.

The plane makers object that if changing conditions abroad should reduce defense needs sharply in the near future, they would be left with great plants which were not needed for normal peacetime production and would have to be written off as almost total loss. They believe that a five year amortization period is the longest they can assume in justice to their stockholders.

The 12 percent profit limit now legally set is expected to be lifted and that feature of the program handled in the general excess profits bill now before congress.

But before committing themselves to contracts the plane men want to know what margin they are to be allowed and whether such items as expense of research and engineering, added taxes, interest on capital borrowed for expansion, and "human error" mistakes in manufacture can be included in the total cost figure to which the profit is added. If this is not allowed, they say, the "profit" might well turn out to be a loss.

Every manufacturer questioned in the present survey expressed full confidence of the industry's ability to produce the proposed 25,000 planes in the allotted time, but only asked that full assurance be given that the industry would be protected against destroying itself in its effort to build up the national defense.

WOULD KEEP PLANTS POSTED

Plane men said that in an effort to overcome hesitancy of manufacturers to enter contracts without full guarantees, the government had offered them "letters of intent," specifying the planned orders to be given each factory as the program develops.

These letters, however, would not be binding if congress should withhold future appropriations due to a slackening of the emergency.

There has been some friction, it was indicated, between the executive branch and administrative branches in charge of the air program and congress. One war department official suggested that if continued delay was caused by lack of satisfactory legislation, a "short cut" might be used.

This would consist of rewriting contracts as now being drawn to raise the unit price so that amortization could be speeded, but this would mean less planes for the money spent and boost the cost of the whole program.

WORKING WITH SINGLE AIM

In all sources of information covered in this survey it was stressed that all parties involved — the defense commission, congress and the manufacturers — were working toward the same objective—adequate national defense. Differences of opinion, however, as to the means to that end were said to be holding up the program to an extent which was threatening its successful completion by the proposed date.

Only this week the defense commission called officials of seven leading plane companies to Washington to thresh the matter out, and it was hoped that these conferences might result in early breaking of the bottleneck. The companies represented were Douglas, Boeing, Consolidated, Curtiss - Wright, Martin, North American and Lockheed.

Most of these companies already have, even without the signing of contracts, begun the purchase of large supplies of material on their own responsibility in order to be ready for immediate production with existing plant equipment as soon as contracts are finally signed.

Union – Wed – 9/18/40

Knox Winds Up Busy 26 Hours in S. D.; Meets Boat Builders, Reviews Marines

Naval Secretary Visits Consair Plant; Hops North

A busy 26 hours in San Diego was concluded yesterday by Secretary of the Navy Frank Knox, his visit winding up with a conference with southern California boat builders, a review at the marine corps base, a trip through the Consolidated Aircraft Corp. plant, and luncheon with the recruits at the Naval Training station.

The conference with the boat builders was held in the office of Rear Adm. Charles A. Blakely, commandant of the 11th Naval district, and fulfilled an appointment made by overseas telephone to Honolulu by Capt. Miller Freeman, U.S.N.R., Seattle publisher and senior naval reserve officer on the Pacific coast. Freeman, who publishes Pacific Motor Boat, Pacific Fisherman and other trade journals, was acting in behalf of the shipyards of the west coast, eager to cooperate with the navy in the building of small craft for naval use.

"We want to cooperate wholeheartedly with the navy in the defense program," said Freeman. "An increasing number of small vessels will be needed by the navy—small torpedo boats, dispatch tenders, and work boats for naval use. Hundreds—perhaps thousands—of these craft will be needed. We have the builders, the facilities, the technique to provide them. Many types in use throughout the country, and even by the forces of the nations now at war, originated on the west coast."

URGES NEW BUREAU

Freeman urged the creation of a new bureau in the navy department, solely for the handling of procurement and operation of small craft. Active in naval reserve work for many years, he organized the first reservists in the 13th naval district, in 1910. During the last war he was a lieutenant commander and worked first with small boat units in the navy, and then in training personnel.

Capt. Oakley J. Hall, head of the Star & Crescent industries here, was the spokesman for the boatbuilders yesterday. Others attending the meeting were George C. Campbell, Campbell Machine Co.; Joseph Fellows jr., Fellows & Stewart, San Pedro; John Rados, Harbor Boat Works, San Pedro, and Walton Hubbard jr., South coast Co., Newoprt harbor.

Secy. Knox expressed his appreciation of the desire of the boatbuilders to cooperate, and assured them that west coast yards would be given every consideration.

Following the meeting in the admiral's office, the secretary left for a brief trip through the Consolidated plant—where the big four-motored plane in which he flew to and from Honolulu was built.

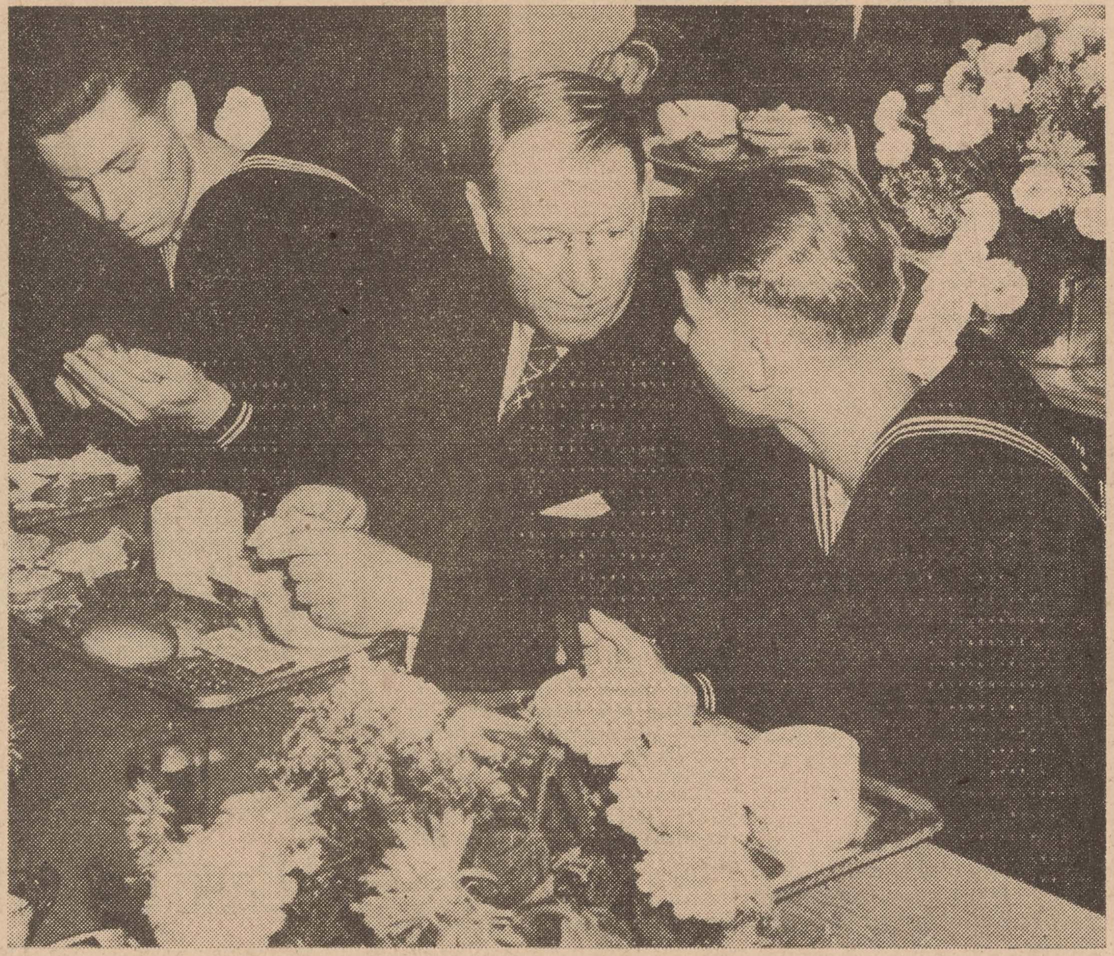
VISITS STATIONS

Proceeding to the marine corps base, Secy. Knox reviewed thousands of marching sea-soldiers and their equipment. The colorful review was open to the public and was attended by many.

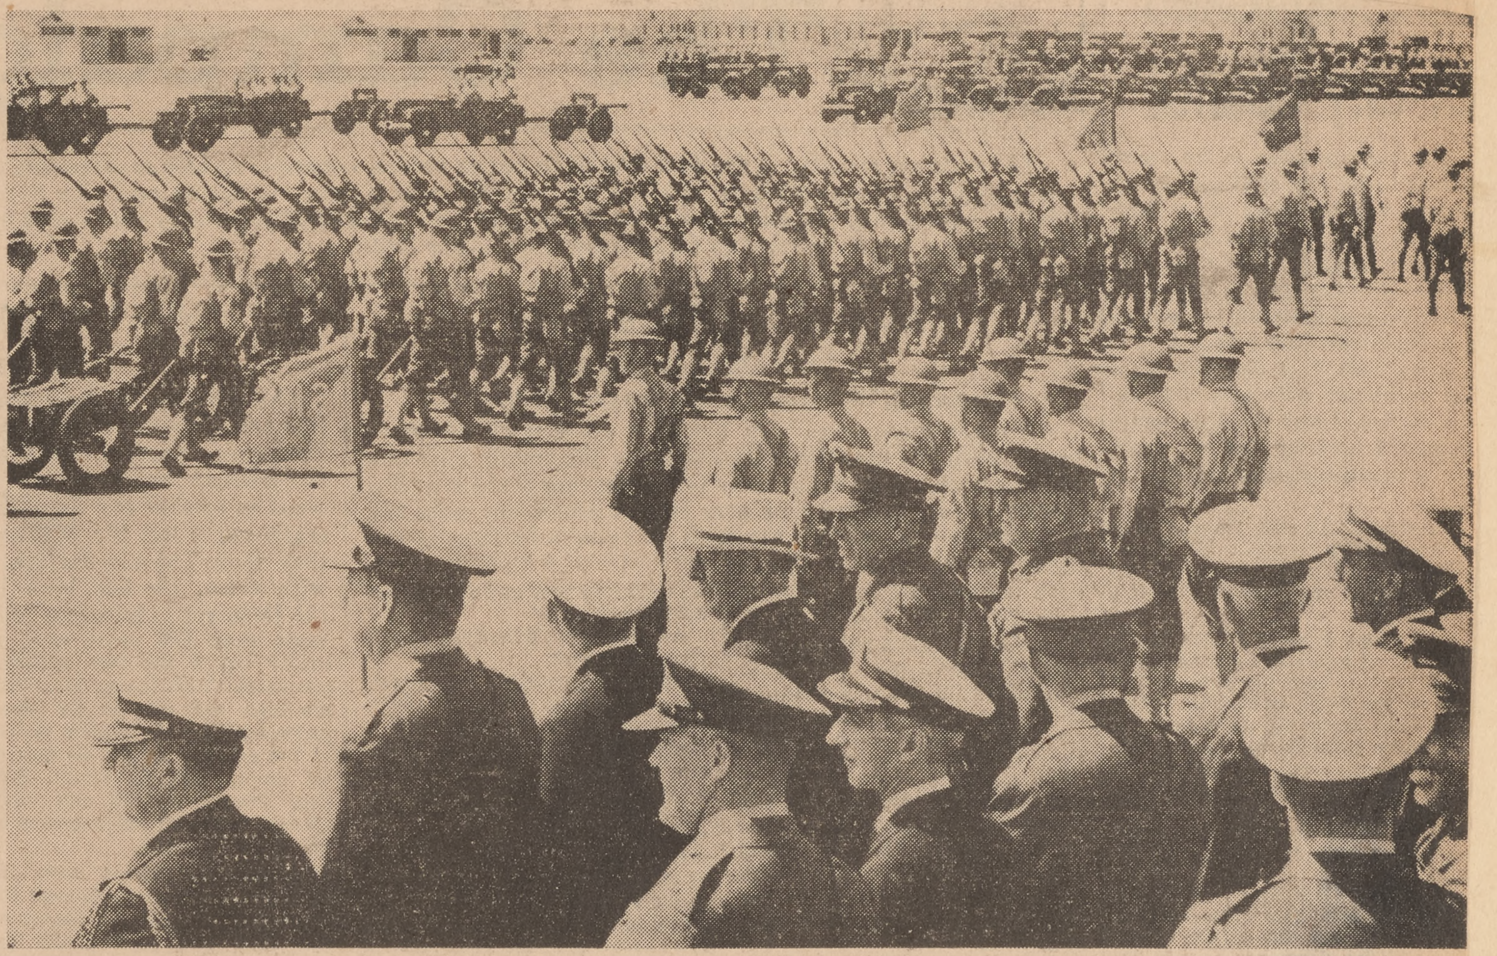
From the marine corps base, the secretary and his party went to the Naval Training station, where after a brief inspection he sat down in the mess-hall with 500 recruits, receiving their initial training as man-o-warsmen. An Illinois recruit sat at each side of the secretary during the meal—R. M. Mathias, 19, Bethany, Ill., and Jackson Carlson, 21, Westmont, Ill.

"One of them told me that he has gained 19 pounds, the other 23 pounds, since joining the navy," Knox said after the meal. "Both said that they joined the navy to get a career and to learn a trade. I think it's wonderful!"

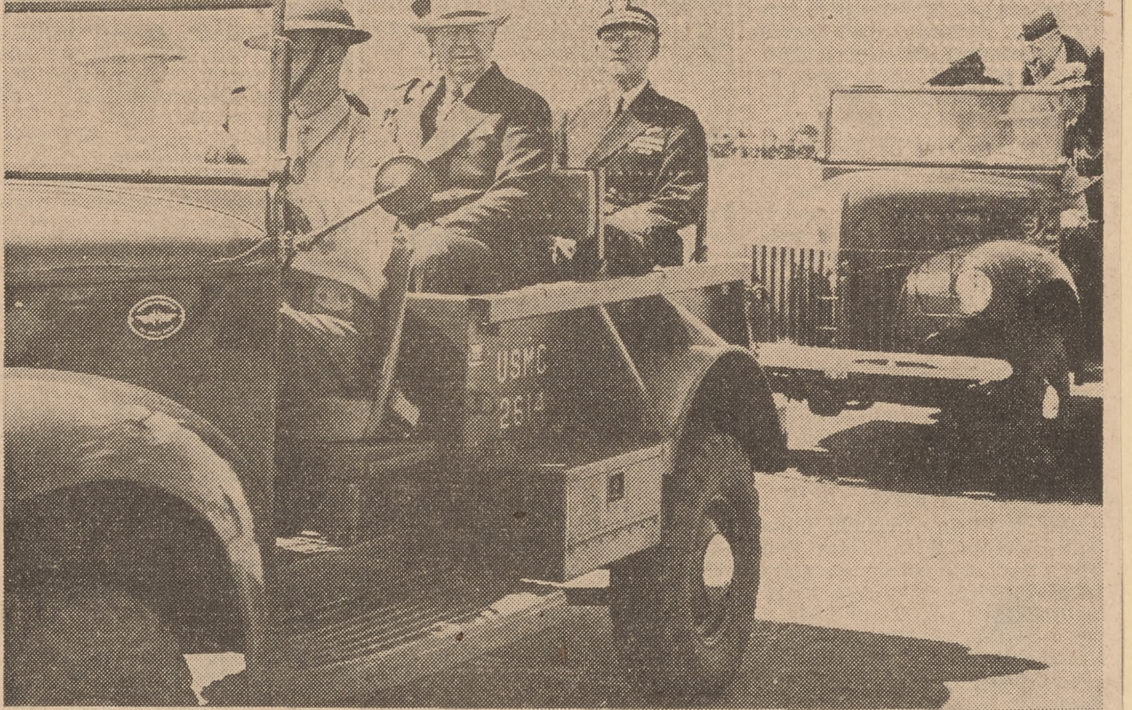
From the training station the secretary and his party went to Lindbergh field, where they took off in a low-winged landplane for San Pedro. Instead of flying directly up the coast, however, they swung inland to give the secretary an air view of the marines' plant at Cam Elliott, on Camp Kearny mesa. Th the plane headed north.



At the Naval Training station yesterday, Col. Knox dropped in at the mess hall to have lunch with 500 recruits. Sitting next to the navy secretary and exchanging views with him are (left) R. M. Mathias, 19, and Jackson Carlson, 21, both of Illinois. Knox said he enjoyed the conversation.



With naval and marine corps officers, Col. Knox (lower center) reviewed thousands of marching sea-soldiers at the marine base. Hundreds of civilians view the parade. From the marine base Knox and his party went to the Naval Training station.



One of Col. Knox's "taxis" in his inspection of San Diego's part of national preparedness was this marine corps "auto." His inspection took in most of San Diego's waterfront, as well as aircraft plants.

U. S. NAVAL CHIEF PUTS STRESS ON AIR POWER

COMDR. J. T. MATHEWS SECY. FRANK KNOX REAR ADM. C. A. BLAKELY
. . . trading destroyers for bases was "a good deal."

* * *

U. S. TO MAKE AMERICAN LAKE OF CARIBBEAN, ASSERTS KNOX

Roosevelt Destroyer Deal, S. D. Planes Praised by Secretary on Arrival

By JERRY MacMULLEN

"The best defense against aircraft is other aircraft, although anti-aircraft fire is important. When we get St. Lucia, Antigua and the rest, it will have made an American lake of the Caribbean—and God help any enemy warcraft that get in, for they'll never get out." Thus Secretary Frank Knox last evening enlarged upon his statement—"it was a good deal"—in referring to the trade of 50 over-age destroyers to England, in return for bases along the Atlantic and the Spanish Main; it was a deal, he says, which has left this country far stronger than before.

INTERVIEWED BY PRESS

Sandwiched in between a busy afternoon of inspections and a dinner given in his honor by the city and the chamber of commerce, the secretary, who arrived yesterday forenoon by plane from Hawaii, found time to grant an interview to press representatives, in which he touched on national defense in many phases, as well as upon the time of the return of the U. S. fleet to the mainland from the Hawaiian area.

"Now that the appropriations for the work have been made," he said, "I am putting every ounce of energy into speeding things up. My job is to drive—drive—drive. We have none too much time; we started late.

AHEAD OF SCHEDULE

"My six days with the fleet in Hawaii revealed to me that the navy is in excellent condition. There is no doubt but what we have the best fleet in the world, in striking power, in personnel and in ability of command. The air arm of the fleet is very, very capable; of course, they have not yet received their new planes, but these are coming. When they get them, the present ones will be used for instruction at Pensacola,

U. S. TO MAKE AMERICAN LAKE OF CARIBBEAN, ASSERTS KNOX

(Continued From Page 1)

San Diego and the new training bases.

"Every phase of the naval expansion work is ahead of schedule. This is true all over the United States; they're working three shifts of men on a 48-hour week, generally with around 40 hours' overtime where it is required in some "bottle-neck.'

"There is no 'bottle-neck' in the aircraft engine production. Just before I left, we let the contract for 17,000 aircraft engines. Of course, they won't be finished tomorrow; it's a two-year program."

Apparently attaching little importance to the "draft industry" provision of the Burke-Wadsworth military training bill, the secretary pointed out the fact that the government had the same power as far back as 1917.

"It's a valuable power to have," he said, "but I hope I never shall have to use it—and I probably never will. Thus far we have had nothing but the finest cooperation from industry."

SHIPS RETURNING

Secretary Knox revealed that the U. S. fleet, now in Hawaiian waters, will return to the California ports in three groups of around 30 ships each, and each group will remain here two weeks for shore-leave and for overhaul. The first group—led by Adm. James O. Richardson, commander-in-chief of the U. S. fleet—was to leave Hawaii yesterday, he said.

The navy's chief revealed that he is not presently interested in either the Nicaraguan canal proposal or the plan to cut a second ship channel through the Coronado strand.

"So far as a second canal is concerned," he said, "I am much more interested in a second set of locks for the Panama canal, and this project already is under way. The new locks will be half a mile or so from the present ones. It will take much less time, and cost far less, than to build a second complete canal.

"I know nothing of the proposal to cut through the Coronado strand, and there are other things in which we are far more interested. That can wait."

AIR ONLY PANAMA PERIL

The only possible vulnerability of the Panama canal is by an air attack, the secretary said. He pictured as hopeless the plight of any naval force so rash as to come within range of the canal defense guns, and pointed out that a land attack, through the impenetrable jungles along the Canal Zone, would be out of the question.

Taking issue with statements attributed to him elsewhere that he had reported this country to be negotiating for bases at Cocos and in the Galapagos archipelago, he made it clear that the thing is merely in the stage of discussion, and that this discussion is only of an intra-departmental nature. He added that the United States has had nothing but "the most enthusiasic cooperation" from the countries controlling these islands.

HOPE FOR ENGLAND

Turning to the European situation, the secretary said that he thinks the danger of a successful invasion of England grows less with each day—that England is holding her own, if not actually gaining.

"One thing to remember," he said, "is that they are fighting over England. If an English plane is crippled and the pilot bails out, he lands in England, and the first thing you know he's up in another plane. If a German pilot bails out he lands in England—and goes to a concentration camp. An offensive force always suffers more than a defensive, and German losses have been much greater than British. I think England has better than a 50-50 chance. The British are good fliers—and so are the Germans. And the Germans are good soldiers; I know, for I fought against them, in France. Never make the mistake of underestimating their ability."

LIKES S. D. PLANES

"You might put in a boost for these planes you build here in San Diego," he said. "That plane in which I went to and from Honolulu, is a beauty. We made a record—14 hours and 15 minutes—for the flight out from San Francisco, and our trip back here was the first return flight to San Diego. From San Francisco we had a tail wind; coming home we had a head wind, and yet we made it in 15 hours and 30 minutes.

"We hit a storm on the way out, but we just climbed up until we were over it, and sailed on, above the clouds. It was the same way coming back. We were up above the clouds, in the light of a beautiful full moon, with nothing in sight below us but moon-lighted banks of clouds."

Today the secretary will visit the Consolidated plant, where the big planes are made. He also will inspect the marine corps base, where a review—open to the public—will be made at 10:20 a.m. At 11 a.m. he will visit the training station, [illegible] after noon will take off in a land plane for San Pedro. Tonight he will be in Los Angeles, and tomorrow morning will take off for the flight back to Washington, D.C. Yesterday, he visited the Naval Air station, the hospital, marine combat range, aircraft shops, new site for the carrier-based plane hangars, and the destroyer base.

MET BY COMMANDANT

The secretary and his party were met at the Naval Air station by Rear Adm. Charles A. Blakely, commandant of the 11th naval district, and Comdr. James T. Mathews (CES), district public works officer; they were accompanied by Frank Forward, president of the chamber of commerce, T. C. Macaulay, executive secretary, and Howard Worth, chairman of the chamber's army and navy committee.

Accompanying the secretary on his trip are Capt. M. L. Deyo, his aid; Col. W. F. Donovan and John F. O'Keefe, his personal secretary. Rear Adm. A. B. Cook, commanding the scouting force aircraft, flew here with him.

Col. Donovan, a former member of the famous "Fighting 69th" regiment in France, was welcomed to San Diego by two other former members of the organization — Arthur George, 1515 Second ave., and John Hilton, of the board of equalization. A third San Diegan from the same "outfit" is James O'Connor, music teacher.

At the invitation of George, former commander of Joyce Kilmer chapter of the Rainbow division association, Donovan last night attended the chapter's local meeting, in the American Legion building. The "Fighting 69th" was a unit of that division.

SERVED WITH T. R.

At the age of 11, in Grand Rapids, Knox began a newspaper career as a paper boy at $1.25 a week. He left school at 15 to become a shipping clerk's helper, and later got into "the big money" — $15 a week —as a wholesale book and stationery salesman. Losing his job in the 1893 panic, he went back to school and later to college.

During the Spanish-American war he effected a transfer from his regiment to Lt. Col. Theodore Roosevelt's famed "Rough Riders," and was near death in the assault on San Juan hill when a Spanish bullet passed through his hat. Later he was to be one of Roosevelt's supporters in the "Bull Moose" campaign of 1912.

Knox' first newspaper of his own —he had been working toward a newspaper career even while serving in '98—was a weekly printed in Sault Ste. Marie. Later he transferred his activities to Manchester, N. H. His paper was a leader in blasting at slackers and draft evaders—and when he was turned down by the officers' reserve corps because of filled quotas he enlisted in the First New Hampshire infantry as a private. In France he became a major.

OPERATED DAILY NEWS

He took over operation of the Chicago Daily News in 1931, and in 1936 was Republican candidate for the vice presidency. Upon the resignation of Charles Edison as secretary of the navy a few months ago he was named to take his place.

Keenly interested in the publishing business, he "turned the tables" on his interviewers by quizzing them on local business conditions. Before the interview, the correspondents had "pooled" their questions, which were presented to him in typewritten form to save time. He went down the list, answering the queries and expanding upon those which opened additional trains of thought. A spirit of friendly cooperation with his interviewers was obvious throughout the conference.

Union 7/3/40

MILLIONS VOTED FOR PLANES, BUT BUILDING STILL HELD UP

By W. W. CHAPLIN

NEW YORK, Aug. 2 (I.N.S.)—Congress has made money available and the aviation industry is ready to begin production to meet the defense goal of 25,000 army and navy planes by July 1, 1942, but to date work has not been begun on one single fighting plane of this new emergency air fleet program, because of a major impasse, a survey of official sources and aircraft factories disclosed tonight.

The national defense commission has "cleared" $84,000,000 worth of contracts for fighting planes—that is, approved terms and prices and specifications—but they have all had to be sent back to the war department for re-writing to provide manufacturers with adequate guarantees against financial loss.

ONLY 1 CONTRACT DELIVERED

So far the only contract in the present air program which has been delivered to a manufacturer, permitting immediate commencement of production, is one for $900,000 worth of training planes to be built by the Cessna Aircraft Corp., of Wichita, Kan.

The bottleneck apparently chiefly responsible for holding up expansion of the fighting air arms is amortization and profit allowance.

Manufacturers insist that as originally drawn and cleared by the defense commission, the contracts for mass plane production might force the aviation companies into "industrial suicide," and subject them to post-war bankruptcy.

Since the 25,000 plane program was decided on, congress has appropriated or authorized expenditure of $688,459,297 for plane production and pending legislation permits expenditure of another $1,522,000,000 for that purpose. The $688,297 has been ready to use for more than a month but still has not been forced through the bottleneck and hence there is virtually no actual construction under way on the fighting planes to be built.

FDR DENIES RED TAPE

Existing laws and regulations do not permit a type of contract which the maufacturers feel gives them a fair chance of coming out even.

President Roosevelt said at his press conference today that governmental red tape was not responsible for slowing up the program, but manufacturers reply that it has been halted and that the cure lies with the government and congress.

As the situation now stands the treasury allows 10 years for amortization of plant expansion and the legal profit to the manufacturer in excess of cost is 12 percent.

The plane makers object that if changing conditions abroad should reduce defense needs sharply in the near future, they would be left with great plants which were not needed for normal peacetime production and would have to be written off as almost total loss. They believe that a five year amortization period is the longest they can assume in justice to their stockholders.

The 12 percent profit limit now legally set is expected to be lifted and that feature of the program handled in the general excess profits bill now before congress.

But before committing themselves to contracts the plane men want to know what margin they are to be allowed and whether such items as expense of research and engineering, added taxes, interest on capital borrowed for expansion, and "human error" mistakes in manufacture can be included in the total cost figure to which the profit is added. If this is not allowed, they say, the "profit" might well turn out to be a loss.

Every manufacturer questioned in the present survey expressed full confidence of the industry's ability to produce the proposed 25,000 planes in the allotted time, but only asked that full assurance be given that the industry would be protected against destroying itself in its effort to build up the national defense.

WOULD KEEP PLANTS POSTED

Plane men said that in an effort to overcome hesitancy of manufacturers to enter contracts without full guarantees, the government had offered them "letters of intent," specifying the planned orders to be given each factory as the program develops.

These letters, however, would not be binding if congress should withhold future appropriations due to a slackening of the emergency.

There has been some friction, it was indicated, between the executive branch and administrative branches in charge of the air program and congress. One war department official suggested that if continued delay was caused by lack of satisfactory legislation, a "short cut" might be used.

This would consist of rewriting contracts as now being drawn to raise the unit price so that amortization could be speeded, but this would mean less planes for the money spent and boost the cost of the whole program.

WORKING WITH SINGLE AIM

In all sources of information covered in this survey it was stressed that all parties involved — the defense commission, congress and the manufacturers — were working toward the same objective—adequate national defense. Differences of opinion, however, as to the means to that end were said to be holding up the program to an extent which was threatening its successful completion by the proposed date.

Only this week the defense commission called officials of seven leading plane companies to Washington to thresh the matter out, and it was hoped that these conferences might result in early breaking of the bottleneck. The companies represented were Douglas, Boeing, Consolidated, Curtiss - Wright, Martin, North American and Lockheed.

Most of these companies already have, even without the signing of contracts, begun the purchase of large supplies of material on their own responsibility in order to be ready for immediate production with existing plant equipment as soon as contracts are finally signed.

Knox Winds Up Busy 26 Hours in S. D.; Meets Boat Builders, Reviews Marines

Naval Secretary Visits Consair Plant; Hops North

A busy 26 hours in San Diego was concluded yesterday by Secretary of the Navy Frank Knox, his visit winding up with a conference with southern California boat builders, a review at the marine corps base, a trip through the Consolidated Aircraft Corp. plant, and luncheon with the recruits at the Naval Training station.

The conference with the boat builders was held in the office of Rear Adm. Charles A. Blakely, commandant of the 11th Naval district, and fulfilled an appointment made by overseas telephone to Honolulu by Capt. Miller Freeman, U.S.N.R., Seattle publisher and senior naval reserve officer on the Pacific coast. Freeman, who publishes Pacific Motor Boat, Pacific Fisherman and other trade journals, was acting in behalf of the shipyards of the west coast, eager to cooperate with the navy in the building of small craft for naval use.

"We want to cooperate wholeheartedly with the navy in the defense program," said Freeman. "An increasing number of small vessels will be needed by the navy—small torpedo boats, dispatch tenders, and work boats for naval use. Hundreds—perhaps thousands—of these craft will be needed. We have the builders, the facilities, the technique to provide them. Many types in use throughout the country, and even by the forces of the nations now at war, originated on the west coast."

URGES NEW BUREAU

Freeman urged the creation of a new bureau in the navy department, solely for the handling of procurement and operation of small craft. Active in naval reserve work for many years, he organized the first reservists in the 13th naval district, in 1910. During the last war he was a lieutenant commander and worked first with small boat units in the navy, and then in training personnel.

Capt. Oakley J. Hall, head of the Star & Crescent industries here, was the spokesman for the boatbuilders yesterday. Others attending the meeting were George C. Campbell, Campbell Machine Co.; Joseph Fellows jr., Fellows & Stewart, San Pedro; John Rados, Harbor Boat Works, San Pedro, and Walton Hubbard jr., South coast Co., Newoprt harbor.

Secy. Knox expressed his appreciation of the desire of the boatbuilders to cooperate, and assured them that west coast yards would be given every consideration.

Following the meeting in the admiral's office, the secretary left for a brief trip through the Consolidated plant—where the big four-motored plane in which he flew to and from Honolulu was built.

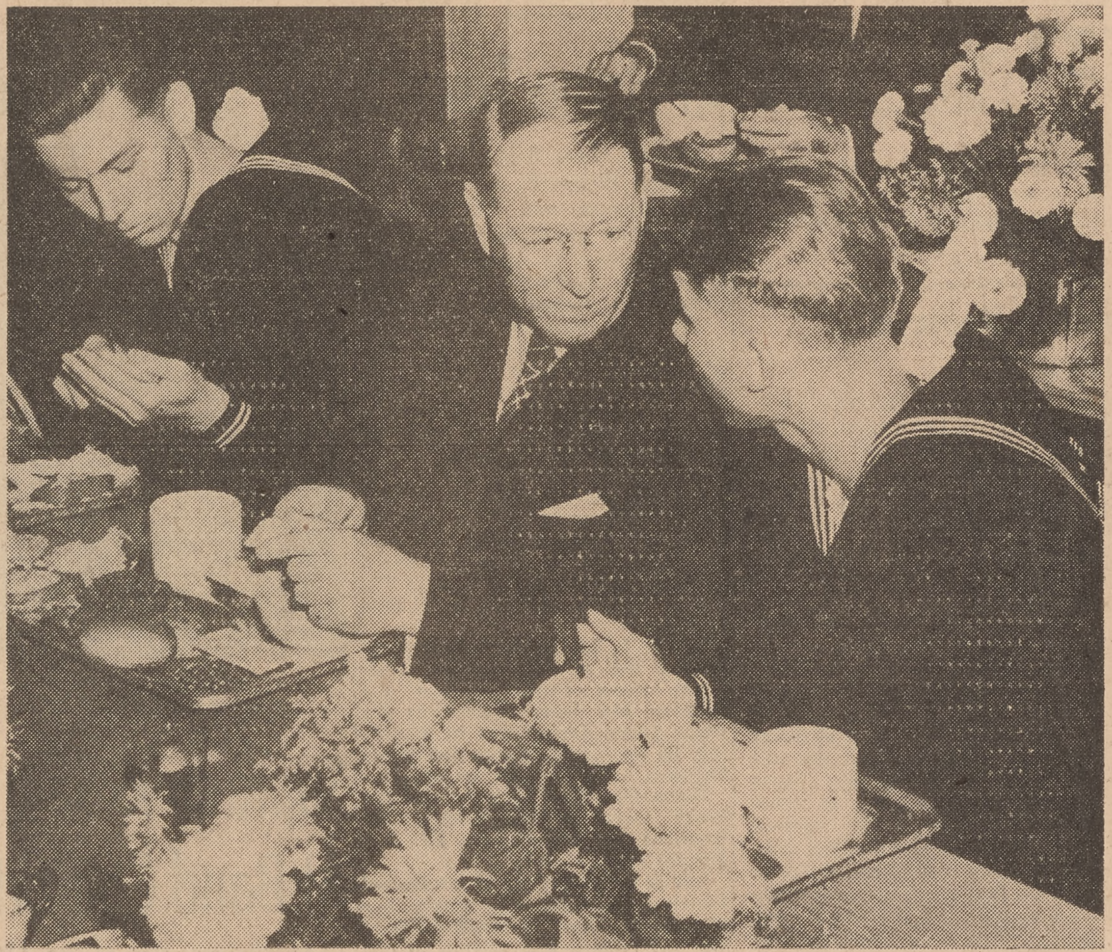
VISITS STATIONS

Proceeding to the marine corps base, Secy. Knox reviewed thousands of marching sea-soldiers and their equipment. The colorful review was open to the public and was attended by many.

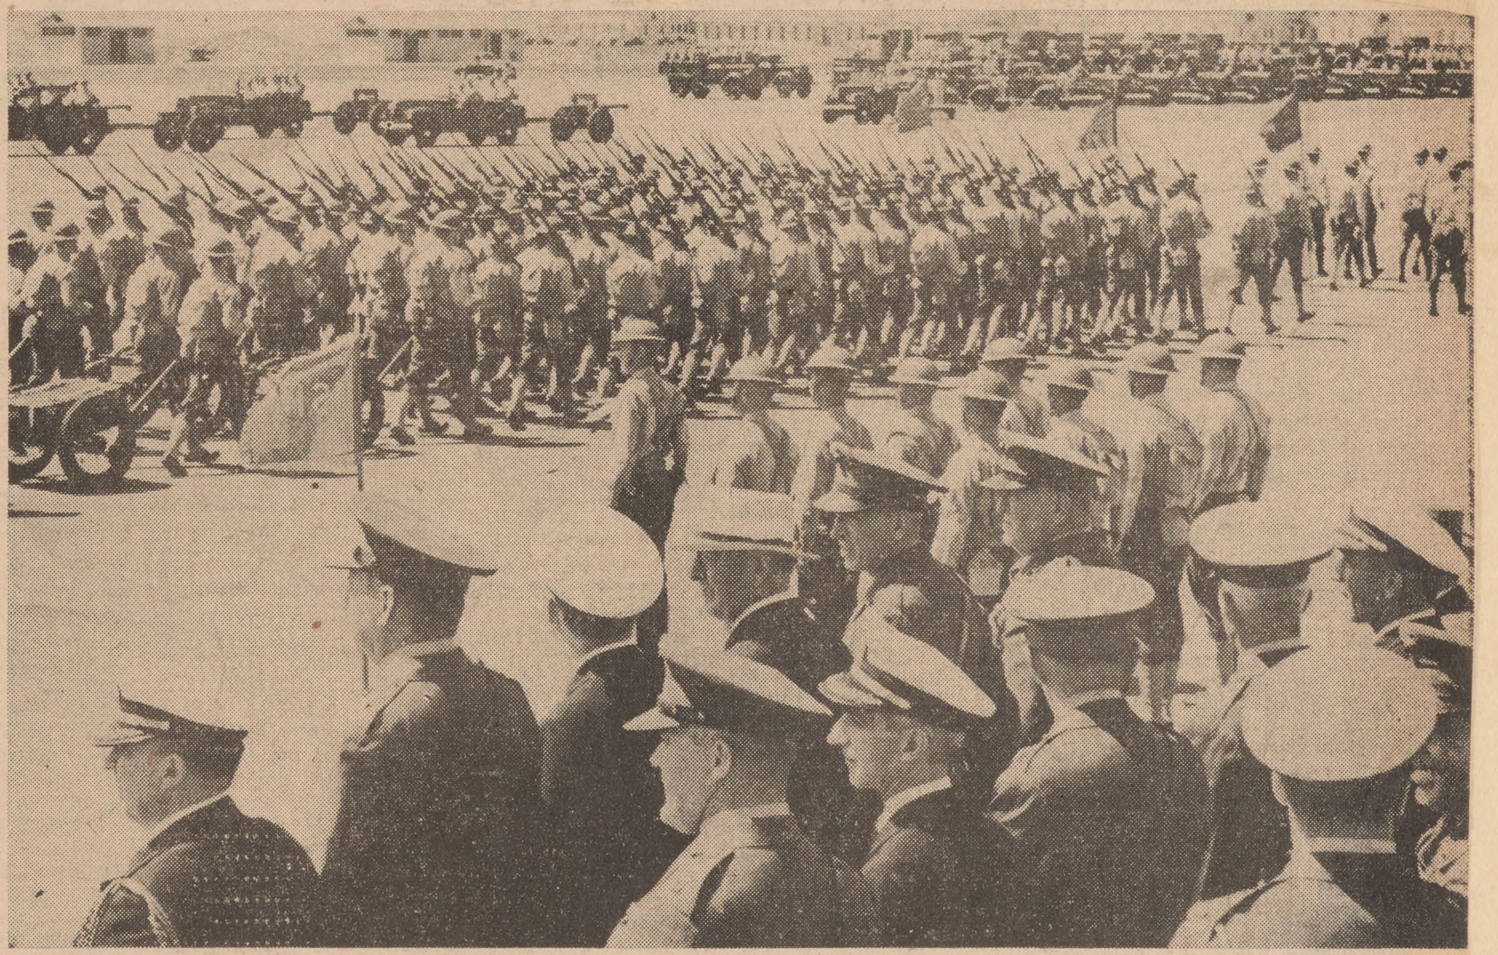
From the marine corps base, the secretary and his party went to the Naval Training station, where after a brief inspection he sat down in the mess-hall with 500 recruits, receiving their initial training as man-o-warsmen. An Illinois recruit sat at each side of the secretary during the meal—R. M. Mathias, 19, Bethany, Ill., and Jackson Carlson, 21, Westmont, Ill.

"One of them told me that he has gained 19 pounds, the other 23 pounds, since joining the navy," Knox said after the meal. "Both said that they joined the navy to get a career and to learn a trade. I think it's wonderful!"

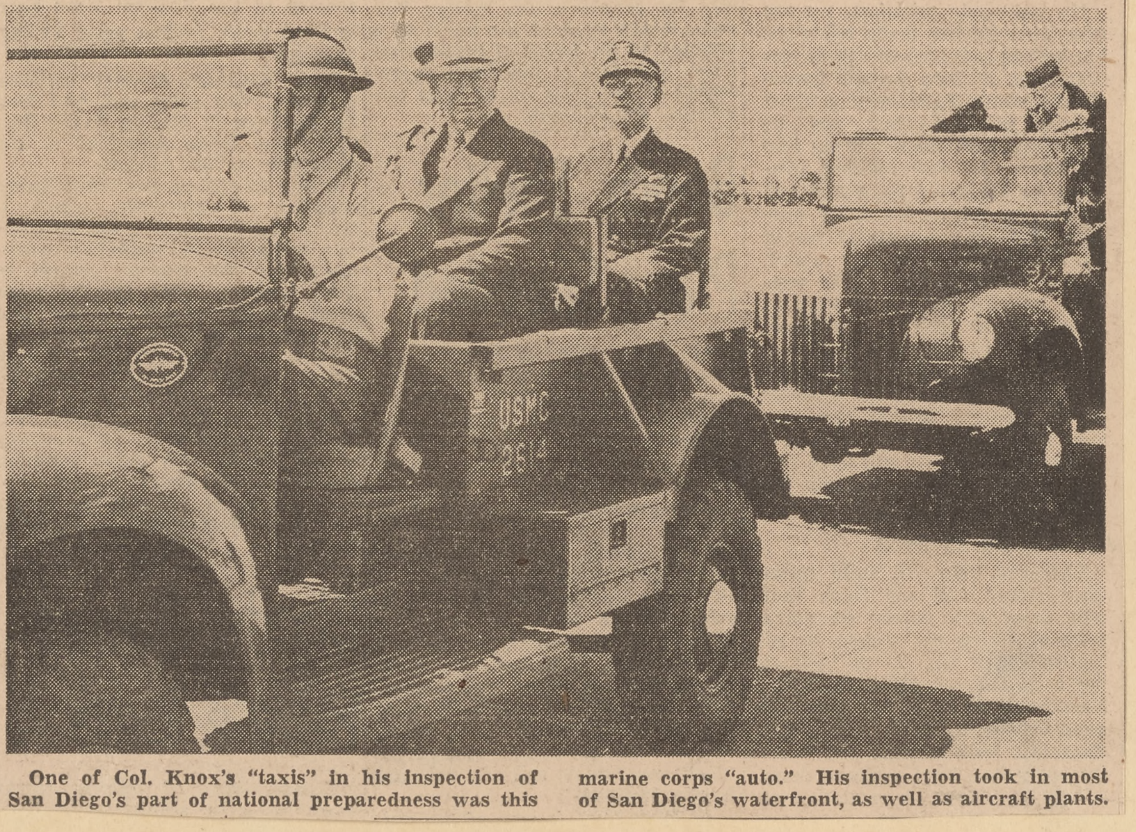
From the training station the secretary and his party went to Lindbergh field, where they took off in a low-winged landplane for San Pedro. Instead of flying directly up the coast, however, they swung inland to give the secretary an air view of the marines' plant at Cam Elliott, on Camp Kearny mesa. Th the plane headed north.



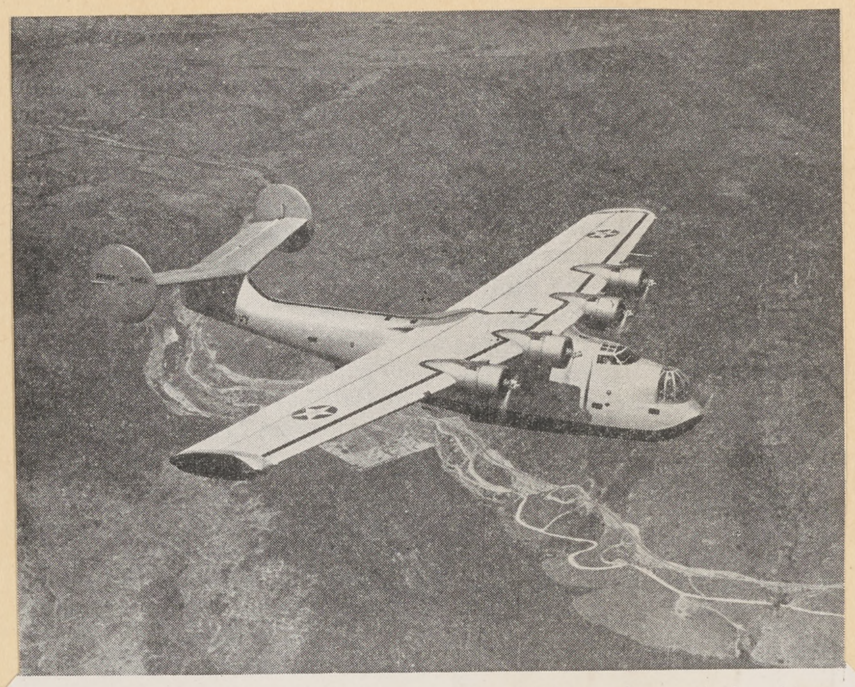
At the Naval Training station yesterday, Col. Knox dropped in at the mess hall to have lunch with 500 recruits. Sitting next to the navy secretary and exchanging views with him are (left) R. M. Mathias, 19, and Jackson Carlson, 21, both of Illinois. Knox said he enjoyed the conversation.



With naval and marine corps officers, Col. Knox (lower center) reviewed thousands of marching sea-soldiers at the marine base. Hundreds of civilians view the parade. From the marine base Knox and his party went to the Naval Training station.

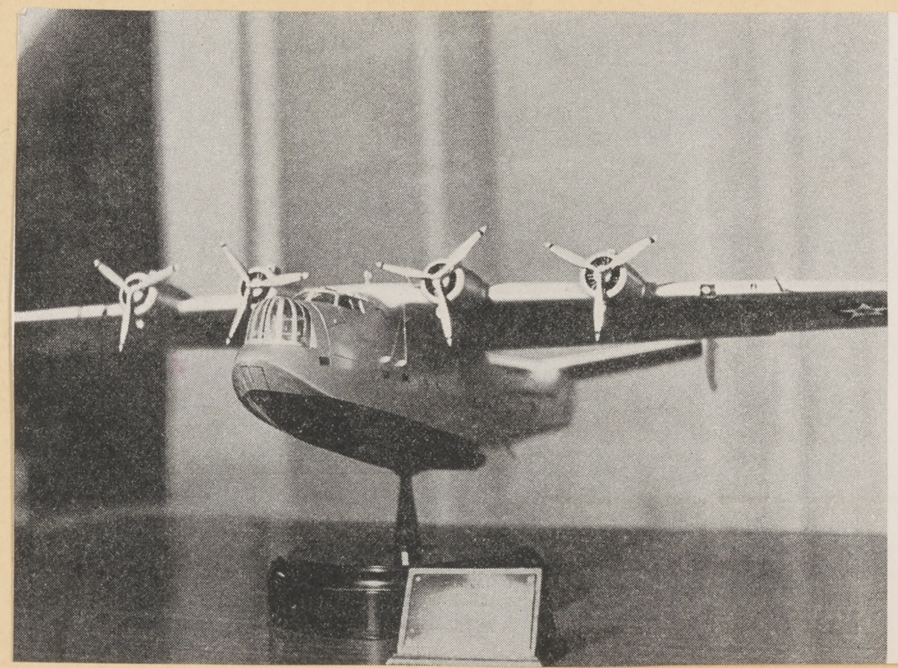


One of Col. Knox's "taxis" in his inspection of San Diego's part of national preparedness was this marine corps "auto." His inspection took in most of San Diego's waterfront, as well as aircraft plants.

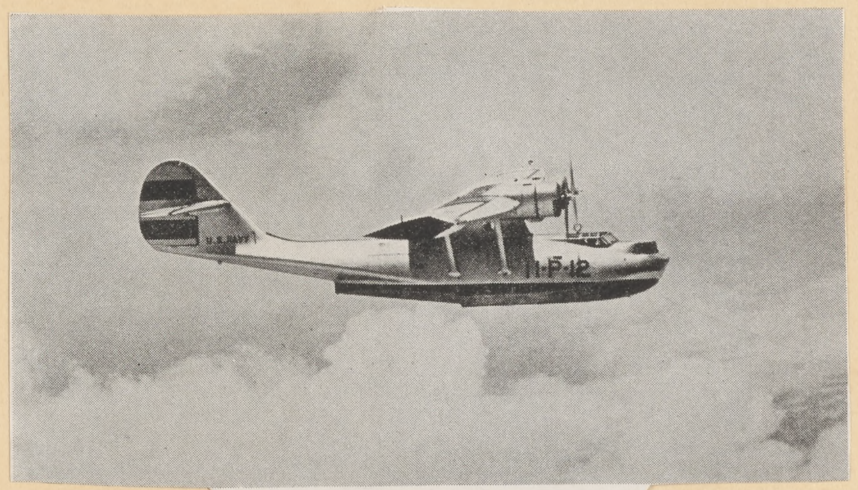


The Consolidated XPB2 Y-1 four engined flying boat of the Aircraft Scouting Force.

From "The Log"
U.S. Naval Academy
2/16/40



XPB2Y Newest Navy 4 engine flying boat six of which are now on order for the Navy Department. It houses a complete bridge, galley, and chart room; and will carry a crew of ten or twelve—including a Captain, Navigator, and three Pilots—with all supplies required for about a week's cruise. Two models similar to these are made up for each new type of plane that the Navy Department considers; one of these will be made available to the Naval Academy immediately upon completion in every case.



Consolidated PBY-2 in flight

CONSOLIDATED'S NEW PLANT DEDICATED AT SAN DIEGO

The huge new buildings of Consolidated Aircraft Corp., at San Diego, which have been constructed within the past few months and which virtually double the manufacturing facilities of the corporation, were officially dedicated Labor Day, September 2, with fitting ceremonies.

Major Reuben H .Fleet, president of Consolidated, diverged in his address to attack the new bill authorizing peace time conscription of plants.

Addresses were given by:

Brig. General Frank D. Lackland, U.S.A., Wing Commander, March Field.

Maj. General W. P. Upshur,U.S. M.C., Commanding Department of the Pacific, Fleet Marine Force and U. S. Marine Corps Base.

Col. Peter H. Ottosen, U. S. A., Commanding Fort Rosecrans.

Major R. H. Fleet, President, Consolidated Aircraft Corporation.

Rear Admiral Charles A. Blakely, U.S.N., Commandant, Eleventh Naval District, gave the dedicatory address of the day saying in part: "I hereby dedicate this new plant to work in national preparedness, to help maintain our rightful place as a mighty nation. And when this present emergency shall have passed, it may be dedicated in more glorious activity in supplying commerce with its products.

* * *

The tremendous expansion program currently being rushed to completion at Consolidated Aircraft Corporation, which is already by far the largest local manufacturing enterprise, will give San Diego the distinction of having the largest integrated covered and uncovered aircraft manufacturing plant in America. Consolidated's manufacturing space, exclusive of field, ramp and railroad sidings, now occupies over 1,910,000 square feet of area or an 87 percent increase over the previous figure, with an option on adjacent land equal to an added 50 percent of this area; plans are nearly completed for its possible use.

This expansion thus brings the local plant into full step with the President's recently announced national defense program, and helps to place San Diego in the forefront of the drive to produce the stated 50,000 plane output per year.

Already operating with a present backlog in excess of $70,000,000, contracts for additional work are being negotiated which, if accepted, will build this huge backlog for San Diego's concern to well over $100,000,000. Roughly one half of this sum will be expended locally, and this largely thru wages to employees, exerting a marked stimulus to local business of a purely beneficial nature, since the plant's operations do not draw upon the communitys' wealth, other than its climate. A distinct climatic advantage is the fact that approximately 30 percent of the manufacturing operations can be conducted out of doors, thus paying health dividends to the employees as well as convenience to the company.

Thoroly modern in contruction and planning, Consolidated's huge plant utilizes all the latest features of aircraft plant design. The plant now extends for half a mile along Pacific Highway, and the new final assembly building at the north end of the plant is more than a city block in size with its tremendous roof held high in the air with remarkably few supporting columns. This construction allows exceptional manufacturing freedom within. A three story structure, the size of an average three story office building of the business district, is housed under the roof of this final assembly building, and a dozen more such structures could be placed under its roof without crowding.

Sawtooth roof construction affords north lighting during the daylight hours. Adequate artificial lighting is provided for the night workers. The plant is now operating three shifts. It is not difficult to appraise the fact that the entire plant is streamlined for the most efficient production and the greatest convenience to the workmen in all necessary facilities provided; for all its huge buildings, and most of its equipment, are less than five years old today. This marks it as one of the newest and finest plants in all the world.

Rounding out its complement of equipment ,some of the finest machine tools available in the market today have, and will be installed as the program progresses. Lathes, automatic screw machines, shapers, millers, die sinkers, planers, punchpresses, hydraulic presses, drop hammers, power shears and brakes and smaller electric and pneumatic tools in almost unlimited number are included. These machines are being operated by men rapidly learning the newest time saving features of this splendid equipment.

At the present moment, approximately 750 of the more than 7,000 skilled aircraftsmen are engaged in tool designed production, and the making of patterns which supplement the machine tools with special equipment; providing jigs, patterns and templates, assembly fixtures and the multitude of special tools required to assist the workmen to produce the finest airplanes possible.

Consolidated's present position, and outlook for the future, bids fair to exert a marked influence on the growth of San Diego. Concluding a statement to the plant personnel on the recent advent of the Consolidated Aircraft Corporation's 17th birthday, President Major Reuben H. Fleet said "We have a good organization—equal to any in our industry—the best in our history. So in counting our blessings let us consider that we have a factory of our own, tailored for our business, in the city of our choice, with plenty of work on hand and in sight, and no mortgage on our premises or our future. In one sense I regret that we are too busy to celebrate."

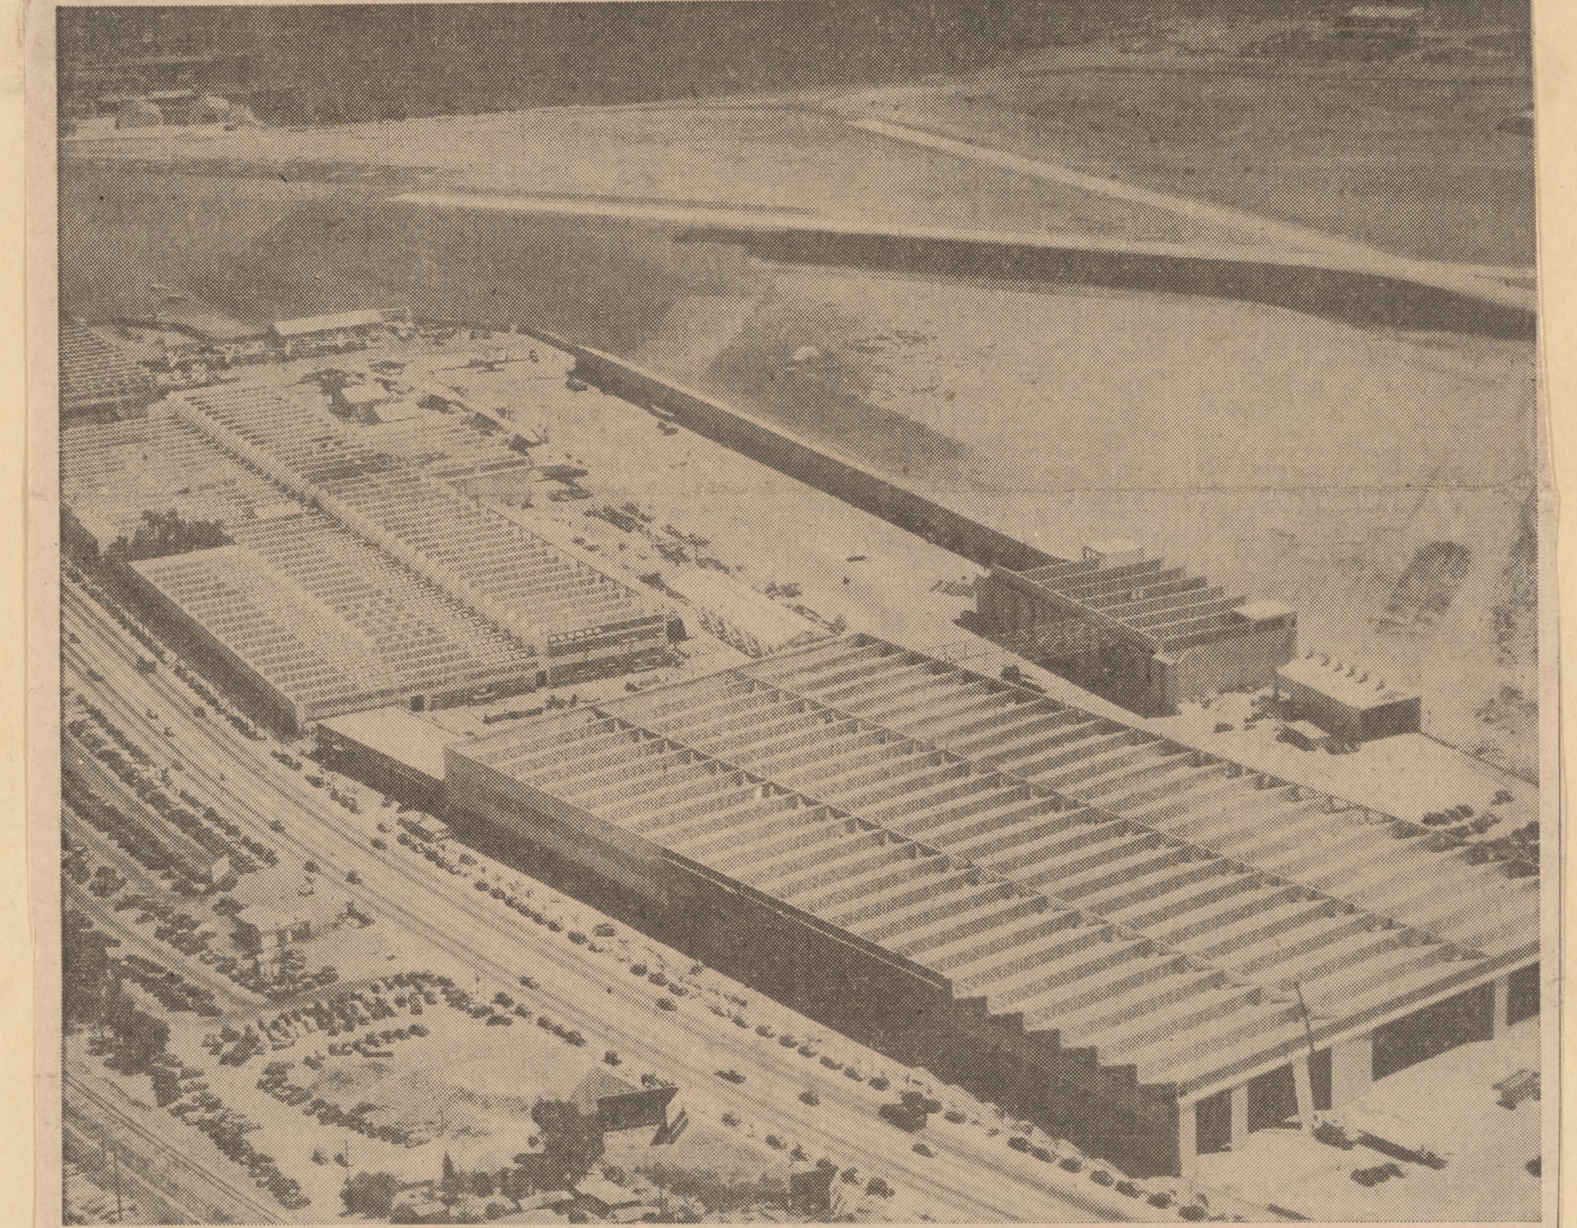
$1,000

New Unit Makes Consair Biggest U. S. Integrated Plane Plant

Trib.--9/1/40



Air view of the Consolidated Aircraft Corp, plant, where dedication exercises will be held at 2 p. m. Monday for the new addition, shown in the right foreground. In back of the large final assembly building and connected to it by an outside monorail is the final finish building, adjoining which is the new boiler house.

Limit Crowd to Employes, Guests At Dedication Ceremonies Monday

Everything is in readiness at the Consolidated Aircraft Corp. plant for the dedication of the firm's new factory addition at 2 p.m. Monday, which makes Consolidated the largest integrated aircraft plant in America, officials of the firm reported today. The ceremonies will take place five years after the original dedication of the plant, which began operations here in September, 1935, after moving to San Diego from Buffalo, N. Y.

The dedication program, featured by a dedication address by Rear Adm. Charles A. Blakely, commandant 11th naval district, will be held out-doors at the northwest corner of the new addition. Because of national emergency restrictions, the new additions, which include a 360 by 720-foot final assembly building, connecting office building, final finish building, boiler house, storage shed and first-aid building, will not be open to visitors, although the doors will be open permitting views of the interiors.

Because of lack of room to accommodate all who might wish to attend the dedication program, only employes of the firm, accompanied by one guest each, will be admitted to the exercises. Before Blakely makes his address, addresses will be given by Brig. Gen. Frank D. Lackland, wing commander, March field; Brig. Gen. William P. Upshur, commanding the marine corps base here and the fleet marine force; Col. Peter H. Ottesen, commanding Ft. Rosecrans, and Maj. R. H. Fleet, Consair president.

The Consolidated orchestra and Consolidated Glee club will offer the following musical program: El Capitan (Sousa); Cossack Love Song (Kountz); Wake Up America (Borgens); Soloist Richard Holtsclaw; Star Spangled Banner; On Parade, from Sweethearts (Herbert); Will You Remember, from Maytime (Romberg); Smoke Gets in Your Eyes, from Roberta (Kern); I've Got My Eyes on You, from Broadway Melody of 1940 (Porter); Love's Own Sweet Song, from Sari (Kalman); Volga Boat Men (Folk Song); Sylvia (Speaks); Indepentia (Hall); God Bless America (Berlin), and National Emblem (Bagley).

In announcing that Consolidated which was founded in 1923, now is the largest integrated aircraft plant in the United States, officials of the firm said it has 1,910,000 square feet of covered and uncovered manufacturing space, and 954,440 square feet of contiguous airport land under option for further expansion. The original San Diego factory building five years ago had a usable floor area of 246,841 square feet, which was approximately 10,000 square feet more than was occupied by Consoldated in its Buffalo plant during 1933, the peak year for the company before it moved to San Diego.

Consoldiated now employs 9485 and has a backlog of army and navy planes orders of approximately $120.000,000. The Monday dedication program is but a "stepping stone" in the firm's expansion, Consair officals last week having taken out an $800,000 building permit for still another addition, which will be 200 feet wide, 1500 feet long and cover eight and one-third acres. It is to be located on the Lindbergh field side of the existing plant.

CONSOLIDATED DEDICATES BUILDINGS

9/12/40
aircraft news.

The huge new buildings of Consolidated which have been constructed within the past few months and which virtually double the manufacturing facilities of the corporation, were officially dedicated Labor Day, September 2, with fitting ceremonies. High ranking officers in the various branches of the United States armed forces, Consolidated and other aviation leaders, employees and their immediate guests attended.

In a surprise move, Major Reuben H. Fleet, president of Consolidated, diverged in his address to attack the new bill authorizing peace time conscription of plants, pointing out that Consolidated had planned to announce further expansion at the dedication ceremonies, but hesitated to expand even in the light of the fact that all the organization's might as a private enterprise is behind the preparedness being stressed through aviation manufacture.

Devoting a greater portion of his address to this measure, he stated in part, "We had planned announcement today of further extensive plant expansion, but the bill recently passed by the Senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our Government, makes us hesitate, much as we have been striving with all our might as a private enterprise to do our bit. Nationalization of her aircraft industry by France was so disastrous, that that country's production fell down terribly, and even though she frantically resorted to foreign help at exorbitant expense, she collapsed as a nation and probably never will recover. We hope our Government will not make this mistake, which would be the beginning of labor regimentation, the emasculation of labor unions which our President has stated cannot strike against the Government, and the end in this country of free men and free enterprise."

In the colorful affair marking the dedication, Edgar N. Gott, Consolidated vice president, was master of ceremonies, several distinguished guests made brief addresses, and congratulatory messages poured in. Addresses were given by:

Brig. General Frank D. Lackland, U.S.A., Wing Commander, March Field.

Maj. General W. P. Uphur, U.S. M.C., Commanding Department of the Pacific, Fleet Marine Force and U. S. Marine Corps Base.

Col. Peter H. Ottosen, U.S.A., Commanding Fort Rosecrans.

Major R. H. Fleet, President, Consolidated Aircraft Corporation.

Rear Admiral Charles A. Blakely, U.S.N., Commandant, Eleventh Naval District.

The dedicatory address of the day was given by Rear Admiral Blakely who said in part: "I hereby dedicate this new plant to work in national preparedness, to help maintain our rightful place as a mighty nation. And when this present emergency shall have passed, it may be dedicated in more glorious activity in supplying commerce with its products. I congratulate Major Fleet and his associates on this fine plant and bring the best wishes of the whole navy. I declare this new addition and plant to be open."

This was followed by a military salute and the raising of the National flag as the orchestra played the "Star Spangled Banner."

CONS. AIRCRAFT PLANS DELAYED

Wall St. Journal- 9/4/40

Further Expansion Held Up by Congressional Effort to Conscript Plants

SAN DIEGO—Dedicating a $2,000,000 addition to plant just completed and put into operation, Major R. H. Fleet, president of Consolidated Aircraft Corp., said yesterday that he had hoped at this time to announce an additional expansion program to fit in with rearmament needs, but now was unable to do so because "the proposed federal legislation permitting the Government to commandeer industrial plants makes us hesitate. He expressed the hope that the Government would not make the mistake of beginning the regimentation of labor and emasculation of labor unions, maintaining also that the nationalization of the aircraft industry by France played a most important contributing role in the collapse of that country.

Major Fleet also announced the acquisition, by purchase, of Hall Aluminum Corp. of Bristol, Conn., which will erect a plant at Dallas, Texas.

Having just completed its $2,000,000 expansion program started earlier this year, Consolidated Aircraft has had in mind an additional expansion of facilities at its single plant at San Diego, now the largest integrated unit in this country, calling for expenditure of another $2,500,000. At the moment, this plan apparently is undecided, awaiting outcome of the present discussions for a rider to legislation permitting governmental acquisition of plants which do not cooperate with the war program. It is also indicated that Consolidated has dropped discussions for a plant to be located at Dallas, Texas.

In this connection, Major Fleet said:

"We had planned announcement of further extensive plant expansion, but the bill recently passed by the Senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our Government, makes us hesitate, much as we have been striving with all our might as a private enterprise to do our bit. Nationalization of her aircraft industry by France was so disastrous that her production fell down terribly.

"Even though France resorted to foreign help at exorbitant expense, she collapsed as a nation and probably will never recover. We hope our Government will not make that mistake, which would be the beginning of labor regimentation, emasculation of labor unions, which our President has stated cannot strike against the Government, and the end in this country of free men and free enterprise."

With a current backlog of $132,000,000 and constantly increasing personnel, Consolidated Aircraft is now employing 9,600, and by the end of this year expects to be employing 15,000, Major Fleet said.

Union--Tues. 9/3/40

Maj. Fleet Raps Commandeering Of Air Industry

$2,500,000 Consair Unit Is Dedicated By Adm. Blakely

Consolidated Aircraft's new $2,500,000 addition was dedicated yesterday by Rear Adm. Charles A. Blakely, but in a surprise speech, Maj. Reuben H. Fleet, Consair head, told 5000 persons that announcement of vast future expansion was being withheld because of a senate bill authorizing conscription of industry.

Maj. Fleet hit at nationalization of the aircraft industry, citing the failure in France, but expressed confidence that the aviation industry would be able not only to protect American from attack but carry the war to any enemy attacking this country.

VIEWS TOLD

"We had planned announcement today of further extensive plant expansion," said Maj. Fleet, "but the bill recently passed by the senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our government, makes us hesitate, much as we have been striving with all our might as a private enterprise to do our bit.

"Nationalization of her aircraft industry by France was so disastrous that that country's production fell down terribly, and even though she frantically resorted to foreign help at exorbitant expense, she collapsed as a nation and probably never will recover. We hope our government will not make this mistake, which would be the beginning of labor regimentation, the emasculation of labor unions which our President has stated cannot strike against the government, and the end in this country of free enterprise."

PRESENT PROGRAM

Decision to withhold announcement of the future expansion will not affect that part of an enlargement program now under way and for which contracts have been let, Maj. Fleet told reporters. This phase of the expansion program, he estimated, will cost $2,500,000 and result in construction of a new building as large as the one dedicated yesterday as well as another structure 1500 feet long. These buildings will bridge the "no man's land" between the existing plant and the marine base, he said. He added that the announcement which was withheld because of the senate bill covered expansion "here or in Texas."

A picture of Consair's rise was given in Fleet's talk.

"Five years ago Consolidated Aircraft Corp. began work in San Diego, the city of our choice, with 300 workers and a plant of 200,000

MAJ. FLEET RAPS PEACETIME COMMANDEERING OF AIR PLANTS

(Continued from Page 1)

square feet," he said. "Today we have 9600 men and 867,000 square feet. By Christmas we shall have 15,000 men and 1,500,000 square feet, having let contracts to take up the 'no man's land' between here and the Marine base.

"We came here with $6,000,000 of business. Today our backlog is $132,000,000. In this plant we have manufactured twice as many airplanes of over 100-foot wing span as have ever been made elsewhere in this country."

AIR POWER VALUE

Referring to the value of air power, he said:

"A year ago Great Britain and France declared war on Germany. Since then, Germany has conquered Poland, Norway, Holland, Denmark, Luxembourg, Belgium and France and now is conducting a strong wor of aggression against England. These results could not have been attained without superior air power. Navies and armies are impotent without adequate air power.

"Part of the new technique developed in this war has been instant concentration of air attack on landing fields. Herein we find the necessity for the possession of flying boats, as they are not grounded by such tactics because water cannot be destroyed by bombs.

"During the next few years our aviation industry will manufacture aircraft capable of protecting America from foreign attack and of carrying a war to the heart of any enemy fighting us. The air power represented by thes aircraft will enable America safely to enter into a world peace pact, capable of enforcement because of the air power represented by these aircraft bows to no obstacle within its range—a continent or an ocean in a day. To preserve world peace, such power must exist; it does not police territory, it need not often be employed; its superiority at home should be sufficient to guarantee against aggression.

"And meanwhile aircraft will continue in peacetime to spread goodwill by enabling peoples to get together quickly and thus to know each other better. With each one realizing his individual responsibility, may those who toil here help to bring air supremacy, and therefore, safety to our beloved country."

DEDICATORY ADDRESS

The dedicatory address by Adm. Blakely, 11th Naval district commandant, followed talks by Maj. Gen. William P. Upshur, U.S.M.C., commanding the marine department of the Pacific, the fleet marine force and the marine base here; Brig. Gen. Frank D. Lackland, U.S.A., wing commander at March field, and Col. Peter H. Ottosen, U.S.A., commanding Ft. Rosecrans.

"For many years Consolidated has built planes for the navy and army and they have been well pleased," Adm. Blakely said. "But it is only in comparatively recent times that the airplane has become indispensable in commerce, transportation and the national defense. And the end is not yet."

The admiral recalled the prophecy of Tennyson's verse 98 years ago when the poet spoke of "airy navies battling in the blue."

"Consolidated planes have played a major role in training navy pilots. I think with pride of my connection with P.B.Y.'s in mass flights to Panama, Alaska, the Caribbean and Newport, R. I., without a casualty. (The flights were made while the admiral headed the scouting force aircraft.)

VISION PRAISED

"The vision and courage of Maj. Fleet in developing this industry in San Diego is appreciated by all. They have brought great benefits to commerce and the nation has been given an efficient and dependable product for our armed forces.

"I hereby dedicate this new plant to work in national preparedness, to help maintain our rightful place as a mighty nation. And when this present emergency shall have passed, it may be dedicated in more glorious activity in supplying commerce with its products. I congratulate Maj. Fleet and his associates on this fine plant and bring the best wishes of the whole navy. I now declare this new addition and plant to be open."

As he spoke, a saluting battery boomed and the national flag rose as the Consolidated orchestra played "The Star-Spangled Banner."

Maj. E. N. Gott of Consolidated acted as master of ceremonies. The first speaker was Brig. Gen. Lackland, who said he had "served and worked with Maj. Fleet in the World war and the years following, "when he flew in Fleet-made ships. He brought a message from Maj. Gen. H. H. Arnold, chief of the army air corps.

"I want to present congratulations on the wonderful addition and express continuing confidence that you will take part in the expansion of the air corps under the national defense program," he said. "I wish I could convey to your minds the same confidence we of the air corps have in the products of the corporation and its ability to meet the needs of expansion in the air."

FURTHER CONSTRUCTION

Maj. Gen. Upshur said he was eager to see the time when the marine base and Consolidated would be brought together by further construction at the aircraft plant. This would end, he said, the present "separation of two good neighbors."

"It is an inspiration," he went on, "to realize we have a great airplane plant here, with extensions planned. It is important for us to have them at this time."

"I hope that plants like this will produce planes that a great many of us can own," said Col. Ottosen after extending his congratulations. "After this emergency is over, it over, it will not seem as impossible for us to own planes as it seemed for us to own automobiles after the World war."

Letters from army and navy officers, as well as from aircraft manufacturers were read, by Gott.

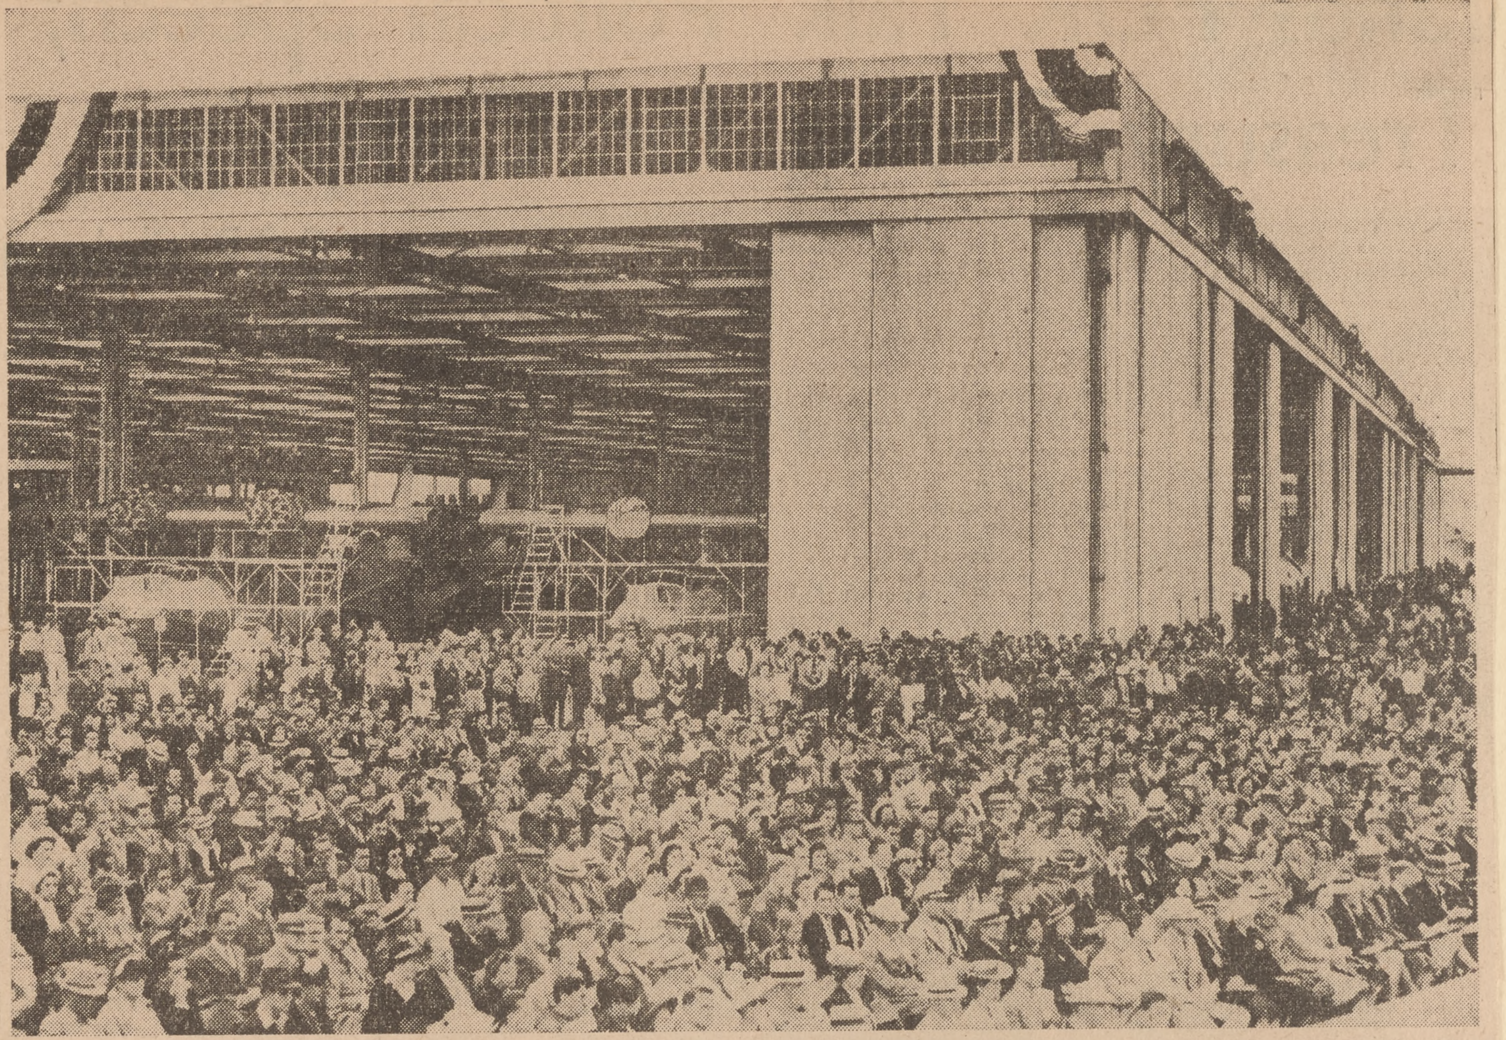
MUSIC PROGRAM

The musical side of the dedication featured the introduction of a new song, "Wake Up America," written by Edward Borgens of the Consolidated orchestra, with words by Mrs. Dorothy Fleet, wife of Maj. Fleet.

The addition which was dedicated was filled with Consolidated planes in various stages of construction, but because of existing restrictions there was no touring of the plant by the 5000 who attended the exercises.

Maj. Fleet estimated the cost of the addition at $2,500,000 including its equipment, other local additions for which contracts have been let will cost $2,500,000 without machinery, he added.

ADM. BLAKELY DEDICATES $2,500,000 ADDITION TO CONSOLIDATED PLANT



Dedicated to the defense of the United States and the commercial air development to follow the emergency was the $2,500,000 plant addition at Consolidated Aircraft Corp. yesterday. The view shows a corner of the addition and some of the 5000 persons who attended.

MAJ. R. H. FLEET

Consolidated Maps Expansion Swelling Employes to 35,000

Details of a huge expansion program which will increase Consolidated Aircraft Corp.'s current backlog of $132,000,000 to $300,000,000 and swell the number of employes from 14,500 to more than 35,000, were outlined to army engineers at a meeting in the harbor commission office yesterday by Maj. Reuben H. Fleet. Consolidated president.

Fleet said several thousand new homes and new barracks will have to be built here to accommodate employes to be added to the aircraft plant at a rate in excess of 500 a week. The barracks, he explained, will be for single men. He astounded even the army engineers by the comprehensive scope of the new construction program. He said he was opposed to building plant No. 2 in Texas, a program which had been advocated by Louis Johnson when he was assistant secretary of war.

The meeting was called by Col. Edwin C. Kelton, district army engineer, to hear protests relative to modification of existing pier and bulkhead lines at Roseville, North Island, Lindbergh field and the south bay.

Fleet said Consair's expansion plans made it imperative to construct a new 1500-foot assembly building and seaplane ramp on the westerly end of the municipal airport.

Glenn Rick, city planning engineer, voiced the only protest relative to a fill at Lindbergh field which might interfere with Harbor

---

CONSAIR MAPS EXPANSION PROVIDING FOR 35,000 JOBS

(Continued From Page 1)

dr., but after hearing Maj. Fleet, expressed the belief the city planning commission may withdraw its objections. Because of emergency conditions, Col. Kelton said the final report of the planning commission must be in his hands within a week.

Joe Brennan, port director, said the harbor department was in full accord with Maj. Fleet and opposed to the protests lodged by Rick.

"There is much more at stake than a view of the bay from Harbor dr.," Brennan said.

This was amply borne out by Maj. Fleet's subsequent testimony. He advised the army engineers that Consair will do five times the amount of business in the next two years than it has accomplished in the last 16 years. Three eight-hour shifts are contemplated at the aircraft factory to supplant the current two 10-hour shifts.

He pointed out that valuable time would be wasted by continuing the resent policy of hauling huge new mbers from the final assembly uilding across the airport to the coast guard air base ramp.

"It has developed we must now deliver at least seven of these big ships a day and we simply cannot afford to take the time to haul and re-haul these ships across the flying field," Fleet said. "It is imperative we have our own ramp."

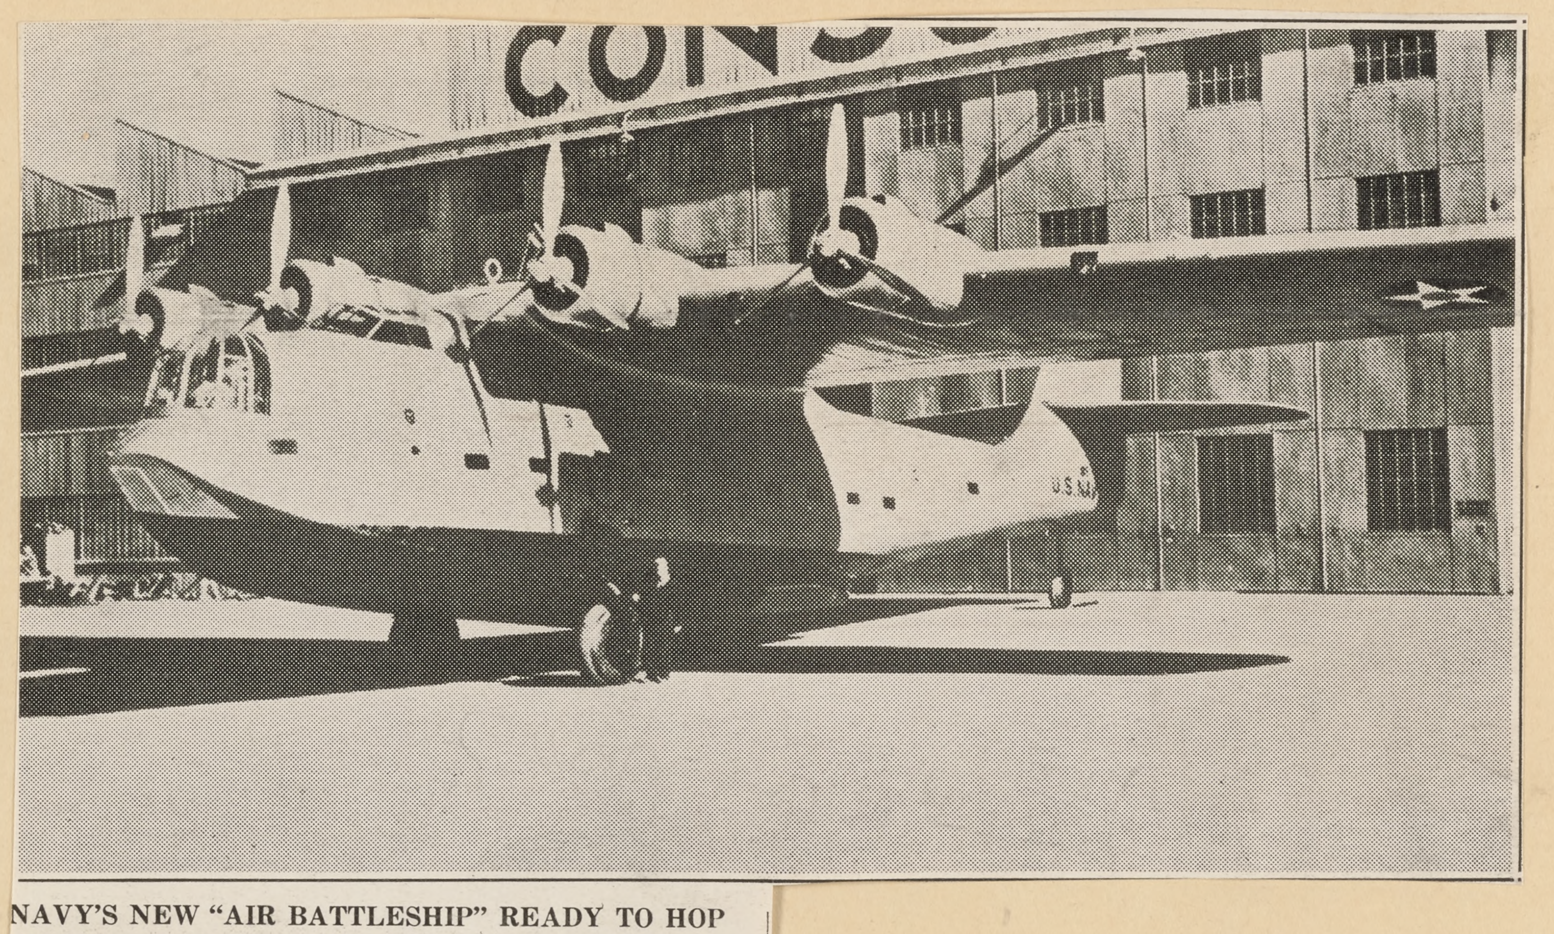
Fleet further revealed Consair has virtually reached an agreement with the navy department for construction of 6000 single units for married Consair employes and barracks capable of housing at least 6000 single men. He said the company also is to have two tenders to assist in handling the navy bombers during their test flights in the bay.

Fleet said "the country is in a very precarious position and the time has come when we have to take government aircraft contracts whether we want to or not."

Lt. Comdr. H. A. Bolles, 11th Naval district assistant public works officer, told Col. Kelton that Rear Adm. Charles A. Blakely had no objections to any of the proposed harbor line changes.

A delegation of Roseville residents said the navy was responsible for clogging up water mains in the vicinity of their homes following the dredging and reclamation of Area M in the area between Roseville and the Naval Training station. Col. Kelton pointed out the hearing was confined to protests based solely on navigation interests and advised the protestants to notify the district commandant of their grievances.

The army engineers intimated protests for filling in the bayside of Harbor dr. between the coast guard air base and the marine base probably will be overruled in view of the national defense problems outlined by Maj. Fleet. Final decision, however, will be made by the war department soon, as Col. Kelton said, "The matter is very pressing, and contracts are about to be let for dredging in this area."



NAVY'S NEW "AIR BATTLESHIP" READY TO HOP—Heralding advent of new fleet of super-dreadnaughts of the air, this first of what is expected to prove most powerful aircraft of its type, makes camera debut outside hangar at San Diego as it was groomed for initial flight. The ship will undergo exhaustive tests before passing into Naval air fleet.

HALL AIRCRAFT NOW PART OF CONSOLIDATED

9/26/40

All physical assets, as well as the name and good will of the Hall Aluminum Aircraft Corporation of Bristol, Penn., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall Aluminum Corporation is now a part of Consolidated Aircraft Corporation.

Some 32 key men of this eastern Consolidated organization and all patent rights, material and equipment of the former company have been acquired through the purchase.

Hall Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, president and sole stockholder, had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Hall applied for and was granted numerous basic patents relating to this field.

Along with the airplanes built, there were developed a complete line of draw bench shapes and other parts of strong aluminum alloys which were perfected and continuously produced and sold since 1923 to various airplane manufacturers.

In 1927 Hall Aluminum Aircraft Corp. was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company until its acquisition by Consolidated Aircraft Corp. has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Clinging rather tenaciously to the naval side of aviation construction, Hall Aluminum Aircraft has produced principally seaplanes and flying boats, pioneering in many phases of the work and particularly in all-metal construction. In 1920 metal wings were constructed for HS-3 flying boats. In 1924, there were built in conjunction with the Curtiss Aeroplane and Motor Co., two U. S. Navy F4C-1 fighter airplanes, the first all-metal aircraft used by the U. S. Navy. Other airplanes built included the C-333, XFH-1, XPH-1, PH-1s, FH-2s, PH-3s and ZPH2H-1 a four-engne long range patrol or bomber boat with four liquid cooled engines. In 1933 it made the longest non-stop flight up to that time by the Navy from Norfolk, Va., to Coco Solo in the Canal Zone.

The company also made the twin float monoplane torpedo bomber, the XPTBH-2. Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U. S. Navy with many of its aircraft the company has also supplied the coast guard with numerous craft.

Aircraft Plant Complains On $300,000,000 Order

Consolidated Head Says U. S. Is Using Pressure

SAN DIEGO, Calif., Sept. 19 (UP).—Maj. Reuben H. Fleet, president of Consolidated Aircraft Corporation, complained today that his concern has been virtually compelled to accept Navy and Army aircraft orders and may be required to fill defense contracts for $300,000,000 in the next two years.

He said that Consolidated, whose Army and Navy business had swelled the company's backlog to $134,000,000, "certainly" has not sought the orders since "under pending profits tax legislation we may be restricted to a net profit of 2¼ per cent—a risky margin."

Maj. Fleet's statement came at a hearing before Col. Edwin C. Kelton, United States Army district engineer from Los Angeles, in which Consolidated sought an allotment of bayfront land on which to construct a hangar for servicing flying boats.

The aircraft executive, head of the company which manufactures the Navy's long range patrol bombers, criticized what he termed government pressure on industry. He said Consolidated had been asked to build a second plant somewhere in Texas, an operation which he said would split up his organization.

---

onsolidated 'Forced' Into U. S. Contracts

(By United Press)

SAN DIEGO, Sept. 18.—Major Reuben H. Fleet, president of Consolidated Aircraft Corp., today declared that his firm, which he said might be required to fill $300,000,000 in government contracts in the next two years, had literally been compelled to take the army and navy business.

Referring to navy and army business which now provides Consolidated with a backlog of $134,000,000, Fleet said "We certainly haven't sought it, as under pending profits tax legislation we may be restricted to a net profit of 2¼ per cent—a risky margin."

The head of the company, which manufactures the famous PBY long-range patrol bombers for the navy, made the statement at a hearing before Col. Edwin C. Kelton, U. S. army district engineer from Los Angeles.

Fleet appeared at the hearing to present his company's appeal for speed in allotting them sufficient bayfront land on which to construct a hangar in which flying boats for the navy could be serviced. The land, according to Fleet, would be created by the government harbor dredging program.

Fleet explained that waterfront hangar space was necessary to provide cover for workmen who frequently have to spend several days servicing the large flying boats.

Fleet said in connection with the proposed service hangar it would be necessary to bring workmen here that would increase San Diego's population by nearly 125,000. This would necessitate construction of 6,000 housing units and vocational training facilities, he said.

The executive, who recently said he hesitated to announce any further plant expansion because of a "bill recently passed by the senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our government," revealed today Consolidated has been urged by the war department to build a second plant "somewhere in Texas."

Fleet said he was "resisting" this "pressure" because he felt a plant in Texas would split up his organization and thus create new difficulties.

Planes "Star" In War Games

SAN FRANCISCO, Jan. .... (RNS)—The value of aircraft to the national defense was being graphically demonstrated to Northern and Central California this week (Jan. 15-20) as the Army, Navy, Air Corps and National Guard staged the most extensive war games the Pacific Coast has ever witnessed.

The drone of plane motors across California skies also brought into sharp focus the importance of the aircraft industry to the state. For nearly 50 per cent of all the floor space devoted to aircraft manufacture in the United States is in California and thousands of men are employed in those factories producing planes for Uncle Sam's fighting services.

Many of these California-built planes were participating in this week's maneuvers.

The war games brought into action 10,000 troops of the Army's Third Division, 700 National Guardsmen, 50 warships of the Fleet and the bombers, pursuit ships and reconnaissance planes of the Pacific Wing of the General Headquarters Air Force.

Centering in the Monterey area, the war games consisted of an attack on the coast by a "black" force and defense measures by a "blue" force, surrounded by all the strategy and secrecy of real warfare.

Several hundred civilians were given an opportunity to participate, as the Aircraft Warning Service, composed of public utility and railroad employes, amateur radio operators, Federal and State foresters, lighthouse tenders and Coast Guardsmen throughout Northern and Central California, "spotted" the movements of "hostile" aircraft and flashed reports to "defense" headquarters in San Francisco.

Sunnyvale Air Lab Gets New Boosts

SAN FRANCISCO, Jan. .... (RNS)—A presidential request that Congress appropriate $4,200,000 for development of the Sunnyvale aeronautical research station and acquisition of 100 acres for a site for the station brought that $10,000,000 Northern California project two steps nearer reality this week.

California's rapidly expanding aircraft industry will work in close cooperation with the government researchers at Sunnyvale, translating their discoveries into increased safety and sturdiness for commercial and military planes.

Californians receive $46,000,000 a year in wages from the state's aircraft industry.

Consolidated Air Gets Order From Australian Government

Wall St. Journal 9/18/40

MELBOURNE—After a meeting of the Australian war cabinet, Prime Minister Menzies announced yesterday the decision of the Australian government to purchase 11 more PBY flying boats from Consolidated Aircraft Corp. in the United States. Delivery is expected before the end of the year. The cost, including spares, will be £1,000,000.

Mr. Menzies added that seven similar boats have already been ordered from America and fulfillment of the latest order would permit formation of a second squadron.

The new machines, which are deemed very suitable for long range reconnaissance work in Australian waters, would be used in place of Sunderland flying boats ordered in England last year and later handed over to the British government.

LOS ANGELES—The order from the Australian government for 11 additional PBY patrol bomber flying boats given to Consolidated Aircraft Corp. of San Diego will involve slightly above $2,500,000, increasing the company's backlog to close to $135,000,000.

In addition to orders from the United States Navy for this well seasoned type of flying boat in use by the Navy for several years, Consolidated's backlog now includes a substantial order for this type from Great Britain. Consolidated, now getting in the swing of mass production on larger type craft, is producing PBY flying boats for both the United States Navy and Great Britain and huge four-engined flying fortress type bombers for the United States Army Air Corps.

Consolidated very recently completed another phase of its expansion program at a cost of $2,000,000 and is understood to have in contemplation expenditure of an additional $2,500,000 at its San Diego plant. Plans for a branch plant at Dallas, Texas, under discussion for a time are understood to have been dropped and the company will apparently concentrate production at its one plant at the tip of Southern California.

Vast Warplane Contract Won

L.A.TIMES 9/21

Consolidated Aircraft Receives $85,800,000 Order From Army

SAN DIEGO, Sept. 20. (Exclusive)—Skyrocketing its backlog of unfilled orders to more than $220,000,000, Consolidated Aircraft Corp. today received an $85,800,000 contract for an unspecified number of giant four-motored Army bombers.

The planes, described by Army Air Corps officers in recent test flights here as an advancement on the "flying fortress" type, generate 5000 horsepower and can fly 3000 miles with a four-ton bomb load. They said they are capable of a 300-mile-per-hour speed.

Maj. E. N. Gott, vice-president of the company, today said the exact number of planes in the Army order or the time they must be delivered is confidential. He disclosed that 10,800 men are now employed in the plant, with several hundred men being added weekly.

Pacific Coast

Edition - Wall St. Journal 9/25/40

Consolidated Aircraft Corp.

Formal acquisition of all physical assets as well as the name and good will of Hall Aluminum Aircraft Corp. of Bristol, Va., was announced yesterday by Consolidated Aircraft Corp. Hall Aluminum, acquired by outright purchase, is now an integral part of Consolidated Aircraft. Purchase price was not divulged.

Hall Aluminum Aircraft Corp. began as Charles Ward Hall, Inc., in 1916. Until the formation of Hall Aluminum Aircraft Corp. in 1927 Charles Ward Hall, president and sole stockholder, was continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall controlled numerous basic patents relating to the aircraft field.

There was developed a complete line of draw bench shapes and other parts of strong aluminum alloys which were perfected and sold to various airplane manufacturers. Hall Aluminum has also been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections and also in overhaul and repair work.

AIRPLANE CONTRACTS

Wall St. Journal 9/17/40

War Department Clears Another $116,842,227 Awards; Coast Firms Included

Dow Jones News Service

WASHINGTON—The War Department announced yesterday that contracts for airplanes totaling $116,842,227 have been cleared by the National Defense Advisory Commission and awarded by the department to five manufacturing concerns.

A summary of contracts awarded to the industry follows:

Glenn L. Martin Co., Baltimore, bombers and spare parts, $14,269,646.

Boeing Airplane Co., Stearman Aircraft Division, Wichita, Kan., training planes and spare parts, $6,934,096.

Boeing Aircraft Co., Seattle, bombers and spare parts, $59,762,850.

Lockheed Aircraft Corp., Burbank, Calif., pursuit planes and spare parts, $15,646,451.

Douglas Airplane Co., Santa Monica, Calif., transport airplanes and spare parts, $20,229,184.

LOS ANGELES—With allocation of yesterday's large plane orders, Southern California producers now have $677,000,000 of business on their books, practically all military for account of the United States defense program and those of Great Britain. Of the total, the amount of commercial work, although at record levels, is probably less than $50,000,000.

All Southern California plants are taking on help as fast as adequate type of men can be obtained. Present employment is probably close to 60,000, and probably will reach 100,000 by next spring.

Backlogs of the major Southern California plants, including yesterday's awards, are approximately as follows: Consolidated Aircraft, $132,000,000; Vultee, $80,000,000; Vega, $32,000,000; Lockheed, $183,000,000; Douglas, $160,000,000, and North American, $90,000,000.

First Bombers From Consair This Month

Tribune 9/6/40

The first of 200 patrol bombers, being built by Consolidated Aircraft Corp. for the United States navy, will be delivered this month, The Associated Press reported today from Washington, D. C., in a dispatch stating that delivery of fighting, scouting and bombing planes to the navy will reach a rate of more than 100 a month by early next year, according to an official statement.

Consolidated deliveries will increase to 22 a month by January and to 40 in October, 1941.

The 100-a-month rate includes only combat-type planes for which formal contracts have been signed. It does not include those which may be contracted for later, nor training, experimental and utility planes.

Delivery Rates Revealed

Delivery dates, hitherto withheld as naval secrets, were disclosed in a navy schedule inserted in the congressional record by Rep. Vinson (D-Ga), chairman of the house naval committee. In the same table, the navy discloses it has reached agreements, pending contracts, with manufacturers for 2617 additional fighting, scouting and bombing planes and 27,000 propellers.

The propellers were intended for both army and navy use during the 1941 and 1942 fiscal years and 70-odd bombers among the planes also were for the army. With the new agreements, the navy had 3648 fighting, patrolling and bombing planes on order, plus large numbers of training and other craft.

S. D. Number Progresses

Considering only the planes contracted for formally, Vinson's statement showed the following delivery rates for undelivered ships:

From 1940 fiscal year funds: 77 Grumman fighters—2 in September, subsequent deliveries depending on receipt of engines; 100 Vought-Sikorsky observation scouting planes —3 in October, 22 in November, 24 in December, 34 in January, 38 in February, 37 in March, 1941; 200 Consolidated patrol bombers—1 in September, the rate rising to 22 in January and then to 40 in October, 1941; 87 Douglas scout-bombers—17 in November, then 21 a month; 57 Vought-Sikorsky scout bombers—1 in September, 4 in November, 13 in December and then 15 a month.

From 1941 fiscal year funds: 234 Grumman fighters—1 in December, 81 additional by August, 1941, 80 additional by November, and 81 additional by February, 1942.

S. D. Plane Plants To Build New Units

9/11/40

Expansion of two plane factories and construction of a two-story 60-room apartment were called for in three building permits aggregating $74,500 that were issued by the inspection department at Civic Center yesterday.

Largest permit was for $30,000 and was obtained by Consolidated Aircraft Corp. for an office building. Plant engineers, the factory manager and test pilots will have quarters in the structure, said C. A. VanDusen, vice president of the corporation.

Ryan Aeronautical Co. took out a $20,000 permit for a steel addition to its hangar on Pacific highway. The third large permit was issued to B. E. Harmer for a $24,500 frame and stucco apartment at 4265-79 Euclid ave.

AUSTRALIA PURCHASES 11 FLYING BOATS

aircraft news. 9/19/40

MELBOURNE — The Australian government yesterday announced its decision to purchase 11 flying boats in the United States at a cost of $3,500,000 for delivery before the year-end.

Seven previously ordered flying boats will be stationed at Australia's new seaplane base at Rathmines, N.S.W., and will provide two squadrons with reserve for long range coastal reconnaisance.

These planes will replace 20 Sunderland flying boats ordered in the United Kingdom, and now turned over to the Royal Air Force. The order was placed with Consolidated Aircraft Corp. of San Diego.

The order from the Australian government for 11 additional PBY patrol bomber flyng boats received by Consolidated Aircraft Corp. of San Diego yesterday, totaling $3,500,000, boosts the company's current backlog to approximately $135,500,000.

In addition to orders from the United States Navy for this well-seasoned type of flying boat in use by the Navy for several years, Consolidated's backlog now includes a substantial order for this type from Great Britain.

Consolidated, now getting into the swing of mass production on larger type craft, is producing PBY flying boats for both the United States Navy and Great Britain and huge four-engined fortress type bomber for the United States Army Air Corps.

The company very recently completed another phase of its expansion program at a cost of $2,000,000 and is understood to have in contemplation expenditure of an additional $2,500,000 at its San Diego plant.

Plans for a branch plant at Dallas, Texas., under discussion for a time are understood to have been dropped and the company will apparently concentrate production at its one plant at San Diego.

S.D. AIR PLANTS' BACKLOGS TOP COUNTY'S ASSESSED VALUATION

Union --9/23/40

With announcement by the war department yesterday that Ryan Aeronautical Co. had received a $5,355,087 contract for new planes, the backlog of San Diego's two major aviation firms has soared far above the total assessed valuation of the entire county, including its eight incorporated cities. The total assessed valuation of the county, including the eight incorporated cities of San Diego, National City, Chula Vista, Coronado, La Mesa, El Cajon, Escondido and Oceanside, is $221,461,643, of which $149,932,440 is listed for the city of San Diego.

Ryan's backlog, with the new order, is $10,200,000. Consolidated Aircraft's backlog is reported as $221,300,000, or a total for the two firms of $231,500,000.

The number, types and delivery dates on the new Ryan order were not specified in the war department's announcement yesterday, The Associated Press reported. It was believed that many of them would be the Ryan S-T primary training planes.

Both aircraft companies are engaged in vast expansion programs to handle the great number of planes they will build for the defense of America. Their payrolls are jumping weekly as hundreds of employes are added every seven days to handle the orders on hand.

Acquires Patents

Consolidated Aircraft Corp. yesterday announced completion of the merger, through purchase, of the Hall - Aluminum Aircraft Corp., Bristol, Pa.

Consolidated officials said 32 key men of the eastern plane plant had joined the San Diego organization, and that all patent rights, material and equipment of the former company had been acquired through the purchase.

The Hall-Aluminum company had its beginning in Charles Ward Hall, Inc., in 1916. The Hall-Aluminum Aircraft Corp. was formed in 1927. The new company engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

The original company had engaged principally in research in the use of aluminum alloys in connection with the design and construction of aircraft. Numerous basic patents relating to this field were acquired by Consolidated through the merger.

Union 9/15/40

Consair Seeks Water St. Cut To Highway

Maj. Fleet Offers $20,000 to Cover Condemnation Cost

Condemnation by the city of a strip of property west of Pacific highway and between Bean and Harasthy sts., to permit Water st. to merge into Pacific highway just south of Harasthy st. instead of at Bean st., has been proposed by Maj. R. H. Fleet, Consolidated Aircraft Corp. president, in a letter just received by the city planning commission.

By doing this, said Glenn Rick, city planning engineer, the big plane plant could erect its proposed new final assembly building, which is to go up north of its present factory, closer to Pacific highway and more in line with the existing structure.

AFFECTS EFFICIENCY

The planning engineer said that this building alignment is important to efficient operation of the plant, and that Maj. Fleet, in his letter, said that if the city would condemn the property required for the new Water st. connection, the corporation "will contribute $20,000 of the expense, unless the total award is less than that amount, in which event our contribution would be limited to the total amount of the award."

Rick explained that part of Water st. is open south from Witherby st. The extension, as it appears on the map, would continue on tidelands to a junction with Pacific highway. If the private property described by Maj. Fleet were obtained by the city for street purposes, Consolidated then could move its proposed new assembly building forward on the tideland strip now set aside for Water st.

WILL DRESS UP WALLS

"If Water st. is not cut through, our building will not face on a highway, and the exterior walls will be finished in corrugated galvanized iron," Maj. Fleet wrote. "However, if the street is located as shown (on a map that accompanied the letter), we will finish the east elevation fronting on Water st. and the north elevation fronting on Harasthy st. in stucco, similar to our present buildings fronting on Pacific highway.

"This will entail an additional expenditure of $10,000, which expenditure we are willing to make in the interest of beautification of the city."

That the $20,000 offer to cover the condemnation award should be ample was indicated in Maj. Fleet's letter, in which he disclosed that "we recently purchased the entire froontage between Vine and Bean sts. on the east side of Pacific highway for $15,000."

SPEEDY APPROVAL SEEN

Development of Water st. is part of a comprehensive plan to relieve traffic congestion at Bancroft ave. and Pacific highway. With that in mind, Rick insisted when the aircraft corporation's original lease was drafted, that sufficient tidelands be excluded to permit Water st. to be merged with Pacific highway at Bean st. In view of Maj. Fleet's offer to pay up to $20,000 of a condemnation award, the planning engineer said he would favor the new proposal.

To speed consideration of the suggestion, Rick said he has advised Consolidated officials to withdraw the letter, which was addressed to the planning commission, and to resubmit it to the city council so that body, if it desired, immediately could order an appraisal made. This could be done Tuesday, said Rick whereas the planning commission, which could not authorize an appraisal, does not meet until Sept. 24, when its nly action would be to refer the letter to the council for consideration the following week.

Clash Looms; U. S. May Get Singapore Base

HONG KONG, Sept. 21 (Saturday) (A.P.) — The British-owned newspaper China Mail reported today that "since yesterday morning" Japanese warships have moved into Tonking bay "as a persuasive gesture" to back up Japanese negotiations for military rights in French Indo-China.

WASHINGTON, Sept. 20 (I.N.S.)—Authoritative Chinese quarters said tonight their government may attempt a fusion with Indo-China's native masses should the French authorities there allow Japanese troops to cross the territory under orders of the Vichy government.

Secy. of State Hull told his press conference meantime that his talks with British and Australian envoys have covered the question of basing the United States fleet at Singapore, closer by 2000 miles to Japan than the present Hawaiian base.

RICHARDSON CALLED BACK

Linked also to the administration's efforts to maintain the Pacific status quo was a navy announcement that the fleet commander-in-chief, Adm. James O. Richardson, on arrival of the first three sections of the battle force for overhaul at San Pedro, Calif., will come on to Washington.

Here, officials said, the admiral will hold his seconnd conference in recent months with President Roosevelt and the navy high command on the Pacific situation. He leaves Honolulu Monday on the battleship New Mexico.

HONGKONG, Sept. 21 (Saturday) (A.P.) — Chinese press reports — unconfirmed elsewhere — declared today that an understanding had been reached for Chinese-French military collaboration in the event Japan invades Indo-China.

These reports said the French would allow Chinese troops to enter Indo-China to oppose any Japanese invaders.

Hull, in confirming reports that he had mentioned Singapore to Lord Lothian, British ambassador, and Richard Casey, Australian minister, emphasized that the talks as yet have not reached the status of negotiations calling for decisions.

A decision entailing the fleet's transfer to Britain's Far Eastern "Gibraltar"—a base separated by three weeks' steaming time from the Panama canal and the Atlantic —presumably would require Richardson's advice and depend in part upon the course of the battle of Britain.

HONG KONG, Sept. 21 (Saturday) (A.P.) — Highly connected Japanese quarters here said today Japan was prepared to take action aiming at the seizure of all French Indo-China if France declined to permit the passage of an unrestricted number of Japanese troops through the French colony.

Competent quarters here expressed doubt the fleet would move to Singapore and until an invasion attempt demonstrated the British fleet's ability to hold the

HARBOR DRIVE, CONSAIR LAND PROJECTS MOVE STEP NEARER

Plan Board Drafts Recommendation To Council for Use of U. S. Defense Funds

Ten to 15 giant seaplanes soon will be produced by Consolidated Aircraft Corp. daily, the city planning commission was informed at a special meeting yesterday which was marked by the drafting of a recommendation to the city council that it immediately authorize an application for national defense fund for Harbor dr. construction Other highlights of the meeting included:

1—Decision by the commission not to protest against modification of pier and bulkhead lines to permit a 500x2500-foot land fill on the bay side of Harbor dr. between the coast guard air station and the Marine base.

CLIPPER BASE MOVE SEEN

2—Forecast that the transpacific clipper ship base eventually will be moved from San Francisco to San Diego "where there are no bridges and no fog."

3—Expression of belief by Joe Brennan, port director, that defense funds can be obtained to build Harbor dr. as a military road connecting the Destroyer base, Navy pier, 11th Naval district headquarters, the coast guard air station, the Marine base, Naval Training station and the Ft. Rosecrans reservation.

4—Report by William Maloney, Consair plant engineer, that the factory is expanding so rapidly that he sometimes wonders whether he is in "the general building contracting business or the aircraft industry," and disclosure by him that because of inadequate city sewage facilities, the plane corporation is installing its own outfall and ejector pumps at a cost of $27,500.

PIER HEARING DELAYED

The meeting was called after Col. Edwin C. Kelton, Los Angeles, district army engineer, continued for a week a hearing he opened here Wednesday on modification of the pier and bulkhead lines. This delay was granted to give the planning commission an opportunity to study the plan.

In the discussion yesterday, Maloney emphasized Consair's need for additional land. He said that seaplane ramps are imperative, and that a site is needed on the water's edge in which seaplanes can be overhauled. He pointed to the inadequacy of the existing ramp at the south end of the field and which also is used by the coast guard, and said new facilities are needed at the north end of Lindbergh field and away from airport plane traffic congestion.

"You're talking about a 300,000,000 business," said Brennan, in urging the commission to indorse the fill. He said that every available

Consair Wins 85-Million Order

Backlog Climbs To $217,800,000

Bringing its total backlog for government warplanes to $217,800,000, Consolidated Aircraft Corp. yesterday received an $85,800,000 contract from the war department for an undisclosed number of four-motored bombers, The Associated Press reported from Washington, D. C.

The previous backlog was $132,000,000.

In a talk before U. S. army engineers in the harbor commission office Wednesday, Maj. Reuben H. Fleet, Consolidated president, said the Lindbergh field plant will have a backlog of $300,000,000 soon, intimating that additional contracts are forthcoming from the war and navy departments.

Delivery dates for the new bombers were not specified.

Consolidated authorities reported new workers are being employed at the rate of 500 a week and that this will be stepped up as new buildings are completed under the company's huge expansion program. Present plans call for a working force of 35,000 men, virtually triple the present number of employes.

R. A. F. Batters German Canals

LONDON, Sept. 21 (Saturday) (I. N.S.)—Crippling destruction dealt by British bombers to Germany's intricate web of canals, railways and roads was followed early today with a prolonged aerial barrage that sent many tons of explosive and incendiary steel crashing into the Nazi battlements across the English channel.

Hour upon hour through the night and into the morning, relays of Royal Air force squadrons vaulted over the narrow waters to deliver their cargoes. They centered their fury mainly on the docks of Calais, the nearest of the Nazi-held invasion springboards to England, and on the long-range German guns planted around near-by Cap Gris Nez.

HEAR HEAVY BLASTS

Watchers on the Dover chalk cliffs, 22 miles opposite Calais, reported they saw and heard the heaviest explosions that have yet rocked the other side of the channel. Violence of the repeated R.A.F. thrusts was attested to by the fact that German anti-aircraft guns erupted not hundreds but thousands of tracer shells that streaked the dark sky like a giant fireworks display.

The waterways and transport lines of Germany—nerve system of Adolf Hitler's war machine—shared with the Nazi invasion bases and inland centers in the gradual paralysis the British bombers sought to spread with their unceasing attacks

Navy Bars Cameras From Ships in Hawaii

HONOLULU, Sept. 20 (A.P.) — The United States navy is increasing its precautions against espionage. Officers and enlisted men, it was learned today, have been forbidden to take cameras aboard ships.

Sale of camera supplies in the ships' service stores also has been stopped.

OVER

S. D. Air Plants Get 'Speed Up' Army Orders

Union--Wed. 9/11/40

WASHINGTON, Sept. 10 (I.N.S.) —The war department announced tonight it had sent "speed up" letters to 21 manufacturers calling for $1,251,000,000 worth of armaments, including 14,394 planes, for national defense.

Among the firms receiving letters was the Ford Motor Co. of Detroit, which will manufacture plane motors under the air defense program.

SEEK 14,394 PLANES

Acting under the five-billion-dollar defense deficiency appropriation bill signed by President Roosevelt yesterday, the war department letters, approved by the national defense commission, authorizes the manufacturers to go ahead with the program without delay while contractual details are being worked out.

The 14,394 planes ordered, at an estimated cost of $817,000,000, provides for every type of army craft, from trainers to fast pursuit ships, medium and heavy bombers.

Earlier in the day the department announced a specific contract with the Bell Aircraft Corp. of Buffalo for 120 fast pursuit planes, at a cost of $4,962,220. These pursuit ships were said to have shown a speed of more than 400 miles an hour in recent army tests.

SILENT ON NUMBERS

In the "speed up" letters tonight, specific numbers of planes, engines or parts to be produced by each company was not specified. The engine program, however, calls for 28,282 plane motors, at a cost of $377,000,000, while $57,000,000 worth of propellors and blades are provided for in the program.

The letters were sent to the following companies:

For planes: Boeing Aircraft Co., Seattle; Consolidated Aircraft Corp., San Diego; Glenn L. Martin Co., Baltimore; North American Aviation, Inglewood; Douglas Aircraft, Santa Monica; Lockheed Aircraft Corp., Burbank; Bell Aircraft Corp., Buffalo; Curtiss plane division, Curtiss Wright Corp., Buffalo; Curtiss Wright Corp., St. Louis plane division, Robertson, Mo.; Republic Aviation Corp., Farmingdale, L. I.; Beech Aircraft Corp., Wichita, Kan.; Vultee Aircraft, Inc., Downey; Fairchild Aircraft, Hagerstown, Md.; Ryan Aeronautical, San Diego; Stearman Aircraft division, Boeing Airplane Co., Wichita, Kan.

ORDER ENGINES

For engines: Ford Motor Co., Dearborn, Mich.; Continental Motors, Muskegon, Mich.; Lycoming division, Aviation Manufacturing corp., Williamsport, Pa.; Allison engineering division, General Motors Corp., Indianapolis, and Wright Aeronautical Corp., Patterson, N. J.

For propellors and blades: Curtiss propellor division, Curtiss Wright Corp., Clifton, N. J.

Lindbergh Field Expansion to Start

Aircraft news 9/19/40

SAN DIEGO—A $1,400,000 improvement program started last Monday to make Lindbergh Field, the municipal airport, suitable for test flights of giant, four-engined Army bombers Consolidated Aircraft Corp. is building for the United States and Great Britain.

Runways will be lengthened, acres of ground reclaimed in bay dredging will be graded and oiled, and sewer and lighting systems will be installed with funds largely provided by the Federal government.

MAJOR RUBEN FLEET, SAN DIEGO'S SANTA CLAUS!

The city of San Diego with its citizens in entirety, owe much to Major Ruben Fleet, president of the Consolidated Aircraft corporation who, in plain language, has completely saved San Diego from falling into the hands of old man poverty!

Perhaps there are many people who are not aware of the fact that the good major had been corralled by "Hogtown" Los Angeles when he first invaded the Pacific coast after leaving his home, the city of Buffalo, New York behind him to seek appropriate climatic conditions that would warrant his powerful aircraft corporation to manufacture airplanes which would be flown immediately upon completion. That could not be accomplished at the Major's home in Buffalo on account of the winter season. But, in California the production of planes could be done the year around.

So, when Major Fleet arrived on this coast and of course, landing in Los Angeles first, he and his associates reconnoitered the Los Angeles vicinities. They were accompanied by a Los Angeles "dragnet" composed of the high-powered chamber of commerce "goodwill ambassadors" who stuck to the Major and his party at the same time making all sorts of overtures to the distinguished eastern visitors.

But, Major Fleet had heard of the San Diego unexcelled climate and after thanking the "Hogtown' Los Angeles gentlemen informed them that he wished to make a survey of San Diego also before making up his mind to select Los Angeles for his airplane site. How the Major ever escaped the clutches of our northern leeches is more than we can ever explain!

However, Major Fleet arrived in San Diego and here he met another Major. That other Major was Macauley, business manager of the San Diego chamber of commerce and executive secretary. Major Macauley lost no time in bringing into the picture Joe Brennan, director of port.

Between Macauley and Brennan's "sales talk,' Major Fleet was convinced in less time than it takes to tell it, that San Diego was the spot he set out to get and the Consolidated Aircraft corporation selected the tideland sites along Pacific boulevard and immediately erected its magnificent factory which makes it the largest now in the United States.

Last Monday another addition was completed and dedicated in the presence of several thousand San Diegans who paid tribute to Major Ruben Fleet and his corporation. Admiral Chas. A. Blakely, commandant of the 11th Naval District was given the honor of the dedication. Admiral Blakely's eulogy to Major Fleet in behalf of the entire navy department, was loudly applauded and San Diegans felt that a great man had come to their city to save them from poverty and to enlighten every home here. This "life saver" made it possible to save the day after the fleet had departed for the Hawaiian Islands with that enormous payroll which has been San Diego's greatest source of revenue.

More than 9,600 men are now employed by the Consolidated Aircraft corporation, and according to the statement made by Major Fleet at the dedicatory ceremonies last Monday, there will be several thousand more men employed by December of this year, which means a larger payroll, supreme happiness and greater prosperity for San Diego and its surrounding territory.

Yes, Major Fleet is San Diego's Santa Claus!

AVIATION ENGINEERING

At the West Coast Meetings of the Institute of Aeronautical Sciences

By

Charles F. McReynolds

West Coast Editor, AVIATION

The Second Annual Summer Meeting of the Institute of the Aeronautical Sciences certainly brought to light a great many advanced ideas which will doubtless have a profound influence on any future war effort that might involve America. If the papers presented there did not startle audiences with revolutionary new ideas, they certainly did present a variety of new ways for doing the same old things. In fact, so militarily significant were some of the ideas that our massive Army Intelligence Service clamped down on at least one paper, refusing permission for presentation of a discussion of the characteristics of rocket motor propulsion, by F. J. Malina.

This meeting of the Institute of the Aeronautical Sciences was among the best yet staged by that commendable organization. Papers were of a uniformly high quality of profundity and the audiences were commendably large and "open-mouthed". Paraphrasing our own American phrase maker, "they may not all have understood all that they heard all of the time but some of them understood some of what they heard some of the time."

Attendance at the meetings was led by such men as Dr. Von Karman, Dr. Millikan, Dr. Klein, Dr. Klemperer, Hall Hibbard, Richard Palmer, and many others of the American aviation industry's scientific and engineering greats. Papers presented during the three days, extending from June 24th through June 26th, greatly extended the industry's knowledge of such subjects as airplane cabin pressurizing, vibration and flutter phenomena, radio shielding and bonding problems, recording of flight test data, characteristics of engine combustion, etc. For convenience the papers were grouped into five sessions under the five general headings: structures, vibration and flutter, instrumentation, high altitude flying, and aerodynamics.

V. H. Pavlecka, Northrop Aircraft, Inc., served as chairman for the opening session on structures. A paper prepared by W. L. Howaland and Carl Beed, Lockheed Aircraft Corp., was presented by Carl Beed. The authors called attention to present requirements which demand aircraft with wings so thin as to be invisible when seen from the front, yet thick enough to carry fuel tanks, supercharging equipment, retracting gear, etc. Since these items must not be hampered by structural members, the wing structure is reduced to a series of load carrying holes. The fuselage design problem is somewhat simpler, requiring only that the fuselage be large on the inside and small on the outside, and capable of pressurization. This paper then presented the results of pressurized cabin structure tests which have been conducted by Lockheed Aircraft Corp. in preparation for construction of the new four-engined Lockheed transport, "Excalibur", and other high-flying Lockheeds. The audience was reminded that the world's first full-scale pressurized plane was the special Lockheed transport built for the U. S. Army Air Corps about three years ago, which made many notable high altitude flights. In conducting pressurizing tests Lockheed engineers worked with a cabin section specially mounted to permit application of structural loads with and without pressure. A complete set of tests was first made without fuselage cutouts, which was followed by an extensive investigation of structural requirements imposed by various types of cutouts. An electrical strain gauge of Baldwin-Southwark type was used for stress measurements. One of the major structural problems of the pressurized cabin is the "quilting" effect by which the pressure tends to bulge the thin sheet covering between the support frame. Interestingly enough, while the longitudinal stiffeners bulge outward, the unsupported skin itself bulges inward slightly at about the center point of each panel. It was also found that the fuselage structure was stronger for some conditions of loading while pressurized. Discussion following the paper revealed that spot welded portions of the section tested were smoother and more rigid under test. A weight saving was also achieved through elimination of the sealing compound necessary with riveting.

A. D. TUTTLE

Symposium on Structures

A symposium on Stability of Aircraft Structures was presented by Alfred S. Niles, Stanford University; Louis G. Dunn, California Institute of Technology; N. J. Hoff, Stanford University; John C. Silliman, Pacific Railway Equipment Co.; and J. L. Frederick, California Institute of Technology.

J. R. Goldstein served as chairman for the Monday evening meeting, devoted to "Vibration and Flutter". A paper on the "Effects of Propeller Slipstream and Tail Position on the Vibration Characteristics of the Lockheed 'Lodestar'," by R. L. Thoren and C. L. Johnson, Lockheed Aircraft Corp., was presented by R. L. Thoren. It was encouraging to learn of the exhaustive program of flight testing conducted on this model in order to eliminate all vestiges of vibration. Instrumentation was explained in detail although about equally accurate results were said to have been obtained by the observations of a recorder sitting on a wooden stool in the lavatory compartment. During the discussion period it was suggested that flutter research might be made less expensively by means of powered wind tunnel models. Dr. Clark Millikan, of Cal.-Tech., suggested that the results might be adversely affected by the proximity of the tunnel walls, a factor difficult to evaluate in connection with tests of this character.

Engine Propeller Systems

"Coupled Oscillations of Aircraft Engine-Propeller Systems" was presented by M. A. Biot, Columbia University, in an interesting mathematical method of analyzing such vibrations.

E. P. Wheaton, Douglas Aircraft Company, presented a paper dealing with "Flutter: A Diagnosis, Its Prevention and Cure", by Jean Wylie, and Wheaton. This study was based on a series of tests involving artificial excitation of the wing structure. Elliott Mock questioned the conclusion that flutter frequency would be reduced

Consair Seeks Water St. Cut To Highway

Maj. Fleet Offers $20,000 to Cover Condemnation Cost

Condemnation by the city of a strip of property west of Pacific highway and between Bean and Harasthy sts., to permit Water st. to merge into Pacific highway just south of Harasthy st. instead of at Bean st., has been proposed by Maj. R. H. Fleet, Consolidated Aircraft Corp. president, in a letter just received by the city planning commission.

By doing this, said Glenn Rick, city planning engineer, the big plane plant could erect its proposed new final assembly building, which is to go up north of its present factory, closer to Pacific highway and more in line with the existing structure.

AFFECTS EFFICIENCY

The planning engineer said that this building alignment is important to efficient operation of the plant, and that Maj. Fleet, in his letter, said that if the city would condemn the property required for the new Water st. connection, the corporation "will contribute $20,000 of the expense, unless the total award is less than that amount, in which event our contribution would be limited to the total amount of the award."

Rick explained that part of Water st. is open south from Witherby st. The extension, as it appears on the map, would continue on tidelands to a junction with Pacific highway. If the private property described by Maj. Fleet were obtained by the city for street purposes, Consolidated then could move its proposed new assembly building forward on the tideland strip now set aside for Water st.

WILL DRESS UP WALLS

"If Water st. is not cut through, our building will not face on a highway, and the exterior walls will be finished in corrugated galvanized iron," Maj. Fleet wrote. "However, if the street is located as shown (on a map that accompanied the letter), we will finish the east elevation fronting on Water st. and the north elevation fronting on Harasthy st. in stucco, similar to our present buildings fronting on Pacific highway.

"This will entail an additional expenditure of $10,000, which expenditure we are willing to make in the interest of beautification of the city."

That the $20,000 offer to cover the condemnation award should be ample was indicated in Maj. Fleet's letter, in which he disclosed that "we recently purchased the entire froontage between Vine and Bean sts. on the east side of Pacific highway for $15,000."

SPEEDY APPROVAL SEEN

Development of Water st. is part of a comprehensive plan to relieve traffic congestion at Bancroft ave. and Pacific highway. With that in mind, Rick insisted when the aircraft corporation's original lease was drafted, that sufficient tidelands be excluded to permit Water st. to be merged with Pacific highway at Bean st. In view of Maj. Fleet's offer to pay up to $20,000 of a condemnation award, the planning engineer said he would favor the new proposal.

To speed consideration of the suggestion, Rick said he has advised Consolidated officials to withdraw the letter, which was addressed to the planning commission, and to resubmit it to the city council so that body, if it desired, immediately could order an appraisal made. This could be done Tuesday, said Rick whereas the planning commission, which could not authorize an appraisal, does not meet until Sept. 24, when its nly action would be to refer the letter to the council for consideration the following week.

Clash Looms; U. S. May Get Singapore Base

HONG KONG, Sept. 21 (Saturday) (A.P.) — The British-owned newspaper China Mail reported today that "since yesterday morning" Japanese warships have moved into Tonking bay "as a persuasive gesture" to back up Japanese negotiations for military rights in French Indo-China.

HARBOR DRIVE, CONSAIR LAND PROJECTS MOVE STEP NEARER

Plan Board Drafts Recommendation To Council for Use of U. S. Defense Funds

Ten to 15 giant seaplanes soon will be produced by Consolidated Aircraft Corp. daily, the city planning commission was informed at a special meeting yesterday which was marked by the drafting of a recommendation to the city council that it immediately authorize an application for national defense fund for Harbor dr. construction. Other highlights of the meeting included:

1—Decision by the commission not to protest against modification of pier and bulkhead lines to permit a 500x2500-foot land fill on the bay side of Harbor dr. between the coast guard air station and the Marine base.

CLIPPER BASE MOVE SEEN

2—Forecast that the transpacific clipper ship base eventually will be moved from San Francisco to San Diego "where there are no bridges and no fog."

3—Expression of belief by Joe Brennan, port director, that defense funds can be obtained to build Harbor dr. as a military road connecting the Destroyer base, Navy pier, 11th Naval district headquarters, the coast guard air station, the Marine base, Naval Training station and the Ft. Rosecrans reservation.

4—Report by William Maloney, Consair plant engineer, that the factory is expanding so rapidly that he sometimes wonders whether he is in "the general building contracting business or the aircraft industry," and disclosure by him that because of inadequate city sewage facilities, the plane corporation is installing its own outfall and ejector pumps at a cost of $27,500.

PIER HEARING DELAYED

The meeting was called after Col. Edwin C. Kelton, Los Angeles, district army engineer, continued for a week a hearing he opened here Wednesday on modification of the pier and bulkhead lines. This delay was granted to give the planning commission an opportunity to study the plan.

In the discussion yesterday, Maloney emphasized Consair's need for additional land. He said that seaplane ramps are imperative, and that a site is needed on the water's edge in which seaplanes can be overhauled. He pointed to the inadequacy of the existing ramp at the south end of the field and which also is used by the coast guard, and said new facilities are needed at the north end of Lindbergh field and away from airport plane traffic congestion.

"You're talking about a 300,000,000 business," said Brennan, in urging the commission to indorse the fill. He said that every available

Consair Wins 85-Million Order

Backlog Climbs To $217,800,000

Bringing its total backlog for government warplanes to $217,800,000, Consolidated Aircraft Corp. yesterday received an $85,800,000 contract from the war department for an undisclosed number of four-motored bombers, The Associated Press reported from Washington, D. C.

The previous backlog was $132,000,000.

In a talk before U. S. army engineers in the harbor commission office Wednesday, Maj. Reuben H. Fleet, Consolidated president, said the Lindbergh field plant will have a backlog of $300,000,000 soon, intimating that additional contracts are forthcoming from the war and navy departments.

Delivery dates for the new bombers were not specified.

Consolidated authorities reported new workers are being employed at the rate of 500 a week and that this will be stepped up as new buildings are completed under the company's huge expansion program. Present plans call for a working force of 35,000 men, virtually triple the present number of employes.

R. A. F. Batters German Canals

LONDON, Sept. 21 (Saturday) (I. N.S.)—Crippling destruction dealt by British bombers to Germany's intricate web of canals, railways and roads was followed early today with a prolonged aerial barrage that sent many tons of explosive and incendiary steel crashing into the Nazi battlements across the English channel.

Hour upon hour through the night and into the morning, relays of Royal Air force squadrons vaulted over the narrow waters to deliver their cargoes. They centered their fury mainly on the docks of Calais, the nearest of the Nazi-held invasion springboards to England, and on the long-range German guns planted around near-by Cap Gris Nez.

HEAR HEAVY BLASTS

Watchers on the Dover chalk cliffs, 22 miles opposite Calais, reported they saw and heard the heaviest explosions that have yet rocked the other side of the channel. Violence of the repeated R.A.F. thrusts was attested to by the fact that German anti-aircraft guns erupted not hundreds but thousands of tracer shells that streaked the dark sky like a giant fireworks display.

The waterways and transport lines of Germany—nerve system of Adolf Hitler's war machine—shared with the Nazi invasion bases and inland centers in the gradual paralysis the British bombers sought to spread with their unceasing attacks

Navy Bars Cameras From Ships in Hawaii

HONOLULU, Sept. 20 (A.P.)—The United States navy is increasing its precautions against espionage. Officers and enlisted men, it was learned today, have been forbidden to take cameras aboard ships.

Sale of camera supplies in the ships' service stores also has been stopped.

S. D. Air Plants Get 'Speed Up' Army Orders

Union--Wed. 9/11/40

WASHINGTON, Sept. 10 (I.N.S.)—The war department announced tonight it had sent "speed up" letters to 21 manufacturers calling for $1,251,000,000 worth of armaments, including 14,394 planes, for national defense.

Among the firms receiving letters was the Ford Motor Co. of Detroit, which will manufacture plane motors under the air defense program.

SEEK 14,394 PLANES

Acting under the five-billion-dollar defense deficiency appropriation bill signed by President Roosevelt yesterday, the war department letters, approved by the national defense commission, authorizes the manufacturers to go ahead with the program without delay while contractual details are being worked out.

The 14,394 planes ordered, at an estimated cost of $817,000,000, provides for every type of army craft, from trainers to fast pursuit ships, medium and heavy bombers.

Earlier in the day the department announced a specific contract with the Bell Aircraft Corp. of Buffalo for 120 fast pursuit planes, at a cost of $4,962,220. These pursuit ships were said to have shown a speed of more than 400 miles an hour in recent army tests.

SILENT ON NUMBERS

In the "speed up" letters tonight, specific numbers of planes, engines or parts to be produced by each company was not specified. The engine program, however, calls for 28,282 plane motors, at a cost of $377,000,000, while $57,000,000 worth of propellors and blades are provided for in the program.

The letters were sent to the following companies:

For planes: Boeing Aircraft Co., Seattle; Consolidated Aircraft Corp., San Diego; Glenn L. Martin Co., Baltimore; North American Aviation, Inglewood; Douglas Aircraft, Santa Monica; Lockheed Aircraft Corp., Burbank; Bell Aircraft Corp., Buffalo; Curtiss plane division, Curtiss Wright Corp., Buffalo; Curtiss Wright Corp., St. Louis plane division, Robertson, Mo.; Republic Aviation Corp., Farmingdale, L. I.; Beech Aircraft Corp., Wichita, Kan.; Vultee Aircraft, Inc., Downey; Fairchild Aircraft, Hagerstown, Md.; Ryan Aeronautical, San Diego; Stearman Aircraft division, Boeing Airplane Co., Wichita, Kan.

ORDER ENGINES

For engines: Ford Motor Co., Dearborn, Mich.; Continental Motors, Muskegon, Mich.; Lycoming division, Aviation Manufacturing corp., Williamsport, Pa.; Allison engineering division, General Motors Corp., Indianapolis, and Wright Aeronautical Corp., Patterson, N. J.

For propellors and blades: Curtiss propellor division, Curtiss Wright Corp., Clifton, N. J.

Lindbergh Field Expansion to Start

aircraft news 9/19/40

SAN DIEGO—A $1,400,000 improvement program started last Monday to make Lindbergh Field, the municipal airport, suitable for test flights of giant, four-engined Army bombers Consolidated Aircraft Corp. is building for the United States and Great Britain.

Runways will be lengthened, acres of ground reclaimed in bay dredging will be graded and oiled, and sewer and lighting systems will be installed with funds largely provided by the Federal government.

MAJOR RUBEN FLEET, SAN DIEGO'S SANTA CLAUS!

The city of San Diego with its citizens in entirety, owe much to Major Ruben Fleet, president of the Consolidated Aircraft corporation who, in plain language, has completely saved San Diego from falling into the hands of old man poverty!

Perhaps there are many people who are not aware of the fact that the good major had been corralled by "Hogtown" Los Angeles when he first invaded the Pacific coast after leaving his home, the city of Buffalo, New York behind him to seek appropriate climatic conditions that would warrant his powerful aircraft corporation to manufacture airplanes which would be flown immediately upon completion. That could not be accomplished at the Major's home in Buffalo on account of the winter season. But, in California the production of planes could be done the year around.

So, when Major Fleet arrived on this coast and of course, landing in Los Angeles first, he and his associates reconnoitered the Los Angeles vicinities. They were accompanied by a Los Angeles "dragnet" composed of the high-powered chamber of commerce "goodwill ambassadors" who stuck to the Major and his party at the same time making all sorts of overtures to the distinguished eastern visitors.

But, Major Fleet had heard of the San Diego unexcelled climate and after thanking the "Hogtown' Los Angeles gentlemen informed them that he wished to make a survey of San Diego also before making up his mind to select Los Angeles for his airplane site. How the Major ever escaped the clutches of our northern leeches is more than we can ever explain!

However, Major Fleet arrived in San Diego and here he met another Major. That other Major was Macauley, business manager of the San Diego chamber of commerce and executive secretary. Major Macauley lost no time in bringing into the picture Joe Brennan, director of port.

Between Macauley and Brennan's "sales talk,' Major Fleet was convinced in less time than it takes to tell it, that San Diego was the spot he set out to get and the Consolidated Aircraft corporation selected the tideland sites along Pacific boulevard and immediately erected its magnificent factory which makes it the largest now in the United States.

Last Monday another addition was completed and dedicated in the presence of several thousand San Diegans who paid tribute to Major Ruben Fleet and his corporation. Admiral Chas. A. Blakely, commandant of the 11th Naval District was given the honor of the dedication. Admiral Blakely's eulogy to Major Fleet in behalf of the entire navy department, was loudly applauded and San Diegans felt that a great man had come to their city to save them from poverty and to enlighten every home here. This "life saver" made it possible to save the day after the fleet had departed for the Hawaiian Islands with that enormous payroll which has been San Diego's greatest source of revenue.

More than 9,600 men are now employed by the Consolidated Aircraft corporation, and according to the statement made by Major Fleet at the dedicatory ceremonies last Monday, there will be several thousand more men employed by December of this year, which means a larger payroll, supreme happiness and greater prosperity for San Diego and its surrounding territory.

Yes, Major Fleet is San Diego's Santa Claus!

FEDERAL PLANE ORDERS LISTED

planes. The 1941 fiscal year appropriation provided funds or contract authorization for approximately 3,000 planes for the Navy, and the supplemental defense appropriation for 4,028.

A recapitulation of awards made by the War Department indicates that since June the Army has placed orders for aircraft, exclusive of engines, armament and certain instruments, with a value of close to $400,000,000. The exact number of airplanes the Army will obtain as a result of these orders has not been divulged, and no information has been furnished as to the number of ships ordered by the Army for the Navy's account. Because of the difference in technical requirements, it is assumed that the combat ships ordered by the Army are all for its own use, but it is understood that some of the cargo and training planes were ordered for the Navy's account.

Army Contracts Listed

The following is a list of aircraft contracts awarded by the Army since June 1 of this year:

Manufacturer	Type	Quantity	Value
Cessna,	twin-engined advanced trainers	33	$900,378
Cessca,	twin-engined advanced trainers	33	$900,378
No American,	single-eng advanced trainers	637	11,335,631
Consolidated,	four-engine heavy bombers	56	14,831,342
Stearman,	primary trainers	300	2,041,947
Beech,	advanced trainers	67	3,410,746
Fairchild,	primary trainers	100	1,038,300
Stinson,	short-range observation	6	‡
Beech,	transports	20	*
Ryan,	primary trainers	100	2,074,234
Beech,	advanced trainers	150	4,847,217
Vultee,	basic trainers	500	7,488,782
Boeing,	four-engined heavy bombers	277	70,449,955
Lockheed,	twin-engined pursuits	410	30,278,788
Platt-Lepate,	rotating-wing autogyro	1	‡
Bell,	single-engined pursuits	120	4,962,220
Republic,	single-engined pursuits	†1,000	56,499,924
Bell,	single-engined pursuits	540	19,688,287
Curtiss,	trainers	450	4,221,069
Curtiss,	transports	46	12,410,116
Martin,	twin-engined bombers	‡	14,269,646
Stearman,	trainers	‡	6,934,096
Boeing,	four-engined heavy bombers	‡	59,762,850
Lockheed,	twin-engined pursuits	‡	15,646,451
Douglas,	transports	‡	20,229,184
Beech,	trainers	‡	13,115,138

† Estimated. ‡ Not released. * Included in the $4,847,217 for advanced trainers.

List of Navy Orders

Figures released by the Navy showed that up to and including September 3 it had awarded contracts for airplanes and engines, out of its $226,088,562 appropriation for the fiscal year 1941, with an aggregate value of $44,720,634. Out of its 1940 fiscal year appropriation of $89,419,000, the Navy had awarded contracts for airplanes and engines with a value of $38,551,966. Since that date, only two new contracts have been announced as awarded by the Navy. One was to Curtiss-Wright for scout observation

FEDERAL PLANE ORDERS LISTED

Continued from First Page

ships with a value of $11,476,633, and the other presumably for scout-bombers with a value of $9,602,384 to Douglas Aircraft.

The following is a break-down of the airplanes reported by the Navy as on order but undelivered as of September 3:

Model	Type	Manufacturer	Quantity
F2A-2,	single seater fighter;	Brewster	43
F4FS,	single seater fighter;	Grumman	320
JRB-1,	utility transport;	Beech	5
JRF-1,	utility transport;	Grumman	10
N3N-3,	primary trainer;	Navy aircraft factory	562
NP-1,	primary trainer;	Spartan	201
NR-1,	primary trainer;	Ryan	100
N2S-1,	primary trainer;	Stearman	600
OS2U-1,	observation scout;	Vought-Sikorsky	42
OS2U-2,	observation scout;	Vought-Sikorsky	158
PBM-1,	two-engined patrol bomber;	Martin	20
PBY-5,	two-engined patrol bomber;	Consolidated	200
PB2Y-2,	four-engined patrol bomber,	Consolidated	2
R3D-2,	transport;	Douglas	4
R5C-1,	transport;	Lockheed	1
SBDS,	scout-bomber;	Douglas	137
SBN-1,	scout-bomber;	Navy aircraft factory	30
SB2U-3,	scout bomber;	Vought-Sikorsky	57
SNJ-2,	advanced trainer;	North American	25
X15F-1,	two-engined fighter (experimental);	Grumman	1
XFL-1,	land fighter (experimental);	Bell	1
XF4U-1,	experimental fighter;	Vought-Sikorsky	1
XN5N-1,	experimental trainer;	naval aircraft	1
XPBB-1,	experimental patrol bomber;	Boeing	1
XPB2M,	experimental patrol bomber;	Martin	1
XPBM2,	experimental 4-eng. patent bomber;	Martin	1
XSB2A1,	experimental scout bomber;	Brewster	1
XSB2C-1,	experimental scout bomber;	Curtiss	1
XTBF-1,	experimental torpedo bomber;	Grumman	2
XTBU-1,	experimental torp. bomber;	Vought-Sikorsky	1

Prospective Orders

In addition to the planes shown as on order and undelivered on September 3, the Navy had agreements preparatory to contracts for the following ships:

Type	Manufacturer	Quantity
Observation-scouts;	Vought-Sikorsky	1,006
Scout-bombers;	Brewster	411
Fighters;	Brewster	108
Fighters;	Grumman	254
Torpedo-bombers;	Grumman	286
Utility transports;	Grumman	144
Scout bombers;	Douglas	252
Scout observation;	Curtiss	300
Advanced trainers;	Curtiss	150

To date the Navy has made no announcement indicating that actual contracts for any of the above airplanes have been awarded. It is quite possible, however, that the orders announced as placed by the War Department with Douglas and Curtiss last Saturday may have included some planes for the Navy.

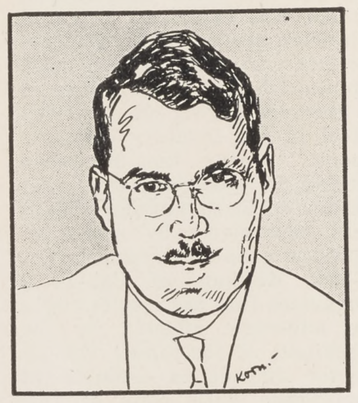
A total of 29 of the planes on order September 3 were scheduled for delivery this month, while 47 are scheduled for October, to increase to 112 in November and 187 in December. These scheduled deliveries do not take into consideration deliveries against orders placed prior to 1940, but still unfilled, which includes the order for 20 patrol bombers against which Martin is just starting deliveries.

---

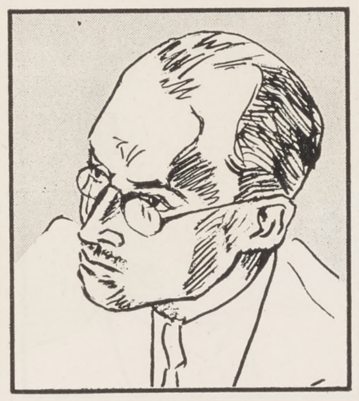
due to re the wing. Wheaton thought that reduction of frequency was a normal phenomenon up to the point of skin wrinkling. "A Graphical Solution of Flutter Instability", by W. B. Bergen and Lee Arnold, The Glenn L. Martin Co., was presented by Bergen. Representing a long step towards elimination of flutter, this paper presented a set of graphs and mathematical curves which were designed to help the engineer arrive in a few minutes at computations that once required weeks of mathematical gymnastics. The long period of intensive vibration study conducted by Martin engineers was outlined.

New Test Recorder

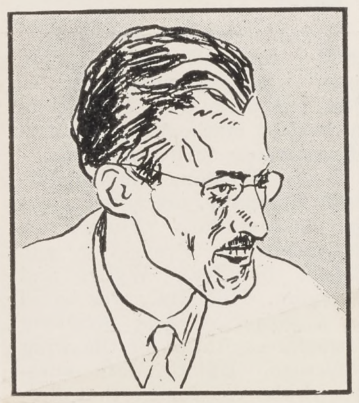
Tuesday's session on Instrumentation was presided over by Dr. E. E. Sechler, of California Institute of Technology. "The General Use of a Magnetic Steel Tape Recorder in Airplane Testing", by James B. Darragh, Jr., Lockheed Aircraft Corp. was well received. This interesting device, the first ever built, has numerous advantages. Using eight recording magnets and 1800 feet of steel tape driven by a variable speed magnet, it is possible to record various electrical impulses, including those from a microphone. Thus the instrument records the voice as well as the results reported by various instruments. Separate magnets are used, on the ground only, for erasing the tape. A continuous recording for as long as 16 hours may be made. Recordings are permanent until erased. Time reference points are marked on the tape by periodic short circuiting of the current. The device is especially adaptable to noise, vibration, and flutter recording, but may be used to record data from any number of flight instruments up to sixteen, simultaneously. Or as many as sixteen different observers may record data simultaneously by using separate microphones. On single-seater planes the device may be mounted with convenient remote controls so that the pilot can dictate a full account of observations at the same time that instrument, noise, stress, and vibration recordings are being made automatically. In the event of a fatal crash the record on the steel tape would be preserved except in event of a fire hot enough to destroy the magnetism of the tape. In commenting on this remarkable development, Dr. Klein pointed out that photographic recording of flight data had not proved entirely satisfactory, due to time element to get films developed, and record and assemble data, etc., but that he preferred direct visual readings wherever possible. Darragh thought the choice might be a matter of opinion but pointed to the ver



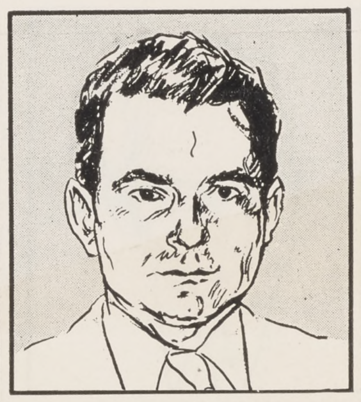
J. B. DARRAGH JR.



WM. WHEATLEY



N. B. MOORE



FRED FOULON

tromagne instrument. Dr. Klein admitted that pointer instrument readings are hard to make accurately.

"The Application of an Electromagnetic Indicator to Internal Combustion Engine Problems", prepared by C. S. Draper, J. H. Lancor, and Leighton Davis, of Massachusetts Inst. of Technology, was presented by C. S. Draper.

Pointing out that future engine refinements must come through exact and painstaking research into the exact nature of engine operation, Draper outlined the years of work that have gone into development of the recording instrument he and his associates have perfected. This instrument has proved far superior to any previously used recording device for obtaining indicator cards on the pressure cycle of high speed internal combustion engines.

Russell G. Robinson, of the N.A.C.A., presented a slow motion study of internal combustion. Motion pictures taken at a speed of 40,000 frames per second were shown. This is made possible by an ultra high speed camera developed at the N.A.C.A. laboratories during the past year by Cearcy D. Miller.

High Altitude Flying

Hall L. Hibbard, Lockheed Aircraft Corporation, served as chairman of the Tuesday evening session on High Altitude Flying. The highlight of the entire meeting was probably the demonstration given during that session of the high altitude pressure chamber of the new oxygen face mask, both developed in the high altitude research laboratory of the Mayo Clinic. This presentation was made jointly by Drs. Walter M. Boothby and W. R. Lovelace. The latter established a new decompression record when he was taken to an altitude equivalent, within the chamber, of 40,000 ft. in 9 minutes, returning to sea level in 2 min. 45 secs. Prior to making this demonstration Dr. Lovelace took oxygen through the Mayo face mask for forty minutes, and also used the mask throughout the test. This eliminates nitrogen from the blood system and prevents formation of bubbles in the blood during the test. It is these blood bubbles which are the chief danger to high altitude pilots. Formed through boiling of the blood due to reduced pressure, such blood bubbles will cause reduced vision, paralysis, double vision, unconsciousness, or even death. Dr. Boothby remarked that this country needs a large number of decompression chambers in altitu have less than a dozen such chambers now in service, Germany is known to be using hundreds of them.

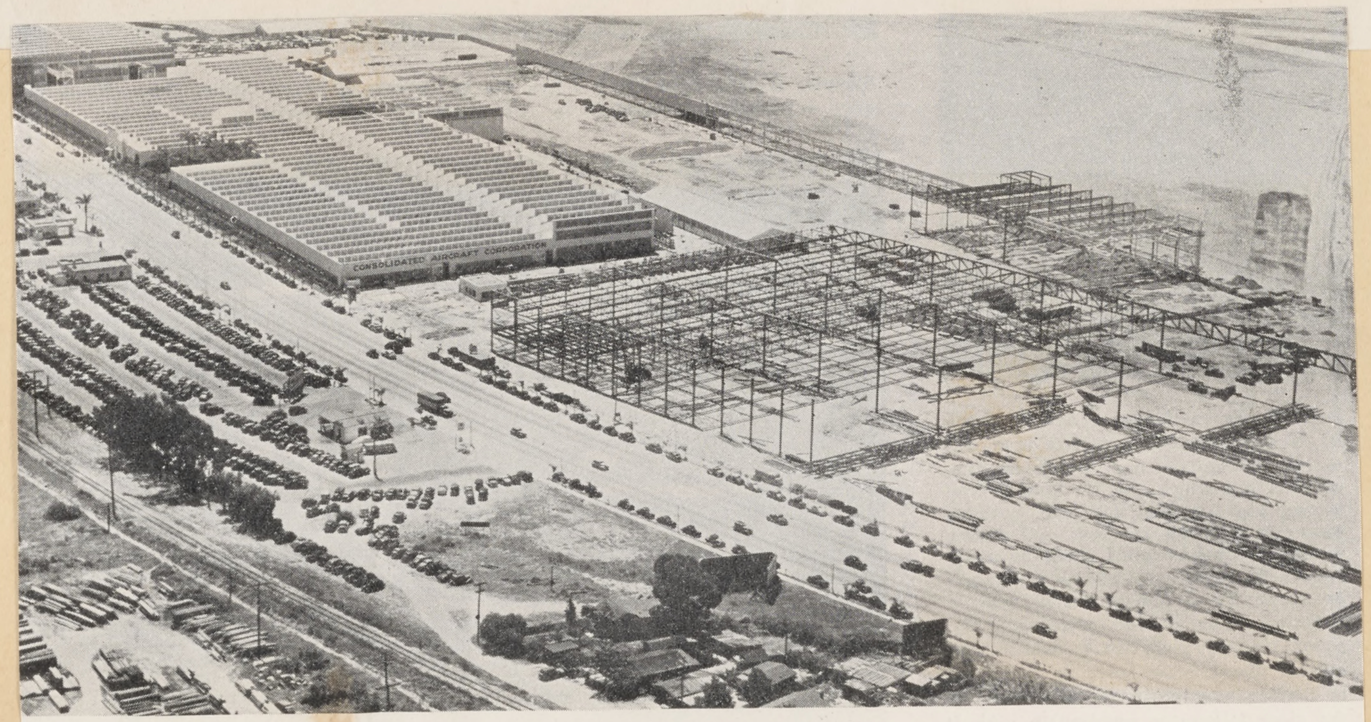
Wednesday's concluding session, on Aerodynamics, was led by Dr. Clark B. Millikan, of California Institute of Technology. A paper titled, "Performance Dictates Design" by Ralph H. Upson, Wayne University, was read by Harold Luskin. The mathematics of this paper was pretty imposing and is probably a real contribution to engineering, but it was too deep for this observer. Major conclusion seemed to be that optimum performance could be reached with an aspect ratio of about 21 to 1. In any case the formula developed by Upson does permit easy examination of various design factors to determine influence on overall efficiency of their variations. Dr. Millikan, in discussing the paper, pointed out that all engineering is as much an art as a science, and that there is a point beyond which complex formulae cannot be carried from an engineering standpoint.

"Experiments on Drop Impingement" by W. H. Hunter, The B. F. Goodrich Co., outlined a program of research on icing. The speaker told his perspiring audience that ice hazards are neither seasonally nor geographically restricted. Smoothness of the wing surface is very important as, under icing conditions, a large volume of water is passing back along the wing very close to the boundary layer. Results of ice formation research are making possible a much greater percentage of flight completions to destination.

Propeller Design

"Some Recent Developments in Propeller Blade Design" was discussed by Louis H. Enos, Curtiss-Wright Propeller Division, Curtiss-Wright Corp. Enos forecast six-bladed propellers for the near future, of dual rotation type with three blades turning in each direction. He demonstrated why the hollow steel blade holds the greatest promise for propeller weight reductions. Steel blades also have superior resistance to abrasion. Propeller blade shank cuffs were described in some detail, their major advantage being improved engine cooling, but little hope was suggested for an early increase in propeller efficiency.

"Range at Constant Speed", was presented by its author, Norton B. Moores, St. Louis Airplane Division, Curtiss-Wright Corp. This paper provided a mathematical short cut method for determination of maximum range.



The new Consolidated plant is typical of what will take place all over the country, here is a new extension going up.

Union 9/15/40

Consair Seeks Water St. Cut To Highway

Maj. Fleet Offers $20,000 to Cover Condemnation Cost

Condemnation by the city of a strip of property west of Pacific highway and between Bean and Harasthy sts., to permit Water st. to merge into Pacific highway just south of Harasthy st. instead of at Bean st., has been proposed by Maj. R. H. Fleet, Consolidated Aircraft Corp. president, in a letter just received by the city planning commission.

By doing this, said Glenn Rick, city planning engineer, the big plane plant could erect its proposed new final assembly building, which is to go up north of its present factory, closer to Pacific highway and more in line with the existing structure.

AFFECTS EFFICIENCY

The planning engineer said that this building alignment is important to efficient operation of the plant, and that Maj. Fleet, in his letter, said that if the city would condemn the property required for the new Water st. connection, the corporation "will contribute $20,000 of the expense, unless the total award is less than that amount, in which event our contribution would be limited to the total amount of the award."

Rick explained that part of Water st. is open south from Witherby st. The extension, as it appears on the map, would continue on tidelands to a junction with Pacific highway. If the private property described by Maj. Fleet were obtained by the city for street purposes, Consolidated then could move its proposed new assembly building forward on the tideland strip now set aside for Water st.

WILL DRESS UP WALLS

"If Water st. is not cut through, our building will not face on a highway, and the exterior walls will be finished in corrugated galvanized iron," Maj. Fleet wrote. "However, if the street is located as shown (on a map that accompanied the letter), we will finish the east elevation fronting on Water st. and the north elevation fronting on Harasthy st. in stucco, similar to our present buildings fronting on Pacific highway.

"This will entail an additional expenditure of $10,000, which expenditure we are willing to make in the interest of beautification of the city."

That the $20,000 offer to cover the condemnation award should be ample was indicated in Maj. Fleet's letter, in which he disclosed that "we recently purchased the entire froontage between Vine and Bean sts. on the east side of Pacific highway for $15,000."

SPEEDY APPROVAL SEEN

Development of Water st. is part of a comprehensive plan to relieve traffic congestion at Bancroft ave. and Pacific highway. With that in mind, Rick insisted when the aircraft corporation's original lease was drafted, that sufficient tidelands be excluded to permit Water st. to be merged with Pacific highway at Bean st. In view of Maj. Fleet's offer to pay up to $20,000 of a condemnation award, the planning engineer said he would favor the new proposal.

To speed consideration of the suggestion, Rick said he has advised Consolidated officials to withdraw the letter, which was addressed to the planning commission, and to resubmit it to the city council so that body, if it desired, immediately could order an appraisal made. This could be done Tuesday, said Rick whereas the planning commission, which could not authorize an appraisal, does not meet until Sept. 24, when its nly action would be to refer the letter to the council for consideration the following week.

Clash Looms; U. S. May Get Singapore Base

HONG KONG, Sept. 21 (Saturday) (A.P.) — The British-owned newspaper China Mail reported today that "since yesterday morning" Japanese warships have moved into Tonking bay "as a persuasive gesture" to back up Japanese negotiations for military rights in French Indo-China.

WASHINGTON, Sept. 20 (I.N.S.)—Authoritative Chinese quarters said tonight their government may attempt a fusion with Indo-China's native masses should the French authorities there allow Japanese troops to cross the territory under orders of the Vichy government.

Secy. of State Hull told his press conference meantime that his talks with British and Australian envoys have covered the question of basing the United States fleet at Singapore, closer by 2000 miles to Japan than the present Hawaiian base.

RICHARDSON CALLED BACK

Linked also to the administration's efforts to maintain the Pacific status quo was a navy announcement that the fleet commander-in-chief, Adm. James O. Richardson, on arrival of the first three sections of the battle force for overhaul at San Pedro, Calif., will come on to Washington.

Here, officials said, the admiral will hold his seconnd conference in recent months with President Roosevelt and the navy high command on the Pacific situation. He leaves Honolulu Monday on the battleship New Mexico.

HONGKONG, Sept. 21 (Saturday) (A.P.) — Chinese press reports — unconfirmed elsewhere — declared today that an understanding had been reached for Chinese-French military collaboration in the event Japan invades Indo-China.

These reports said the French would allow Chinese troops to enter Indo-China to oppose any Japanese invaders.

Hull, in confirming reports that he had mentioned Singapore to Lord Lothian, British ambassador, and Richard Casey, Australian minister, emphasized that the talks as yet have not reached the status of negotiations calling for decisions.

A decision entailing the fleet's transfer to Britain's Far Eastern "Gibraltar"—a base separated by three weeks' steaming time from the Panama canal and the Atlantic —presumably would require Richardson's advice and depend in part upon the course of the battle of Britain.

HONG KONG, Sept. 21 (Saturday) (A.P.) — Highly connected Japanese quarters here said today Japan was prepared to take action aiming at the seizure of all French Indo-China if France declined to permit the passage of an unrestricted number of Japanese troops through the French colony.

Competent quarters here expressed doubt the fleet would move to Singapore and until an invasion attempt demonstrated the British fleet's ability to hold the

HARBOR DRIVE, CONSAIR LAND PROJECTS MOVE STEP NEARER

Plan Board Drafts Recommendation To Council for Use of U. S. Defense Funds

Ten to 15 giant seaplanes soon will be produced by Consolidated Aircraft Corp. daily, the city planning commission was informed at a special meeting yesterday which was marked by the drafting of a recommendation to the city council that it immediately authorize an application for national defense fund for Harbor dr. construction Other highlights of the meeting included:

1—Decision by the commission not to protest against modification of pier and bulkhead lines to permit a 500x2500-foot land fill on the bay side of Harbor dr. between the coast guard air station and the Marine base.

CLIPPER BASE MOVE SEEN

2—Forecast that the transpacific clipper ship base eventually will be moved from San Francisco to San Diego "where there are no bridges and no fog."

3—Expression of belief by Joe Brennan, port director, that defense funds can be obtained to build Harbor dr. as a military road connecting the Destroyer base, Navy pier, 11th Naval district headquarters, the coast guard air station, the Marine base, Naval Training station and the Ft. Rosecrans reservation.

4—Report by William Maloney, Consair plant engineer, that the factory is expanding so rapidly that he sometimes wonders whether he is in "the general building contracting business or the aircraft industry," and disclosure by him that because of inadequate city sewage facilities, the plane corporation is installing its own outfall and ejector pumps at a cost of $27,500.

PIER HEARING DELAYED

The meeting was called after Col. Edwin C. Kelton, Los Angeles, district army engineer, continued for a week a hearing he opened here Wednesday on modification of the pier and bulkhead lines. This delay was granted to give the planning commission an opportunity to study the plan.

In the discussion yesterday, Maloney emphasized Consair's need for additional land. He said that seaplane ramps are imperative, and that a site is needed on the water's edge in which seaplanes can be overhauled. He pointed to the inadequacy of the existing ramp at the south end of the field and which also is used by the coast guard, and said new facilities are needed at the north end of Lindbergh field and away from airport plane traffic congestion.

"You're talking about a 300,000,000 business," said Brennan, in urging the commission to indorse the fill. He said that every available

Consair Wins 85-Million Order

Backlog Climbs To $217,800,000

Bringing its total backlog for government warplanes to $217,800,000, Consolidated Aircraft Corp. yesterday received an $85,800,000 contract from the war department for an undisclosed number of four-motored bombers, The Associated Press reported from Washington, D. C.

The previous backlog was $132,000,000.

In a talk before U. S. army engineers in the harbor commission office Wednesday, Maj. Reuben H. Fleet, Consolidated president, said the Lindbergh field plant will have a backlog of $300,000,000 soon, intimating that additional contracts are forthcoming from the war and navy departments.

Delivery dates for the new bombers were not specified.

Consolidated authorities reported new workers are being employed at the rate of 500 a week and that this will be stepped up as new buildings are completed under the company's huge expansion program. Present plans call for a working force of 35,000 men, virtually triple the present number of employes.

R. A. F. Batters German Canals

LONDON, Sept. 21 (Saturday) (I.N.S.)—Crippling destruction dealt by British bombers to Germany's intricate web of canals, railways and roads was followed early today with a prolonged aerial barrage that sent many tons of explosive and incendiary steel crashing into the Nazi battlements across the English channel.

Hour upon hour through the night and into the morning, relays of Royal Air force squadrons vaulted over the narrow waters to deliver their cargoes. They centered their fury mainly on the docks of Calais, the nearest of the Nazi-held invasion springboards to England, and on the long-range German guns planted around near-by Cap Gris Nez.

HEAR HEAVY BLASTS

Watchers on the Dover chalk cliffs, 22 miles opposite Calais, reported they saw and heard the heaviest explosions that have yet rocked the other side of the channel. Violence of the repeated R.A.F. thrusts was attested to by the fact that German anti-aircraft guns erupted not hundreds but thousands of tracer shells that streaked the dark sky like a giant fireworks display.

The waterways and transport lines of Germany—nerve system of Adolf Hitler's war machine—shared with the Nazi invasion bases and inland centers in the gradual paralysis the British bombers sought to spread with their unceasing attacks

Navy Bars Cameras From Ships in Hawaii

HONOLULU, Sept. 20 (A.P.) — The United States navy is increasing its precautions against espionage. Officers and enlisted men, it was learned today, have been forbidden to take cameras aboard ships.

Sale of camera supplies in the ships' service stores also has been stopped.

S. D. Air Plants Get 'Speed Up' Army Orders

Union--Wed. 9/11/40

WASHINGTON, Sept. 10 (I.N.S.) —The war department announced tonight it had sent "speed up" letters to 21 manufacturers calling for $1,251,000,000 worth of armaments, including 14,394 planes, for national defense.

Among the firms receiving letters was the Ford Motor Co. of Detroit, which will manufacture plane motors under the air defense program.

SEEK 14,394 PLANES

Acting under the five-billion-dollar defense deficiency appropriation bill signed by President Roosevelt yesterday, the war department letters, approved by the national defense commission, authorizes the manufacturers to go ahead with the program without delay while contractual details are being worked out.

The 14,394 planes ordered, at an estimated cost of $817,000,000, provides for every type of army craft, from trainers to fast pursuit ships, medium and heavy bombers.

Earlier in the day the department announced a specific contract with the Bell Aircraft Corp. of Buffalo for 120 fast pursuit planes, at a cost of $4,962,220. These pursuit ships were said to have shown a speed of more than 400 miles an hour in recent army tests.

SILENT ON NUMBERS

In the "speed up" letters tonight, specific numbers of planes, engines or parts to be produced by each company was not specified. The engine program, however, calls for 28,282 plane motors, at a cost of $377,000,000, while $57,000,000 worth of propellors and blades are provided for in the program.

The letters were sent to the following companies:

For planes: Boeing Aircraft Co., Seattle; Consolidated Aircraft Corp., San Diego; Glenn L. Martin Co., Baltimore; North American Aviation, Inglewood; Douglas Aircraft, Santa Monica; Lockheed Aircraft Corp., Burbank; Bell Aircraft Corp., Buffalo; Curtiss plane division, Curtiss Wright Corp., Buffalo; Curtiss Wright Corp., St. Louis plane division, Robertson, Mo.; Republic Aviation Corp., Farmingdale, L. I.; Beech Aircraft Corp., Wichita, Kan.; Vultee Aircraft, Inc., Downey; Fairchild Aircraft, Hagerstown, Md.; Ryan Aeronautical, San Diego; Stearman Aircraft division, Boeing Airplane Co., Wichita, Kan.

ORDER ENGINES

For engines: Ford Motor Co., Dearborn, Mich.; Continental Motors, Muskegon, Mich.; Lycoming division, Aviation Manufacturing corp., Williamsport, Pa.; Allison engineering division, General Motors Corp., Indianapolis, and Wright Aeronautical Corp., Patterson, N. J.

For propellors and blades: Curtiss propellor division, Curtiss Wright Corp., Clifton, N. J.

Lindbergh Field Expansion to Start

Aircraft News 9/19/40

SAN DIEGO—A $1,400,000 improvement program started last Monday to make Lindbergh Field, the municipal airport, suitable for test flights of giant, four-engined Army bombers Consolidated Aircraft Corp. is building for the United States and Great Britain.

Runways will be lengthened, acres of ground reclaimed in bay dredging will be graded and oiled, and sewer and lighting systems will be installed with funds largely provided by the Federal government.

MAJOR RUBEN FLEET, SAN DIEGO'S SANTA CLAUS!

The city of San Diego with its citizens in entirety, owe much to Major Ruben Fleet, president of the Consolidated Aircraft corporation who, in plain language, has completely saved San Diego from falling into the hands of old man poverty!

Perhaps there are many people who are not aware of the fact that the good major had been corralled by "Hogtown" Los Angeles when he first invaded the Pacific coast after leaving his home, the city of Buffalo, New York behind him to seek appropriate climatic conditions that would warrant his powerful aircraft corporation to manufacture airplanes which would be flown immediately upon completion. That could not be accomplished at the Major's home in Buffalo on account of the winter season. But, in California the production of planes could be done the year around.

So, when Major Fleet arrived on this coast and of course, landing in Los Angeles first, he and his associates reconnoitered the Los Angeles vicinities. They were accompanied by a Los Angeles "dragnet" composed of the high-powered chamber of commerce "goodwill ambassadors" who stuck to the Major and his party at the same time making all sorts of overtures to the distinguished eastern visitors.

But, Major Fleet had heard of the San Diego unexcelled climate and after thanking the "Hogtown' Los Angeles gentlemen informed them that he wished to make a survey of San Diego also before making up his mind to select Los Angeles for his airplane site. How the Major ever escaped the clutches of our northern leeches is more than we can ever explain!

However, Major Fleet arrived in San Diego and here he met another Major. That other Major was Macauley, business manager of the San Diego chamber of commerce and executive secretary. Major Macauley lost no time in bringing into the picture Joe Brennan, director of port.

Between Macauley and Brennan's "sales talk,' Major Fleet was convinced in less time than it takes to tell it, that San Diego was the spot he set out to get and the Consolidated Aircraft corporation selected the tideland sites along Pacific boulevard and immediately erected its magnificent factory which makes it the largest now in the United States.

Last Monday another addition was completed and dedicated in the presence of several thousand San Diegans who paid tribute to Major Ruben Fleet and his corporation. Admiral Chas. A. Blakely, commandant of the 11th Naval District was given the honor of the dedication. Admiral Blakely's eulogy to Major Fleet in behalf of the entire navy department, was loudly applauded and San Diegans felt that a great man had come to their city to save them from poverty and to enlighten every home here. This "life saver" made it possible to save the day after the fleet had departed for the Hawaiian Islands with that enormous payroll which has been San Diego's greatest source of revenue.

More than 9,600 men are now employed by the Consolidated Aircraft corporation, and according to the statement made by Major Fleet at the dedicatory ceremonies last Monday, there will be several thousand more men employed by December of this year, which means a larger payroll, supreme happiness and greater prosperity for San Diego and its surrounding territory.

Yes, Major Fleet is San Diego's Santa Claus!

FEDERAL PLANE ORDERS LISTED

Army and Navy Have Awarded Contracts for 12,500; to Buy 17,000 More

Dow Jones News Service

NEW YORK—The War Department and the Navy together have on order at the present time close to 12,500 airplanes, approximately 8,700 of which have been ordered since June 1. Orders for almost 17,000 additional ships are to be placed under appropriations already voted by Congress.

An accurate break-down of orders placed by the two services cannot be made due to the fact that for the sake of greater efficiency in manufacture, and therefore prompt deliveries, they apparently are ordering planes as well as engines for each other.

Available information indicates that as of July 1 the Army had roughly 2,700 ships on order. Since that date, a total of approximately 6,850 planes have been ordered out of the 1941 fiscal year appropriation and the $5,000,000,000 supplemental defense appropriation. The former provided funds or contract authorizations for 4,247 planes and the latter for 14,394.

Navy Orders

The Navy is estimated to have had in the neighborhood of 1,100 planes on order at mid-year, and since that time has placed orders for about 1,850 planes. In addition, it has made agreements preparatory to contracts for 2,911 planes. The 1941 fiscal year appropriation provided funds or contract authorization for approximately 3,000 planes for the Navy, and the supplemental defense appropriation for 4,028.

A recapitulation of awards made by the War Department indicates that since June the Army has placed orders for aircraft, exclusive of engines, armament and certain instruments, with a value of close to $400,000,000. The exact number of airplanes the Army will obtain as a result of these orders has not been divulged, and no information has been furnished as to the number of ships ordered by the Army for the Navy's account. Because of the difference in technical requirements, it is assumed that the combat ships ordered by the Army are all for its own use, but it is understood that some of the cargo and training planes were ordered for the Navy's account.

Army Contracts Listed

The following is a list of aircraft contracts awarded by the Army since June 1 of this year:

Manufacturer Type	Quantity	Value
Cessna, twin-engined advanced trainers...	33	$900,378
Cessca, twin-engined advanced trainers....	33	$900,378
No American, single-eng advanced trainers.	637	11,335,631
Consolidated, four-engine heavy bombers...	56	14,831,342
Stearman, primary trainers	300	2,041,947
Beech, advanced trainers	67	3,410,746
Fairchild, primary trainers	100	1,038,300
Stinson, short-range observation..........	6	‡.......
Beech, transports	20	*.......
Ryan, primary trainers	100	2,074,234
Beech, advanced trainers	150	4,847,217
Vultee, basic trainers	500	7,488,782
Boeing, four-engined heavy bombers.....	277	70,449,955
Lockheed, twin-engined pursuits	410	30,278,788
Platt-Lepate, rotating-wing autogyro.....	1	‡.......
Bell, single-engined pursuits	120	4,962,220
Republic, single-engined pursuits	†1,000	56,499,924

FEDERAL PLANE ORDERS LISTED

Continued from First Page

ships with a value of $11,476,633, and the other presumably for scout-bombers with a value of $9,602,384 to Douglas Aircraft.

The following is a break-down of the airplanes reported by the Navy as on order but undelivered as of September 3:

Model	Type	Manufacturer	Quantity
F2A-2,	single seater fighter;	Brewster................	43
F4FS,	single seater fighter;	Grumman................	320
JRB-1,	utility transport;	Beech	5
JRF-1,	utility transport;	Grumman	10
N3N-3,	primary trainer;	Navy aircraft factory.......	562
NP-1,	primary trainer;	Spartan	201
NR-1,	primary trainer;	Ryan	100
N2S-1,	primary trainer;	Stearman	600
OS2U-1,	observation scout;	Vought-Sikorsky.........	42
OS2U-2,	observation scout;	Vought-Sikorsky.........	158
PBM-1,	two-engined patrol bomber;	Martin..........	20
PBY-5,	two-engined patrol bomber;	Consolidated.....	200
PB2Y-2,	four-engined patrol bomber,	Consolidated.....	2
R3D-2,	transport;	Douglas	4
R5C-1,	transport;	Lockheed	1
SBDS,	scout-bomber;	Douglas	137
SBN-1,	scout-bomber;	Navy aircraft factory.........	30
SB2U-3,	scout bomber;	Vought-Sikorsky.............	57
SNJ-2,	advanced trainer;	North American...........	25
X15F-1,	two-engined fighter (experimental);	Grumman.	1
XFL-1,	land fighter (experimental);	Bell...........	1
XF4U-1,	experimental fighter;	Vought-Sikorsky.......	1
XN5N-1,	experimental trainer;	naval aircraft.........	1
XPBB-1,	experimental patrol bomber;	Boeing.........	1
XPB2M,	experimental patrol bomber;	Martin.........	1
XPBM2,	experimental 4-eng. patent bomber;	Martin..	1
XSB2A1,	experimental scout bomber;	Brewster........	1
XSB2C-1,	experimental scout bomber;	Curtiss.........	1
XTBF-1,	experimental torpedo bomber;	Grumman.....	2
XTBU-1,	experimental torp. bomber;	Vought-Sikorsky.	1

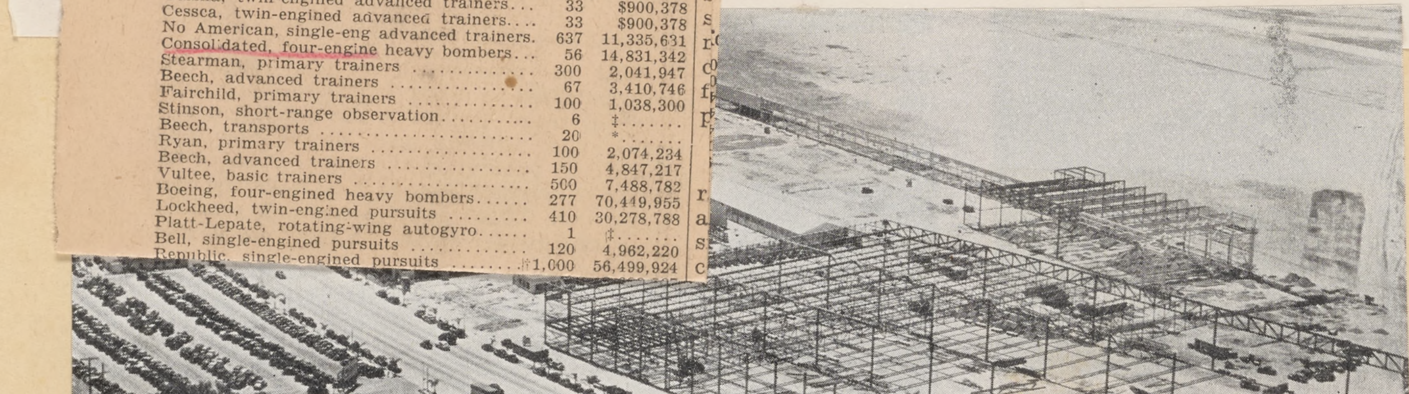
Prospective Orders

In addition to the planes shown as on order and undelivered on September 3, the Navy had agreements preparatory to contracts for the following ships:

Type	Manufacturer	Quantity
Observation-scouts;	Vought-Sikorsky	1,006
Scout-bombers;	Brewster	411
Fighters;	Brewster	108
Fighters;	Grumman	254
Torpedo-bombers;	Grumman	286
Utility transports;	Grumman	144
Scout bombers;	Douglas	252
Scout observation;	Curtiss	300
Advanced trainers;	Curtiss	150

To date the Navy has made no announcement indicating that actual contracts for any of the above airplanes have been awarded. It is quite possible, however, that the orders announced as placed by the War Department with Douglas and Curtiss last Saturday may have included some planes for the Navy.

A total of 29 of the planes on order September 3 were scheduled for delivery this month, while 47 are scheduled for October, to increase to 112 in November and 187 in December. These scheduled deliveries do not take into consideration deliveries against orders placed prior to 1940, but still unfilled, which includes the order for 20 patrol bombers against which Martin is just starting deliveries.



The new Consolidated plant is typical of what will take place all over the country, here is a new extension going up.

---

due to re... the wing. Wheaton thought that reduction of frequency was a normal phenomenon up to the point of skin wrinkling. "A Graphical Solution of Flutter Instability", by W. B. Bergen and Lee Arnold, The Glenn L. Martin Co., was presented by Bergen. Representing a long step towards elimination of flutter, this paper presented a set of graphs and mathematical curves which were designed to help the engineer arrive in a few minutes at computations that once required weeks of mathematical gymnastics. The long period of intensive vibration study conducted by Martin engineers was outlined.

New Test Recorder

Tuesday's session on Instrumentation was presided over by Dr. E. E. Sechler, of California Institute of Technology. "The General Use of a Magnetic Steel Tape Recorder in Airplane Testing", by James B. Darragh, Jr., Lockheed Aircraft Corp. was well received. This interesting device, the first ever built, has numerous advantages. Using eight recording magnets and 1800 feet of steel tape driven by a variable speed magnet, it is possible to record various electrical impulses, including those from a microphone. Thus the instrument records the voice as well as the results reported by various instruments. Separate magnets are used, on the ground only, for erasing the tape. A continuous recording for as long as 16 hours may be made. Recordings are permanent until erased. Time reference points are marked on the tape by periodic short circuiting of the current. The device is especially adaptable to noise, vibration, and flutter recording, but may be used to record data from any number of flight instruments up to sixteen, simultaneously. Or as many as sixteen different observers may record data simultaneously by using separate microphones. On single-seater planes the device may be mounted with convenient remote controls so that the pilot can dictate a full account of observations at the same time that instrument, noise, stress, and vibration recordings are being made automatically. In the event of a fatal crash the record on the steel tape would be preserved except in event of a fire hot enough to destroy the magnetism of the tape. In commenting on this remarkable development, Dr. Klein pointed out that photographic recording of flight data had not proved entirely satisfactory, due to time element to get films developed, and record and assemble data, etc., but that he preferred direct visual readings wherever possible. Darragh thought the choice might be a matter of opinion but pointed to the ver... ctromagn... instrument. Dr. Klein admitted that pointer instrument readings are hard to make accurately.

"The Application of an Electromagnetic Indicator to Internal Combustion Engine Problems", prepared by C. S. Draper, J. H. Lancor, and Leighton Davis, of Massachusetts Inst. of Technology, was presented by C. S. Draper.

Pointing out that future engine refinements must come through exact and painstaking research into the exact nature of engine operation, Draper outlined the years of work that have gone into development of the recording instrument he and his associates have perfected. This instrument has proved far superior to any previously used recording device for obtaining indicator cards on the pressure cycle of high speed internal combustion engines.

Russell G. Robinson, of the N.A.C.A., presented a slow motion study of internal combustion. Motion pictures taken at a speed of 40,000 frames per second were shown. This is made possible by an ultra high speed camera developed at the N.A.C.A. laboratories during the past year by Cearcy D. Miller.

High Altitude Flying

Hall L. Hibbard, Lockheed Aircraft Corporation, served as chairman of the Tuesday evening session on High Altitude Flying. The highlight of the entire meeting was probably the demonstration given during that session of the high altitude pressure chamber of the new oxygen face mask, both developed in the high altitude research laboratory of the Mayo Clinic. This presentation was made jointly by Drs. Walter M. Boothby and W. R. Lovelace. The latter established a new decompression record when he was taken to an altitude equivalent, within the chamber, of 40,000 ft. in 9 minutes, returning to sea level in 2 min. 45 secs. Prior to making this demonstration Dr. Lovelace took oxygen through the Mayo face mask for forty minutes, and also used the mask throughout the test. This eliminates nitrogen from the blood system and prevents formation of bubbles in the blood during the test. It is these blood bubbles which are the chief danger to high altitude pilots. Formed through boiling of the blood due to reduced pressure, such blood bubbles will cause reduced vision, paralysis, double vision, unconsciousness, or even death. Dr. Boothby remarked that this country needs a large number of decompression chambers in ... have less than a dozen such chambers now in service, Germany is known to be using hundreds of them.

Wednesday's concluding session, on Aerodynamics, was led by Dr. Clark B. Millikan, of California Institute of Technology. A paper titled, "Performance Dictates Design" by Ralph H. Upson, Wayne University, was read by Harold Luskin. The mathematics of this paper was pretty imposing and is probably a real contribution to engineering, but it was too deep for this observer. Major conclusion seemed to be that optimum performance could be reached with an aspect ratio of about 21 to 1. In any case the formula developed by Upson does permit easy examination of various design factors to determine influence on overall efficiency of their variations. Dr. Millikan, in discussing the paper, pointed out that all engineering is as much an art as a science, and that there is a point beyond which complex formulae cannot be carried from an engineering standpoint.

"Experiments on Drop Impingement" by W. H. Hunter, The B. F. Goodrich Co., outlined a program of research on icing. The speaker told his perspiring audience that ice hazards are neither seasonally nor geographically restricted. Smoothness of the wing surface is very important as, under icing conditions, a large volume of water is passing back along the wing very close to the boundary layer. Results of ice formation research are making possible a much greater percentage of flight completions to destination.

Propeller Design

"Some Recent Developments in Propeller Blade Design" was discussed by Louis H. Enos, Curtiss-Wright Propeller Division, Curtiss-Wright Corp. Enos forecast six-bladed propellers for the near future, of dual rotation type with three blades turning in each direction. He demonstrated why the hollow steel blade holds the greatest promise for propeller weight reductions. Steel blades also have superior resistance to abrasion. Propeller blade shank cuffs were described in some detail, their major advantage being improved engine cooling, but little hope was suggested for an early increase in propeller efficiency.

"Range at Constant Speed", was presented by its author, Norton B. Moores, St. Louis Airplane Division, Curtiss-Wright Corp. This paper provided a mathematical short cut method for determination of maximum range.

Consair Seeks Water St. Cut To Highway

Maj. Fleet Offers $20,000 to Cover Condemnation Cost

Condemnation by the city of a strip of property west of Pacific highway and between Bean and Harasthy sts., to permit Water st. to merge into Pacific highway just south of Harasthy st. instead of at Bean st., has been proposed by Maj. R. H. Fleet, Consolidated Aircraft Corp. president, in a letter just received by the city planning commission.

By doing this, said Glenn Rick, city planning engineer, the big plane plant could erect its proposed new final assembly building, which is to go up north of its present factory, closer to Pacific highway and more in line with the existing structure.

AFFECTS EFFICIENCY

The planning engineer said that this building alignment is important to efficient operation of the plant, and that Maj. Fleet, in his letter, said that if the city would condemn the property required for the new Water st. connection, the corporation "will contribute $20,000 of the expense, unless the total award is less than that amount, in which event our contribution would be limited to the total amount of the award."

Rick explained that part of Water st. is open south from Witherby st. The extension, as it appears on the map, would continue on tidelands to a junction with Pacific highway. If the private property described by Maj. Fleet were obtained by the city for street purposes, Consolidated then could move its proposed new assembly building forward on the tideland strip now set aside for Water st.

WILL DRESS UP WALLS

"If Water st. is not cut through, our building will not face on a highway, and the exterior walls will be finished in corrugated galvanized iron," Maj. Fleet wrote. "However, if the street is located as shown (on a map that accompanied the letter), we will finish the east elevation fronting on Water st. and the north elevation fronting on Harasthy st. in stucco, similar to our present buildings fronting on Pacific highway.

"This will entail an additional expenditure of $10,000, which expenditure we are willing to make in the interest of beautification of the city."

That the $20,000 offer to cover the condemnation award should be ample was indicated in Maj. Fleet's letter, in which he disclosed that "we recently purchased the entire froontage between Vine and Bean sts. on the east side of Pacific highway for $15,000."

SPEEDY APPROVAL SEEN

Development of Water st. is part of a comprehensive plan to relieve traffic congestion at Bancroft ave. and Pacific highway. With that in mind, Rick insisted when the aircraft corporation's original lease was drafted, that sufficient tidelands be excluded to permit Water st. to be merged with Pacific highway at Bean st. In view of Maj. Fleet's offer to pay up to $20,000 of a condemnation award, the planning engineer said he would favor the new proposal.

To speed consideration of the suggestion, Rick said he has advised Consolidated officials to withdraw the letter, which was addressed to the planning commission, and to resubmit it to the city council so that body, if it desired, immediately could order an appraisal made. This could be done Tuesday, said Rick whereas the planning commission, which could not authorize an appraisal, does not meet until Sept. 24, when its nly action would be to refer the letter to the council for consideration the following week.

UNION - 9-21-40

Clash Looms; U. S. May Get Singapore Base

HONG KONG, Sept. 21 (Saturday) (A.P.) — The British-owned newspaper China Mail reported today that "since yesterday morning" Japanese warships have moved into Tonking bay "as a persuasive gesture" to back up Japanese negotiations for military rights in French Indo-China.

WASHINGTON, Sept. 20 (I.N.S.)—Authoritative Chinese quarters said tonight their government may attempt a fusion with Indo-China's native masses should the French authorities there allow Japanese troops to cross the territory under orders of the Vichy government.

Secy. of State Hull told his press conference meantime that his talks with British and Australian envoys have covered the question of basing the United States fleet at Singapore, closer by 2000 miles to Japan than the present Hawaiian base.

RICHARDSON CALLED BACK

Linked also to the administration's efforts to maintain the Pacific status quo was a navy announcement that the fleet commander-in-chief, Adm. James O. Richardson, on arrival of the first three sections of the battle force for overhaul at San Pedro, Calif., will come on to Washington.

Here, officials said, the admiral will hold his seconnd conference in recent months with President Roosevelt and the navy high command on the Pacific situation. He leaves Honolulu Monday on the battleship New Mexico.

HONGKONG, Sept. 21 (Saturday) (A.P.) — Chinese press reports — unconfirmed elsewhere — declared today that an understanding had been reached for Chinese-French military collaboration in the event Japan invades Indo-China.

These reports said the French would allow Chinese troops to enter Indo-China to oppose any Japanese invaders.

Hull, in confirming reports that he had mentioned Singapore to Lord Lothian, British ambassador, and Richard Casey, Australian minister, emphasized that the talks as yet have not reached the status of negotiations calling for decisions.

A decision entailing the fleet's transfer to Britain's Far Eastern "Gibraltar"—a base separated by three weeks' steaming time from the Panama canal and the Atlantic—presumably would require Richardson's advice and depend in part upon the course of the battle of Britain.

HONG KONG, Sept. 21 (Saturday) (A.P.) — Highly connected Japanese quarters here said today Japan was prepared to take action aiming at the seizure of all French Indo-China if France declined to permit the passage of an unrestricted number of Japanese troops through the French colony.

Competent quarters here expressed doubt the fleet would move to Singapore and until an invasion attempt demonstrated the British fleet's ability to hold the

HARBOR DRIVE, CONSAIR LAND PROJECTS MOVE STEP NEARER

Plan Board Drafts Recommendation To Council for Use of U. S. Defense Funds

Ten to 15 giant seaplanes soon will be produced by Consolidated Aircraft Corp. daily, the city planning commission was informed at a special meeting yesterday which was marked by the drafting of a recommendation to the city council that it immediately authorize an application for national defense fund for Harbor dr. construction Other highlights of the meeting included:

1—Decision by the commission not to protest against modification of pier and bulkhead lines to permit a 500x2500-foot land fill on the bay side of Harbor dr. between the coast guard air station and the Marine base.

CLIPPER BASE MOVE SEEN

2—Forecast that the transpacific clipper ship base eventually will be moved from San Francisco to San Diego "where there are no bridges and no fog."

3—Expression of belief by Joe Brennan, port director, that defense funds can be obtained to build Harbor dr. as a military road connecting the Destroyer base, Navy pier, 11th Naval district headquarters, the coast guard air station, the Marine base, Naval Training station and the Ft. Rosecrans reservation.

4—Report by William Maloney, Consair plant engineer, that the factory is expanding so rapidly that he sometimes wonders whether he is in "the general building contracting business or the aircraft industry," and disclosure by him that because of inadequate city sewage facilities, the plane corporation is installing its own outfall and ejector pumps at a cost of $27,500.

PIER HEARING DELAYED

The meeting was called after Col. Edwin C. Kelton, Los Angeles, district army engineer, continued for a week a hearing he opened here Wednesday on modification of the pier and bulkhead lines. This delay was granted to give the planning commission an opportunity to study the plan.

In the discussion yesterday, Maloney emphasized Consair's need for additional land. He said that seaplane ramps are imperative, and that a site is needed on the water's edge in which seaplanes can be overhauled. He pointed to the inadequacy of the existing ramp at the south end of the field and which also is used by the coast guard, and said new facilities are needed at the north end of Lindbergh field and away from airport plane traffic congestion.

"You're talking about a 300,000,000 business," said Brennan, in urging the commission to indorse the fill. He said that every available

Consair Wins 85-Million Order

Backlog Climbs To $217,800,000

Bringing its total backlog for government warplanes to $217,800,000, Consolidated Aircraft Corp. yesterday received an $85,800,000 contract from the war department for an undisclosed number of four-motored bombers, The Associated Press reported from Washington, D. C.

The previous backlog was $132,000,000.

In a talk before U. S. army engineers in the harbor commission office Wednesday, Maj. Reuben H. Fleet, Consolidated president, said the Lindbergh field plant will have a backlog of $300,000,000 soon, intimating that additional contracts are forthcoming from the war and navy departments.

Delivery dates for the new bombers were not specified.

Consolidated authorities reported new workers are being employed at the rate of 500 a week and that this will be stepped up as new buildings are completed under the company's huge expansion program. Present plans call for a working force of 35,000 men, virtually triple the present number of employes.

R. A. F. Batters German Canals

LONDON, Sept. 21 (Saturday) (I. N.S.)—Crippling destruction dealt by British bombers to Germany's intricate web of canals, railways and roads was followed early today with a prolonged aerial barrage that sent many tons of explosive and incendiary steel crashing into the Nazi battlements across the English channel.

Hour upon hour through the night and into the morning, relays of Royal Air force squadrons vaulted over the narrow waters to deliver their cargoes. They centered their fury mainly on the docks of Calais, the nearest of the Nazi-held invasion springboards to England, and on the long-range German guns planted around near-by Cap Gris Nez.

HEAR HEAVY BLASTS

Watchers on the Dover chalk cliffs, 22 miles opposite Calais, reported they saw and heard the heaviest explosions that have yet rocked the other side of the channel. Violence of the repeated R.A.F. thrusts was attested to by the fact that German anti-aircraft guns erupted not hundreds but thousands of tracer shells that streaked the dark sky like a giant fireworks display.

The waterways and transport lines of Germany—nerve system of Adolf Hitler's war machine—shared with the Nazi invasion bases and inland centers in the gradual paralysis the British bombers sought to spread with their unceasing attacks.

Navy Bars Cameras From Ships in Hawaii

HONOLULU, Sept. 20 (A.P.)—The United States navy is increasing its precautions against espionage. Officers and enlisted men, it was learned today, have been forbidden to take cameras aboard ships.

Sale of camera supplies in the ships' service stores also has been stopped.

S. D. Air Plants Get 'Speed Up' Army Orders

Union--Wed. 9/11/40

WASHINGTON, Sept. 10 (I.N.S.)—The war department announced tonight it had sent "speed up" letters to 21 manufacturers calling for $1,251,000,000 worth of armaments, including 14,394 planes, for national defense.

Among the firms receiving letters was the Ford Motor Co. of Detroit, which will manufacture plane motors under the air defense program.

SEEK 14,394 PLANES

Acting under the five-billion-dollar defense deficiency appropriation bill signed by President Roosevelt yesterday, the war department letters, approved by the national defense commission, authorizes the manufacturers to go ahead with the program without delay while contractual details are being worked out.

The 14,394 planes ordered, at an estimated cost of $817,000,000, provides for every type of army craft, from trainers to fast pursuit ships, medium and heavy bombers.

Earlier in the day the department announced a specific contract with the Bell Aircraft Corp. of Buffalo for 120 fast pursuit planes, at a cost of $4,962,220. These pursuit ships were said to have shown a speed of more than 400 miles an hour in recent army tests.

SILENT ON NUMBERS

In the "speed up" letters tonight, specific numbers of planes, engines or parts to be produced by each company was not specified. The engine program, however, calls for 28,282 plane motors, at a cost of $377,000,000, while $57,000,000 worth of propellors and blades are provided for in the program.

The letters were sent to the following companies:

For planes: Boeing Aircraft Co., Seattle; Consolidated Aircraft Corp., San Diego; Glenn L. Martin Co., Baltimore; North American Aviation, Inglewood; Douglas Aircraft, Santa Monica; Lockheed Aircraft Corp., Burbank; Bell Aircraft Corp., Buffalo; Curtiss plane division, Curtiss Wright Corp., Buffalo; Curtiss Wright Corp., St. Louis plane division, Robertson, Mo.; Republic Aviation Corp., Farmingdale, L. I.; Beech Aircraft Corp., Wichita, Kan.; Vultee Aircraft, Inc., Downey; Fairchild Aircraft, Hagerstown, Md.; Ryan Aeronautical, San Diego; Stearman Aircraft division, Boeing Airplane Co., Wichita, Kan.

ORDER ENGINES

For engines: Ford Motor Co., Dearborn, Mich.; Continental Motors, Muskegon, Mich.; Lycoming division, Aviation Manufacturing corp., Williamsport, Pa.; Allison engineering division, General Motors Corp., Indianapolis, and Wright Aeronautical Corp., Patterson, N. J.

For propellors and blades: Curtiss propellor division, Curtiss Wright Corp., Clifton, N. J.

Lindbergh Field Expansion to Start

aircraft news 9/19/40

SAN DIEGO—A $1,400,000 improvement program started last Monday to make Lindbergh Field, the municipal airport, suitable for test flights of giant, four-engined Army bombers Consolidated Aircraft Corp. is building for the United States and Great Britain.

Runways will be lengthened, acres of ground reclaimed in bay dredging will be graded and oiled, and sewer and lighting systems will be installed with funds largely provided by the Federal government.

MAJOR RUBEN FLEET, SAN DIEGO'S SANTA CLAUS!

The city of San Diego with its citizens in entirety, owe much to Major Ruben Fleet, president of the Consolidated Aircraft corporation who, in plain language, has completely saved San Diego from falling into the hands of old man poverty!

Perhaps there are many people who are not aware of the fact that the good major had been corralled by "Hogtown" Los Angeles when he first invaded the Pacific coast after leaving his home, the city of Buffalo, New York behind him to seek appropriate climatic conditions that would warrant his powerful aircraft corporation to manufacture airplanes which would be flown immediately upon completion. That could not be accomplished at the Major's home in Buffalo on account of the winter season. But, in California the production of planes could be done the year around.

So, when Major Fleet arrived on this coast and of course, landing in Los Angeles first, he and his associates reconnoitered the Los Angeles vicinities. They were accompanied by a Los Angeles "dragnet" composed of the high-powered chamber of commerce "goodwill ambassadors" who stuck to the Major and his party at the same time making all sorts of overtures to the distinguished eastern visitors.

But, Major Fleet had heard of the San Diego unexcelled climate and after thanking the "Hogtown' Los Angeles gentlemen informed them that he wished to make a survey of San Diego also before making up his mind to select Los Angeles for his airplane site. How the Major ever escaped the clutches of our northern leeches is more than we can ever explain!

However, Major Fleet arrived in San Diego and here he met another Major. That other Major was Macauley, business manager of the San Diego chamber of commerce and executive secretary. Major Macauley lost no time in bringing into the picture Joe Brennan, director of port.

Between Macauley and Brennan's "sales talk,' Major Fleet was convinced in less time than it takes to tell it, that San Diego was the spot he set out to get and the Consolidated Aircraft corporation selected the tideland sites along Pacific boulevard and immediately erected its magnificent factory which makes it the largest now in the United States.

Last Monday another addition was completed and dedicated in the presence of several thousand San Diegans who paid tribute to Major Ruben Fleet and his corporation. Admiral Chas. A. Blakely, commandant of the 11th Naval District was given the honor of the dedication. Admiral Blakely's eulogy to Major Fleet in behalf of the entire navy department, was loudly applauded and San Diegans felt that a great man had come to their city to save them from poverty and to enlighten every home here. This "life saver" made it possible to save the day after the fleet had departed for the Hawaiian Islands with that enormous payroll which has been San Diego's greatest source of revenue.

More than 9,600 men are now employed by the Consolidated Aircraft corporation, and according to the statement made by Major Fleet at the dedicatory ceremonies last Monday, there will be several thousand more men employed by December of this year, which means a larger payroll, supreme happiness and greater prosperity for San Diego and its surrounding territory.

Yes, Major Fleet is San Diego's Santa Claus!

FEDERAL PLANE ORDERS LISTED

planes. The 1941 fiscal year appropriation provided funds or contract authorization for approximately 3,000 planes for the Navy, and the supplemental defense appropriation for 4,028.

A recapitulation of awards made by the War Department indicates that since June the Army has placed orders for aircraft, exclusive of engines, armament and certain instruments, with a value of close to $400,000,000. The exact number of airplanes the Army will obtain as a result of these orders has not been divulged, and no information has been furnished as to the number of ships ordered by the Army for the Navy's account. Because of the difference in technical requirements, it is assumed that the combat ships ordered by the Army are all for its own use, but it is understood that some of the cargo and training planes were ordered for the Navy's account.

Army Contracts Listed

The following is a list of aircraft contracts awarded by the Army since June 1 of this year:

Manufacturer Type	Quantity	Value
Cessna, twin-engined advanced trainers...	33	$900,378
Cessca, twin-engined advanced trainers....	33	$900,378
No American, single-eng advanced trainers.	637	11,335,631
Consolidated, four-engine heavy bombers...	56	14,831,342
Stearman, primary trainers	300	2,041,947
Beech, advanced trainers	67	3,410,746
Fairchild, primary trainers	100	1,038,300
Stinson, short-range observation..........	6	‡.......
Beech, transports	20	*.......
Ryan, primary trainers	100	2,074,234
Beech, advanced trainers	150	4,847,217
Vultee, basic trainers	500	7,488,782
Boeing, four-engined heavy bombers......	277	70,449,955
Lockheed, twin-engined pursuits	410	30,278,788
Platt-Lepate, rotating-wing autogyro.....	1	‡.......
Bell, single-engined pursuits	120	4,962,220
Republic, single-engined pursuits	†1,000	56,499,924
Bell, single-engined pursuits	540	19,688,287
Curtiss, trainers	450	4,221,069
Curtiss, transports	46	12,410,116
Martin, twin-engined bombers	‡..	14,269,646
Stearman, trainers	‡..	6,934,096
Boeing, four-engined heavy bombers......	‡..	59,762,850
Lockheed, twin-engined pursuits	‡..	15,646,451
Douglas, transports	‡..	20,229,184
Beech, trainers	‡..	13,115,138

† Estimated. ‡ Not released. * Included in the $4,847,217 for advanced trainers.

List of Navy Orders

Figures released by the Navy showed that up to and including September 3 it had awarded contracts for airplanes and engines, out of its $226,088,562 appropriation for the fiscal year 1941, with an aggregate value of $44,720,634. Out of its 1940 fiscal year appropriation of $89,419,000, the Navy had awarded contracts for airplanes and engines with a value of $38,551,966. Since that date, only two new contracts have been announced as awarded by the Navy. One was to Curtiss-Wright for scout observation

Continued on Second Page, Column 2

FEDERAL PLANE ORDERS LISTED

Continued from First Page

ships with a value of $11,476,633, and the other presumably for scout-bombers with a value of $9,602,384 to Douglas Aircraft.

The following is a break-down of the airplanes reported by the Navy as on order but undelivered as of September 3:

Model Type Manufacturer	Quantity
F2A-2, single seater fighter; Brewster................	43
F4FS, single seater fighter; Grumman................	320
JRB-1, utility transport; Beech	5
JRF-1, utility transport; Grumman	10
N3N-3, primary trainer; Navy aircraft factory.......	562
NP-1, primary trainer; Spartan	201
NR-1, primary trainer; Ryan	100
N2S-1, primary trainer; Stearman	600
OS2U-1, observation scout; Vought-Sikorsky.........	42
OS2U-2, observation scout; Vought-Sikorsky.........	158
PBM-1, two-engined patrol bomber; Martin...........	20
PBY-5, two-engined patrol bomber; Consolidated......	200
PB2Y-2, four-engined patrol bomber, Consolidated.....	2
R3D-2, transport; Douglas	4
R5C-1, transport; Lockheed	1
SBDS, scout-bomber; Douglas	137
SBN-1, scout-bomber; Navy aircraft factory..........	30
SB2U-3, scout bomber; Vought-Sikorsky...............	57
SNJ-2, advanced trainer; North American............	25
X15F-1, two-engined fighter (experimental); Grumman.	1
XFL-1, land fighter (experimental); Bell............	1
XF4U-1, experimental fighter; Vought-Sikorsky.......	1
XN5N-1, experimental trainer; naval aircraft.........	1
XPBB-1, experimental patrol bomber; Boeing.........	1
XPB2M, experimental patrol bomber; Martin..........	1
XPBM2, experimental 4-eng. patent bomber; Martin..	1
XSB2A1, experimental scout bomber; Brewster........	1
XSB2C-1, experimental scout bomber; Curtiss.........	1
XTBF-1, experimental torpedo bomber; Grumman.....	2
XTBU-1, experimental torp. bomber; Vought-Sikorsky.	1

Prospective Orders

In addition to the planes shown as on order and undelivered on September 3, the Navy had agreements preparatory to contracts for the following ships:

Type Manufacturer	Quantity
Observation-scouts; Vought-Sikorsky	1,006
Scout-bombers; Brewster	411
Fighters; Brewster	108
Fighters; Grumman	254
Torpedo-bombers; Grumman	286
Utility transports; Grumman	144
Scout bombers; Douglas	252
Scout observation; Curtiss	300
Advanced trainers; Curtiss	150

To date the Navy has made no announcement indicating that actual contracts for any of the above airplanes have been awarded. It is quite possible, however, that the orders announced as placed by the War Department with Douglas and Curtiss last Saturday may have included some planes for the Navy.

A total of 29 of the planes on order September 3 were scheduled for delivery this month, while 47 are scheduled for October, to increase to 112 in November and 187 in December. These scheduled deliveries do not take into consideration deliveries against orders placed prior to 1940, but still unfilled, which includes the order for 20 patrol bombers against which Martin is just starting deliveries.

---

due to [illegible] the wing. Wheaton thought that reduction of frequency was a normal phenomenon up to the point of skin wrinkling. "A Graphical Solution of Flutter Instability", by W. B. Bergen and Lee Arnold, The Glenn L. Martin Co., was presented by Bergen. Representing a long step towards elimination of flutter, this paper presented a set of graphs and mathematical curves which were designed to help the engineer arrive in a few minutes at computations that once required weeks of mathematical gymnastics. The long period of intensive vibration study conducted by Martin engineers was outlined.

New Test Recorder

Tuesday's session on Instrumentation was presided over by Dr. E. E. Sechler, of California Institute of Technology. "The General Use of a Magnetic Steel Tape Recorder in Airplane Testing", by James B. Darragh, Jr., Lockheed Aircraft Corp. was well received. This interesting device, the first ever built, has numerous advantages. Using eight recording magnets and 1800 feet of steel tape driven by a variable speed magnet, it is possible to record various electrical impulses, including those from a microphone. Thus the instrument records the voice as well as the results reported by various instruments. Separate magnets are used, on the ground only, for erasing the tape. A continuous recording for as long as 16 hours may be made. Recordings are permanent until erased. Time reference points are marked on the tape by periodic short circuiting of the current. The device is especially adaptable to noise, vibration, and flutter recording, but may be used to record data from any number of flight instruments up to sixteen, simultaneously. Or as many as sixteen different observers may record data simultaneously by using separate microphones. On single-seater planes the device may be mounted with convenient remote controls so that the pilot can dictate a full account of observations at the same time that instrument, noise, stress, and vibration recordings are being made automatically. In the event of a fatal crash the record on the steel tape would be preserved except in event of a fire hot enough to destroy the magnetism of the tape. In commenting on this remarkable development, Dr. Klein pointed out that photographic recording of flight data had not proved entirely satisfactory, due to time element to get films developed, and record and assemble data, etc., but that he preferred direct visual readings wherever possible. Darragh thought the choice might be a matter of opinion but pointed to the ver[illegible]tromagn[illegible] instrument. Dr. Klein admitted that pointer instrument readings are hard to make accurately.

"The Application of an Electromagnetic Indicator to Internal Combustion Engine Problems", prepared by C. S. Draper, J. H. Lancor, and Leighton Davis, of Massachusetts Inst. of Technology, was presented by C. S. Draper.

Pointing out that future engine refinements must come through exact and painstaking research into the exact nature of engine operation, Draper outlined the years of work that have gone into development of the recording instrument he and his associates have perfected. This instrument has proved far superior to any previously used recording device for obtaining indicator cards on the pressure cycle of high speed internal combustion engines.

Russell G. Robinson, of the N.A.C.A., presented a slow motion study of internal combustion. Motion pictures taken at a speed of 40,000 frames per second were shown. This is made possible by an ultra high speed camera developed at the N.A.C.A. laboratories during the past year by Cearcy D. Miller.

High Altitude Flying

Hall L. Hibbard, Lockheed Aircraft Corporation, served as chairman of the Tuesday evening session on High Altitude Flying. The highlight of the entire meeting was probably the demonstration given during that session of the high altitude pressure chamber of the new oxygen face mask, both developed in the high altitude research laboratory of the Mayo Clinic. This presentation was made jointly by Drs. Walter M. Boothby and W. R. Lovelace. The latter established a new decompression record when he was taken to an altitude equivalent, within the chamber, of 40,000 ft. in 9 minutes, returning to sea level in 2 min. 45 secs. Prior to making this demonstration Dr. Lovelace took oxygen through the Mayo face mask for forty minutes, and also used the mask throughout the test. This eliminates nitrogen from the blood system and prevents formation of bubbles in the blood during the test. It is these blood bubbles which are the chief danger to high altitude pilots. Formed through boiling of the blood due to reduced pressure, such blood bubbles will cause reduced vision, paralysis, double vision, unconsciousness, or even death. Dr. Boothby remarked that this country needs a large number of decompression chambers in [illegible] have less than a dozen such chambers now in service, Germany is known to be using hundreds of them.

Wednesday's concluding session, on Aerodynamics, was led by Dr. Clark B. Millikan, of California Institute of Technology. A paper titled, "Performance Dictates Design" by Ralph H. Upson, Wayne University, was read by Harold Luskin. The mathematics of this paper was pretty imposing and is probably a real contribution to engineering, but it was too deep for this observer. Major conclusion seemed to be that optimum performance could be reached with an aspect ratio of about 21 to 1. In any case the formula developed by Upson does permit easy examination of various design factors to determine influence on overall efficiency of their variations. Dr. Millikan, in discussing the paper, pointed out that all engineering is as much an art as a science, and that there is a point beyond which complex formulae cannot be carried from an engineering standpoint.

"Experiments on Drop Impingement" by W. H. Hunter, The B. F. Goodrich Co., outlined a program of research on icing. The speaker told his perspiring audience that ice hazards are neither seasonally nor geographically restricted. Smoothness of the wing surface is very important as, under icing conditions, a large volume of water is passing back along the wing very close to the boundary layer. Results of ice formation research are making possible a much greater percentage of flight completions to destination.

Propeller Design

"Some Recent Developments in Propeller Blade Design" was discussed by Louis H. Enos, Curtiss-Wright Propeller Division, Curtiss-Wright Corp. Enos forecast six-bladed propellers for the near future, of dual rotation type with three blades turning in each direction. He demonstrated why the hollow steel blade holds the greatest promise for propeller weight reductions. Steel blades also have superior resistance to abrasion. Propeller blade shank cuffs were described in some detail, their major advantage being improved engine cooling, but little hope was suggested for an early increase in propeller efficiency.

"Range at Constant Speed", was presented by its author, Norton B. Moores, St. Louis Airplane Division, Curtiss-Wright Corp. This paper provided a mathematical short cut method for determination of maximum range.

Aviation - Sept., 1940

A $1,400,000 improvement program is now under way on Lindberg field, San Diego, Calif. Runways are being lengthened, graded and surfaced in preparation for test flights of the four-engined bombers being built by Consolidated Aircraft Corp.

Aviation - Sept. 1940

Backlogs of the primary plane producers are more than keeping pace with accelerated deliveries. The following table gives the latest approximate unfilled orders of fourteen companies.

Aviation Corp	$5,000,000
Bell	22,000,000
Boeing	47,000,000
Brewster	44,000,000
Consolidated	97,000,000
Curtiss-Wright	200,000,000
Douglas	140,000,000
Grumman	9,000,000
Lockheed	140,000,000
Martin	110,000,000
North American	84,000,000
Republic	15,000,000
United	200,000,000
Vultee	15,000,000

Aviation - Sept. 1940

Consolidated Completed

Dedication ceremonies were held September 2nd, for the new Consolidated Aircraft Corp. factory building which virtually doubles the size of the San Diego factory. Completed at a cost of more than $2,000,000, the new building is more than 300 ft. wide and 700 ft. long. With other construction this brings total Consolidated floor space to about 2,000,000 sq.ft., said to be the largest integrated aircraft factory in America. Employment currently totals about 10,000; with 12,000 scheduled to be on the payroll by December, and 18,000 at the peak activity of the present plant.

Aviation - Sept. 1940

West Coast News

Aircraft Parts Manufacturing Association has been formed in Los Angeles, Calif., for the purpose of collecting, analyzing, and distributing information of interest to its members, particularly relating to problems arising through the enactment of new legislation affecting subcontractors and aircraft parts suppliers. Membership includes California companies engaged in manufacturing or processing parts, accessories, or products used in the aircraft industry. Jack Frost, former secretary to

Major R. H. Fleet, Consolidated Aircraft Corp., is serving as executive secretary of the new association.

Aviation - Sept 1940

Consolidated Aircraft has practically completed its $2,000,000 building program and probably will deliver planes valued somewhere between $10,000,000 and $15,000,000 in the final six months of 1940, as against $408,000 in the first half. The new facilities should enable an output of close to $40,000,000 annually. Yet there is a possibility of some further plant expansion in the coming months.

Aviation - Sept. 1940

Consolidated Expands

Editor's Note: the following summary of Consolidated's readiness to do its part in the national defense movement was received too late to be published last month with the statements of other manufacturers.

"Consolidated Aircraft Corp.'s position relative to the President's recently announced national defense program calling for 50,000 plane output per year, is one of timely alignment. Our present expansion program by which our factory is being doubled, was already under way before the announcement. Completed, this expansion will give us 1,910,000 sq.ft. of covered and uncovered manufacturing space, making it, I believe, the largest integrated aircraft manufacturing plant in America, and we have an option on additional land adjacent, equal to 50 percent of this area, with plans practically complete for its possible improvement. We have a factory of our own, a good organization—equal to any in our industry—the best in our history, and no mortgage on our premises or our future."—Maj. Reuben H. Fleet, president and manager, Consolidated Aircraft Corp.

Major Fleet

Aviation - Sept. 1940

Unfilled orders of the primary plane producers are steadily rising and are now well over twice the $600,000,000 estimated aggregate backlog at the beginning of the year. Contracts in negotiation under the defense program will increase the grand total by another $400,000,000. For example, the Army Air Corps is understood to be negotiating a large engine order with Curtiss-Wright which would boost the latter's unfilled orders to better than $400,000,000. As it is, Curtiss-Wright's $248,000,000 backlog is slightly in excess of total shipments by all aircraft makers in 1939. The following table gives the latest approximate unfilled orders of fifteen primary companies.

Allison	$40,000,000
Aviation Corp.	12,000,000
Bell	22,000,000
Boeing	90,000,000
Brewster	45,000,000
Consolidated	110,000,000
Curtiss-Wright	248,000,000
Douglas	140,000,000
Grumman	9,000,000
Lockheed	170,000,000
Martin	110,000,000
North American	95,000,000
Republic	12,000,000
United	212,000,000
Vultee	30,000,000
	$1,345,000,000

Aviation - September 1940

SPEAKING at the official dedication of Consolidated Aircraft's huge new buildings (San Diego, Cal.) on Labor Day, Major Reuben H. Fleet, company president (l.) took occasion to condemn peace-time conscription of plane plants as a deterrent to further expansion. Edgar N. Gott acted as master of ceremonies, and Rear Admiral Charles Blakely (r.) dedicated the plant to preparedness.

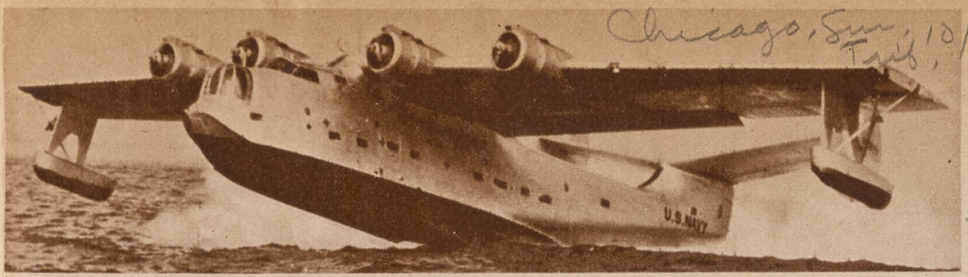
Aviation - September 1940

THIS NEW BUILDING doubled the capacity of Consolidated Aircraft in San Diego. At left is view of final assembly building, into which two football fields would fit comfortably.

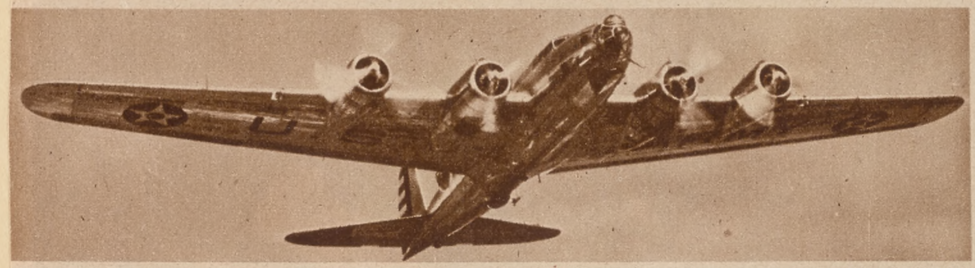
Chicago, Sun. Trib. 10/6/40

AMERICAN WINGS

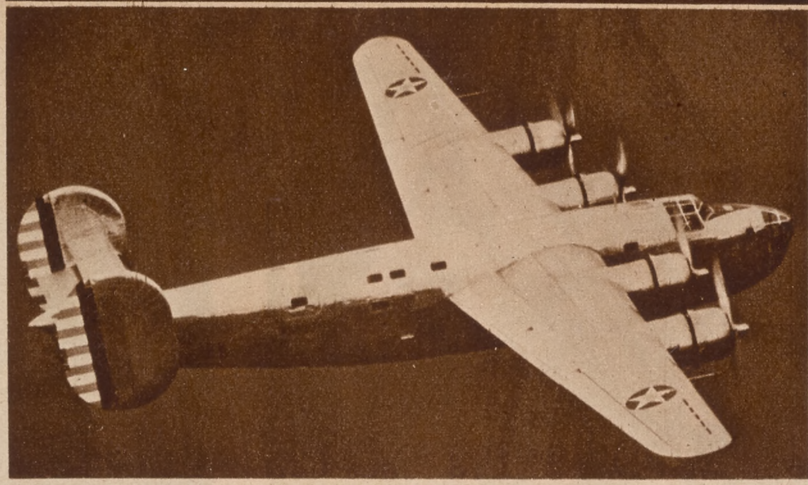
BOMBARDMENT



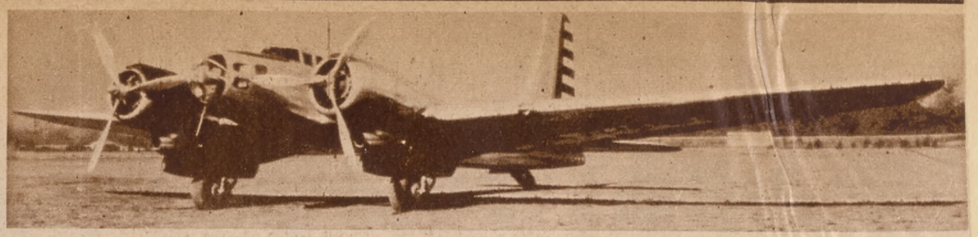
A LONG RANGE NAVY PATROL BOMBER, the PB2Y-1, which carries four tons of bombs for 5,000 miles at 240 m. p. h. Span, 135 ft.; four engines, 1,250 h. p. 14 cylinder two row radials.



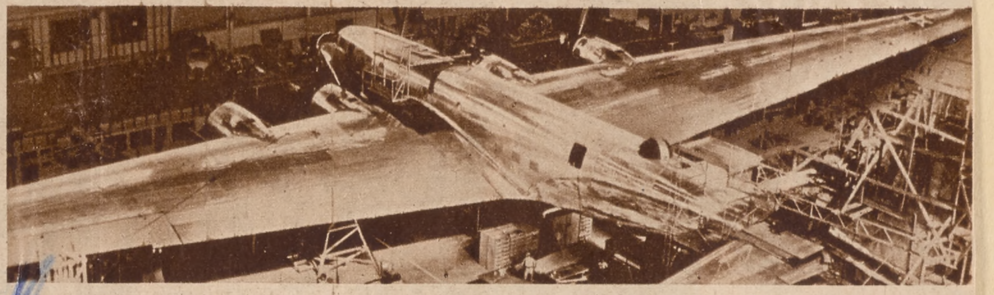
THE BOEING FLYING FORTRESS B-17. Span, 105 ft.; speed, 280 m. p. h. at 25,000 ft.; range, 3,000 mi.; four engines, 1,200 h. p.



THE FIRST TRICYCLE LANDING GEAR BOMBER, the army's B-24 (a Consolidated). Span, 110 ft.; speed, 300 m. p. h.; range 3,000 mi.; four engines, 1,500 h. p. two row radials; carries four tons of bombs.

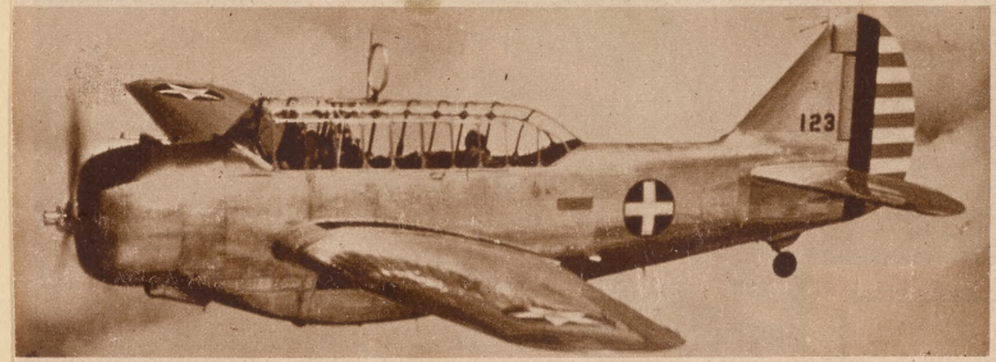


A MEDIUM BOMBER, the army's Douglas B-24. Span, 92 ft.; speed, 260 m. p. h.; range, 3,500 mi.; two engines, 14 cylinder 1,500 h. p.

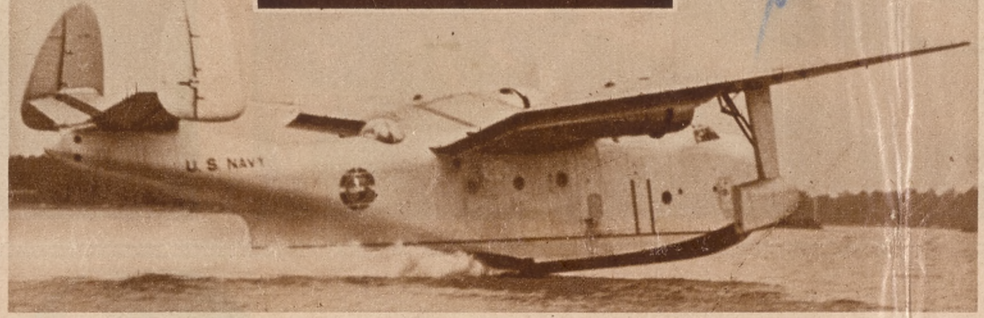


THE BIGGEST MILITARY PLANE IN THE WORLD, the Douglas B-19, now in the final assembly stage. Span, 250 ft.; designed speed, 220 m. p. h.; designed range, 6,000 miles with six tons of bombs and crew of 12; four engines, 2,000 h. p. 18 cylinder two row radials.

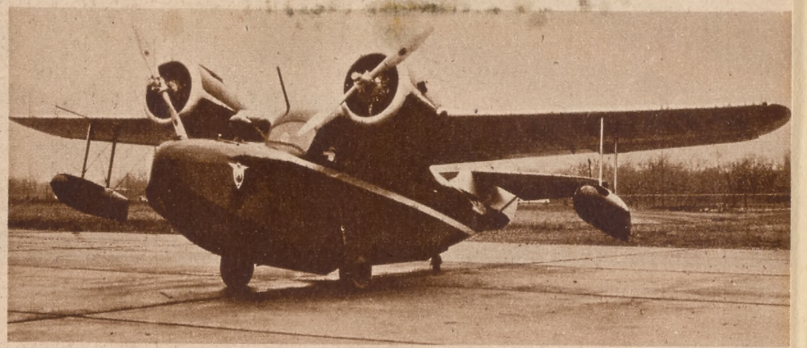
OBSERVATION—RECONNAISSANCE



THE LATEST AND BEST of the army's single-motored observation planes, the North American O-47. Span, 46 ft.; speed, 240 m. p. h.; range, 1,000 mi.; engine, 1,000 h. p.; crew, three.

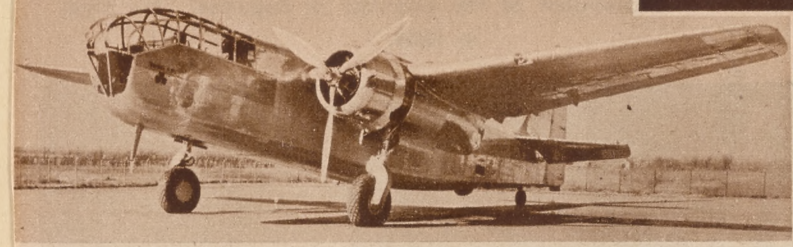


A NEW NAVY PATROL BOMBER, a Martin. Span, 118 ft.; reported speed, 250 m. p. h.; range, nearly 4,000 mi.; two engines, 1,400 h. p.

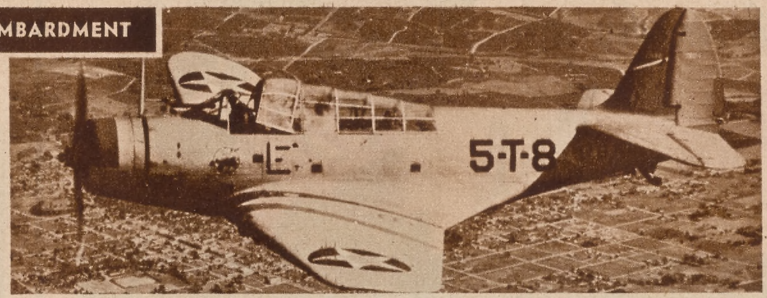


A RECONNAISSANCE PLANE, the amphibian Grumman G-21, used by army, navy, and coast guard. Span, 49 ft.; speed, 201 m. p. h.; range, 1,000 mi.; two engines, 450 h. p.

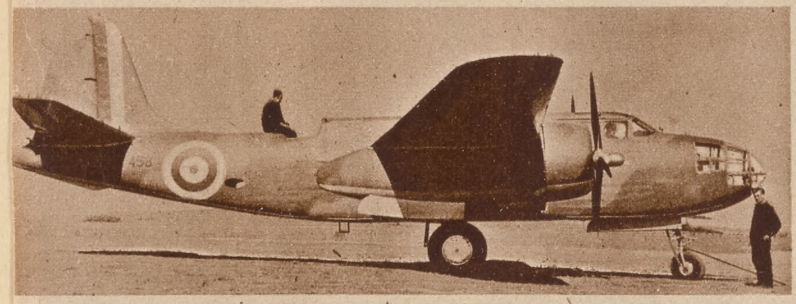
ATTACK - BOMBARDMENT



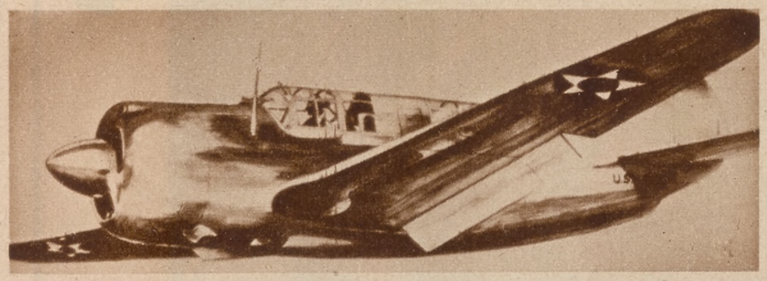
A STEARMAN ATTACK BOMBER ordered in quantity by the army. Span, 65 ft.; speed, just under 300 m. p. h.; two engines, 1,400 h. p.



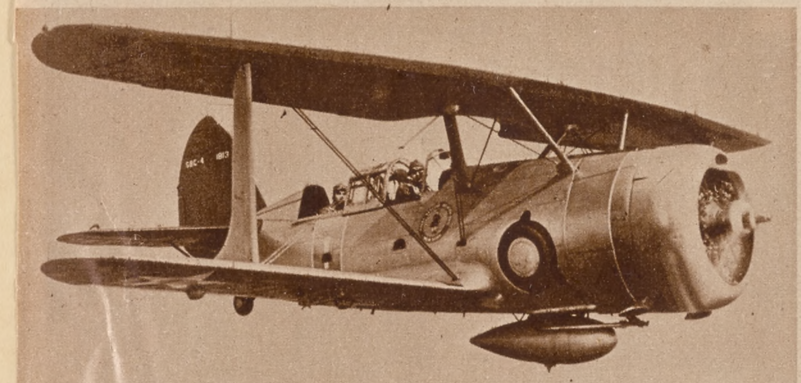
A DOUGLAS FOLDING-WING TORPEDO BOMBER for operation off aircraft carriers. Span, approximately 45 ft.; speed, 225 m. p. h.; range, 1,200 mi. Carries 400 pounds of bombs and 1,600 pound torpedo; fitted with arresting gear for landings.



ONE OF THE FASTEST and most heavily armed of new army attack bombers. Span, 61 ft.; estimated speed, 380 m. p. h.; two engines, 1,800 h. p.

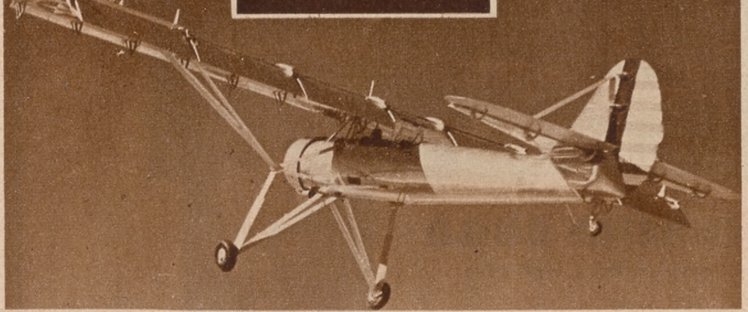


ONE OF THE NAVY'S NEWEST ATTACK BOMBERS, a Curtiss-Wright. Span, 42 ft.; speed, 320 m. p. h.; range, 1,400 mi. (all estimates); engine, 1,700 h. p.



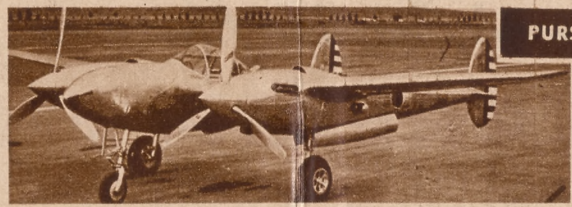
THE CURTISS SBC-4 DIVE BOMBER, one of the last of the navy's biplanes. Span, 34 ft.; speed, 240 m. p. h.; engine, 840 h. p.

ARTILLERY SPOTTER

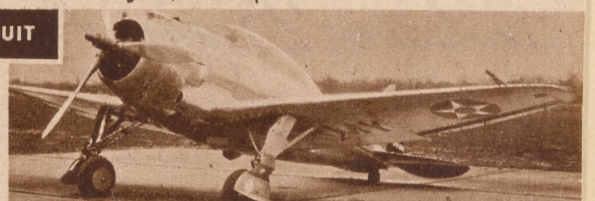


THE YO-51, a Ryan Dragonfly artillery spotter and communications plane. Fitted with full automatic slots and Fowler type area-increasing flaps, it is able to climb or land almost vertically. Span, 50 ft.; engine, 450 h. p.

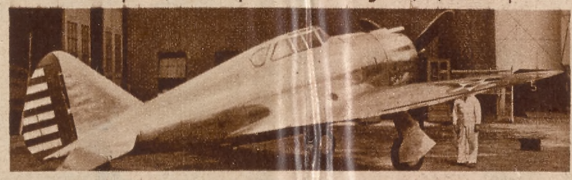
PURSUIT



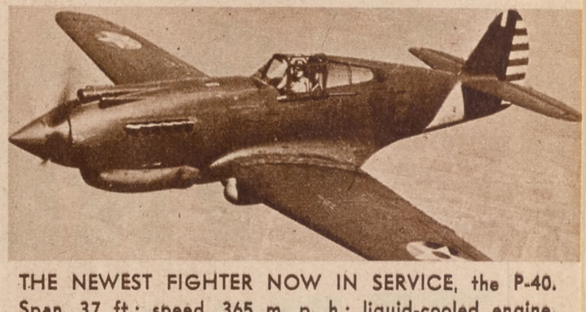
THE ARMY'S FIRST 400 M. P. H. FIGHTER the Lockheed P-38. Two 37 mm. cannon, four machine guns; tricycle landing gear; twin tail; span, 52 ft.; top speed, 404 m. p. h.; two liquid-cooled engines, 1,090 h. p.



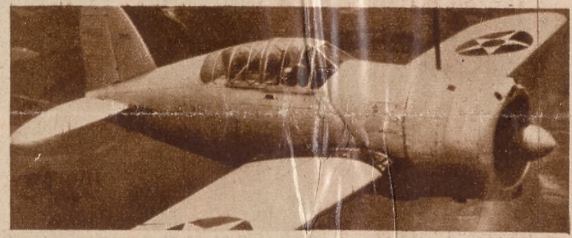
THE REPUBLIC P-41 PURSUITER—Estimates: Span, 40 ft.; speed, 360 m. p. h.; range, more than 2,000 mi. Engine, 1,500 h. p.



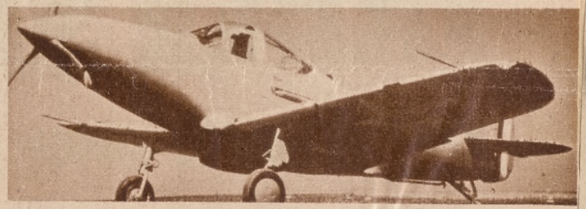
A HIGH SPEED, HIGH ALTITUDE FIGHTER, the Republic P-43. Built for combat above 30,000 ft.; span, 40 ft.; speed, 365 m. p. h. at 22,000 ft.; estimated range, 2,000 mi.; engine, 1,700 h. p.



THE NEWEST FIGHTER NOW IN SERVICE, the P-40. Span, 37 ft.; speed, 365 m. p. h.; liquid-cooled engine, 1,000 h. p.



THE NAVY'S BREWSTER SINGLE SEATER FIGHTER—Span, 36 ft.; speed, 345 m. p. h.; engine, 1,200 h. p. Britain has ordered several hundred of these; some have been delvered.



THE NEWEST and perhaps the fastest navy fighter, the Bell XFL-1. Span, 35 ft.; liquid cooled engine, 980 h. p. (takeoff).

Night Workers To Report Hour Later at Plant

Consair's huge gong sounded, indicating the hour of 5:30 and end of the working period for the day shift. Approximately 7000 men laid down their tools and started for the huge parking lot opposite the plant where their autos were parked—only to meet another 7000 workers, parking their cars and entering the plant to begin night shift duties at 6.

That's the situation which daily has been producing the worst traffic congestion in San Diego's history. Pacific highway, on which the Consolidated Aircraft Corp. plant faces, is the city's main entrance from the north. Hundreds of autos, adding to the thousands of aircraft workers' cars, tie up traffic for blocks in both directions.

SHIFT WILL START LATER

And that's the reason why Consair officials announced yesterday that beginning tomorrow evening the night shift will go on duty at 7 instead of 6 and work an hour longer. The day shift will continue to end at 5:30. The 90 minutes intervening will give time for the day crew to leave and the traffic crush it causes to end before the thousands of night workers drive up.

Recommended by the city traffic commission on report of a special committee, the change is expected to prevent overlapping and congestion of pedestrians and vehicles. It has been found necessary in recent weeks to assign five police officers for an hour each day to handle Pacific highway traffic near the Consolidated plant with other officers at the intersections of the highway with Laurel and Sassafras sts. and when one was available, at Pacific and Juniper.

FIRM AGREES TO CHANGE

"We have agreed to the change of hours in an effort to improve conditions for our employes and the San Diego public," Consair officials said in announcing the change. "It will entail some extra expense but we cheerfuly will stand it if it will relieve the situation."

The traffic commission also has recommended erection of three overpasses and the city council will act this week on that recommendation. One of these overpasses would be located 75 feet south of the south gate; one 50 feet south of the present gate at the north end of the main building and the third at the south side of the Bean st. connection.

Erection of these overpasses will entail extra expense on the aircraft concern for guards and watchmen but corporation officials are willing to meet that cost.

S. D. Plane Orders Total 244 Million

Oct 10-40 Union

San Diego's three major aircraft plants, Consolidated, Ryan and Solar, yesterday reported a total backlog of $244,000,000 and a total payroll of 14,108 men and women.

Officials of Consolidated Aircraft Corp. said the backlog of the big municipal airport plant up to last night totaled $231,000,000. The number of employes was placed at 12,000 with several hundred being added each week.

Ryan Aeronautical Corp. has a backlog of $11,000,000 with 1480 employes and Solar Aircraft Co. a $3,000,000 backlog and 628 employes.

All three companies are expanding their plants.

CONSAIR STANDARDIZATION SPEEDS U. S., BRITISH PLANES

WASHINGTON, Oct. 14 (I.N.S.)—Standardization of U. S. military equipment to conform with British needs has been placed in the hands of a new committee created by President Roosevelt, Treasury Secretary Morgenthau disclosed late today.

Besides Morgenthau, the committee is composed of War Secretary Stimson, Navy Secretary Knox and the national defense production commissioner, William S. Knudsen.

LONDON EXPERTS ON WAY

Broad duties of the group will include fundamental aid to Great Britain through further speeding of armament production and, especially, by long-range standardization of American artillery and aircraft to fit into the British war machine. The plan will be speeded, Morgenthau announced, by the early arrival in this country of 10 British experts, who will advise on the standardizing measures.

A system of making British and American fighting equipment uniform already has been started, Morgenthau said, in the case of the Curtiss plane plant at Buffalo, N. Y., where daily six P-40 pursuit planes leave the assembly line, destined for both U. S. and British air forces.

BUILDING TWO TYPES

Parallel uniformity is to be initiated in production of the Consolidated Aircraft plant at San Diego, Calif., the secretary added, where flying boats are under construction for both the U. S. army and the British Royal navy, as well as four-engined bombers for the air forces of both nations.

At the Consolidated plant in San Diego four types of planes were being produced, two types of flying boats for the American and British navies and two types of bombers for the American and British armies. Now production has been placed on a basis of one type of flying boat and one type of bomber.

O. K. Brazil, Chile Bases

WASHINGTON, Oct. 14 (A.P.)—The day brought these defense developments:

Secy. Hull indicated that naval and air base facilities were involved in exchanges taking place with various South American countries on all phases of hemisphere defense. His comment followed reports that Brazil and Chile had agreed to lease bases to the United States.

President Roosevelt signed legislation providing for a $150,000,000 housing program for defense workers.

The house completed congressional action on a measure authorizing states to establish "home guards" to replace national guardsmen called to federal service.

SEEK 186,000 VEHICLES

The treasury sent to congress a request for reorganization of the coast guard reserve as a military group whose members would be available for active duty in a war or emergency.

Acquisition of 186,000 automotive vehicles—enough to equip a field force of 1,400,000 men—was disclosed by Robert P. Patterson, assistant secretary of war, as the goal of the army's motorization policy.

William S. Knudsen, director of production for the national defense council, declared in Detroit that "if we all get together and pull for it," no nation can rival the United States in arms production.

PLAN POWER PROJECT

Earlier, in a press conference, the former General Motors president said the defense production schedule calls for full equipment for an army of 1,200,000 and heavy equipment for an army of 800,000 by April 1, 1942.

The United States and Canada have agreed to start immediate engineering "investigations" on a major hydro-electric project in the St. Lawrence river in what the state department described as a plan to assure "adequate power supplies for defense industries.

Union 10/23/

BOARDING HOUSE BAN LIFTED IN EMERGENCY ORDINANCE

Prohibition against boarding houses in residential zones was lifted by the city council yesterday when it passed an emergency ordinance designed to provide additional housing facilities for the thousands of men who are coming here to engage in the rapidly expanding aircraft industry.

The action was taken over the vigorous objection of Glenn Rick, city planning engineer, who questioned legality and necessity of the measure, and who said it would "scuttle" zoning laws.

He said there are 58,000 residential units in the city, of which 46,000 are in zones in which boarding houses are permitted. Deed restrictions prevent 4000 of the remaining 12,000 units from being used as boarding houses, he reported, and argued that facilities are ample to care for the influx of aircraft workers in areas in which boarding houses are permitted.

CONSAIR PLANS CITED

Mayor P. J. Benbough reported that Consolidated Aircraft Corp., at whose behest the ordinance was prepared, plans to increase its force from 12,000 to 20,000 men, and that provision for housing and training aircraft workers must be made immediately if the huge plant is to obtain additional orders and is to be successful in its efforts to ward off requests that it establish another factory elsewhere.

"There will be complaints, and we are prepared for them," he said, "but we believe any difficulty that may arise from permitting boarding houses in residential zones can be adjusted. It is simply a question of whether San Diego is to aid or retard the national defense program, and I believe the people are willing to do their part."

Fear that the suspension "would jeopardize the entire plan under which the planning commission operates," was expressed by Fred B. Mitchell, realty board president, in a letter in which he reported the board is "in accord" with the council's "endeavor to meet the emergency needs for boarding and rooming houses. . . ."

As an alternative, the board suggested that the council grant individual requests for permission to operate such houses without conducting public hearings, charging a fee, or referring the applications to the planning commision. A similar procedure was urged by Rick, who asked that each case be considered on its merits.

H. B. Daniel, assistant city attorney, said the ordinance suspends, but does not repeal a zoning restriction and emphasized that every effort has been made to preserve "the integrity of zoning."

MAY EXTEND EMERGENCY

The ordinance provides that there is to be no relaxation of restrictions against rest homes, convalescent homes and homes for the ill and aged and was passed on motion by Councilman Addison Housh seconded by Councilman Louis Weggenman.

Under it, boarding house operators must register with the city clerk and agree not to continue to use their premises as boarding houses after the ordinance is repealed. The initial period of the housing-shortage emergency has been set at six months, but Benbough made it clear to protestants that it may be necessary to extend this period.

UNION - Oct. 24 '40

First Lodging House Listed

Loraine Burgess, 3605 Wawona dr., yesterday was the first person to register under the boarding-lodging house zoning moratorium ordinance passed by the city council Tuesday, Fred Sick, city clerk, reported.

The emergency measure lifts for six months the ban against boarding-lodging houses in residential zones, and is designed to relieve a housing shortage caused by steadily increasing employment at Consolidated Aircraft Corp.

Burgess' property was described by Clark Foote, chief deputy city clerk, as being in the heart of the Pt. Loma single-family-dwelling residential unit, and was registered by the owner as available for boarding and lodging 30 persons.

The registration forms, which all boarding-lodging house operators must fill out if they propose to operate in districts zoned against such uses, are in triplicate. The city retains one copy, the registrant receives one, and the third copy is sent to Consolidated.

Union Oct 10-40

$1,500,000 Airport Development Is Proposed for Mission Bay

A broad plan for development of a $1,500,000 airport on Mission bay was suggested to the city council yesterday morning by Maj. Frank Seifert, U. S. army air corps, and in the afternoon Matthew Gleason, state park commission chairman, said he will confer Monday with the attorney general on steps necessary to speed acquisition by the city of a site for the field.

Dredging of Mission bay to a uniform depth and using the spoil to build up the airport, was recommended by Seifert, and Gleason described the plan as "the salvation of Mission bay," development of which has been blocked by lack of funds.

SITES NEEDED

A long-time resident of San Diego, Seifert is a former city councilman and a distinguished pilot who years ago over this city flew into the headlines by participating in the first midair refueling. For years a reserve officer, he said he had been ordered back to active duty Oct. 1, and that he will leave tomorrow for Washington, D. C., where he will be in the office of the assistant secretary of war. However, he appeared yesterday before the council in the role of a private citizen, and asked that it be understood that his remarks carried no official weight.

Tracing briefly the rapid strides being made in aviation, he pointed to the limited facilities at Lindbergh field and to the indicated desire by several large plane manufacturers to move their plants here provided sites can be obtained.

He then said he long has felt that an ideal airport, with mile-long runways, could be developed on Mission bay marsh lands, and expressed the belief that national defense funds can be obtained.

Roughly, the improvement would be bounded on the north by the mean high-tide line; on the east by Pacific highway, and on the south by the now-abandoned La Jolla street car tracks. The western line would be west of the Causeway.

PLAN INDORSED

Major P. J. Benbough and councilmen quickly indorsed the plan, and Dayton Ault, city attorney; Walter Cooper, city manager, and Glen Rick, city planning engineer, were appointed to set it in motion.

Ault said that ownership of the more than 1000 acres involved is in the hands of the state, the city and about 80 individuals. Gleason, after a hurriedly called conference with Ault and H. B. Daniel, assistant city attorney, expressed belief that the park commission gladly will release control of land under its jurisdiction that is needed provided it legally can be accomplished.

It was suggested that a cooperative agreement might be worked out under which the state would give up the park lands in return for dredging Mission bay around which lies Mission Bay State park, and Gleason said he will lay this plan before the attorney general in San Francisco Monday. Then, he added, he will present the proposal to the park commission at its meeting Tuesday and Wednesday at Asilomar on the Monterey peninsula.

IDEAL AIRPORT

Basing his remarks on inspection trips he has made to plane factories since he returned to active duty, Seifert pictured for the council the huge planes of the future, and said that a Mission bay airport would be ideal for any planes now built or contemplated, as approaches would be unobstructed, and the planes could roar in over the field from any direction and at low altitudes.

"Fifty-five percent of the planes being built in the United States are being made in southern California," he said, and then told of the difficulty many southern California plants are having in expanding because of limited sites adjacent to airports.

He pointed to conditions at Lindbergh field, bounded by the coast guard air base, and the Ryan, Solar and Consolidated plants, and indicated that the time may come when this field should be used only by commercial airlines and by factory test pilots.

LOW COST SEEN

Fred Rhodes, public works director, described Seifert's plan as entirely feasible, and said that the cost of the proposed bay dredging would be low, as the water is shallow. This also was apparent from air photos Seifert used to illustrate his remarks.

The flier said that his $1,500,000 cost estimate was "a shot in the dark," and was subject to adjustment after an engineering survey. However, he said that should the figure be upped, the increase would not be an obstacle becouse of the millions of dollars that have been and will be made available for such vital national defense improvements.

NAVY NEWS

A permit for erection of a $700,000 final assembly building was granted Consolidated Aircraft Company at San Diego last week. The building will be 720 feet long and 360 feet wide. A duplicate building will be erected as soon s dredging and reclamation work nakes land available at Western nd of San Diego's airport.

10/15/40

COUNCIL RUSHES 5-POINT PLAN TO SPEED DEFENSE PROGRAM

S.D. "Tribune" - 10/17/40

San Diego's entire resources yesterday were marshaled behind the rapidly expanding national defense program. At a hurriedly called action-packed city council conference the way was cleared for training and housing thousands of aircraft workers, and obstacles that might delay a drafted municipal employe from entering the army when summoned.

Called by Major P. J. Benbough, the informal meeting was attended by Walter W. Cooper, city manager; Dayton Ault, city attorney; his assistant, H. B. Daniel, and by Councilmen Addison Housh, Fred Simpson and Herbert Fish. It was highlighted by:

1—Decision to pass an emergency ordinance declaring a six-month moratorium on certain zoning restrictions to permit San Diegans in any part of the city to turn their homes into boarding houses for employes of industries vital to national defense.

PARK BUILDINGS

2—Indorsement of a Consolidated Aircraft Corp., suggested plan to make park buildings available for national defense vocational training classes, and a pledge to approve any such occupancy permit on receipt of an application from the board of education.

3—Issuing of instructions to the city attorney to prepare a resolution in which the council formally and strongly will put itself on record as being behind all national defense measures, and in which the city will pledge itself to place facilities at its command at the disposal of the defense program.

4—A declaration that only in "exceptional and unusual" cases will a municipal worker of draft age be considered as indispensable, and will an affidavit be provided to this effect.

EMPLOYE LIST SOUGHT

5—Disclosure by Cooper that he has asked Russel T. Bailey, civil service personnel director, for the names and positions of the 401 city employes in the 21-to-35 age bracket who registered under the selective service act Wednesday, and an indication by the manager that not one of these men hold posts that readily could not be refilled, or a job that would lead to them being placed in deferred draft classifications if they so demanded.

Back of the meeting loomed a series of conferences between city officials and Consolidated executives, and the decisions reached yesterday were designed to bolster Consolidated's efforts to resist pressure from Washington to get the corporation to establish another plant elsewhere, and to make it possible, through provision of housing and training facilities, for Consolidated to get additional contracts that, it was reported unofficially, would total $80,000,000.

Accordingly, the council squared its shoulders against expected complaints from some residents in R-1 or single-family zones that will be opened to boarding houses and, after voicing the belief that it is the patriotic duty of every San Diegan to tolerate any inconvenience that may be caused by the emergency

(Continued on Page 2-A, Col. 5)

zoning moratorium, instructed the city attorney to draft the ordinance that will:

1—Lift the boarding house ban for six months.

2—Require all operators of such houses to register with the city clerk, giving their names, addresses, number of rooms to be rented, and proposed number of men to be accommodated.

3—Provide a form which the operators must sign, and in which they will agree to discontinue immediately the operation of a boarding house in violation of present zoning restrictions when the council lifts the moratorium and determines that there no longer is an emergency

Stays in London

LONDON, Oct. 17 (A.P.)—Britain's government is staying in London, informed parliamentary source disclosed today, and is not yet ready to order compulsory evacuation of the bomb-strafed capital.

The same sources, however, conveyed anew the government's desire that "the more people who can leave London without interfering with their business the better" and, in the house of commons, the minister of health disclosed an "ominous increase" in the wartime spread of cerebro-spinal fever.

Malcolm Macdonald, the minister, said gravely that this "should make us pause in contemplation of the coming winter."

No reason was given for the semi-official reiteration of the government's determination to stay in London, on this 41st day of unbroken air siege. The parliamentary correspondent of Reuter's, British news agency, merely quoted: "There is no question of the government leaving London. On the contrary, they intend to stay here."

He added: "There is no question of any compulsory evacuation at present."

S. D. Vocational School Places 2500 in Jobs

More than 50 men and women, representing the business, professional and industrial life of San Diego, met yesterday as members of a citizens' advisory committee on vocational education and heard a report on the immense strides made in the last year in vocational training as a part of the city school system. The meeting was held at the vocational school building on Market and State sts. with Jacob Weinberger, city board of education president, presiding.

More than 2500 who attended vocational school last year have been placed in permament jobs here, 1294 of them in national defense work, Will C. Crawford, school superintendent told the committee. The school is turning out 125 weekly who find immediate employment in the aircraft industries. Enlarged facilities and staff, made possible by recent federal appropriations, will enable the school to more than double that output soon, Crawford said.

Included in the committee personnel are clubwomen, teachers, aircraft company officials, civil service heads, naval officers, chamber of commerce executives, realtors, clearing house members, industrialists and business and professional men. Organized almost four years ago, the committee has aided school authorities in development of vocational training work.

MORE FUNDS SOUGHT

Recently given $300,000 in federal funds for enlargement of facilities, Crawford informed the committee that an additional $600,000 for equipment and $900,000 for buildings has been requested and probably will be granted. The board of education had placed $400,000 in its budget for this year for the school, the present building has been purchased and contract let for an addition. Rooms in the Spreckels building have been rented for use of the business division of the vocational school and buildings in the park are being made available.

Growth of the school is shown in a report compiled for the board of education. Enrollment in September, 1939, was 722 and in September of this year, 2494. Enrollment in trade and industrial classes increased from 1918 for the fiscal year ended June 30, 1939, 3859 for the following fiscal year. Fifty-three instructors were employed to teach 97 evening classes.

Apprentice training classes are conducted in carpentry, plumbing, painting, electricity and meat cutting. The business division has a total enrollment of 2561 after opening Sept. 15', 1939, with 95 students. During the year, 292 students were placed with business firms. Public service, including selling classes, had 1500 enrolled.

HANDICAPPED CHILDREN

Vocational rehabilitation bureau handled 305 cases of physically handicapped children and rehabilitated 68 of them. The junior placement service provided employment since July 1, 1939, for 5076 young men and women of whom the vocational school trained 2637, or more than one-half the number placed.

Others to address the meeting were J. G. Sullivan, director of vocational education; Sam F. Fick, assistant supervisor, trade and industrial training, University of California at Los Angeles; Dr. Paul E. Wedgewood for the medical society; Jack Wright of the federal committee; Maj. T. C. Macaulay, chamber of commerce; Maj. Edgar N. Gott and R. H. Waterbury, Consolidated Aircraft Corp.

Maj. Gott repeated a former announcement that his company hoped to have 30,000 workers employed by July 1, 1941, and that preference in employment would be given to San Diegans, trained at the vocational school.

City Leads U.S. In Defense Awards, Word

Tribune 10/29

President Roosevelt's approval of "immediate construction of housing projects in 63 vital defense areas" with $45,762,500 of defense funds was announced today by Charles F. Palmer, defense housing coordinator, who said largest of the 63 projects would be at San Diego, The Associated Press reports from Washington. The local project involves approximately $15,000,000.

Unit Cost Set at $3000

The San Diego program, said Palmer provides for construction of 2000 additional dwelling units, 750 dormitory rooms for single men and 1000 portable-type homes. He said the projects would not exceed a maximum of $3000 a unit.

Site for the new community here has not been announced, said Charles A. Sloan, construction engineer, United States public build-

(Continued on Page 4A, Col. 3)

15 Million Awarded For Defense Homes

CONTINUED FROM PAGE ONE

ing administration, resident engineer for the project. Indications are the community may be in the Camp Kearny area.

"Absorption" Forecast

Palmer emphasized the new housing "will be absorbed in the San Diego community pattern so that the normal life will not be disrupted." He said a housing emergency resulted here from the large navy, army and aircraft expansion, and declared the new project "will create dwellings equivalent to those in a town of 30,000 people."

In Addition to Navy Job

The new work is in addition to a $3,800,000 project for 1200 concrete housing units for navy families, 600 of which will adjoin the destroyer base and 600 the naval training station. Contract for the navy housing project was awarded Oct. 17 to the William Simpson Construction Co., of Los Angeles.

All Complete in Year

Palmer said the $45,762,500 of defense funds will provide 13,315 family dwelling units throughout the United States, contracts to be handled by John M. Carmody, federal works administrator.

Palmer estimated all the projects will be completed in four to 12 months. Congress has provided a total of $290,000,000 for defense housing construction, he said, and estimates indicate a total of $560,000,000 will be needed to complete the job.

The number of family units to be constructed at other places, The Associated Press reported, is as follows: Tucson, 150; Benicia, Calif., 50; Fresno, 150; San Rafael, 175; Stockton, 150; Sunnyvale, 150; Boise, 100; Albuquerque, 100; Houston, 200; San Angelo, Tex., 100; Ft. Huachuca, Ariz., 30; Riverside, 150; Denver, 50; Lowry field, Colo., 125; Ft. Sill, Okla., 150; Ft. Meade, S. D., 50; El Paso, 200; Ft. Clark, Tex., 50; San Antonio, 500; South Tacoma, 150; Spokane, 200; Oahu, T. H., 550; Ft. Ord, Calif., 550, and Ft. Lewis, Wash., 250.

$80,000,000 For Facilities In S. D., Word

SD Tribune 10/21/40

By DON SHORT

Yielding to pressure by federal government officials, the city council today voted to turn over to the school board the Ford building in Balboa park and such other structures as may be desired for vocational training of youths to be employed in the aircraft industry.

To meet federal demands, also, the council voted to suspend zoning restriction in order that temporary housing and boarding can accomodate thousands of youths who are to be employed in the aircraft industry in this city.

Council action followed conferences late yesterday between federal agents, aircraft officials and Mayor P. J. Benbough when the latter was informed that an additional $80,000,000 for San Diego depends on the city's ability to take care of thousands of employes. The $80,000,000 will be spent here for factory construction and for greater plane output, it was said.

The agents here gave Mayor Benbough an ultimatum that word of the city's ability to cope with the nation's defense plans would have to be made known today. Hence, Benbough called the councilmen to his office this morning when they met with Walter W. Cooper, city manager, to discuss effect of the

(Continued on Page 4A, Col. 3)

ultimatum given the mayor, he said, by officials direct from the office of William Knudsen, of the national defense council, who was said to have allocated $80,000,000 more funds to San Diego provided the conditions could be met.

Council O.K.'s Action

Benbough put the issue direct to the councilmen and each agreed to the program as outlined by the government agents, who want at once, as an emergency measure, accommodations for training 600 youths in lots; that is when one batch of 600 recruits complete training, another 600 will take their place. Correlated to the training the government agents put up to the council requirements for housing the youths until such a time as the Consolidated Aircraft Corp. is ready to erect housing for its employes, for which money is forthcoming from the federal government, said Benbough.

The schooling is to be directed by the school board under Will C. Crawford, school superintendent, who conferred this morning with Cooper. Under the national defense act, schooling of employes for the defense industry is to be directed by the national board of education, through which office the San Diego school board was chosen to conduct the vocational schools here. Crawford informed Cooper that no expense, whatever, would be attached to the city; that in case funds were needed to repair park buildings he would find the money necessary to meet the cost.

Crawford suggested use of the food and beverage building in the park for training aircraft classes. He said it could be utilized for educational classes and that instructions in machinery operation wou be conducted in the Ford build Immediate use of the Ford s ture was asked by the gover agents. Councilmen were in y Cooper that the main f een vacated by the natio nd was ready for turn ne school board.

ADEQUATE WATER VITAL TO PLANE PLANTS, SAYS GOTT; VICENTE DAM, DISTRIBUTION SYSTEM EXPANSION BACKED

Union 10/15/40

By EDGAR N. GOTT

Vice President, Consolidated Aircraft Corp.

E. N. Gott

The aircraft industry in San Diego is definitely interested in the water propositions which will be presented to voters of the city at the election Nov. 5. Of immediate concern is the problem of assuring an adequate supply of water now and in the future, because nothing must be permitted to interfere with plant expansions and production under the national defense program.

Consolidated, Ryan and Solar plants require about 13,000,000 gallons a month. The demand for water will be stepped up materially when these plants swing into greater production.

One proposition to come before the voters will authorize extensions and enlargements of the water distribution system. I am informed that few major additions have been made to the system in about 25 years, despite the fact that the city's population has more than doubled in that period. The public will recall that due to inadequate transmission lines, low pressures and near-water shortages occurred this last summer and caused great inconvenience to many families.

Any possibility of a curtailment of water supply to the aircraft industry necessarily would be viewed with grave concern.

Along with population increases has come the greatest industrial expansion in San Diego's history. Consolidated now employs 11,500 and by next summer anticipates the possibility of about 30,000 on its payroll. This industrial expansion is so closely linked with the national defense program that in itself it makes it imperative that the city provide immediate enlargements to the water distributing system.

In a semi-arid region such as this, it is a wise precaution to conserve every gallon of water we can. San Vicente dam is San Diego's next great water development and conservation project. It will appear on the special city ballot as Proposition 2. It should likewise have the approval of the voters, especially in view of the fact that with our anticipated population increase the present water storage facilities will soon become inadequate.

Union 10/28/40

Hundreds of engineers and draftsmen work in the huge engineering department of Consolidated Aircraft Corp., designing, detailing and checking all steps necessary to build modern birds of metal.

Airports and Airpilots

~~Rochester Democrat & Chronicle - Oct 28 1940~~

~~Hutchinson Advertising Agency~~

By G. J. DUNKLEBERG

PRIVATE pilots who for years have been spending their own money for flight instruction and for flying time to maintain their licenses, are at last to get a break from the Government! Holders of private certificates who can pass the Commercial CPT physical examination and who have at least 175 hours of flying time logged may apply for a commercial refresher course.

This consists of intensive advance ground school training and, for those who pass the ground ~~school exa~~mination, a 25-hour commercial refresher flight course. Completion of this program will allow private pilots to secure commercial licenses. All qualified pilots who are interested are asked to communicate with Jim Wilmot at Rochester Municipal Airport as there is room for about 10 more applicants in the ground class.

* * *

MANAGER Howard Schaffer had a busy time last week keeping pheasant hunters off the Municipal Airport areas. The airport is forbidden territory to hunters, and judging from the number of birds on the field, the pheasants know it.

* * *

SHIP 'O THE WEEK is the Consolidated Aircraft Corporation's XB-24, a four-motor land bomber built by the makers of the famous Consolidated Patrol Bombers for the Navy. The XB-24 is a high-wing bomber, all-metal, and with a full cantilever type wing of high aspect ratio. Fowler-type wing flaps extend from aileron to center section.

Power is furnished four Pratt & Whitney 14-cylinder twin-row radials rated at 1200 h.p. each. Hamilton Standard props are of the 3-bladed hydromatic constant speed type and are 12-feet in diameter. The new bomber weighs 40,000 pounds and has a wing span of 110 feet. Tactical requirements are for a crew of from six to nine, depending upon the mission to be performed.

From preliminary examinations, this new Consolidated giant gives evidence of living up to the exceptional advancements in aerodynamic performance characteristics predicted for it. These include a speed of better than 300 miles an hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

* * *

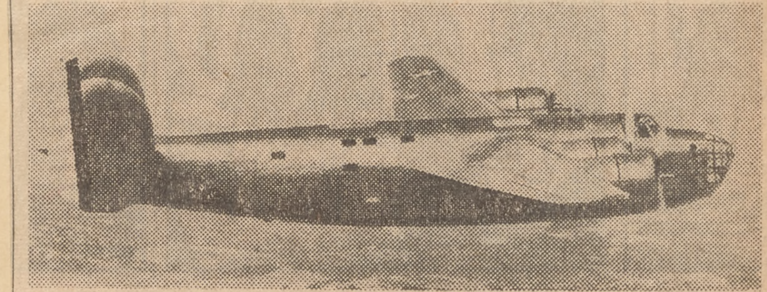
ANOTHER of the sleek new all-metal Luscombe Silvairs will be available at Rochester Municipal Airport shortly. Glen Wilkes, manager of the Rochester Flying School, has announced purchase of one of these popular ships from Jim Wilmot, Luscombe distributor.

* * *

A NEW kind of aircraft service for private plane owners and operators has been inaugurated at Rochester Municipal Airport. Charlie LaBar and Charlie Knab have established a plane service that is unique in that they do their work at night. Repairs and servicing done in the small hours have the ship "on the line" ready to go in the morning.

* * *

SAFETY TIP . . . Revving up your engine on beaches or gravel surfaces results in a sand blasting of the propeller as small stones, sand, etc. are sucked up into it. This causes nicking and scuffing of the blades. Sand-blasting effects can be reduced somewhat on taking-off from sandy or gravel areas by opening the throttle slowly so that the increasing forward speed will counteract the suction from the increasing rpm. This also will lessen the possibility of damaging tail surfaces by showering them with gravel. But be sure you have enough takeoff distance if you adopt the slow-throttle take-off.



Official U. S. Army photograph of Consolidated's powerful four-engine land bomber, designated as the XB-24. It has a bomb capacity of approximately four tons.

* * *

Howard Schaffer's crew at the Municipal Airport is prepared for the next field emergency, now that the Department of Commerce has provided the airport with a completely-equipped, modern airport emergency truck.

* * *

THE waters of Canandaigua Lake won't see as much of Dr. and Mrs. Chester Forkel next summer as they have in the past, for both have begun their flight instruction under the tutelage of Ray Hylan. Together they learned to ride, swim and sail and are now adding flying to their other accomplishments.

* * *

CONGRATULATIONS . . . to Joseph Sanara upon the successful completion of his first solo flight. Many happy landings to James Lattimer, Phl Long, Dick Werner, Al Struchen, Jim Long and Chester Pike, all of whom have begun flight instruction with the Rochester Flying School at Municipal Airport.

* * *

THE Hermmann brothers and Hank Zornow are sporting a new Aeronca tandem-trainer at Genesee Airport. The new ship is to be used for flight instruction.

CONSAIR STANDARDIZATION SPEEDS U. S., BRITISH PLANES

WASHINGTON, Oct. 14 (I.N.S.)—Standardization of U. S. military equipment to conform with British needs has been placed in the hands of a new committee created by President Roosevelt, Treasury Secretary Morgenthau disclosed late today.

Besides Morgenthau, the committee is composed of War Secretary Stimson, Navy Secretary Knox and the national defense production commissioner, William S. Knudsen.

LONDON EXPERTS ON WAY

Broad duties of the group will include fundamental aid to Great Britain through further speeding of armament production and, especially, by long-range standardization of American artillery and aircraft to fit into the British war machine. The plan will be speeded, Morgenthau announced, by the early arrival in this country of 10 British experts, who will advise on the standardizing measures.

A system of making British and American fighting equipment uniform already has been started, Morgenthau said, in the case of the Curtiss plane plant at Buffalo, N. Y., where daily six P-40 pursuit planes leave the assembly line, destined for both U. S. and British air forces.

BUILDING TWO TYPES

Parallel uniformity is to be initiated in production of the Consolidated Aircraft plant at San Diego, Calif., the secretary added, where flying boats are under construction for both the U. S. army and the British Royal navy, as well as four-engined bombers for the air forces of both nations.

At the Consolidated plant in San Diego four types of planes were being produced, two types of flying boats for the American and British navies and two types of bombers for the American and British armies. Now production has been placed on a basis of one type of flying boat and one type of bomber.

O. K. Brazil, Chile Bases

WASHINGTON, Oct. 14 (A.P.)—The day brought these defense developments:

Secy. Hull indicated that naval and air base facilities were involved in exchanges taking place with various South American countries on all phases of hemisphere defense. His comment followed reports that Brazil and Chile had agreed to lease bases to the United States.

President Roosevelt signed legislation providing for a $150,000,000 housing program for defense workers.

The house completed congressional action on a measure authorizing states to establish "home guards" to replace national guardsmen called to federal service.

SEEK 186,000 VEHICLES

The treasury sent to congress a request for reorganization of the coast guard reserve as a military group whose members would be available for active duty in a war or emergency.

Acquisition of 186,000 automotive vehicles—enough to equip a field force of 1,400,000 men—was disclosed by Robert P. Patterson, assistant secretary of war, as the goal of the army's motorization policy.

William S. Knudsen, director of production for the national defense council, declared in Detroit that "if we all get together and pull for it," no nation can rival the United States in arms production.

PLAN POWER PROJECT

Earlier, in a press conference, the former General Motors presiden said the defense production schedule calls for full equipment for a army of 1,200,000 and heavy equipment for an army of 800,000 b April 1, 1942.

The United States and Canad have agreed to start immediate engineering "investigations" on a major hydro-electric project in the S Lawrence river in what the sta department described as a plan assure "adequate power supplie for defense industries.

Union 10/23/

BOARDING HOUSE BAN LIFTED IN EMERGENCY ORDINANCE

Prohibition against boarding houses in residential zones was lifted by the city council yesterday when it passed an emergency ordinance designed to provide additional housing facilities for the thousands of men who are coming here to engage in the rapidly expanding aircraft industry.

The action was taken over the vigorous objection of Glenn Rick, city planning engineer, who questioned legality and necessity of the measure, and who said it would "scuttle" zoning laws.

He said there are 58,000 residential units in the city, of which 46,000 are in zones in which boarding houses are permitted. Deed restrictions prevent 4000 of the remaining 12,000 units from being used as boarding houses, he reported, and argued that facilities are ample to care for the influx of aircraft workers in areas in which boarding houses are permitted.

CONSAIR PLANS CITED

Mayor P. J. Benbough reported that Consolidated Aircraft Corp., at whose behest the ordinance was prepared, plans to increase its force from 12,000 to 20,000 men, and that provision for housing and training aircraft workers must be made immediately if the huge plant is to obtain additional orders and is to be successful in its efforts to ward off requests that it establish another factory elsewhere.

"There will be complaints, and we are prepared for them," he said, "but we believe any difficulty that may arise from permitting boarding houses in residential zones can be adjusted. It is simply a question of whether San Diego is to aid or retard the national defense program, and I believe the people are willing to do their part."

Fear that the suspension "would jeopardize the entire plan under which the planning commission operates," was expressed by Fred B. Mitchell, realty board president, in a letter in which he reported the board is "in accord" with the council's "endeavor to meet the emergency needs for boarding and rooming houses. . . ."

As an alternative, the board suggested that the council grant individual requests for permission to operate such houses without conducting public hearings, charging a fee, or referring the applications to the planning commision. A similar procedure was urged by Rick, who asked that each case be considered on its merits.

H. B. Daniel, assistant city attorney, said the ordinance suspends, but does not repeal a zoning restriction and emphasized that every effort has been made to preserve "the integrity of zoning."

MAY EXTEND EMERGENCY

The ordinance provides that there is to be no relaxation of restrictions against rest homes, convalescent homes and homes for the ill and aged and was passed on motion by Councilman Addison Housh seconded by Councilman Louis Weggenman.

Under it, boarding house operators must register with the city clerk and agree not to continue to use their premises as boarding houses after the ordinance is repealed. The initial period of the housing-shortage emergency has been set at six months, but Benbough made it clear to protestants that it may be necessary to extend this period.

UNION - Oct. 24 '40

First Lodging House Listed

Loraine Burgess, 3605 Wawona dr., yesterday was the first person to register under the boarding-lodging house zoning moratorium ordinance passed by the city council Tuesday, Fred Sick, city clerk, reported.

The emergency measure lifts for six months the ban against boarding-lodging houses in residential zones, and is designed to relieve a housing shortage caused by steadily increasing employment at Consolidated Aircraft Corp.

Burgess' property was described by Clark Foote, chief deputy city clerk, as being in the heart of the Pt. Loma single-family-dwelling residential unit, and was registered by the owner as available for boarding and lodging 30 persons.

The registration forms, which all boarding-lodging house operators must fill out if they propose to operate in districts zoned against such uses, are in triplicate. The city retains one copy, the registrant receives one, and the third copy is sent to Consolidated.

Union Oct 10-40

$1,500,000 Airport Development Is Proposed for Mission Bay

A broad plan for development of a $1,500,000 airport on Mission bay was suggested to the city council yesterday morning by Maj. Frank Seifert, U. S. army air corps, and in the afternoon Matthew Gleason, state park commission chairman, said he will confer Monday with the attorney general on steps necessary to speed acquisition by the city of a site for the field.

Dredging of Mission bay to a uniform depth and using the spoil to build up the airport, was recommended by Seifert, and Gleason described the plan as "the salvation of Mission bay," development of which has been blocked by lack of funds.

SITES NEEDED

A long-time resident of San Diego, Seifert is a former city councilman and a distinguished pilot who years ago over this city flew into the headlines by participating in the first midair refueling. For years a reserve officer, he said he had been ordered back to active duty Oct. 1, and that he will leave tomorrow for Washington, D. C., where he will be in the office of the assistant secretary of war. However, he appeared yesterday before the council in the role of a private citizen, and asked that it be understood that his remarks carried no official weight.

Tracing briefly the rapid strides being made in aviation, he pointed to the limited facilities at Lindbergh field and to the indicated desire by several large plane manufacturers to move their plants here provided sites can be obtained.

He then said he long has felt that an ideal airport, with mile-long runways, could be developed on Mission bay marsh lands, and expressed the belief that national defense funds can be obtained.

Roughly, the improvement would be bounded on the north by the mean high-tide line; on the east by Pacific highway, and on the south by the now-abandoned La Jolla street car tracks. The western line would be west of the Causeway.

PLAN INDORSED

Major P. J. Benbough and councilmen quickly indorsed the plan, and Dayton Ault, city attorney; Walter Cooper, city manager, and Glen Rick, city planning engineer, were appointed to set it in motion.

Ault said that ownership of the more than 1000 acres involved is in the hands of the state, the city and about 80 individuals. Gleason, after a hurriedly called conference with Ault and H. B. Daniel, assistant city attorney, expressed belief that the park commission gladly will release control of land under its jurisdiction that is needed provided it legally can be accomplished.

It was suggested that a cooperative agreement might be worked out under which the state would give up the park lands in return for dredging Mission bay around which lies Mission Bay State park, and Gleason said he will lay this plan before the attorney general in San Francisco Monday. Then, he added, he will present the proposal to the park commission at its meeting Tuesday and Wednesday at Asilomar on the Monterey peninsula.

IDEAL AIRPORT

Basing his remarks on inspection trips he has made to plane factories since he returned to active duty, Seifert pictured for the council the huge planes of the future, and said that a Mission bay airport would be ideal for any planes now built or contemplated, as approaches would be unobstructed, and the planes could roar in over the field from any direction and at low altitudes.

"Fifty-five percent of the planes being built in the United States are being made in southern California," he said, and then told of the difficulty many southern California plants are having in expanding because of limited sites adjacent to airports.

He pointed to conditions at Lindbergh field, bounded by the coast guard air base, and the Ryan, Solar and Consolidated plants, and indicated that the time may come when this field should be used only by commercial airlines and by factory test pilots.

LOW COST SEEN

Fred Rhodes, public works director, described Seifert's plan as entirely feasible, and said that the cost of the proposed bay dredging would be low, as the water is shallow. This also was apparent from air photos Seifert used to illustrate his remarks.

The flier said that his $1,500,000 cost estimate was "a shot in the dark," and was subject to adjustment after an engineering survey. However, he said that should the figure be upped, the increase would not be an obstacle becouse of the millions of dollars that have been and will be made available for such vital national defense improvements.

NAVY NEWS

A permit for erection of a $700,000 final assembly building was granted Consolidated Aircraft Company at San Diego last week. The building will be 720 feet long and 360 feet wide. A duplicate building will be erected as soon as dredging and reclamation work makes land available at Western end of San Diego's airport.

10/15/40

COUNCIL RUSHES 5-POINT PLAN TO SPEED DEFENSE PROGRAM

S.D. "Tribune" – 10/17/40

San Diego's entire resources yesterday were marshaled behind the rapidly expanding national defense program. At a hurriedly called action-packed city council conference the way was cleared for training and housing thousands of aircraft workers, and obstacles that might delay a drafted municipal employe from entering the army when summoned.

Called by Major P. J. Benbough, the informal meeting was attended by Walter W. Cooper, city manager; Dayton Ault, city attorney; his assistant, H. B. Daniel, and by Councilmen Addison Housh, Fred Simpson and Herbert Fish. It was highlighted by:

1—Decision to pass an emergency ordinance declaring a six-month moratorium on certain zoning restrictions to permit San Diegans in any part of the city to turn their homes into boarding houses for employes of industries vital to national defense.

PARK BUILDINGS

2—Indorsement of a Consolidated Aircraft Corp., suggested plan to make park buildings available for national defense vocational training classes, and a pledge to approve any such occupancy permit on receipt of an application from the board of education.

3—Issuing of instructions to the city attorney to prepare a resolution in which the council formally and strongly will put itself on record as being behind all national defense measures, and in which the city will pledge itself to place facilities at its command at the disposal of the defense program.

4—A declaration that only in "exceptional and unusual" cases will a municipal worker of draft age be considered as indispensable, and will an affidavit be provided to this effect.

EMPLOYE LIST SOUGHT

5—Disclosure by Cooper that he has asked Russel T. Bailey, civil service personnel director, for the names and positions of the 401 city employes in the 21-to-35 age bracket who registered under the selective service act Wednesday, and an indication by the manager that not one of these men hold posts that readily could not be refilled, or a job that would lead to them being placed in deferred draft classifications if they so demanded.

Back of the meeting loomed a series of conferences between city officials and Consolidated executives, and the decisions reached yesterday were designed to bolster Consolidated's efforts to resist pressure from Washington to get the corporation to establish another plant elsewhere, and to make it possible, through provision of housing and training facilities, for Consolidated to get additional contracts that, it was reported unofficially, would total $80,000,000.

Accordingly, the council squared its shoulders against expected complaints from some residents in R-1 or single-family zones that will be opened to boarding houses and, after voicing the belief that it is the patriotic duty of every San Diegan to tolerate any inconvenience that may be caused by the emergency

(Continued on Page 2-A, Col. 5)

zoning moratorium, instructed the city attorney to draft the ordinance that will:

1—Lift the boarding house ban for six months.

2—Require all operators of such houses to register with the city clerk, giving their names, addresses, number of rooms to be rented, and proposed number of men to be accommodated.

3—Provide a form which the operators must sign, and in which they will agree to discontinue immediately the operation of a boarding house in violation of present zoning restrictions when the council lifts the moratorium and determines that there no longer is an emergency.

LIMITS SPECIFIED

The council was careful to emphasize that the boarding-house moratorium is to apply only to accommodating national defense industry workers, and that there is to be no relaxation of zone prohibitions against rest homes, nursing homes and homes for the aged.

Close control is to be exercised by Consolidated personnel executives over activities of employes of the huge plane factory who move into residential-zone boarding houses, said Mayor Benbough, and neither the city nor the corporation will tolerate any conditions that will lead to justifiable complaints, he added. This probably will be accomplished in part, he said, by drafting by Consolidated of a uniform set of rules that will be posted in all private homes thrown open to aircraft workers.

It was estimated by Glenn Rick, city planning engineer, that about 50 percent of the built-up part of the city now is zoned against boarding houses, and will be thrown open under the proposed moratorium.

So hurriedly was yesterday's conference called, that two councilmen—Louis Weggenman and Harley Knox—were unable to attend, and a third, A. E. Flowers, vice mayor, was out of the city on a vacation. However, the mayor and the three councilmen who attended, and who constituted a councilmanic majority, expressed the view that their colleagues, when informed of the factors behind the decisions, will concur when the resolution and ordinances that will put the actions into force, come up at next Tuesday's council meeting.

BUILDINGS SOUGHT

Immediately after the meeting, Will C. Crawford, city school's superintendent, mailed an application to Cooper for an occupancy permit to use the Ford building and the Foods and Beverages building for vocational training classes.

Also pending is an application for federal funds for the machinery that would be set up in the Ford building, which is being surveyed by the schools' architect and vocational director to determine how many students can be accommodated, what alterations, if any, will be needed, and where the machinery is to be placed.

Because of the structural condition of the Foods building, that structure would be used only for drafting and classroom instruction, said Crawford, who expressed hope that the training program can be strated in "a few weeks." Under it, students would be "graduated" at six-week intervals, and would have received sufficient training in that time to qualify for employment as aircraft workers.

Union Oct. 31-40

S. D. Vocational School Places 2500 in Jobs

More than 50 men and women, representing the business, professional and industrial life of San Diego, met yesterday as members of a citizens' advisory committee on vocational education and heard a report on the immense strides made in the last year in vocational training as a part of the city school system. The meeting was held at the vocational school building on Market and State sts. with Jacob Weinberger, city board of education president, presiding.

More than 2500 who attended vocational school last year have been placed in permament jobs here, 1294 of them in national defense work, Will C. Crawford, school superintendent told the committee. The school is turning out 125 weekly who find immediate employment in the aircraft industries. Enlarged facilities and staff, made possible by recent federal appropriations, will enable the school to more than double that output soon, Crawford said.

Included in the committee personnel are clubwomen, teachers, aircraft company officials, civil service heads, naval officers, chamber of commerce executives, realtors, clearing house members, industrialists and business and professional men. Organized almost four years ago, the committee has aided school authorities in development of vocational training work.

MORE FUNDS SOUGHT

Recently given $300,000 in federal funds for enlargement of facilities, Crawford informed the committee that an additional $600,000 for equipment and $900,000 for buildings has been requested and probably will be granted. The board of education had placed $400,000 in its budget for this year for the school, the present building has been purchased and contract let for an addition. Rooms in the Spreckels building have been rented for use of the business division of the vocational school and buildings in the park are being made available.

Growth of the school is shown in a report compiled for the board of education. Enrollment in September, 1939, was 722 and in September of this year, 2494. Enrollment in trade and industrial classes increased from 1918 for the fiscal year ended June 30, 1939, 3859 for the following fiscal year. Fifty-three instructors were employed to teach 97 evening classes.

Apprentice training classes are conducted in carpentry, plumbing, painting, electricity and meat cutting. The business division has a total enrollment of 2561 after opening Sept. 15', 1939, with 95 students. During the year, 292 students were placed with business firms. Public service, including selling classes, had 1500 enrolled.

HANDICAPPED CHILDREN

Vocational rehabilitation bureau handled 305 cases of physically handicapped children and rehabilitated 68 of them. The junior placement service provided employment since July 1, 1939, for 5076 young men and women of whom the vocational school trained 2637, or more than one-half the number placed.

Others to address the meeting were J. G. Sullivan, director of vocational education; Sam F. Fick, assistant supervisor, trade and industrial training, University of California at Los Angeles; Dr. Paul E. Wedgewood for the medical society; Jack Wright of the federal committee; Maj. T. C. Macaulay, chamber of commerce; Maj. Edgar N. Gott and R. H. Waterbury, Consolidated Aircraft Corp.

Maj. Gott repeated a former announcement that his company hoped to have 30,000 workers employed by July 1, 1941, and that preference in employment would be given to San Diegans, trained at the vocational school.

City Leads U.S. In Defense Awards, Word

Tribune 10/29

President Roosevelt's approval of "immediate construction of housing projects in 63 vital defense areas" with $45,762,500 of defense funds was announced today by Charles F. Palmer, defense housing coordinator, who said largest of the 63 projects would be at San Diego, The Associated Press reports from Washington. The local project involves approximately $15,000,000.

Unit Cost Set at $3000

The San Diego program, said Palmer provides for construction of 2000 additional dwelling units, 750 dormitory rooms for single men and 1000 portable-type homes. He said the projects would not exceed a maximum of $3000 a unit.

Site for the new community here has not been announced, said Charles A. Sloan, construction engineer, United States public build-

(Continued on Page 4A, Col. 3)

15 Million Awarded For Defense Homes

CONTINUED FROM PAGE ONE

ing administration, resident engineer for the project. Indications are the community may be in the Camp Kearny area.

"Absorption" Forecast

Palmer emphasized the new housing "will be absorbed in the San Diego community pattern so that the normal life will not be disrupted." He said a housing emergency resulted here from the large navy, army and aircraft expansion, and declared the new project "will create dwellings equivalent to those in a town of 30,000 people."

In Addition to Navy Job

The new work is in addition to a $3,800,000 project for 1200 concrete housing units for navy families, 600 of which will adjoin the destroyer base and 600 the naval training station. Contract for the navy housing project was awarded Oct. 17 to the William Simpson Construction Co., of Los Angeles.

All Complete in Year

Palmer said the $45,762,500 of defense funds will provide 13,315 family dwelling units throughout the United States, contracts to be handled by John M. Carmody, federal works administrator.

Palmer estimated all the projects will be completed in four to 12 months. Congress has provided a total of $290,000,000 for defense housing construction, he said, and estimates indicate a total of $560,000,000 will be needed to complete the job.

The number of family units to be constructed at other places, The Associated Press reported, is as follows: Tucson, 150; Benicia, Calif., 50; Fresno, 150; San Rafael, 175; Stockton, 150; Sunnyvale, 150; Boise, 100; Albuquerque, 100; Houston, 200; San Angelo, Tex., 100; Ft. Huachuca, Ariz., 30; Riverside, 150; Denver, 50; Lowry field, Colo., 125; Ft. Sill, Okla., 150; Ft. Meade, S. D., 50; El Paso, 200; Ft. Clark, Tex., 50; San Antonio, 500; South Tacoma, 150; Spokane, 200; Oahu, T. H., 550; Ft. Ord, Calif., 550, and Ft. Lewis, Wash., 250.

$80,000,000 For Facilities In S. D., Word

SD Tribune 10/21/40

By DON SHORT

Yielding to pressure by federal government officials, the city council today voted to turn over to the school board the Ford building in Balboa park and such other structures as may be desired for vocational training of youths to be employed in the aircraft industry.

To meet federal demands, also, the council voted to suspend zoning restriction in order that temporary housing and boarding can accomodate thousands of youths who are to be employed in the aircraft industry in this city.

Council action followed conferences late yesterday between federal agents, aircraft officials and Mayor P. J. Benbough when the latter was informed that an additional $80,000,000 for San Diego depends on the city's ability to take care of thousands of employes. The $80,000,000 will be spent here for factory construction and for greater plane output, it was said.

The agents here gave Mayor Benbough an ultimatum that word of the city's ability to cope with the nation's defense plans would have to be made known today. Hence, Benbough called the councilmen to his office this morning when they met with Walter W. Cooper, city manager, to discuss effect of the

(Continued on Page 4A, Col. 3)

ultimatum given the mayor, he said, by officials direct from the office of William Knudsen, of the national defense council, who was said to have allocated $80,000,000 more funds to San Diego provided the conditions could be met.

Council O.K.'s Action

Benbough put the issue direct to the councilmen and each agreed to the program as outlined by the government agents, who want at once, as an emergency measure, accommodations for training 600 youths in lots; that is when one batch of 600 recruits complete training, another 600 will take their place. Correlated to the training the government agents put up to the council requirements for housing the youths until such a time as the Consolidated Aircraft Corp. is ready to erect housing for its employes, for which money is forthcoming from the federal government, said Benbough.

The schooling is to be directed by the school board under Will C. Crawford, school superintendent, who conferred this morning with Cooper. Under the national defense act, schooling of employes for the defense industry is to be directed by the national board of education, through which office the San Diego school board was chosen to conduct the vocational schools here. Crawford informed Cooper that no expense, whatever, would be attached to the city; that in case funds were needed to repair park buildings he would find the money necessary to meet the cost.

Crawford suggested use of the food and beverage building in the park for training aircraft classes. He said it could be utilized for educational classes and that instructions in machinery operation would be conducted in the Ford building. Immediate use of the Ford structure was asked by the government agents. Councilmen were informed by Cooper that the main floor had been vacated by the national guard and was ready for turning over to the school board.

Repairs Suggested

Repairs to the roof of the food and beverage building was suggested by Benbough. Crawford said this would be taken care of by the school board. The council also considered and approved plans for the park board covering parking in the park during the emergency occupation of the buildings. Cooper reported that the board recommended restrictions on certain streets in the park would be enforced, but in general ample parking space would be reserved for the general public. Ample bus transportation was suggested by Councilman Herbert Fish, The mayor said he would consult street railway officials regarding use of buses.

Dayton L. Ault, city attorney, and H. B. Daniel, assistant, advised that the council had the right, under present emergency for the national defense, to transfer park structures to the school board and the federal government for use and that an ordinance granting an occupancy permit would be prepared for council consideration next Tuesday. Daniel suggested that it cover a six months' period with a clause for renewal if necessary.

To Suspend Zoning

The city attorney also will prepare an ordinance, as an emergency measure, suspending operation of the residential zoning ordinance so far as it affects so-called boarding or rooming houses. Under its provisions all persons having rooms for rent will be required to register with the city clerk, giving location, the number of rooms available and the price. Suggestion was made that this would tend to stiffen competition and, in a way, would prevent a hike in room rentals.

The youths who are to be trained for aircraft work are to come from different locations, it was suggested to the conference, and because of this suitable lodging and board must be provided. The mayor and council declared that the ordinance would be prepared in such a manner as to not apply to the numerous so-called rest homes or old peoples' homes which the zoning is intended to control.

Transportation for the youths to and from the aircraft plant was discussed by the council, numerous suggestions being made with the universal opinion that additional buses should be provided.

ADEQUATE WATER VITAL TO PLANE PLANTS, SAYS GOTT; VICENTE DAM, DISTRIBUTION SYSTEM EXPANSION BACKED

Union 10/15/40

By EDGAR N. GOTT

Vice President, Consolidated Aircraft Corp.

The aircraft industry in San Diego is definitely interested in the water propositions which will be presented to voters of the city at the election Nov. 5. Of immediate concern is the problem of assuring an adequate supply of water now and in the future, because nothing must be permitted to interfere with plant expansions and production under the national defense program.

E. N. Gott

Consolidated, Ryan and Solar plants require about 13,000,000 gallons a month. The demand for water will be stepped up materially when these plants swing into greater production.

One proposition to come before the voters will authorize extensions and enlargements of the water distribution system. I am informed that few major additions have been made to the system in about 25 years, despite the fact that the city's population has more than doubled in that period. The public will recall that due to inadequate transmission lines, low pressures and near-water shortages occurred this last summer and caused great inconvenience to many families.

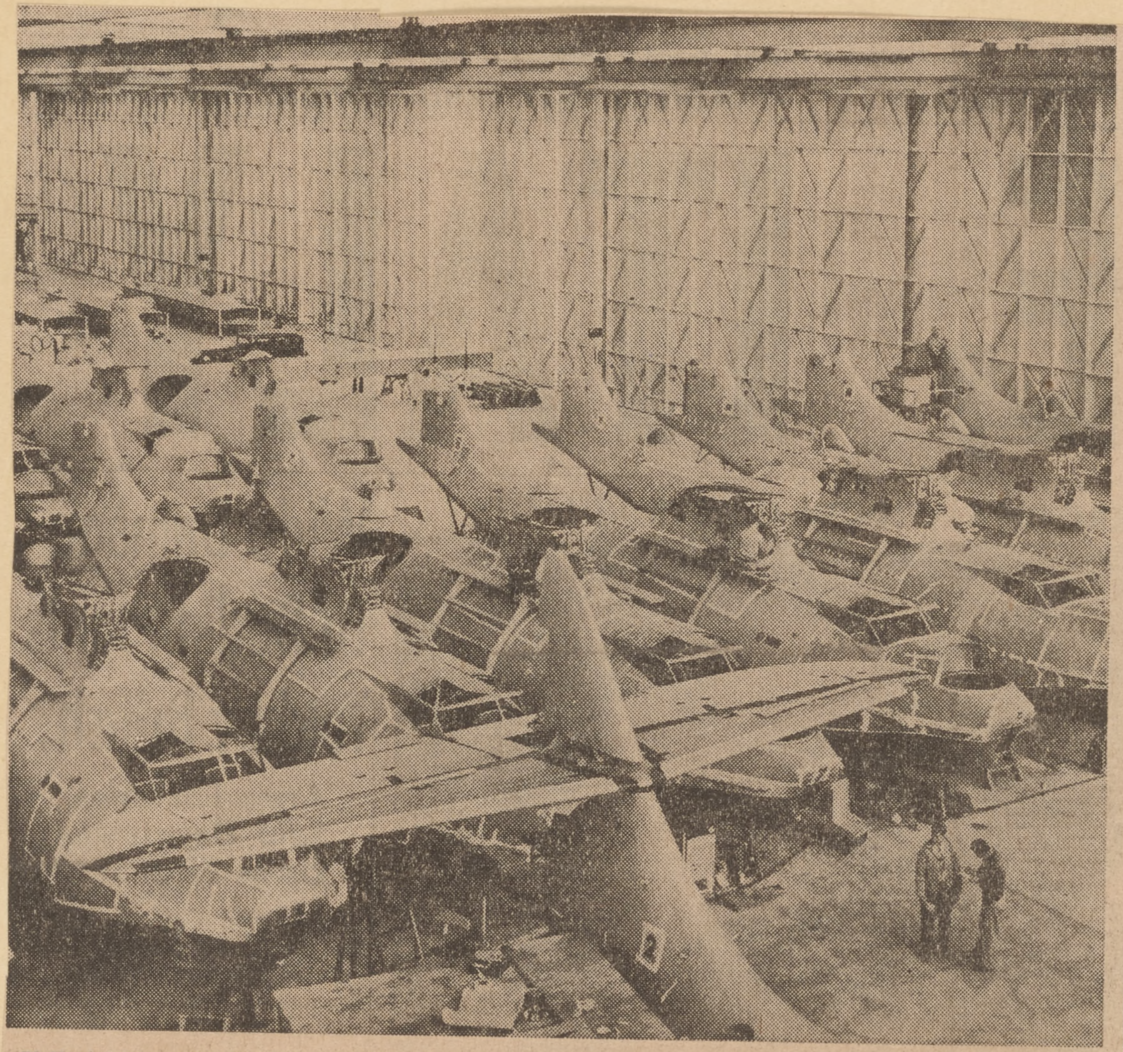
Any possibility of a curtailment of water supply to the aircraft industry necessarily would be viewed with grave concern.

Along with population increases has come the greatest industrial expansion in San Diego's history. Consolidated now employs 11,500 and by next summer anticipates the possibility of about 30,000 on its payroll. This industrial expansion is so closely linked with the national defense program that in itself it makes it imperative that the city provide immediate enlargements to the water distributing system.

In a semi-arid region such as this, it is a wise precaution to conserve every gallon of water we can. San Vicente dam is San Diego's next great water development and conservation project. It will appear on the special city ballot as Proposition 2. It should likewise have the approval of the voters, especially in view of the fact that with our anticipated population increase the present water storage facilities will soon become inadequate.

Union 10/28/40

Hundreds of engineers and draftsmen work in the huge engineering department of Consolidated Aircraft Corp., designing, detailing and checking all steps necessary to build modern birds of metal.



Hulls for Model 28 (U.S. Navy PBY) planes stand in the final assembly line. They are criss-crossed with heavy paper and tape to protect them during final assembly operations at the San Diego plant.

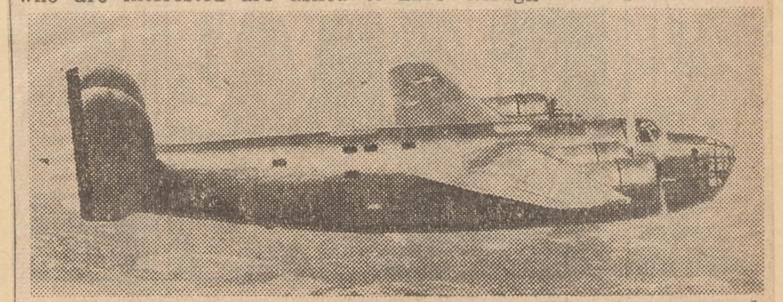
Airports and Airpilots

Hutchinson advertising agency

By G. J. DUNKLEBERG

PRIVATE pilots who for years have been spending their own money for flight instruction and for flying time to maintain their licenses, are at last to get a break from the Government! Holders of private certificates who can pass the Commercial CPT physical examination and who have at least 175 hours of flying time logged may apply for a commercial refresher course.

This consists of intensive advance ground school training and, for those who pass the ground school examination, a 25-hour commercial refresher flight course. Completion of this program will allow private pilots to secure commercial licenses. All qualified pilots who are interested are asked to communicate with Jim Wilmot at Rochester Municipal Airport as there is room for about 10 more applicants in the ground class.



Official U. S. Army photograph of Consolidated's powerful four-engine land bomber, designated as the XB-24. It has a bomb capacity of approximately four tons.

* * *

MANAGER Howard Schaffer had a busy time last week keeping pheasant hunters off the Municipal Airport areas. The airport is forbidden territory to hunters, and judging from the number of birds on the field, the pheasants know it.

* * *

SHIP 'O THE WEEK is the Consolidated Aircraft Corporation's XB-24, a four-motor land bomber built by the makers of the famous Consolidated Patrol Bombers for the Navy. The XB-24 is a high-wing bomber, all-metal, and with a full cantilever type wing of high aspect ratio. Fowler-type wing flaps extend from aileron to center section.

Power is furnished four Pratt & Whitney 14-cylinder twin-row radials rated at 1200 h.p. each. Hamilton Standard props are of the 3-bladed hydromatic constant speed type and are 12-feet in diameter. The new bomber weighs 40,000 pounds and has a wing span of 110 feet. Tactical requirements are for a crew of from six to nine, depending upon the mission to be performed.

From preliminary examinations, this new Consolidated giant gives evidence of living up to the exceptional advancements in aerodynamic performance characteristics predicted for it. These include a speed of better than 300 miles an hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

* * *

ANOTHER of the sleek new all-metal Luscombe Silvairs will be available at Rochester Municipal Airport shortly. Glen Wilkes, manager of the Rochester Flying School, has announced purchase of one of these popular ships from Jim Wilmot, Luscombe distributor.

* * *

A NEW kind of aircraft service for private plane owners and operators has been inaugurated at Rochester Municipal Airport. Charlie LaBar and Charlie Knab have established a plane service that is unique in that they do their work at night. Repairs and servicing done in the small hours have the ship "on the line" ready to go in the morning.

* * *

SAFETY TIP . . . Revving up your engine on beaches or gravel surfaces results in a sand blasting of the propeller as small stones, sand, etc. are sucked up into it. This causes nicking and scuffing of the blades. Sand-blasting effects can be reduced somewhat on taking-off from sandy or gravel areas by opening the throttle slowly so that the increasing forward speed will counteract the suction from the increasing rpm. This also will lessen the possibility of damaging tail surfaces by showering them with gravel. But be sure you have enough takeoff distance if you adopt the slow-throttle takeoff.

* * *

Howard Schaffer's crew at the Municipal Airport is prepared for the next field emergency, now that the Department of Commerce has provided the airport with a completely-equipped, modern airport emergency truck.

* * *

THE waters of Canandaigua Lake won't see as much of Dr. and Mrs. Chester Forkel next summer as they have in the past, for both have begun their flight instruction under the tutelage of Ray Hylan. Together they learned to ride, swim and sail and are now adding flying to their other accomplishments.

* * *

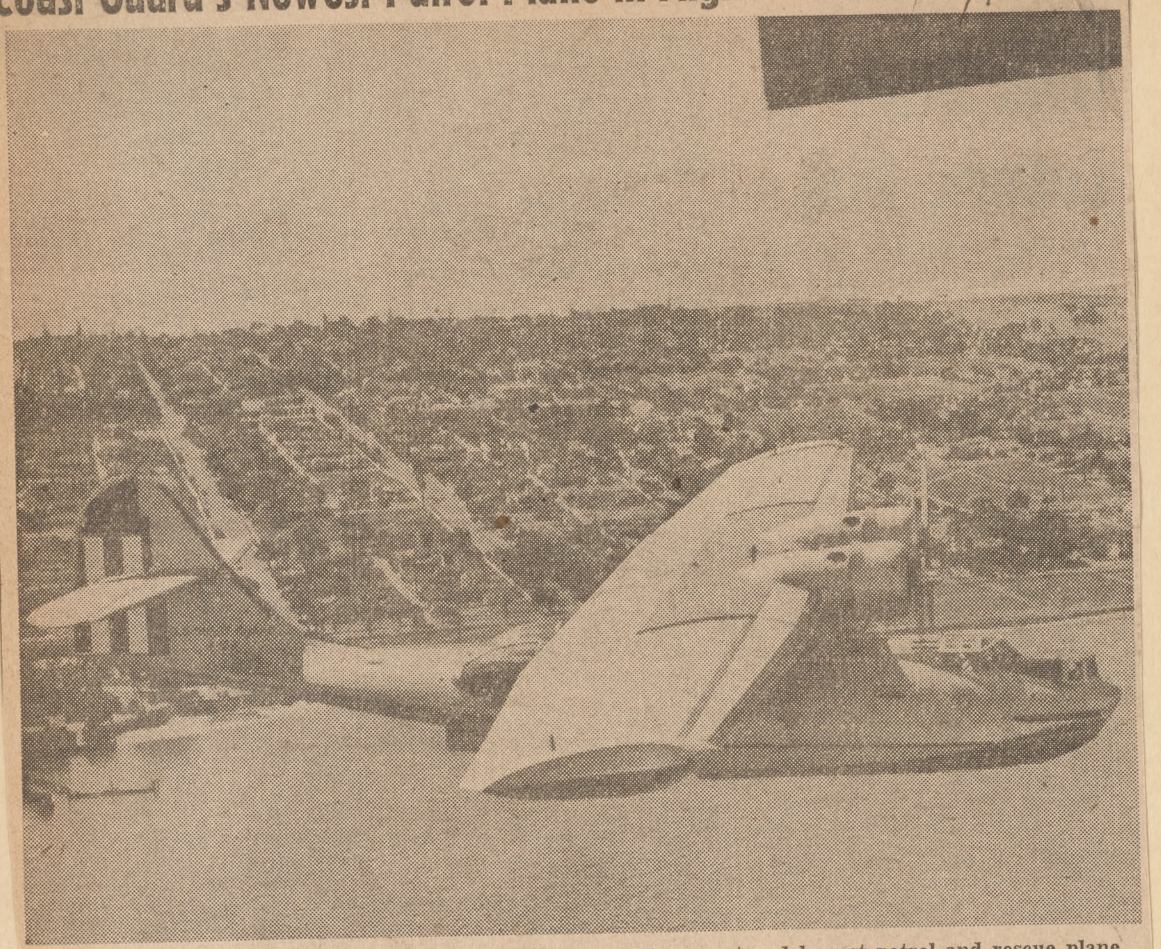
CONGRATULATIONS . . . to Joseph Sanara upon the successful completion of his first solo flight. Many happy landings to James Lattimer, Phl Long, Dick Werner, Al Struchen, Jim Long and Chester Pike, all of whom have begun flight instruction with the Rochester Flying School at Municipal Airport.

* * *

THE Hermmann brothers and Hank Zornow are sporting a new Aeronca tandem-trainer at Genesee Airport. The new ship is to be used for flight instruction.

Coast Guard's Newest Patrol Plane in Flight

Trib. 10/30/40



In graceful flight over San Diego bay, the coast guard's newest and largest patrol and rescue plane, a counterpart of the navy's famed Consolidated PBY patrol-bombers, is shown undergoing shakedown tests. (Official coast guard photo by H. Davis, chief yeoman.)

HIGH NAVAL OFFICIAL SHUNS CEREMONY IN LOCAL CALL

E. H. FOLEY JAMES V. FORRESTAL CAPT. G. W. RAVENSCROFT
. . . the undersecretary of the navy (center) works swiftly and quietly.

* * *

FORRESTAL VISITS CONSAIR PLANT IN BRIEF S. D. STOP

Speeding the tempo of national defense production is the job of James V. Forrestal, undersecretary of the navy, who arrived here yesterday on what was a flying trip in more ways than one.

It wasn't until Thursday evening that local naval officials revealed that the undersecretary—a recently created post which ranks second only to that of the secretary of the navy—was about to land. Yesterday morning, at the naval air station, the landing became an accomplished fact; the secretary alighted from his plane, with the small official party.

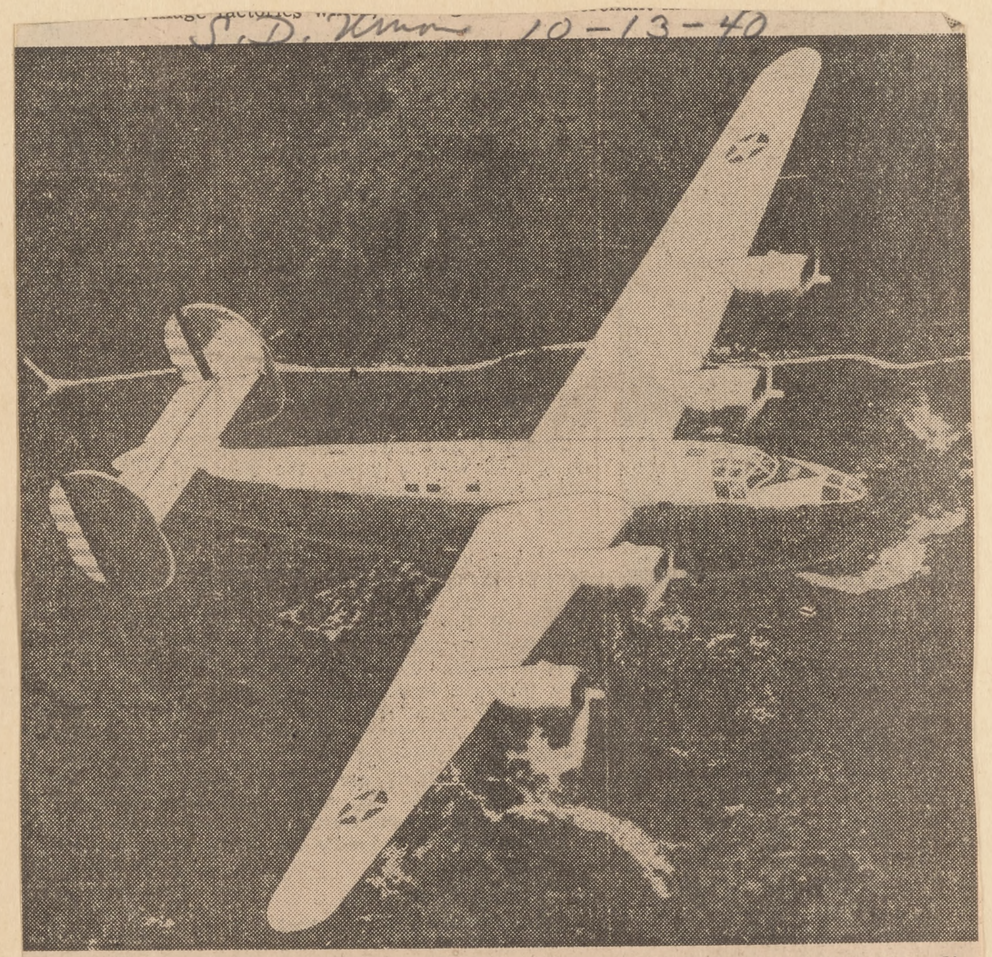
KEEP PURPOSE SECRET

With him on his trip to San Diego are E. H. Foley, assistant secretary of the treasury; Capt. George D. Murray of the bureau of aeronautics, navy department; Comdr. John Gingrich, the secretary's aid, and Lt. Frank A. Brandley, pilot. They were met by Capt. G. W. Ravenscroft, chief of staff of the 11th naval district, and left forthwith for the Consolidated Aircraft Co. plant — apparently their only objective here. In fact, the only available information on future movements of the party which was available was this:

"We hope to start back this afternoon."

A naval flier himself during World War I, Secy. Forrestal moves swiftly in other ways. When the $5,000,000,000 defense bill was signed, he already had prepared many contracts for naval armament, with a resultant saving of considerable time. Officers who have been associated with him give him credit for much of the streamlining of naval procurement which has no time to spare. While information on the party's movements is meager, it was intimated yesterday that Consolidated would be his only conference point while here, and that he then will return directly to the nation's capital.

S. D. Union 10-13-40



From our national rearmament efforts in making bombers like this Consolidated craft, the America of tomorrow will have better commercial planes and a host of thoroughly trained fliers.

U.S. TALKS WITH SOVIET

FROM OUR OWN CORRESPONDENT

WASHINGTON, Thursday.

The possibility of Russia becoming a full-fledged member of the "Three Power Desperadoes' Club" is felt to be remote in diplomatic circles here.

It is felt that her ambitions now conflict with Germany in the Baltic, with Germany and Italy in the Balkans, and with Japan in North China.

The United States strongly disapproves of her past policies, and any amelioration of the present relations between the two countries depends on future development of the Russian policy. Closer association with the Axis Powers would be unlikely to bring any material advantages to Russia, and would make the possibility of obtaining any of the economc favours which she is seeking in the United States extremely remote.

Conversations which have been taking place in Washington with the Russian Ambassador, Mr. K. Oumansky, and, since his return to Moscow, between Mr. Steinhardt, the United States Ambassador, and M. Molotoff, the Soviet Premier, have dealt realistically with the present situation. The United States has not adopted an "appeasement" policy of attempting to purchase Russian neutrality with concessions, but has dealt with the immediate situation in practical terms.

Since the middle of last century Japan and Russia have been rivals in North China, and the United States has given diplomatic support for first one, then the other. British diplomacy before the war failed to take advantage of Russian and German rivalry in Europe. It is felt here that the United States has no intention of repeating the error in the Far East.

TWO FURTHER STEPS

Two further steps to strengthen American defence were adopted to-day.

The Atlantic neutrality patrol and the Atlantic Fleet were united under the command of Adml. Hayne Ellis, and a drive was begun to speed up 'plane production by increased standardisation.

British air experts have been in Washington for some weeks and have made known improvements in design learned by practical experience. No attempt has been made to keep anything secret, and American and British production will both benefit from this policy.

A group of British and American experts left to-day for San Diego to consult with officials of the Consolidated Aircraft Company about co-ordinating designs of 'planes which they are building for the two countries. Later similar steps will be taken to standardise production of other companies manufacturing for both countries.

A similar policy was adopted some time ago in tank construction and Army chiefs paid tribute to the helpful advice which had been given by British experts.

HALF-FINISHED IN BIG CRAFT'S TEST HOPS

The half-way mark had been reached today in shakedown tests of the coast guard's newest and largest flying boat, a counterpart of the navy's famed PBY-5 Consolidated patrol-bombers.

The big plane was delivered Oct. 17 and has been undergoing the tests since, Lt. C. G. Bowman, commander of the local coast guard air base, revealed. It is assigned to the local base only for duration of the tests but Bowman said it possibly would be assigned here permanently.

Except for armament, the coast guard's PBY is exactly like the navy's planes of the type. Among its features are huge, glass-enclosed "blisters" amidships, where, in navy prototypes, machine guns are mounted.

With a range unofficially estimated at some 4000 miles non-stop, the flying boat is able to operate about twice as far as any coast guard plane now in service, said Bowman. It will be used primarily for rescue flights but is adaptable to armed patrol work should the need arise.

SAN DIEGO, CALIFORNIA, OCTOBER 7, 1940

To All Consolidated Employees . . .

Who, and what is, Aircraft Local No. 1125? How many Consolidated Employees have asked themselves this question? Not many of the old employees perhaps, but plenty of the new ones have.

In answer to these questions, the following information comes from the Lodge itself. Aircraft Local No. 1125 is a group of **Consolidated employees** operating under a charter from the International Association of Machinists, to provide an appropriate unit for the purpose of collective bargaining as regards wages, hours, and other conditions of employment. This group of employees, now in the thousands as to number, are authorized by the Government of the United States to act as spokesman for every hourly paid employee. To date they have operated in such a manner as to merit the healthy respect of their employer, gaining at the same time for all employees, by group action, more pay, and more satisfactory working conditions, than the individual employee could possibly obtain for himself by individual action.

It's the old story, made popular by Ben Franklin, of "In Union there is strength." The Union of the States has brought to them, and their citizens, strength, riches, and an enviable position of World Power. From them let us take our lesson and cling to our own Union of Consolidated Employees, so that we as individuals may acquire more of the reward due us for our honest toil. This group of employees, by their contract with the Consolidated Aircraft Company, are engaged three times a year in reviewing the wage rate and employment record of every employee, no matter who he is or what he does. THE RESULTS THEY HAVE IN COMPELLING THE MANAGEMENT TO RECOGNIZE THE ABILITY OF AN EMPLOYEE TO EARN MORE PAY BY GIVING HIM AN INCREASE IN WAGES, IS IN DIRECT PROPORTION TO THE MEMBERSHIP OF THIS EMPLOYEE GROUP.

Knowing the above to be a fact, and knowing too, that the membership of this Union of Employees is more than four times as large as all the other Consair employee groups rolled into one, it is hard to conceive of any employee failing to actively support their own Union by becoming a member of it, when they have everything to gain and nothing to lose.

To those of us who do belong to this Union, wear the membership button in plain sight, so those who do not belong may know whom to ask for further information.

We meet at Turner Hall, 9th & G sts., at 8:00 every Tuesday evening for the Day Shift, and at the same Hall at 2:00 every Wednesday afternoon for the Night Shift. Our dues are low in comparison to the benefits we have obtained for our membership, and we invite you as a Consolidated employee to join hands with us in this important work of making a living that amounts to something financially.

L. A. PERRY,
Rec. Sec.

Fleet Forecasts Giant Consair Growth

Navy Plans 6,000 New Homes For Married Aircraft Workers

Recently Maj. Reuben H. Fleet, president of Consolidated Aircraft at San Diego, was in an expensive mood at a meeting of the army engineers held in the offices of the harbor commission. The outline of expansion ran up to and including a backlog of $300,000,000 with probably more than 35,000 employees. This compares with the present conditions of a backlog of $132,000,000 and 14,500 employees. Even after some allowance for shrinkage this still allows that Consolidated is a BIG aircraft company.

To Increase Employees At Rate of 500 Per Week

New employees are expected at the rate of 500 per week but no date was set for the beginning. To accommodate this number of

(Continued on Page 3)

NEW ORDER BOOSTS BACKLOG TO $221,300,000

War Department Awards Consair $85,800,000 Contract For Four Motored Planes

Consolidated Aircraft Corp. has a backlog of $221,300,000 as result of a contract for $85,800,000 for planes placed by the war department. The Associated Press, in a dispatch from Washington, D. C., states the order, placed yesterday, is for an "undisclosed number" of four-motored planes.

It is the second received by the firm this week. Tuesday, the Australian government announced its decision to purchase 11 flying boats in the United States for $3,500,000, and placed an order for this amount with Consolidated. The firm's previous backlog was $132,000,000.

Now Employs 10,600 Men

Approximately 10,600 are employed at the Consolidated plant, with several hundred new employes being added each week. The firm, which recently dedicated a new addition to its plant, has started work on still another addition to Lindbergh field.

Delivery dates for new army

New Order Boosts Backlog

(Continued from Page 1)

planes were not specified. The Associated Press reports from Melbourne, Australia, that the Australian planes are to be ready "for delivery before the year-end." They will replace 20 Sunderland flying boats ordered in the United Kingdom but now turned over to the Royal Air force.

The Australian government obtained first-hand information on the performance of Consolidated-built planes as a result of the round-the-world flight by Richard Archbold, scientist, in the flying boat Guba. Part of the Guba's route, after it left New Guinea, where Archbold carried on exploration work 10 months, was from Australia over the Indian ocean last year over a course never before covered by plane.

Craft for England

In addition to the planes for the army and for Australia, Consolidated also is building PBY-type craft for the navy and for England.

Rumors that Consolidated is planning to establish another plant "somewhere in the east," were scouted today by officials of the plant. Yesterday a query was received from Buffalo, N. Y., asking if a branch of the firm would be located there. Today, The Associated Press sent an inquiry asking if a branch would be established between Allentown and Easton, Pa. To both inquiries, Consolidated officials answered "No."

Objection to filling in 25 acres of land for use of the Consolidated Aircraft Corp. as a seaplane base was withdrawn yesterday afternoon by the planning commission when it was declared by an official that Consair was ready to turn out 15 seaplanes daily. The seaplane site is between the coast guard station and the marine base. Dredging now is in progress and the site for the spoil embraces a water frontage of 2500 feet by 200 feet wide.—Union-Tribune.

Fleet Forecasts Consair Growth

(Continued from Page 1)

workmen and their families housing facilities would have to be provided. This item would require several thousand new homes for married employees and barracks for the single men.

His plans for expansion apparently dwarf all previous activity in San Diego. His most startling revelation was the implication that the Navy Department and Consair have practically reached an agreement for construction of 6000 single units to house married couples and barracks for 6000 single men.

Coming down to the actual expansion of the plant at San Diego, Maj. Fleet pointed out that valuable time would be wasted if he had to continue the present policy of hauling huge new bombers from the final assembly plant across the flying field to the Coast Guard ramp.

"It is imperative that we have our own ramp," said he.

Maj. Fleet predicted that the Consair organization will do as much business in the next two years as the company did in the previous sixteen years. Three eight hour shifts are planned instead of the present two ten hour shifts. In discussing the precarious condition the country is in he said, "the time has come when we have to take government aircraft contracts whether we want to or not." He also expressed his personal opposition to building plant number two in Texas.

Aircraft Factory Expansion

Adds 396,000 Sq. Ft. to Consolidated's Plant in San Diego, Calif.

Aircraft Buying Plan Becomes Definite

Nearly two months after it was first announced that the armed forces had settled on just what planes and engines they wanted to standardize on, the public is beginning to get a glimpse of the program. Only phase definitely announced is the plan for air-cooled big engines: 40,000 are wanted in the next two years about equally divided between Wright and Pratt & Whitney designs. This follows the accepted procedure of having two types of each item needed.

Still largely unsettled is the program for liquid-cooled engines, though it is generally assumed that GM's Allison will take about half the load and Packard's Rolls Royce the other half—with Ford's unofficial and still theoretical liquid engine still an unknown factor. About 6,000 Rolls Royces are believed definitely scheduled.

No authoritative statements have been made on plane types desired, but orders on the early program for which appropriations were completed in June, and first orders under the full program seem to reveal some phases of the pattern.

Definitely part of Army's pursuit squadrons will be Lockheed's P-38E, Curtiss's P-40D, Republic's P-44, and Bell's P-39; Army has apparently resolved its doubts about the radical design of Bell's Airacobra and is buying them in quantity.

As a two-engine ship there is the P-38E. Lockheed's ship is a new two-seater version of the P-38 and is said to be capable of 500 m.p.h.

The P-40 and P-39 are both single-place single-engine jobs using liquid-cooled engines. The P-44 provides an air-cooled engine alternative and is, moreover, especially designed for the high altitudes at which bombers are now operating.

Navy fighter plans are not so well established, but it is clear that a Grumman (probably the Skyrocket) will occupy an important place.

On heavy bombers, Boeing's four-engine B-17E has been bought in largest quantities, but Consolidated's similar B-24D has also been ordered. Medium bombers and attack bombers are still open.

North America's AT-6A is the main reliance for advanced trainers, while Vultee, with its BT-13A, provides most of the basic trainers. Primary trainers, as might be expected, are more split up.

Army and Navy between them want 41,500 air-cooled engines in the 500-2,000 hp. range, and have made arrangements to get them from Wright, Pratt & Whitney, and Ford. P & W, which is doing all its negotiation with Navy, will furnish 17,000 of the engines. Ford is settling details with the Army on a program to build 4,500 engines on the P & W 2,000-hp. design. Wright, which is also dealing with Army, will handle 20,000 Cyclone and Whirlwind engines.

To handle its share, Pratt & Whitney will undertake a 400,000-sq.ft. plant expansion (additional to 700,000 sq.ft. already this year). The company will meet the $15,000,000 cost of buildings, while Navy will pay for and retain title to $7,000,000 or $8,000,000 worth of tools.

Ford is paying for his own $11,000,000 plant (of which about $7,000,000 is for tools.) He is to pay P & W a nominal license fee of a dollar an engine.

The Wright engines involve expansion of more than 1,000,000 sq.ft. and will cost about $90,000,000 to be financed through an RFC defense loan.

AVIATION, October, 1940

The Sun News-Pictorial

£2,032,000 MORE

Victoria Australia 6/7/40

500 TRAINING

U.S. FLYING-BOATS TO SUPPLEMENT BIG ORDER LOCALLY

AIRCRAFT orders amounting to £2,032,000, including training and other aircraft to be made in Australia at a cost of more than £1,000,000, have been approved of by War Cabinet following consultation with Britain.

The aircraft will meet needs under the Empire Air Scheme which cannot now be fulfilled by Britain, and will also include special machines for Australian defence.

Seven flying-boats of the Guba type are to be bought from the United States to replace Empire flying-boats, which were to have been brought to Australia. These will cost about £500,000.

MAKING this announcement last night, the Prime Minister (Mr. Menzies) said orders would be placed in Australia for—

300 Tiger Moth aircraft,

with spare engines, airframe spares and engine spares. This order will be additional to the 350 of these craft at present being manufactured for the R.A.A.F. by the De Havilland Aircraft Pty. Ltd. in Sydney, which will also make the new planes.

200 Wackett Trainer aircraft

together with 50 spare engines, airframe spares and engine spares. This plane has been designed by the Commonwealth Aircraft Corporation and the order is subject to the successful outcome of trials which will be carried out next week by the R.A.A.F. The C.A.C. factory will switch to production of the new plane when Wirraway orders are completed.

An order will also be placed with the Commonwealth Aircraft Corporation for a prototype light bomber reconnaissance twin-engined aircraft, the design of which has already favorably impressed Australian air authorities.

It will be made from local materials and fitted with twin Row Wasp engines of the type to be made locally.

The specifications of this aircraft provide for long endurance, and good bomb-carrying capacity.

Its potential defensive ability and dive bombing characteristics, said Mr. Menzies, would make it of considerable utility for Australia's defence problem.

Air Race Pilot's Ordeal In Holland

LONDON, Thursday. — After a fortnight's nightmare journey from Holland, Chevalier J. J. Moll, who was Chevalier Parmentier's co-pilot in the Centenary Air Race, has reached England.

During the first four days of the invasion, Chevalier Moll fought with a rifle against parachutists near Rotterdam and, on May 14, was placed in charge of a dyke, which he opened in the face of a German attack.

Chevalier J. J. Moll

Later, he was picked up by a lorry, which threaded its way through a stream of refugees.

Eventually he reached Ushant, where he caught a small freighter carrying cognac to England.

Chevalier Moll is now training Dutch pilots for squadrons which may operate separately or merge with the Royal Air Force. — **Exclusive.**

CONSOLIDATED AIRCRAFT CORPORATION
LINDBERGH FIELD, SAN DIEGO, CALIF.

VICTORIA AUSTRALIA FRIDAY, The Hera

One of the United States navy's flying boats of the type ordered by Australia.

GIANT "EYES" FOR OUR AIR FORCE

By The Herald Writer On Aviation

If a squadron of Royal Australian Air Force planes flew non-stop from Sydney to Darwin, most Australians would find it hard to believe.

If, instead of alighting there, the planes flew on over the Timor, over the Netherlands Indies, along the Java Sea, and finally touched down on Singapore Harbor, it would seem something like a miracle.

But to the seven Consolidated PBY5 flying-boats that have been ordered from the United States by the R.A.A.F., such a flight would be possible, provided they met no head winds.

THAT IS probably the most spectacular way of indicating the great range which is the outstanding feature of these 13-ton boats; or one could say that they could fly from their base at Rathmines (N.S.W.) to New Guinea and back, to Fiji and back, or to New Zealand and back, and then back to New Zealand again.

It may be found that the best way of getting them here is to fly them—if legal difficulties connected with the landing at Honolulu can be overcome. Scores of similar planes owned by the United States Navy have flown the longest stage of the journey, the 2400 miles from California to Hawaii, and Richard Archbold's Guba, an unarmed sister-ship of our new boats, flew down the Pacific before she pioneered the Indian Ocean route and casually crossed Africa and the Atlantic on her way home.

In choosing Consolidateds because Britain cannot spare us Sunderlands—the military version of the Empire boat which was previously on order—Australia is taking no gamble.

More PBYs are in service than any other type of flying-boat in the world. The United States Navy has long owned 250, and is reported to have ordered 300 more some months ago. The British Air Ministry bought one, tested it thoroughly, and ordered 50 more, with a further order for 250 regarded as almost certain.

When the United States battle fleet puts to sea it is preceded by a great screen of PBYs, scouting the ocean ahead as destroyers would, but over a vastly greater area.

LOOK into one of these boats on patrol.

In the cockpit are two pilots, one of whom frequently slips back into the chart room just behind his seat, where he may take a drift sight of a "shot" of the sun, then do a small sum to check the plane's position. In the chart room, too, is the radio operator, in touch with shore stations and the fleet, and perhaps with other boats patrolling not far out of sight.

Move further back in the hull — all bare metal work, with walls and structural members exposed, for this is no tourist ship—and you notice a pair of legs hanging from what seems to be a hole in the roof.

They belong to the flight engineer, whose chair is up in the turret-like structure that holds the wing well above the hull. Here he has before him all the instruments that tell him how the two engines are working—the temperature of cylinder-heads, oil, air intake, and a score of other things. This arrangement takes much work from the pilots, and lets them spend their time flying and navigating.

In the bunks in the main hold—a roomy cabin about 14ft. long, 10ft. wide, and with plenty of head room—members of the crew who are off duty may be sleeping or one of them may be through the next door aft, cooking a meal in the galley.

The boat's armaments are secret, but there is probably one machine-gun turret in the forward observation post out ahead of and below the cockpit. In a civil version this is used only for mooring. There would probably be another turret on top of the hull, in the roof of the galley, and perhaps another, with a downward view and sweep, well back along the narrowing tunnel of the hull, toward the tail.

The PBY carries a small bomb-load, and it can be equipped as a torpedo-carrier; but just as the bombing plane is primarily a very long range gun, so the reconnaissance flying-boat is primarily a very long-range eye.

It needs its machine guns for self-defence, its bombs in case, when convoying merchant ships, it sights a submarine; but its main job is to find out what is going on 1000 miles or so from the shore it is helping to defend.

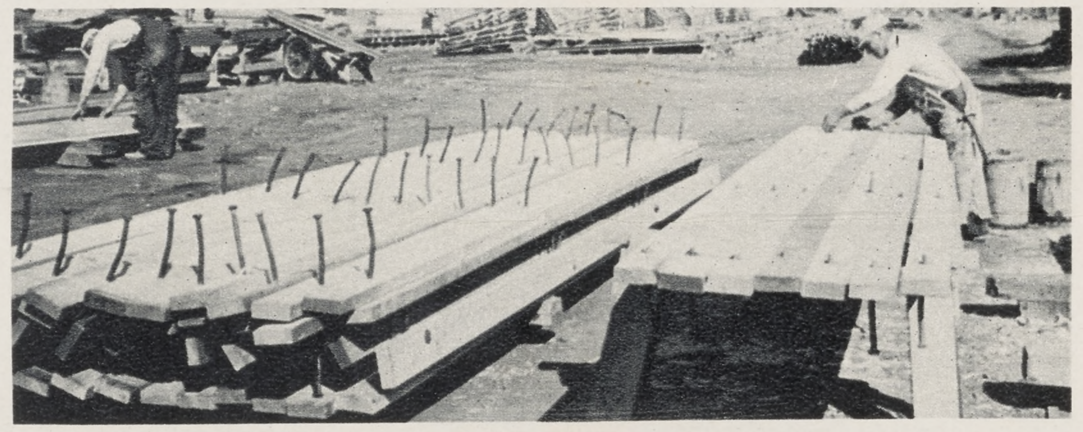
Compared with, say, the Sunderland, the Consolidated is not a big boat, weighing less than 30,000lb. when fully-loaded; but in comparison with most of our Air Force machines, the new boats are giants.

Its top speed is not much below 200 miles and hour, and it can cruise comfortably at 140 to 150 miles an hour. More important, it is no temperamental craft, but can stand hard usage. Probably no other flying-boat in the world has had as stern a test as the Archbold expedition gave the Guba in New Guinea, but when she had had a little overhaul work done in Australia, she was ready for more globe-spanning.

CONTROLLING EROSION on fill slopes of new four-lane divided highway at New London, Connecticut State Highway Department installs treated timber rail at shoulder edge and lines shallow ditch 1 ft. wide with 2 in. of bituminous material shoveled from suspended platform at back of truck **(above)** and spread and tamped to form a gutter **(below)** leading to drop inlets.

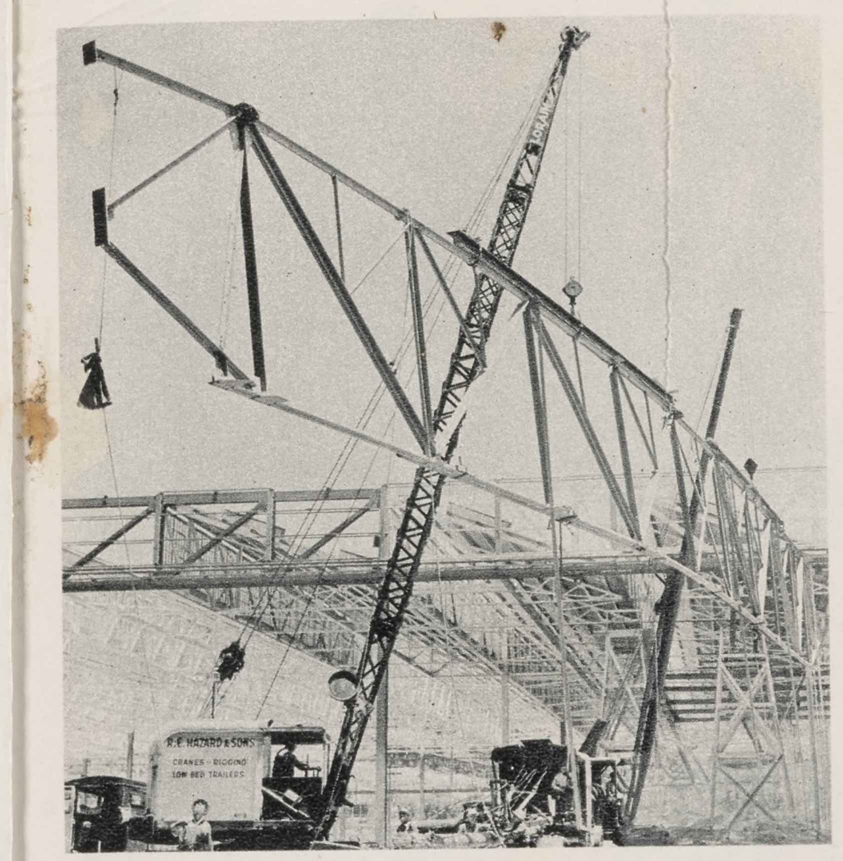
MECHANICAL SHAKER aids U. S. Bureau of Reclamation engineers make sieve analyses of sand samples at Grand Coulee dam.

ADJUSTABLE TELESCOPIC METAL SPOUT designed by Charles Inman, master mechanic, replaces awkward canvas spout under bulk cement batching plant of States Engineering Co., Rapid City, S. D., on Pennsylvania Turnpike paving job. Adjustable section of metal spout is to be suspended on counterweighted lines permitting ready raising and lowering to accommodate batch trucks of various heights.



BENT BY SLEDGE to prevent rotation in concrete when nuts are tightened, anchor bolts are installed in 2x6-in. plates which go on top of reinforced-concrete walls of row houses at Sunnydale housing project, San Francisco, Barrett & Hilp, contractors.

SPECIAL TRACTOR-DRAWN PLOW installs continuous counterpoise wire used in conjunction with two overhead ground wires to protect Parker-Phoenix 161-kv. transmission line against lighting damage in dry country. Continuous parallel counterpoise of ¼-in. black copper rod **(right)** feeds from reel on trailer **(left)** through welded tube on rig and around sheave in heel of plow, which can lay wire up to 26 in. underground. Metal tape on wood block **(right)** indicates that plow exceeds 2 ft. in length.



STEEL TRUSS ERECTION for final assembly building is handled by pair of truck-mounted cranes. Truss will carry overhead monorail connecting new assembly building and finish building.

OVERHEAD STRUCTURE of large steel building is coated with aluminum paint. Note wide spacing of columns to provide clear floor space.

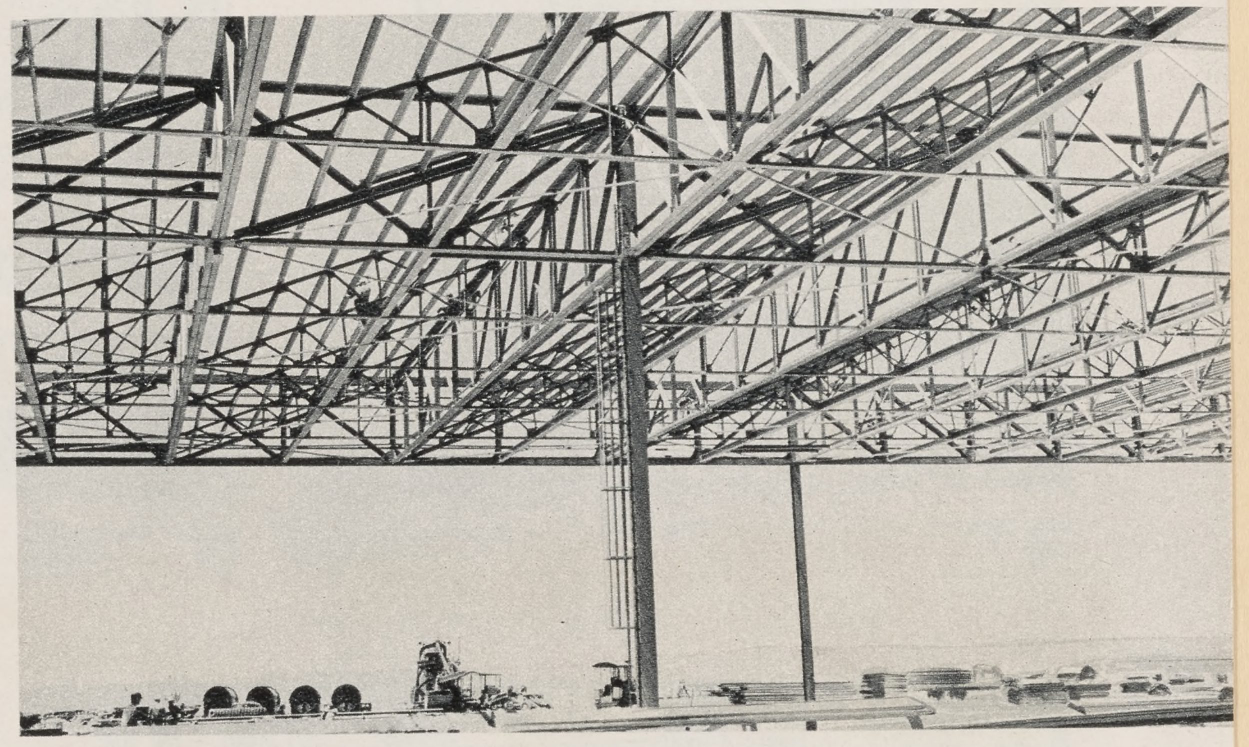
ANNOUNCEMENT WAS MADE by the Navy Department on December 20th, 1939, that the Consolidated Aircraft Corp. of San Diego, Calif., had been awarded a contract for $20,016,699, at that time the largest single order for airplanes ever placed by the United States Government. With work on other contracts occupying most of the production capacity, the record order made it necessary for the company to add new plant facilities to meet the deliveries required by the contract.

Prior to the expansion, Consolidated had under lease 24.7 acres on which factory buildings are located, and an additional 7.6 acres under option. New leases and options now cover an area of 64 acres. This area is all located on Lindbergh Field, San Diego's municipal airport.

The building expansion illustrated in the accompanying photographs, comprising additions to final assembly, final finish, paint shop, wood mill, experimental, maintenance and office departments aggregates approximately 396,000 sq.ft., or an increase in the former area of 87 per cent. The largest single area to be roofed is the new final assembly building measuring 360x720 ft. This has a clear span of 120 ft. and a clearance from floor to roof truss bottoms of 36 ft. Sawtooth roof construction similar to the existing buildings is used. Design of the buildings provides for a minimum of supporting columns, thus leaving floor space clear for manufacturing purposes.

In addition to the buildings, all factory yard areas are paved with asphaltic concrete. These areas, due to the mild

be



MINIMUM USE OF COLUMNS to support steel superstructure of aircraft factory buildings leaves floors unobstructed for manufacturing and assembling purposes.

BITUMINOUS PAVING (below) is applied to yard areas where 30 per cent of manufacturing operations may be conducted out of doors due to equable climate of Southern California.

Aviation DEFENSE

Aircraft Buying Plan Becomes Definite

Nearly two months after it was first announced that the armed forces had settled on just what planes and engines they wanted to standardize on, the public is beginning to get a glimpse of the program. Only phase definitely announced is the plan for air-cooled big engines: 40,000 are wanted in the next two years about equally divided between Wright and Pratt & Whitney designs. This follows the accepted procedure of having two types of each item needed.

Still largely unsettled is the program for liquid-cooled engines, though it is generally assumed that GM's Allison will take about half the load and Packard's Rolls Royce the other half—with Ford's unofficial and still theoretical liquid engine still an unknown factor. About 6,000 Rolls Royces are believed definitely scheduled.

No authoritative statements have been made on plane types desired, but orders on the early program for which appropriations were completed in June, and first orders under the full program seem to reveal some phases of the pattern.

Definitely part of Army's pursuit squadrons will be Lockheed's P-38E, Curtiss's P-40D, Republic's P-44, and Bell's P-39; Army has apparently resolved its doubts about the radical design of Bell's Airacobra and is buying them in quantity.

As a two-engine ship there is the P-38E. Lockheed's ship is a new two-seater version of the P-38 and is said to be capable of 500 m.p.h.

The P-40 and P-39 are both single-place single-engine jobs using liquid-cooled engines. The P-44 provides an air-cooled engine alternative and is, moreover, especially designed for the high altitudes at which bombers are now operating.

Navy fighter plans are not so well established, but it is clear that a Grumman (probably the Skyrocket) will occupy an important place.

On heavy bombers, Boeing's four-engine B-17E has been bought in largest quantities, but Consolidated's similar B-24D has also been ordered. Medium bombers and attack bombers are still open.

North America's AT-6A is the main reliance for advanced trainers, while Vultee, with its BT-13A, provides most of the basic trainers. Primary trainers, as might be expected, are more split up.

Army and Navy between them want 41,500 air-cooled engines in the 500-2,000 hp. range, and have made arrangements to get them from Wright, Pratt & Whitney, and Ford. P & W, which is doing all its negotiation with Navy, will furnish 17,000 of the engines. Ford is settling details with the Army on a program to build 4,500 engines on the P & W 2,000-hp. design. Wright, which is also dealing with Army, will handle 20,000 Cyclone and Whirlwind engines.

To handle its share, Pratt & Whitney will undertake a 400,000-sq.ft. plant expansion (additional to 700,000 sq.ft. already this year). The company will meet the $15,000,000 cost of buildings, while Navy will pay for and retain title to $7,000,000 or $8,000,000 worth of tools.

Ford is paying for his own $11,000,000 plant (of which about $7,000,000 is for tools.) He is to pay P & W a nominal license fee of a dollar an engine.

The Wright engines involve expansion of more than 1,000,000 sq.ft. and will cost about $90,000,000 to be financed through an RFC defense loan.

The Sun News-Pictorial

£2,032,000 MORE

Victoria Australia 6/7/40

500 TRAINING

U.S. FLYING-BOATS TO SUPPLEMENT BIG ORDER LOCALLY

AIRCRAFT orders amounting to £2,032,000, including training and other aircraft to be made in Australia at a cost of more than £1,000,000, have been approved of by War Cabinet following consultation with Britain.

The aircraft will meet needs under the Empire Air Scheme which cannot now be fulfilled by Britain, and will also include special machines for Australian defence.

Seven flying-boats of the Guba type are to be bought from the United States to replace Empire flying-boats, which were to have been brought to Australia. These will cost about £500,000.

MAKING this announcement last night, the Prime Minister (Mr. Menzies) said orders would be placed in Australia for—

300 Tiger Moth aircraft,

with spare engines, airframe spares and engine spares. This order will be additional to the 350 of these craft at present being manufactured for the R.A.A.F. by the De Havilland Aircraft Pty. Ltd. in Sydney, which will also make the new planes.

200 Wackett Trainer aircraft

together with 50 spare engines, airframe spares and engine spares. This plane has been designed by the Commonwealth Aircraft Corporation and the order is subject to the successful outcome of trials which will be carried out next week by the R.A.A.F. The C.A.C. factory will switch to production of the new plane when Wirraway orders are completed.

An order will also be placed with the Commonwealth Aircraft Corporation for a prototype light bomber reconnaissance twin-engined aircraft, the design of which has already favorably impressed Australian air authorities.

It will be made from local materials and fitted with twin Row Wasp engines of the type to be made locally.

The specifications of this aircraft provide for long endurance, and good bomb-carrying capacity.

Its potential defensive ability and dive bombing characteristics, said Mr. Menzies, would make it of considerable utility for Australia's defence problem.

Air Race Pilot's Ordeal In Holland

LONDON, Thursday. — After a fortnight's nightmare journey from Holland, Chevalier J. J. Moll, who was Chevalier Parmentier's co-pilot in the Centenary Air Race, has reached England.

During the first four days of the invasion, Chevalier Moll fought with a rifle against parachutists near Rotterdam and, on May 14, was placed in charge of a dyke, which he opened in the face of a German attack.

Chevalier J. J. Moll

Later, he was picked up by a lorry, which threaded its way through a stream of refugees.

Eventually he reached Ushant, where he caught a small freighter carrying cognac to England.

Chevalier Moll is now training Dutch pilots for squadrons which may operate separately or merge with the Royal Air Force. — **Exclusive.**

CONSOLIDATED AIRCRAFT CORPORATION
LINDBERGH FIELD, SAN DIEGO, CALIF.

VICTORIA AUSTRALIA

FRIDAY, The Hera

One of the United States navy's flying boats of the type ordered by Australia.

GIANT "EYES" FOR OUR AIR FORCE

By The Herald Writer On Aviation

If a squadron of Royal Australian Air Force planes flew non-stop from Sydney to Darwin, most Australians would find it hard to believe.

If, instead of alighting there, the planes flew on over the Timor, over the Netherlands Indies, along the Java Sea, and finally touched down on Singapore Harbor, it would seem something like a miracle.

But to the seven Consolidated PBY5 flying-boats that have been ordered from the United States by the R.A.A.F., such a flight would be possible, provided they met no head winds.

THAT IS probably the most spectacular way of indicating the great range which is the outstanding feature of these 13-ton boats; or one could say that they could fly from their base at Rathmines (N.S.W.) to New Guinea and back, to Fiji and back, or to New Zealand and back, and then back to New Zealand again.

It may be found that the best way of getting them here is to fly them—if legal difficulties connected with the landing at Honolulu can be overcome. Scores of similar planes owned by the United States Navy have flown the longest stage of the journey, the 2400 miles from California to Hawaii, and Richard Archbold's Guba, an unarmed sister-ship of our new boats, flew down the Pacific before she pioneered the Indian Ocean route and casually crossed Africa and the Atlantic on her way home.

In choosing Consolidateds because Britain cannot spare us Sunderlands—the military version of the Empire boat which was previously on order—Australia is taking no gamble.

More PBYs are in service than any other type of flying-boat in the world. The United States Navy has long owned 250, and is reported to have ordered 300 more some months ago. The British Air Ministry bought one, tested it thoroughly, and ordered 50 more, with a further order for 250 regarded as almost certain.

When the United States battle fleet puts to sea it is preceded by a great screen of PBYs, scouting the ocean ahead as destroyers would, but over a vastly greater area.

LOOK into one of these boats on patrol.

In the cockpit are two pilots, one of whom frequently slips back into the chart room just behind his seat, where he may take a drift sight of a "shot" of the sun, then do a small sum to check the plane's position. In the chart room, too, is the radio operator, in touch with shore stations and the fleet, and perhaps with other boats patrolling not far out of sight.

Move further back in the hull — all bare metal work, with walls and structural members exposed, for this is no tourist ship—and you notice a pair of legs hanging from what seems to be a hole in the roof.

They belong to the flight engineer, whose chair is up in the turret-like structure that holds the wing well above the hull. Here he has before him all the instruments that tell him how the two engines are working—the temperature of cylinder-heads, oil, air intake, and a score of other things. This arrangement takes much work from the pilots, and lets them spend their time flying and navigating.

In the bunks in the main hold—a roomy cabin about 14ft. long, 10ft. wide, and with plenty of head room—members of the crew who are off duty may be sleeping or one of them may be through the next door aft, cooking a meal in the galley.

The boat's armaments are secret, but there is probably one machine-gun turret in the forward observation post out ahead of and below the cockpit. In a civil version this is used only for mooring. There would probably be another turret on top of the hull, in the roof of the galley, and perhaps another, with a downward view and sweep, well back along the narrowing tunnel of the hull, toward the tail.

The PBY carries a small bomb-load, and it can be equipped as a torpedo-carrier; but just as the bombing plane is primarily a very long range gun, so the reconnaissance flying-boat is primarily a very long-range eye.

It needs its machine guns for self-defence, its bombs in case, when convoying merchant ships, it sights a submarine; but its main job is to find out what is going on 1000 miles or so from the shore it is helping to defend.

Compared with, say, the Sunderland, the Consolidated is not a big boat, weighing less than 30,000lb. when fully-loaded; but in comparison with most of our Air Force machines, the new boats are giants.

Its top speed is not much below 200 miles and hour, and it can cruise comfortably at 140 to 150 miles an hour. More important, it is no temperamental craft, but can stand hard usage. Probably no other flying-boat in the world has had as stern a test as the Archbold expedition gave the Guba in New Guinea, but when she had had a little overhaul work done in Australia, she was ready for more globe-spanning.

THE DAYTON DAILY NEWS

Plane Concern Doubles Plant Size On Coast

BY HAROLD KEEN

Copyright, 1940, by North American Newspaper Alliance and The Dayton Daily News

SAN DIEGO, Cal., June 15.—Tracing a grim pattern along the shores of San Diego bay, against a background of warships and the biggest naval air base on the continent, a sprawling steel framework today dramatizes America's race to achieve air supremacy in a war-ravaged world.

By Aug. 1, those girders will support a structure through which will flow the materials for army and navy bombers in the nation's largest integrated aircraft plant.

Consolidated Aircraft Corp. will be the first major manufacturer of warplanes to implement the president's call for enlarged facilities in an unprecedented national defense production program.

At a cost of $2,000,000, its plant will be almost doubled. Now employing over 6000 men, an all-time high, this concern will have an estimated 10,000 on its payrolls by the end of 1940.

Within a single fenced-in area will be 1,910,000 square feet of manufacturing space adjacent to 954,440 square feet of municipal airport land under option for further expansion.

This is a graphic example of how the military aircraft industry, concentrated to great degree in southern California, is gearing itself to meet the staggering burden imposed by cataclysmic events that may threaten America's security.

Consolidated Aircraft has a backlog of unfilled orders totalling $70,000,000—much of this for 200 more of the famed PBY patrol bombers now used so effectively by the navy in neutrality patrols far off the mainland and insular possessions.

Should the United States, Hawaii, Alaska, the Philippines, the Canal Zone, Puerto Rico, the naval base at Guantanamo bay, Cuba, become the objective of an aggressor, much of the defense task will rest on this wide-ranging fleet of twin-engined air scouts.

Consolidated Aircraft production also is a matter of basic importance to the allies, who have just placed a $20,000,000 order for approximately 100 four-motored "Liberator" type army bombers, the recently engineered 20-ton giant which can outperform the "Flying Fortress," heretofore the deadliest weapon of the United

shores—Maj. Fleet and fellow officials have been quietly surveying interior points of the nation for a "branch" plant site.

Meanwhile, the clatter of steel workers erecting a great addition to an indispensable factory sounds the note of the times—preparedness in short order!

States army air corps. Able to carry an 8000-pound bomb load, this ship, powered with four 1200-horsepower engines, can travel 3000 miles non-stop at more than 300 miles per hour.

But it is for its seaplanes that Consolidated Aircraft is internationally famed. Since its establishment in 1923, the company has built four times as many giant airboats, with wingspan of 100 feet or more, as all other American manufacturers combined.

Use of these craft in non-stop flights from San Diego and San Francisco to Hawaii, the Canal Zone, the Caribbean, and even across the continent, has demonstrated that the United States navy is unequalled in its long-range flight equipment.

Identified most closely with the navy, Consolidated Aircraft is headed by a former army fl[illegible] Maj. Reuben H. Fleet, who was [illegible] charge of the first regularly scheduled United States airmail service more than two decades ago.

Well aware of the fact that San Diego, with its naval air station, its long harbor, in which 100 warships normally are based, would be a logical target of enemy attack—should the enemy reach Pacific

18 Consair Bombers Will Hop to Australia

HONOLULU, Nov. 19 (U.P.)—The Australian government, it was reported tonight, has nearly completed plans to take delivery of 18 Consolidated PBY twin-engined patrol bombers built at the Consolidated factory in San Diego.

It was understood here the bombers, of the same type used by the U. S. Navy, will be flown over the transpacific route used by Pan American Airways' clipper ships.

Tribune 11/23/40

MAKE TEST FLIGHTS OF NEW CONSAIR NAVY BOMBER

San Diegans today turned eyes skyward to view the first of several 4-motor longrange patrol planes being built by Consolidated Aircraft Corp. for the navy, aloft on test flight Similar to the plane in which Secy. of Navy Frank Knox recently flew to Hawaii and back, the $200,000 silvery giant is the first of six being turned out for Patrol Squadron VP-13 here, of which Lt. Comdr. Stephen B. Cooke is in command.

Powered by four 1200-horsepower engines, the bomber weighs 30 tons and has a speed in excess of 200 miles an hour. Its range is more than 5000 miles. It has accommodations for a crew of nine. The experimental plane from which this model was made became aerial flagship of commander aircraft scouting force and made the flight to Hawaii with Knox aboard in record time.

Consair Offers Aid To CCC Members

Checking on available employe material and vocational training facilities in the San Diego county civilian conservation corps camps, Consolidated Aircraft Corp. officials accompanied Allan Flaven, county CCC selecting aid, on an official camp tour.

The aircraft officials offered full cooperation with local camps in providing study and work materials, and professed willingness to give full consideration to all corps employment referrals of qualified subjects, Flaven said.

Company commanders who were hosts to the Consair group were Le. Henry Wishart of Vista; Le. Ernest Smith of Cuyamaca, and Capt. Joseph Benoit of Pine Valley.

Officials who made the tour were J. H. Waterbury, personnel director; Dr. S. A. Bearned, plant physician, and Earl T. Gray, H. R. Wiseman, H. E. Pasek and L. D. Larimer of the personnel department.

Expanding Plane Plants Mean More Residents, Bigger Payrolls

Case of San Diego Shows How Industry Adds to Prosperity of Typical Community

SAN DIEGO, Nov. 00.—Millions of dollars are being spent on plant expansions and thousands of skilled workers are being added to payrolls as aircraft manufacturers race into the creation of a mighty air force for the nation's defense.

What effect is this vast expansion, this upsurge of employment, having on the economic structure of communities where airplane plants are located? To answer this question, a researcher for the Aviation News Committee of the Aeronautical Chamber of Commerce of America visited San Diego, Calif.

FEW INDUSTRIES

The 1930 census gave San Diego a population of 147,995. Its limited basic industries—tuna fishing, boat building, some manufacturing—hardly classified it as an industrial community. But Army and Navy bases were located here and the city's prosperity consequently rested heavily upon payrolls of service personnel, which consequently fluctuated with the comings and goings of the Fleet.

From an aeronautical standpoint San Diego had two distinct advantages—almost perfect weather and an excellent airport practically in the center of the city.

In 1935, Major R. H. Fleet decided to bring his Consolidated Aircraft Corporation to San Diego. At that time the city's industrial payroll was $15,000,000.

Today San Diego has four aircraft and aircraft parts plants—Consolidated, Ryan Aeronautical Company, Solar Aircraft Company, Rohr Aircraft Company—employing more than 14,000 workers. Largely as a result of the coming of this industry, San Diego's industrial payroll has risen to approximately $20,000,000 in 1940. Two new theaters and between 25 and 30 grocery stores have been built.

And what of the future?

20,400 NEW WORKERS

Consolidated Aircraft, now hiring workers at a rate of 300 weekly, expects to add 13,000 new employes to its payroll within the next eight months. The smaller plants are also expanding rapidly. Result: the four plants will have taken on 20,400 additional workers by the summer of 1941.

Statisticians estimate that some 16,400 of these men will be drawn from outside the San Diego area. Of this number, they say, 9840 will be married. Bringing their families with them, they will increase San Diego's population by an estimated 29,500.

Already the influx of aircraft workers has resulted in stimulation of home construction. Increased payrolls are attracting new businesses. And the coming of nearly 10,000 tax-paying families will, it is estimated, mean the employment of more than 200 additional school teachers and the building of a like number of class rooms in the San Diego schools.

So extensive is the Consolidated Aircraft Corporation plant at San Diego, California, that employes use bicycles to travel from building to building.

L.A. Times 11/10/40

Plane Contract Goes to San Diego

WASHINGTON, Nov. 9. (AP)—The Navy today awarded a $75,313,000 contract for planes to the Consolidated Aircraft Corp., San Diego, Cal.

---

7 Consolidated Bombers to Be Sold to Britain

Union 11/4/40

Informed sources disclosed yesterday that Great Britain had contracted for seven of the Consolidated Aircraft Corp. new long-range bombers, the first of which received its initial test here Saturday.

It was reported the fleet of bombers first would be used to ferry Canadian pilots to the British Isles and return to Canada fliers not suited for combat duty to fly fighting planes back to England.

WOULD DOUBLE FIGURE

Official sources here indicated the British hoped to double the monthly deliverance of planes to England if the national defense priorities board gave favorable consideration to that nation's request for permission to purchase 12,000 additional ships in the United States. President Roosevelt recently asked the board to give "sympathetic consideration" to the request.

The bomber tested Saturday is similar to the XB-24, the first land plane developed by Consolidated last February for the U. S. army. That 20-ton bomber was tested by the army air corps, and later returned to the factory for improvements, apparently in armament, which company officials said were regarded as "highly advisable in the light of war developments."

HAVE WIDE RANGE

Both bombers, the one just tested and camouflaged and marked with the insignia of the British Royal air force, and the XB-24, are powered with four 1200-horsepower, 18-cylinder radial engines. They have a cruising range exceeding 3000 miles and a top speed better than 300 miles an hour.

In the interest of speed it was believed the bombers contracted by England would not be equipped with as extensive armament as is planned for the XB-24, which is capable of carrying a load of four tons of bombs.

TEST NEW BOMBER MADE LOCALLY FOR GREAT BRITAIN

Union 11/4/40

Forerunner of a fleet of at least seven long-range, four-motored bombers, which informed sources state have been ordered from the Consolidated Aircraft Corp. by Great Britain, the firm's B-24 received its initial test in flights over the city Saturday afternoon. The plane, piloted by George Newman and Jack Kline, Consolidated test pilots, was camouflaged and carried insignia of the Royal Air Force.

To Ferry Canadian Pilots

Initial work of the bombers, it was reported, will be to ferry Canadian pilots to the British islands and return to Canada fliers not suited for combat duty to fly fighting planes back to England. Armament will be limited in the interest of speed.

The plane flown Saturday is similar to the XB-24, first land plane developed by Consolidated, last February, for the United States army. It weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. It is powered by four 1200-horsepower, 18-cylinder, radial air-cooled Pratt-Whitney engines. The wingspread is 110 feet, fuselage 64 feet and overall height 19 feet. Planes of this type for the United States army are capable of carrying four tons of bombs.

Tribune 11/11

First Errand of Mercy For New Guard Plane

The new Consolidated-built PBY patrol plane at the local coast guard air base made its initial mercy of errand flight Saturday when it flew to Turtle bay, down the Lower California coast, and brought back a fisherman stricken with a throat infection, Robert King, 1132 Bush st., member of the crew of the fishing boat Senator. The plane was piloted by Lt. C. G. Bowman, commanding the air base, with Lt. T. J. Harris as co-pilot.

Union 11/7/40

Housing for 61,580 Needed Here As Army, Navy, Industries Expand

In the next eight months San Diego must provide houring for 45,530 persons who will reside in private homes, in addition to 16,050 men who will be housed in barracks and camps, as a result of army, navy and industrial expansion, Arnold Klaus, assistant manager, chamber of commerce, announced yesterday after completing a new population survey.

At present, Consolidation Aircraft Corp. has 12,000 employes, Arnold said, 5500 more than when the 1940 census was enumerated. The firm plans to hire 18,000 more in the next eight months, estimating that 60 percent of these new employes will be married men, and 80 percent will come from outside San Diego county.

Ryan Aeronautical Co. plans to add 1000 to its personnel of 1400 and Solar Aircraft Co. will increase its staff by 400 to a total of 1048, Klaus said. Rohr Aircraft Co. employs 35 and will add 250 to its San Diego plant by Jan. 1 and 700 in the Chula Vista plant by July 1, 1941.

Therefore, the four aircraft plants in the San Diego area will employ a total of 20,400 new men by July 1, Klaus said. Of these, 20 percent, or 4000, will be San Diego residents and the other 16,400 will be men from outside the county, the survey indicated.

Of the out-of-county men expected, 40 percent will be single. The 60 percent in the married group, avering three to a family, will bring an influx of 29,520 persons to the county, Klaus said.

Navy forces afloat were not enumerated in the census figure of 17,000 navy and marine corps officers and men in San Diego, Klaus pointed out. This number will be increased to 27,000 by July, he said. Of the new men, 2500 will be married. Assuming the three-a-family average, this will mean 7500 additional persons will establish residences here.

CANTONMENT PLANNED

Of 2000 men and 100 officers to be stationed at Ft. Rosecrans in the next six months, 100 officers and 100 married non-commissioned officers will acquire residences in the city. Assuming three to a family, this indicates 600 additional persons.

A cantonment planned by the army for the San Diego area will accommodate 7500 soldiers, plus 1000 regular officers and troops as instructors. This camp will necessitate the assignment of 225 officers and 225 married non-commissioned officers. This means that 450 additional homes in the community will be established as a result of this camp, to accommodate, in family figures, 1350 persons.

BUSINESS TO INCREASE

All this, Klaus said, does not take into account increased employment in mercantile establishments, theaters and other businesses resulting from the increased population. Probably most of the increased employment in these various businesses will be of persons already residing in the community, he said.

To the 1940 census total of 202,038 for San Diego's metropolitan population, the survey added 10,000 residents of other states enumerated as present in the city but not credited to San Diego. Combined with populations of surrounding towns: Coronado, 6908; National City, 10,204; Chula Vista, 5126; La Mesa, 3912; El Cajon, 2500, and officers and men resident on ships at anchor in San Diego bay, 16,000; the total population for the enumerated area was given as 256,688.

Consair Begins Tests of New Patrol Bombers

Union 11/4/40

Consolidated Aircraft Corp announced yesterday that the first group of the new PBY-5 twin-engined, long -range patrol bombers ordered for the navy were being given initial performance tests this week.

This type of craft, made by Consolidated for the navy, has established many group flight records from San Diego to Panama and Hawaii, and from Honolulu to the Philippines. Last March the company said it had obtained a release from the government for export sale of this type of patrol bomber for the Allies' use. The foreign contract was believed to involve a $9,000,000 expenditure.

Consolidated also is rushing a navy order for a squadron of 30-ton, four-engined, long-range patrol bombers. The huge airboats, if found satisfactory, may supplant the with the fleet patrol wings. It was understood six would be delivered twin-motored bombers in service to patrol squadron 12 at the naval air station here.

The new bombers will have a cruising range of 5000 miles, carrying a crew of nine and several tons of bombs. With a speed in excess of 200 miles an hour, they are expected to be the fastest aircraft of their type in the world.

Union 11/3/40

New Aircraft Firm To Open Plant Here

A new San Diego aviation industry will get under way in the next few days when the Weaver Aircraft Co. will begin operations, John L. Weaver, president, reported yesterday.

The company is starting business at 1341 State st., and will produce machine parts and sub-assembly jobs for aircraft manufacturing firms.

In addition the company expects to develop several of Weaver's "pancake" motors for government testing. These motors, it is claimed, develop one horsepower for each pound of weight.

Nashville and

Fire in Big Bomber Warming Up at Field

Flames shot from under the cowling of the port inboard engine of the Consolidated-built four-engine bomber, camouflaged and bearing the insignia of the R.A.F., as it warmed up on the line at Lindbergh field today.

The fire burned for several minutes before the engine was shut off, when it died out. The plane was taxied from the runway for inspection. The fire apparently caused no damage, for soon after the craft trundled down the field on its tricycle landing gear and shot into the air.

Consair Head Mum On New S. D. Plant

"No comments right now," said a spokesman for Consolidated Aircraft Corp. today on rumors the firm is planning to construct a large factory near Old Town for the manufacture of plane parts and accessories. The firm is building a large addition to its existing plant on Lindbergh field.

'S.D. Leading U.S. Air, Naval Base for All Time,' Claim Of Retiring Officer; New Chamber Officials Inducted

Tribune 11/8/40

Scott Takes Gavel Of Civic Group; Future Bright

Declaring that San Diego "for all time will accommodate a great aircraft industry and the greatest all-around navy base on the North American continent," Frank G. Forward yesterday relinquished the presidency of the chamber of commerce to George A. Scott, department store vice president and manager.

Speaking to members of the chamber's directorate, at its annual meeting, Forward urged that "any doubt as to the future of San Diego be dispelled."

"The constantly increasing importance of aircraft in national defense combined with the indisputable fact that no place in the country is so ideally adapted to the manufacture and testing of aircraft as is San Diego, means that for all time to come San Diego will accommodate a great aircraft industry established in this favored location," Forward said. "Your chamber of commerce, under its new leadership, will continue to strive untiringly to guarantee the future industrial and business welfare of your city and county."

In assuming the presidency, Scott pledged adherence to those same policies which accord the chamber of commerce opportunity to work cooperatively with "our navy, marine corps and army authorities, city and county officials, industrial and business leaders and others contributing to the economic welfare of the people of our city and county."

Other Officers Installed

Other officers elected to head the chamber in its 71st year of service to the community are D. R. Minshall, John T. Martin and G. Frank Nolan, vice presidents, and J. O. Miller, treasurer. For the 12th consecutive year, Maj. T. H. Macaulay was re-elected secretary-manager.

In concluding a 30-page report covering the multiplicity of chamber activities in 1940, Forward condemned "the defeatist attitude already apparent in certain quarters" concerning San Diego's future.

"Statements are being made," Forward declared, "that present expansion would end in the creation of a future 'ghost town.' Such statements are not only unworthy of forward-looking citizens but probably are the result of wishful thinking on the part of that small minority of our residents who fought Lindbergh field, harbor dredging, naval expansion, the Nolen plan and water conservation, and who profess to prefer the San Diego of old days

$15,000,000 S. D. Housing Project Approved; Work to Start at Once

Union 11/2/40

Immediate construction on a $15,000,000 federal housing program here was approved yesterday by President Roosevelt. San Diego will get the largest of the 63 housing projects which will total $45,762,500.

In announcing the president's approval yesterday, Charles F. Palmer, defense housing coordinator, said the local project calls for construction of 2000 additional dwelling units, 750 dormitory rooms for single men and 1000 portable-type homes, The Associated Press reported from Washington. He estimated the work would be completed within a year and some houses would be ready in four months.

Charles A. Sloan, federal construction engineer here to supervise the big job necessitated by demand for housing defense workers, reported the site for the new community has not been selected but there were indications it might be in the Kearny mesa section.

From Washington, Palmer said the new housing "will be absorbed in the San Diego community pattern so that normal life will not be interrupted." He added the housing emergency in this city resulted from the large navy, army and aircraft expansion and asserted the project "will create dwellings equivalent to those in a town of 30,000 people."

The program is in addition to a $3,800,000 navy-family project for 1200 housing units adjoining the destroyer base and naval training station. A contract for the navy project has been awarded.

Trib.-Sun 11/14/40

FREIGHTER HERE WITH YULE LIQUOR, CONSAIR METAL

Fresh to strong easterly winds off Pt. Loma were encountered early today by the American-Hawaiian intercoastal freighter American, which arrived from Atlantic waters with cargo for local discharge ranging from a carload of Christmas liquor to pipe and galvanized sheet metal for the new addition to the Consolidated Aircraft Corp. plant, according to report by Capt. Louis A. Carlisle, master. He reported the winds subsided as the freighter entered the harbor.

On his first visit to San Diego since 1922, when he was here aboard the American-Hawaiian freighter Dakotan, Carlisle said the last A-H freighter of which he was master, the Californian, was sunk the latter part of August soon after it had been sold to Great Britain. He turned the Californian over to an English master and crew at Mobile, Ala., July 29.

Word was received today by H. E. Holbrook, steamship agent, that the Norwegian motorship Braga is due at San Diego either Saturday or Sunday. The Braga has 500 tons of Cuban sugar aboard for discharge here.

Two westbound Quaker line freighters, the Vermont and San Clemente, are due here next Wednesday. Their cargo for San Diego ranges from marine corps trucks to canned soup.

Consair Gets Huge Contract

Bringing the total backlog to $324,500,000 Consolidated Aircraft Corp. received an $18,529,500 contract yesterday from the navy department for planes and spare parts.

No details of the contract were given by the bureau of aeronautics, The Associated Press reported from Washington. Last Saturday the firm received a $75,313,000 contract from the navy for an undisclosed number of four-motored patrol bombers.

Reports are current that Consolidated soon will build a $14,000,000 factory for the manufacture of plane parts and accessories near Old Town.

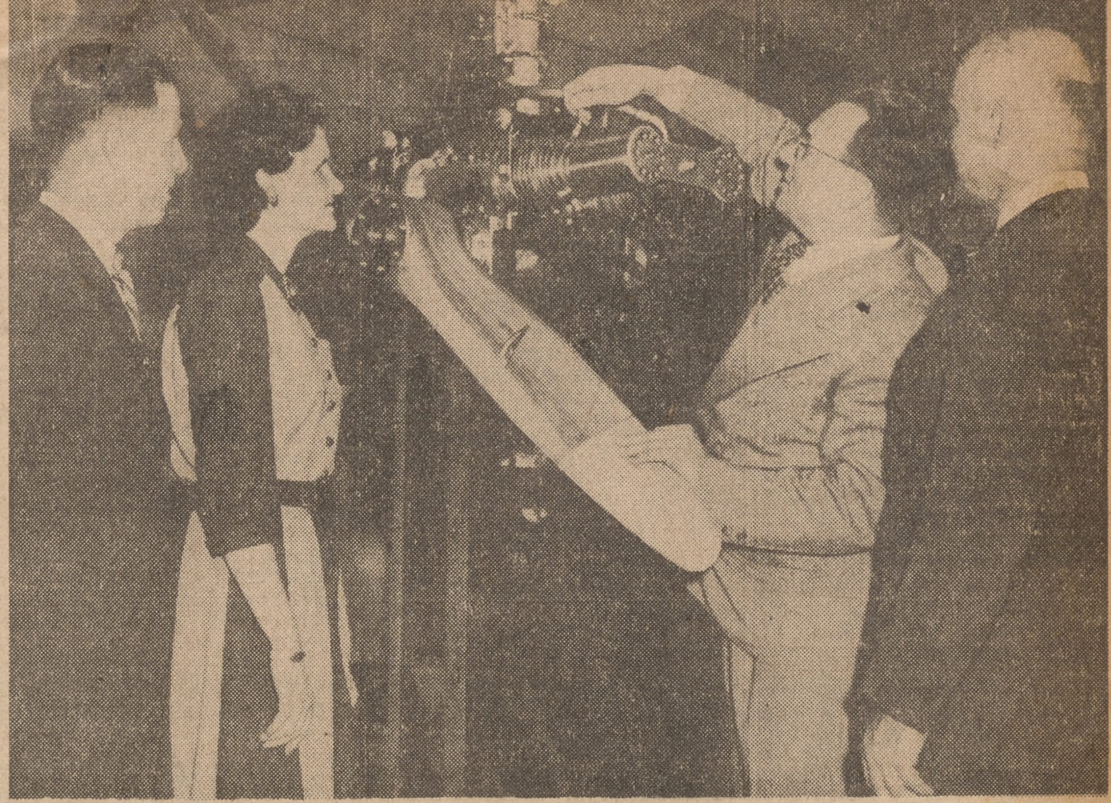
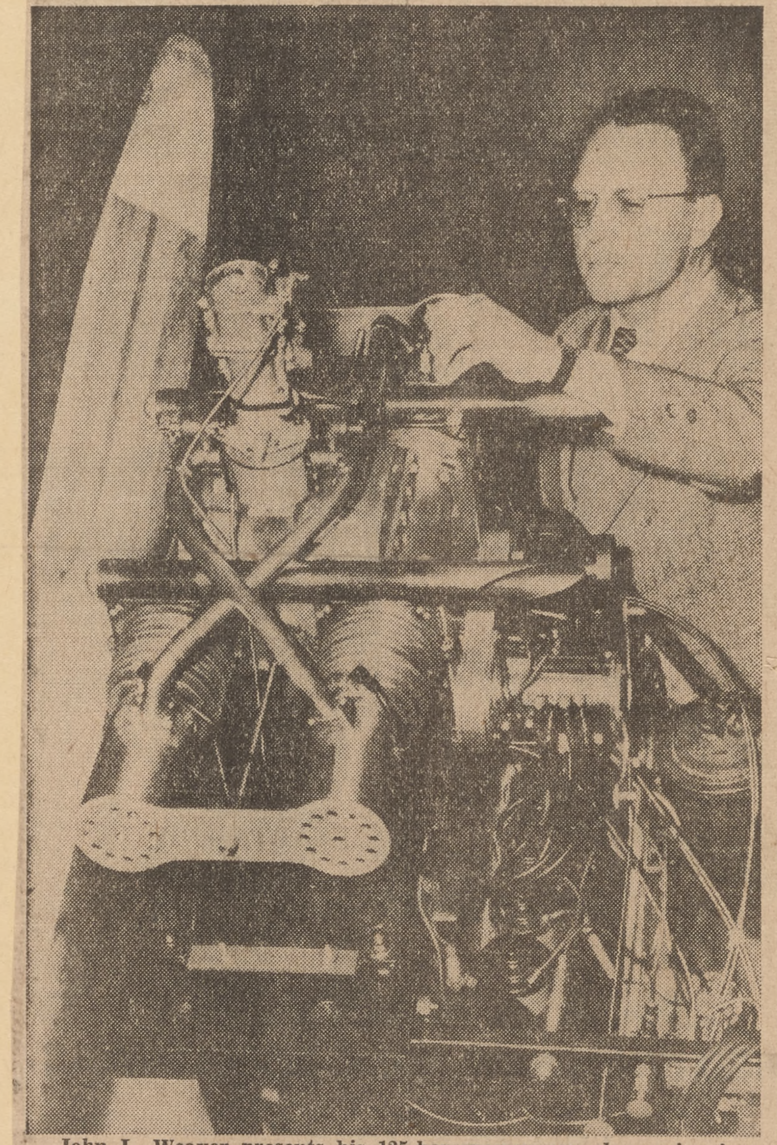
'PANCAKE' ENGINE WILL BE BUILT IN SAN DIEGO



TOM BOMAR MRS. GRACE PRESCOTT J. L. WEAVER MAJ. T. C. MACAULAY

Weaver, head of Weaver Aircraft Co., exhibits one of the engines his company will build here, to chamber of commerce executives and Mrs. Prescott, noted aviatrix. He plans one 12 times as powerful.



John L. Weaver presents his 125-horsepower pancake engine in a close-up. It embodies ideas which he says give one horsepower for each pound of weight.

* * *

NEW AIRCRAFT PLANT PLANS TO BEGIN WORK NEXT WEEK

San Diego's newest factory—the Weaver Aircraft Co. plant at 1341 State st., will begin production of aviation engines and airplane parts early next week, John Weaver, company head, announced yesterday.

Contracts for engine and airplane parts already are on hand, and the company plans call for employment of approximately 150 men working two shifts. Some delay in starting operations has been experienced because part of the machinery for the plant has been delayed in arrival, Weaver said.

Along with the work of filling contracts for parts, the company will make two of the new-type Weaver engines. These machines are known as the "pancake" type and are four-cylinder supercharged models, estimated to deliver one horsepower for each pound of weight. The two to be built first will be somewhat in excess of 125 horsepower each. One is to be used by the company for its breakdown tests, and the other will be turned over to the army for military tests.

Weaver reported that plans for a 1500-horsepower model, with 24 cylinders, are now being made and he expects to have it completed within the next year.

Besides Weaver, the company's officers are Tom Keck, vice president, and Robert R. Dunn, secretary-treasurer.

TIN SMELTER FAVORED

WASHINGTON, Nov. 13 (A.P.)—A spokesman for the national defense commission today said the commission was sending a recommendation to the Reconstruction Finance Corp. for construction of a tin smelter.

Consair Gets Big Navy Order

Union 11/10/40

Backlog Tops 300-Million Mark

A contract for additional planes costing $75,313,000 yesterday was awarded to Consolidated Aircraft Corp. by the navy, it was reported in a Washington dispatch by The Associated Press.

Bringing to an estimated total of $306,000,000 the local plant's backlog, the latest planes are of types which wer not divulged, although it is understood that the order is for four-motored scouting craft of long-range type which the company has been turning out for the navy.

Types of planes, how many of each, and delivery dates were withheld, and officials at Consolidated declined comment. The order came as work was being rushed on a large addition to the factory on Lindbergh field, where a $2,000,000 extension to the plant was dedicated last Labor day.

Test flights on the first of seven 20-ton long-range bombers, reported building for the Royal Air Force, already have begun. The big four-motored plane was over San Diego yesterday.

As well as supplying planes to the American army and navy, Consolidated is turning them out for England and Australia. Two months ago, the Australian Commonwealth stated that the purchase of 11 flying boats from Consolidated had been decided upon, the planes to cost $3,500,000 and to be delivered this winter.

Operating on a 10-hour day and a five-day week, Consolidated now is reported to be employing 13,000 men.

Trib-Sun. Nov. 9/40

Plane Firms Agreed On Standardization

ST. LOUIS, Nov. 9 (A.P.)—Long-sought standardization in the aircraft industry to speed plane output for national defense was pledged today by the aircraft standards committee.

The national group, organized yesterday by 22 major aircraft companies, will "develop and get into production aircraft standard parts, material and processes."

William Smith, of Bell Aircraft Co., Buffalo, chairman of the committee, said screws, rivets and protective finishes were examples of things the committee would attempt to standardize.

"The development of these standards will permit a greater degree of interchangeability and facilitate mass production, with early delivery dates resulting in quantities required for the defense program," said Smith.

THE DAYTON DAILY NEWS

Plane Concern Doubles Plant Size On Coast

BY HAROLD KEEN

Copyright, 1940, by North American Newspaper Alliance and The Dayton Daily News

SAN DIEGO, Cal., June 15.—Tracing a grim pattern along the shores of San Diego bay, against a background of warships and the biggest naval air base on the continent, a sprawling steel framework today dramatizes America's race to achieve air supremacy in a war-ravaged world.

By Aug. 1, those girders will support a structure through which will flow the materials for army and navy bombers in the nation's largest integrated aircraft plant.

Consolidated Aircraft Corp. will be the first major manufacturer of warplanes to implement the president's call for enlarged facilities in an unprecedented national defense production program.

At a cost of $2,000,000, its plant will be almost doubled. Now employing over 6000 men, an all-time high, this concern will have an estimated 10,000 on its payrolls by the end of 1940.

Within a single fenced-in area will be 1,910,000 square feet of manufacturing space adjacent to 954,440 square feet of municipal airport land under option for further expansion.

This is a graphic example of how the military aircraft industry, concentrated to great degree in southern California, is gearing itself to meet the staggering burden imposed by cataclysmic events that may threaten America's security.

Consolidated Aircraft has a backlog of unfilled orders totalling $70,000,000—much of this for 200 more of the famed PBY patrol bombers now used so effectively by the navy in neutrality patrols far off the mainland and insular possessions.

Should the United States, Hawaii, Alaska, the Philippines, the Canal Zone, Puerto Rico, the naval base at Guantanamo bay, Cuba, become the objective of an aggressor, much of the defense task will rest on this wide-ranging fleet of twin-engined air scouts.

Consolidated Aircraft production also is a matter of basic importance to the allies, who have just placed a $20,000,000 order for approximately 100 four-motored "Liberator" type army bombers, the recently engineered 20-ton giant which can outperform the "Flying Fortress," heretofore the deadliest weapon of the United shores—Maj. Fleet and fellow officials have been quietly surveying interior points of the nation for a "branch" plant site.

Meanwhile, the clatter of steel workers erecting a great addition to an indispensable factory sounds the note of the times—preparedness in short order!

States army air corps. Able to carry an 8000-pound bomb load, this ship, powered with four 1200-horsepower engines, can travel 3000 miles non-stop at more than 300 miles per hour.

But it is for its seaplanes that Consolidated Aircraft is internationally famed. Since its establishment in 1923, the company has built four times as many giant airboats, with wingspan of 100 feet or more, as all other American manufacturers combined.

Use of these craft in non-stop flights from San Diego and San Francisco to Hawaii, the Canal Zone, the Caribbean, and even across the continent, has demonstrated that the United States navy is unequalled in its long-range flight equipment.

Identified most closely with the navy, Consolidated Aircraft is headed by a former army fl[illegible] Maj. Reuben H. Fleet, who was [illegible] charge of the first regularly scheduled United States airmail service more than two decades ago.

Well aware of the fact that San Diego, with its naval air station, its long harbor, in which 100 warships normally are based, would be a logical target of enemy attack—should the enemy reach Pacific

Union 11/20/40

18 Consair Bombers Will Hop to Australia

HONOLULU, Nov. 19 (U.P.)—The Australian government, it was reported tonight, has nearly completed plans to take delivery of 18 Consolidated PBY twin-engined patrol bombers built at the Consolidated factory in San Diego.

It was understood here the bombers, of the same type used by the U. S. Navy, will be flown over the transpacific route used by Pan American Airways' clipper ships.

Tribune 11/23/40

MAKE TEST FLIGHTS OF NEW CONSAIR NAVY BOMBER

San Diegans today turned eyes skyward to view the first of several 4-motor longrange patrol planes being built by Consolidated Aircraft Corp. for the navy, aloft on test flight Similar to the plane in which Secy. of Navy Frank Knox recently flew to Hawaii and back, the $200,000 silvery giant is the first of six being turned out for Patrol Squadron VP-13 here, of which Lt. Comdr. Stephen B. Cooke is in command.

Powered by four 1200-horsepower engines, the bomber weighs 30 tons and has a speed in excess of 200 miles an hour. Its range is more than 5000 miles. It has accommodations for a crew of nine. The experimental plane from which this model was made became aerial flagship of commander aircraft scouting force and made the flight to Hawaii with Knox aboard in record time.

Consair Offers Aid To CCC Members

Checking on available employe material and vocational training facilities in the San Diego county civilian conservation corps camps, Consolidated Aircraft Corp. officials accompanied Allan Flaven, county CCC selecting aid, on an official camp tour.

The aircraft officials offered full cooperation with local camps in providing study and work materials, and professed willingness to give full consideration to all corps employment referrals of qualified subjects, Flaven said.

Company commanders who were hosts to the Consair group were Le. Henry Wishart of Vista; Le. Ernest Smith of Cuyamaca, and Capt. Joseph Benoit of Pine Valley.

Officials who made the tour were J. H. Waterbury, personnel director; Dr. S. A. Bearned, plant physician, and Earl T. Gray, H. R. Wiseman, H. E. Pasek and L. D. Larimer of the personnel department.

Aviation News Features 11/22/40

Expanding Plane Plants Mean More Residents, Bigger Payrolls

Case of San Diego Shows How Industry Adds to Prosperity of Typical Community

SAN DIEGO, Nov. 00.—Millions of dollars are being spent on plant expansions and thousands of skilled workers are being added to payrolls as aircraft manufacturers race into the creation of a mighty air force for the nation's defense.

What effect is this vast expansion, this upsurge of employment, having on the economic structure of communities where airplane plants are located? To answer this question, a researcher for the Aviation News Committee of the Aeronautical Chamber of Commerce of America visited San Diego, Calif.

FEW INDUSTRIES

The 1930 census gave San Diego a population of 147,995. Its limited basic industries—tuna fishing, boat building, some manufacturing—hardly classified it as an industrial community. But Army and Navy bases were located here and the city's prosperity consequently rested heavily upon payrolls of service personnel, which consequently fluctuated with the comings and goings of the Fleet.

From an aeronautical standpoint San Diego had two distinct advantages—almost perfect weather and an excellent airport practically in the center of the city.

In 1935, Major R. H. Fleet decided to bring his Consolidated Aircraft Corporation to San Diego. At that time the city's industrial payroll was $15,000,000.

Today San Diego has four aircraft and aircraft parts plants—Consolidated, Ryan Aeronautical Company, Solar Aircraft Company, Rohr Aircraft Company—employing more than 14,000 workers. Largely as a result of the coming of this industry, San Diego's industrial payroll has risen to approximately $20,000,000 in 1940. Two new theaters and between 25 and 30 grocery stores have been built.

And what of the future?

20,400 NEW WORKERS

Consolidated Aircraft, now hiring workers at a rate of 300 weekly, expects to add 13,000 new employes to its payroll within the next eight months. The smaller plants are also expanding rapidly. Result: the four plants will have taken on 20,400 additional workers by the summer of 1941.

Statisticians estimate that some 16,400 of these men will be drawn from outside the San Diego area. Of this number, they say, 9840 will be married. Bringing their families with them, they will increase San Diego's population by an estimated 29,500.

Already the influx of aircraft workers has resulted in stimulation of home construction. Increased payrolls are attracting new businesses. And the coming of nearly 10,000 tax-paying families will, it is estimated, mean the employment of more than 200 additional school teachers and the building of a like number of class rooms in the San Diego schools.

So extensive is the Consolidated Aircraft Corporation plant at San Diego, California, that employes use bicycles to travel from building to building.

L.A. Times 11/10/40

Plane Contract Goes to San Diego

WASHINGTON, Nov. 9. (AP)—The Navy today awarded a $75,313,000 contract for planes to the Consolidated Aircraft Corp., San Diego, Cal.

---

7 Consolidated Bombers to Be Sold to Britain

11/4/40

Informed sources disclosed yesterday that Great Britain had contracted for seven of the Consolidated Aircraft Corp. new long-range bombers, the first of which received its initial test here Saturday.

It was reported the fleet of bombers first would be used to ferry Canadian pilots to the British Isles and return to Canada fliers not suited for combat duty to fly fighting planes back to England.

WOULD DOUBLE FIGURE

Official sources here indicated the British hoped to double the monthly deliverance of planes to England if the national defense priorities board gave favorable consideration to that nation's request for permission to purchase 12,000 additional ships in the United States. President Roosevelt recently asked the board to give "sympathetic consideration" to the request.

The bomber tested Saturday is similar to the XB-24, the first land plane developed by Consolidated last February for the U. S. army. That 20-ton bomber was tested by the army air corps, and later returned to the factory for improvements, apparently in armament, which company officials said were regarded as "highly advisable in the light of war developments."

HAVE WIDE RANGE

Both bombers, the one just tested and camouflaged and marked with the insignia of the British Royal air force, and the XB-24, are powered with four 1200-horsepower, 18-cylinder radial engines. They have a cruising range exceeding 3000 miles and a top speed better than 300 miles an hour.

In the interest of speed it was believed the bombers contracted by England would not be equipped with as extensive armament as is planned for the XB-24, which is capable of carrying a load of four tons of bombs.

TEST NEW BOMBER MADE LOCALLY FOR GREAT BRITAIN

Union 11/4/40

Forerunner of a fleet of at least seven long-range, four-motored bombers, which informed sources state have been ordered from the Consolidated Aircraft Corp. by Great Britain, the firm's B-24 received its initial test in flights over the city Saturday afternoon. The plane, piloted by George Newman and Jack Kline, Consolidated test pilots, was camouflaged and carried insignia of the Royal Air Force.

To Ferry Canadian Pilots

Initial work of the bombers, it was reported, will be to ferry Canadian pilots to the British islands and return to Canada fliers not suited for combat duty to fly fighting planes back to England. Armament will be limited in the interest of speed.

The plane flown Saturday is similar to the XB-24, first land plane developed by Consolidated, last February, for the United States army. It weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. It is powered by four 1200-horsepower, 18-cylinder, radial air-cooled Pratt-Whitney engines. The wingspread is 110 feet, fuselage 64 feet and overall height 19 feet. Planes of this type for the United States army are capable of carrying four tons of bombs.

Tribune 11/11

First Errand of Mercy For New Guard Plane

The new Consolidated-built PBY patrol plane at the local coast guard air base made its initial mercy of errand flight Saturday when it flew to Turtle bay, down the Lower California coast, and brought back a fisherman stricken with a throat infection, Robert King, 1132 Bush st., member of the crew of the fishing boat Senator. The plane was piloted by Lt. C. G. Bowman, commanding the air base, with Lt. T. J. Harris as co-pilot.

Union 11/7/40

Housing for 61,580 Needed Here As Army, Navy, Industries Expand

In the next eight months San Diego must provide houring for 45,530 persons who will reside in private homes, in addition to 16,050 men who will be housed in barracks and camps, as a result of army, navy and industrial expansion, Arnold Klaus, assistant manager, chamber of commerce, announced yesterday after completing a new population survey.

At present, Consolidation Aircraft Corp. has 12,000 employes, Arnold said, 5500 more than when the 1940 census was enumerated. The firm plans to hire 18,000 more in the next eight months, estimating that 60 percent of these new employes will be married men, and 80 percent will come from outside San Diego county.

Ryan Aeronautical Co. plans to add 1000 to its personnel of 1400 and Solar Aircraft Co. will increase its staff by 400 to a total of 1048, Klaus said. Rohr Aircraft Co. employs 35 and will add 250 to its San Diego plant by Jan. 1 and 700 in the Chula Vista plant by July 1, 1941.

Therefore, the four aircraft plants in the San Diego area will employ a total of 20,400 new men by July 1, Klaus said. Of these, 20 percent, or 4000, will be San Diego residents and the other 16,400 will be men from outside the county, the survey indicated.

Of the out-of-county men expected, 40 percent will be single. The 60 percent in the married group, avering three to a family, will bring an influx of 29,520 persons to the county, Klaus said.

Navy forces afloat were not enumerated in the census figure of 17,000 navy and marine corps officers and men in San Diego, Klaus pointed out. This number will be increased to 27,000 by July, he said. Of the new men, 2500 will be married. Assuming the three-a-family average, this will mean 7500 additional persons will establish residences here.

CANTONMENT PLANNED

Of 2000 men and 100 officers to be stationed at Ft. Rosecrans in the next six months, 100 officers and 100 married non-commissioned officers will acquire residences in the city. Assuming three to a family, this indicates 600 additional persons.

A cantonment planned by the army for the San Diego area will accommodate 7500 soldiers, plus 1000 regular officers and troops as instructors. This camp will necessitate the assignment of 225 officers and 225 married non-commissioned officers. This means that 450 additional homes in the community will be established as a result of this camp, to accommodate, in family figures, 1350 persons.

BUSINESS TO INCREASE

All this, Klaus said, does not take into account increased employment in mercantile establishments, theaters and other businesses resulting from the increased population. Probably most of the increased employment in these various businesses will be of persons already residing in the community, he said.

To the 1940 census total of 202,038 for San Diego's metropolitan population, the survey added 10,000 residents of other states enumerated as present in the city but not credited to San Diego. Combined with populations of surrounding towns: Coronado, 6908; National City, 10,204; Chula Vista, 5126; La Mesa, 3912; El Cajon, 2500, and officers and men resident on ships at anchor in San Diego bay, 16,000; the total population for the enumerated area was given as 256,688

Consair Begins Tests of New Patrol Bombers

Union 11/6/40

Consolidated Aircraft Corp announced yesterday that the first group of the new PBY-5 twin-engined, long-range patrol bombers ordered for the navy were being given initial performance tests this week.

This type of craft, made by Consolidated for the navy, has established many group flight records from San Diego to Panama and Hawaii, and from Honolulu to the Philippines. Last March the company said it had obtained a release from the government for export sale of this type of patrol bomber for the Allies' use. The foreign contract was believed to involve a $9,000,000 expenditure.

Consolidated also is rushing a navy order for a squadron of 30-ton, four-engined, long-range patrol bombers. The huge airboats, if found satisfactory, may supplant the with the fleet patrol wings. It was understood six would be delivered twin-motored bombers in service to patrol squadron 12 at the naval air station here.

The new bombers will have a cruising range of 5000 miles, carrying a crew of nine and several tons of bombs. With a speed in excess of 200 miles an hour, they are expected to be the fastest aircraft of their type in the world.

Union 11/3/40

New Aircraft Firm To Open Plant Here

A new San Diego aviation industry will get under way in the next few days when the Weaver Aircraft Co. will begin operations, John L. Weaver, president, reported yesterday.

The company is starting business at 1341 State st., and will produce machine parts and sub-assembly jobs for aircraft manufacturing firms.

In addition the company expects to develop several of Weaver's "pancake" motors for government testing. These motors, it is claimed, develop one horsepower for each pound of weight.

Tribune 11/14

Testing New Bombers Built by Consair

Initial test flights of the first group of new PBY-5 twin-engined long-range patrol bombers ordered for the navy are being made this week, Consolidated Aircraft Corp. officials report. Consolidated also is rushing a navy order for a squadron of 30-ton, four-engined patrol bombers, with a speed in excess of 200 miles an hour.

Fire in Big Bomber Warming Up at Field

Flames shot from under the cowling of the port inboard engine of the Consolidated-built four-engine bomber, camouflaged and bearing the insignia of the R.A.F., as it warmed up on the line at Lindbergh field today.

The fire burned for several minutes before the engine was shut off, when it died out. The plane was taxied from the runway for inspection. The fire apparently caused no damage, for soon after the craft trundled down the field on its tricycle landing gear and shot into the air.

Trib. Sun 11/15/40

Consair Head Mum On New S. D. Plant

"No comments right now," said a spokesman for Consolidated Aircraft Corp. today on rumors the firm is planning to construct a large factory near Old Town for the manufacture of plane parts and accessories. The firm is building a large addition to its existing plant on Lindbergh field.

'S.D. Leading U.S. Air, Naval Base for All Time,' Claim Of Retiring Officer; New Chamber Officials Inducted

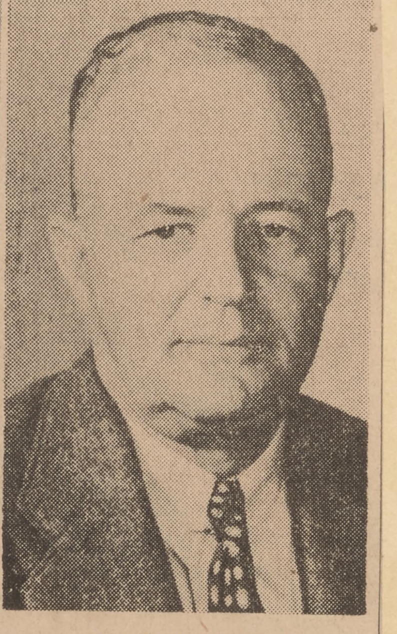
Scott Takes Gavel Of Civic Group; Future Bright

GEORGE A. SCOTT

D. R. MINSHALL

JOHN T. MARTIN



G. FRANK NOLAN

MAJ. T. C. MACAULAY

J. O. MILLER

Declaring that San Diego "for all time will accommodate a great aircraft industry and the greatest all-around navy base on the North American continent," Frank G. Forward yesterday relinquished the presidency of the chamber of commerce to George A. Scott, department store vice president and manager.

Speaking to members of the chamber's directorate, at its annual meeting, Forward urged that "any doubt as to the future of San Diego be dispelled."

"The constantly increasing importance of aircraft in national defense combined with the indisputable fact that no place in the country is so ideally adapted to the manufacture and testing of aircraft as is San Diego, means that for all time to come San Diego will accommodate a great aircraft industry established in this favored location," Forward said. "Your chamber of commerce, under its new leadership, will continue to strive untiringly to guarantee the future industrial and business welfare of your city and county."

In assuming the presidency, Scott pledged adherence to those same policies which accord the chamber of commerce opportunity to work cooperatively with "our navy, marine corps and army authorities, city and county officials, industrial and business leaders and others contributing to the economic welfare of the people of our city and county."

Other Officers Installed

Other officers elected to head the chamber in its 71st year of service to the community are D. R. Minshall, John T. Martin and G. Frank Nolan, vice presidents, and J. O. Miller, treasurer. For the 12th consecutive year, Maj. T. H. Macaulay was re-elected secretary-manager.

In concluding a 30-page report covering the multiplicity of chamber activities in 1940, Forward condemned "the defeatist attitude already apparent in certain quarters" concerning San Diego's future.

"Statements are being made," Forward declared, "that present expansion would end in the creation of a future 'ghost town.' Such statements are not only unworthy of forward-looking citizens but probably are the result of wishful thinking on the part of that small minority of our residents who fought Lindbergh field, harbor dredging, naval expansion, the Nolen plan and water conservation, and who profess to prefer the San Diego of old days of mud-flats and horse-drawn vehicles to the attractive, rapidly growing metropolis of today.

To Hold Gains

"We believe that directors of this organization speak for our business interests and progressive, forward-looking citizens in general when we state that although perhaps it is premature to discuss the aftermath of new industrial expansion before it has occurred, there is no question that there are logical reasons to believe this community can consolidate and retain a considerable portion of its new-found gains. This can be done provided it carries out the same sound program and principles which have made this city what it is today.

"Let us remember that this present industrial growth has not just happened. It was not made possible by the defeatist or by political groups. It came solely as the direct results of the recognition by your organization of an industrial future tied into the aircraft industry.

"For two decades, the San Diego chamber of commerce has pointed out that just as Detroit became a great industrial community through the development of the automotive industry, San Diego can become another great city through the development of the aircraft industry and all that goes with it.

Sales Effort Told

"A great aircraft industry moved to San Diego in 1935 from the shores of Lake Erie. It was brought here, as its dynamic head has constantly reiterated, through sales effort by this organization. However, that sales effort would have counted for little had not a rare combination of careful planning, resulting in Lindbergh field, been augmented by climatic conditions beyond compare, plnus a smooth, calm protected harbor for the testing of the great multiple motored flying boats.

"That these factors provide us with an unbeatable combination to have and to hold and expand aircraft industry has been demonstrated by the fact that two of the major manufacturers of flying boats have indicated that San Diego has it all over their present location. In fact, one of these manufacturers, only a short time ago, made the statement that in the event his directors and stockholders would permit the movement of his great plant, he would favor its location in the South Bay area of San Diego as the most ideal location he knew of in the entire country. His judgment has only recently been confirmed by the location in that area of another great naval seaplane base with an initial allocation of funds totaling $3,875,000.

Jobs For Thousands

"Let us remember that after the termination of the present emergency, the repairs, overhaul and replacement of our great military and naval air fleets now built or building will mean jobs for thousands. Let us not forget that the past decade has indicated that air transport, both over land and water, has been expanding at such tremendous pace that air transport lines have been hard-pressed to obtain enough equipment to meet new demands for this type of transportation.

"These facts spell opportunity for San Diego, opportunity to work out our destiny for San Diego to a degree undreamed of heretofore. These facts spell opportunity, however, not alone to us but to our children and our children's children.

"With all of our advantages we have been handicapped by the fact that our young people, graduates of our schools and state college, have in constantly increasing numbers been forced to seek careers elsewhere. Our future holds opportunities that demand we meet a responsibility, a responsibility for taking necessary steps and laying necessary plans that we may realize new achievements which have been placed within our reach."

Growth Destined

Forward said that with continued cooperation of progressive organizations composed of forward-looking citizens, "San Diego is destined to continue to be the fastest growing city of the west."

Steps taken by the chamber in encouraging a program of vocational training to prepare San Diego's youth for employment in the new industries here, activities of important chamber committees and the cooperation accorded important navy, marine corps and army authorities and leading industrialists during the year were summarized by the retiring president.

Vast navy expansion, including provisions for a $3,000,000 graving dock large enough to accommodate vessels up to 10,000 tons; important improvements at all local shore establishments which will raise the navy's investment here to more than $80,000,000, and the important role San Diego citizens have played in ceding areas upon which this expansion can be carried out, were stressed by Forward.

Army Areas Sought

The retiring president also emphasized the chamber's part in encouraging creation of an army cantonment in this area which will accommodate 7500 enlisted men and 1200 regular officers and troops as instructors.

"Our organization has taken the leadership in working cooperatively toward a solution of problems such as sewage disposal and water distribution and supply — problems made more complex by the tremendous influx of newcomers to San Diego who today are engaged in many industrial and military activities."

Highway development, generous entertainment of visiting congressional committees, dissemination of local and nation-wide publicity concerning San Diego city and county; valuable research work concerning major proposed developments of various kinds; inauguration of steps for strengthening San Diego's defense facilities and many other activities were reviewed in the report.

Serving with new officers as directors for the new year are N. F. Baranov, H. H. Benjamin, Lester G. Bradley, A. B. Cadman, O. W. Cotton, Charles Davies, Don C. Dickinson, Earle F. Farnsworth, Frank Forward, Morley H. Golden, Maj. Edgar N. Gott, A. D. Hagaman, Donald E. Hanson, Fred A. Heilbron, Knute Kristell, William F. La Monte, R. F. MacNally, Lawrence Oliver, Walter C. Renwick, W. D. Rudd, Donald B. Smith, Herbert Sponholz, S. M. Sullivan, Phil D. Swing, Raymond A. Wheeler, G. Campbell Janney, E. K Hilton, Irving Friedman, Rear Adm. T. J. Senn, U.S.N., ret.; O. B. Wetzell, George Stephan, T. J. Lords, Russell S. Stowell, Arthur A. Jensen and the new junior chamber of commerce president.

Maj. Macaulay introduced chamber department heads including Tom Bomar, industrial and aviation; Arnold Klaus, San Diego-California club manager; William Van Dusen, membership and military affairs; D. W. Campbell, special events and federal projects; Harold Requa jr., publicity; Ernest Hulick, junior chamber secretary; Mabel Ferrin, bookkeeping; Susanne Montague, information. Department assistants introduced by Maj. Macaulay include Gertrude S. Bradford, Anne Dunn, Kathryn Fiedeke, Kathryn Simpson, Nadine S. Joy and Faith Miller.

$15,000,000 S. D. Housing Project Approved; Work to Start at Once

Union ~~to~~ 11/1/40

Immediate construction on a $15,000,000 federal housing program here was approved yesterday by President Roosevelt. San Diego will get the largest of the 63 housing projects which will total $45,762,500.

In announcing the president's approval yesterday, Charles F. Palmer, defense housing coordinator, said the local project calls for construction of 2000 additional dwelling units, 750 dormitory rooms for single men and 1000 portable-type homes, The Associated Press reported from Washington. He estimated the work would be completed within a year and some houses would be ready in four months.

Charles A. Sloan, federal construction engineer here to supervise the big job necessitated by demand for housing defense workers, reported the site for the new community has not been selected but there were indications it might be in the Kearny mesa section.

From Washington, Palmer said the new housing "will be absorbed in the San Diego community pattern so that normal life will not be interrupted." He added the housing emergency in this city resulted from the large navy, army and aircraft expansion and asserted the project "will create dwellings equivalent to those in a town of 30,000 people."

The program is in addition to a $3,800,000 navy-family project for 1200 housing units adjoining the destroyer base and naval training station. A contract for the navy project has been awarded.

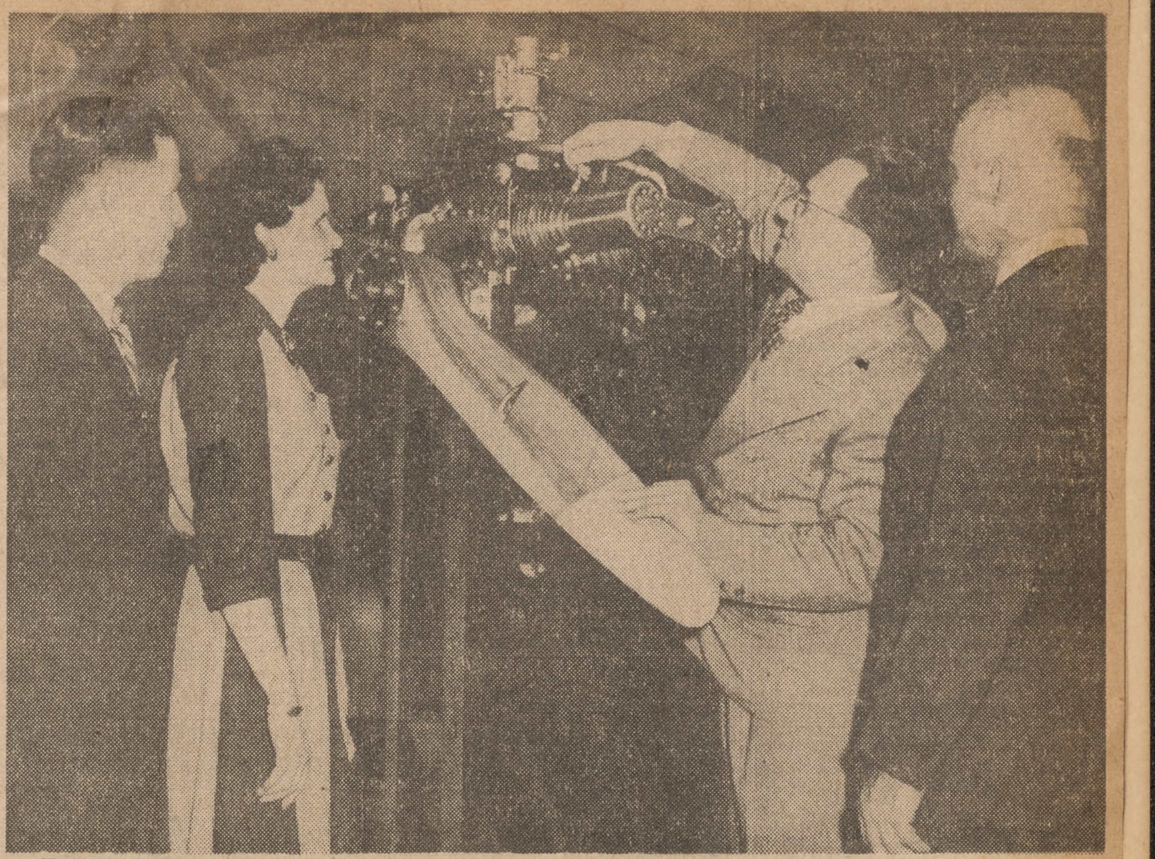
'PANCAKE' ENGINE WILL BE BUILT IN SAN DIEGO



TOM BOMAR MRS. GRACE PRESCOTT J. L. WEAVER MAJ. T. C. MACAULAY

Weaver, head of Weaver Aircraft Co., exhibits one of the engines his company will build here, to chamber of commerce executives and Mrs. Prescott, noted aviatrix. He plans one 12 times as powerful.

Trib.-Sun 11/14/40

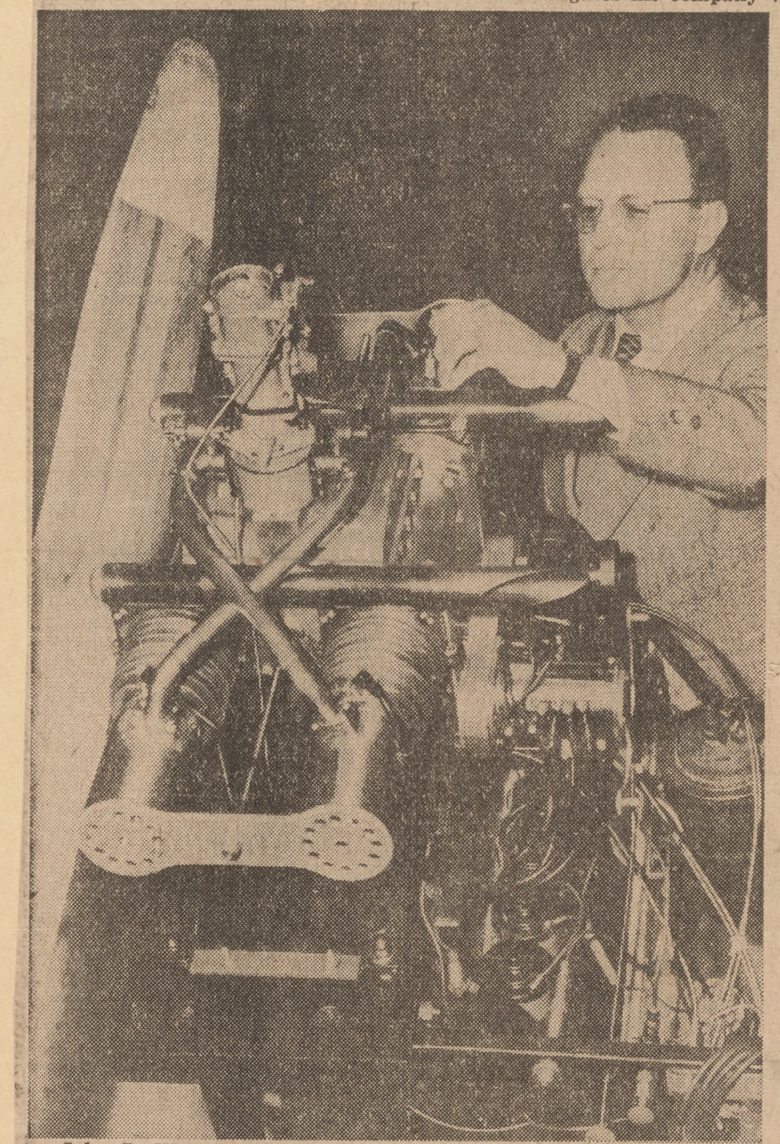
FREIGHTER HERE WITH YULE LIQUOR, CONSAIR METAL

Fresh to strong easterly winds off Pt. Loma were encountered early today by the American-Hawaiian intercoastal freighter American, which arrived from Atlantic waters with cargo for local discharge ranging from a carload of Christmas liquor to pipe and galvanized sheet metal for the new addition to the Consolidated Aircraft Corp. plant, according to report by Capt. Louis A. Carlisle, master. He reported the winds subsided as the freighter entered the harbor.

On his first visit to San Diego since 1922, when he was here aboard the American-Hawaiian freighter Dakotan, Carlisle said the last A-H freighter of which he was master, the Californian, was sunk the latter part of August soon after it had been sold to Great Britain. He turned the Californian over to an English master and crew at Mobile, Ala., July 29.

Word was received today by H. E. Holbrook, steamship agent, that the Norwegian motorship Braga is due at San Diego either Saturday or Sunday. The Braga has 500 tons of Cuban sugar aboard for discharge here.

Two westbound Quaker line freighters, the Vermont and San Clemente, are due here next Wednesday. Their cargo for San Diego ranges from marine corps trucks to canned soup.



John L. Weaver presents his 125-horsepower pancake engine in a close-up. It embodies ideas which he says give one horsepower for each pound of weight.

* * *

NEW AIRCRAFT PLANT PLANS TO BEGIN WORK NEXT WEEK

San Diego's newest factory—the Weaver Aircraft Co. plant at 1341 State st., will begin production of aviation engines and airplane parts early next week, John Weaver, company head, announced yesterday.

Contracts for engine and airplane parts already are on hand, and the company plans call for employment of approximately 150 men working two shifts. Some delay in starting operations has been experienced because part of the machinery for the plant has been delayed in arrival, Weaver said.

Along with the work of filling contracts for parts, the company will make two of the new-type Weaver engines. These machines are known as the "pancake" type and are four-cylinder supercharged models, estimated to deliver one horsepower for each pound of weight. The two to be built first will be somewhat in excess of 125 horsepower each. One is to be used by the company for its breakdown tests, and the other will be turned over to the army for military tests.

Weaver reported that plans for a 1500-horsepower model, with 24 cylinders, are now being made and he expects to have it completed within the next year.

Besides Weaver, the company's officers are Tom Keck, vice president, and Robert R. Dunn, secretary-treasurer.

TIN SMELTER FAVORED

WASHINGTON, Nov. 13 (A.P.)—A spokesman for the national defense commission today said the commission was sending a recommendation to the Reconstruction Finance Corp. for construction of a tin smelter.

Union 11/15/40

Consair Gets Huge Contract

Bringing the total backlog to $324,500,000 Consolidated Aircraft Corp. received an $18,529,500 contract yesterday from the navy department for planes and spare parts.

No details of the contract were given by the bureau of aeronautics, The Associated Press reported from Washington. Last Saturday the firm received a $75,313,000 contract from the navy for an undisclosed number of four-motored patrol bombers.

Reports are current that Consolidated soon will build a $14,000,000 factory for the manufacture of plane parts and accessories near Old Town.

Consair Gets Big Navy Order

Union 11/10/40

Backlog Tops 300-Million Mark

A contract for additional planes costing $75,313,000 yesterday was awarded to Consolidated Aircraft Corp. by the navy, it was reported in a Washington dispatch by The Associated Press.

Bringing to an estimated total of $306,000,000 the local plant's backlog, the latest planes are of types which wer not divulged, although it is understood that the order is for four-motored scouting craft of long-range type which the company has been turning out for the navy.

Types of planes, how many of each, and delivery dates were withheld, and officials at Consolidated declined comment. The order came as work was being rushed on a large addition to the factory on Lindbergh field, where a $2,000,000 extension to the plant was dedicated last Labor day.

Test flights on the first of seven 20-ton long-range bombers, reported building for the Royal Air Force, already have begun. The big four-motored plane was over San Diego yesterday.

As well as supplying planes to the American army and navy, Consolidated is turning them out for England and Australia. Two months ago, the Australian Commonwealth stated that the purchase of 11 flying boats from Consolidated had been decided upon, the planes to cost $3,500,000 and to be delivered this winter.

Operating on a 10-hour day and a five-day week, Consolidated now is reported to be employing 13,000 men.

Plane Firms Agreed On Standardization

ST. LOUIS, Nov. 9 (A.P.)—Long-sought standardization in the aircraft industry to speed plane output for national defense was pledged today by the aircraft standards committee.

The national group, organized yesterday by 22 major aircraft companies, will "develop and get into production aircraft standard parts, material and processes."

William Smith, of Bell Aircraft Co., Buffalo, chairman of the committee, said screws, rivets and protective finishes were examples of things the committee would attempt to standardize.

"The development of these standards will permit a greater degree of interchangeability and facilitate mass production, with early delivery dates resulting in quantities required for the defense program," said Smith.

PLANE PARTS SAME UNDER PROPOSAL TO SPEED OUTPUT

LOS ANGELES, Nov. 9 (A.P.)—By making one piece of metal fit several kinds of planes, the American aircraft industry has taken a long step toward speedier production and lowered costs in the air-rearmament drive, says Engineer John T. Thompson.

Standardization in aircraft design—as has long been practiced in auto design—was described in Thompson's paper before the Society of Automotive Engineers' national production meeting.

Thompson, employed by the Glenn L. Martin Co., of Baltimore, declared "judicious standardization applied to aircraft design will form one method by which the mass production of planes may be expedited."

The idea originated in the Los Angeles area, where some 60 percent of all the large airplanes made in the United States are manufactured.

A "western aircraft standard's committee" was formed in the beginning. It was followed by a similar group on the east coast, The idea is now carried out to such extent that certain unrestricted engineering information, such as test reports and research data, is circulated freely among the various companies.

A "pool" for extrusion dies is the major accomplishment of the standards committes to date.

An extruded aircraft structure is a piece of metal which has been forced through a die, or shaping machine. The pool not only enables manufacturers of aircraft to standardize on many common structural parts, but reduces die costs as well.

OUR BEST BOMBER GOING TO BRITAIN

New Ship Approved for Export Even While 'Fortress' Sale Was Under Debate

North American Newspaper Alliance.

SAN DIEGO, Calif., Nov. 17—The most powerful long-range bombers in America—and probably the world—are in production here for the Royal Air Force, it was disclosed today, even though President Roosevelt has made known that a "rule-of-thumb" policy had been set whereby Great Britain and Canada were to receive 50 per cent of American defense items now coming off factory lines.

While debate raged whether the United States should make immediately available to England quantities of its B-17 "flying fortresses," this newest bomber, known to the Army as the B-24, actually had been approved for export and test flights on the first of an undisclosed number in the R. A. F. order are now nearing completion.

Made at the Consolidated Aircraft Corporation factory here, the B-24, a 20-ton four-motored craft, is said to incorporate engineering improvements perfected since the army acquired its Boeing "flying fortresses."

Lifts Backlog To Estimated $324,500,000

Tribune-Sun 11/14/40

Coming within five days of a large order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy today announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

Details Not Disclosed

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

S. D. Bombers For British in Egypt, Word

The navy will permit Great Britain to take first deliveries on the long-range patrol bombers now coming off assembly lines of the Consolidated Aircraft Corp. plant at San Diego, The United Press reported today from Washington, D. C. The planes are expected to be used on flights from England to Egypt.

Consolidated officials made no statement, but officials at Washington emphasized that the arrangement does not involve formal negotiations or trade, such as occurred recently when the army released its biggest and newest type bombers.

Authoritative quarters said the huge twin-engined flying boats—PBY-5s—are being assembled on twin lines, one for the United States and the other for Britain, Australia and Canada. The company is understood to have orders for about 200 planes for the navy and a similar number for the others. They cost about $100,000 each.

Priority in Delieveries

The program envisages delieveries to each nation at an equal rate. The United Press informant said some delay has been encountered in obtaining sufficient wings to keep the two assembly lines operating. As a result, an informal arrangement was worked out whereby the British will get the first of the new planes until the wing supply situation is corrected.

The PBY-5s weigh 15 tons, carry a crew of five, have a reputed range of 4000 miles and a speed of about 300 miles an hour.

Aviation experts said the British easily could fly them from the British Isles to Egypt; that their long cruising range would make them especially valuable in the Mediterranean and far eastern areas. They can be serviced by tenders, making land bases unnecessary.

Trib. 11/25/40

FURTHER EXPANSION PLANNED BY CONSOLIDATED, SAYS SOLON

Declaring San Diego "is fortunate to have such a national defense project" as the Consolidated Aircraft Corp. plant, Rep. Dow Harter (D-O), chairman of the aviation subcommittee of the house committee on military affairs, prepared to leave today for March field and Los Angeles, after inspecting the Consolidated plant and conferring with Edgar N. Gott, vice president, and other officials. Gott and Harter became acquainted in Washington, D. C.

Harter intimated still further expansion is planned by Consolidated, but to date no official announcement on a project additional to the present expansion program has been made. En route to San Diego, Harter said, he stopped at the St. Louis division of the Curtiss-Wright Corp., which he described as "expanding," and at Lowry field, Denver, where, he said, the force of 4000 officers and men is expected to be doubled soon.

Accompanied by his wife, Harter spent the week-end visiting with his former Akron, O., neighbor, Ollie Morris, owner and operator of the Carlsbad hotel. This is his first visit to San Diego.

S. D. Bombers To Raid Berlin

LONDON, Nov. 21 (A.P.)—The Royal Air Force's offensive spirit flamed higher today as its bomber striking force, soon to be strengthened by the release of 26 of the United States army's big four-motored bombers, prepared for bolder and harder strokes against their powerful foe across the channel.

R.A.F. officers left little doubt the long-range Consolidated (San Diego) bombers now to come to Britain will be in the van of the attacks which they intend to extend to eastern Germany and more completely into Italy.

Equipped with the Sperry gyroscopic bombing sight, these gigantic planes also may be used for the nightly bombing "ferry service" to Berlin, they said.

R.A.F. officers said their large fuel capacity, bomb load and altitude keeping abilities made them "ideal for sustained attacks over important targets."

Other officers, who said every sign points to an early opening of a widespread air war on Italy, declared the American-made planes "are the babies to do it with."

Employment of the long-range American-made bombers also will release more British bombers for their most vital task outside the systematic attack on German industry—the steady hammering of German submarine nests along the channel, observers said.

Last night these bases at Lorient, Cherbourg, Dunkerque and Ostend were pounded again by bombers intent on strangling the submarine menace which if not checked may strangle Britain by cutting off her seaborne supplies.

The Ruhr, industrial heart of Germany, also was the objective of a "serious" British raid last night which the air ministry news service said "must inevitably have disorganized essential traffic and destroyed indispensable raw materials" at Duisburg-Ruhrort, the largest river port in the world.

Tribune-Sun 11/26/40

DELAY DELIVERY OF PLANES FOR NEW BOMBSIGHTS

Installation of the Sperry bombsight, instead of the highly secret Norden sight, on 20 Boeing "flying fortresses" sought by the British may delay their delivery for several months, it was learned today, The United Press reported from Washington, D. C. Since the flying fortresses originally were designed for the Norden sight, several changes in design and, in some cases, the actual structure of a finished plane would have to be made to permit installation of the Sperry bombsight. Substitution of the Sperry sight is one of the conditions on which the army air corps plans to release the flying fortresses, in addition to 26 heavy Consolidated bombers, to the Royal Air force.

Trib. 11/25/40

CONSAIR BIG COG IN U. S. DEFENSE, PRAISE OF SOLON

Deliveries to Great Britain first of Consolidated Aircraft Corp. long-range patrol bombers "is in keeping with what has been United States policy for several months to give all aid possible to England," Rep. Dow Harter, Dem., O., stated today as he inspected the huge San Diego plant.

Harter, chairman of the aviation sub-committee of the house committee on military affairs, added that "by permitting early deliveries of planes to England, we can have the advantage of any change which might result after the planes have been in actual usage in the war zone."

The Consolidated plant, he added, "is a very wonderful plant. I am surprised at its capacity. It is an important cog in national defense." Harter recently was re-elected to office. He came here Saturday with his wife from Akron to visit a former Akron neighbor, Ollie Morris, owner of the Carlsbad hotel. While here he decided to confer with Consolidated officials on proggress of bomber production.

Union 11/23/40

Big New Consair Bomber Tested

Test flights of a new type four-motored long-range patrol bomber, of which a number are being built by Consolidated Aircraft Corp. for the navy's patrol wings, were started here yesterday.

Similar in construction to the XPB-2Y1, in which Frank Knox, secretary of the navy, recently flew to Hawaii and return, the 30-ton airboats will be the first squadron of their design to be delivered to the navy. Six are to be delivered to Patrol Squadron 12 at the Naval Air station here.

The new bombers have a cruising range of 5000 miles carrying a crew of nine and several tons of bombs. With a speed in excess of 200 miles an hour they are rated the fastest aircraft of their type in the world.

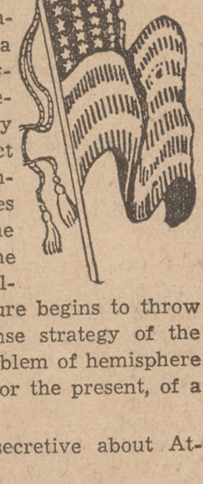
U. S. Patrol Bombers Will Guard Atlantic by Using Naval Bases Recently Acquired From Britain

By DEVON FRANCIS
Associated Press Aviation Editor

WASHINGTON, Nov. 16—The navy is buttressing defense in the Atlantic with warplanes which can fly half way to Europe in search of an enemy surface fleet. They are designed for long-distance patrol work, to flash back a wireless alarm of any hostile threat. They are designed also for heavy bombing, to make direct attacks on enemy ship concentrations, supply bases and aviation depots. The airplanes are rolling off the assembly line in big volume and their manufacture begins to throw some light on the defense strategy of the navy which faces the problem of hemisphere defense in the absence, for the present, of a two-ocean fleet.



The navy has been secretive about Atlantic defense.

A key to its plans has been the letting of huge contracts for long-range patrol bomb-

flying boats, for all practical purposes, are much like the clipper planes plying between the United States and Portugal. They are smaller in point of tonnaage by more than half but they carry heavy defensive armament and a formidable load of bombs at a cruising speed of more than 200 miles an hour.

The largest single contract for this type of plane recently was placed with the Glenn L. Martin Co., a pioneer flying boat builder, at Baltimore. The $106,125,000 being spent at the Martin Co. will provide approximately 400 of the planes, bi-motored and equipped with an odd-shaped "gull" wing.

Other contracts have been let by the navy from time to time to the Consolidated Aircraft Corp. of San Diego, another veteran builder of both commercial and military flying boats. This company, too, has received a fresh order for long-range bombers.

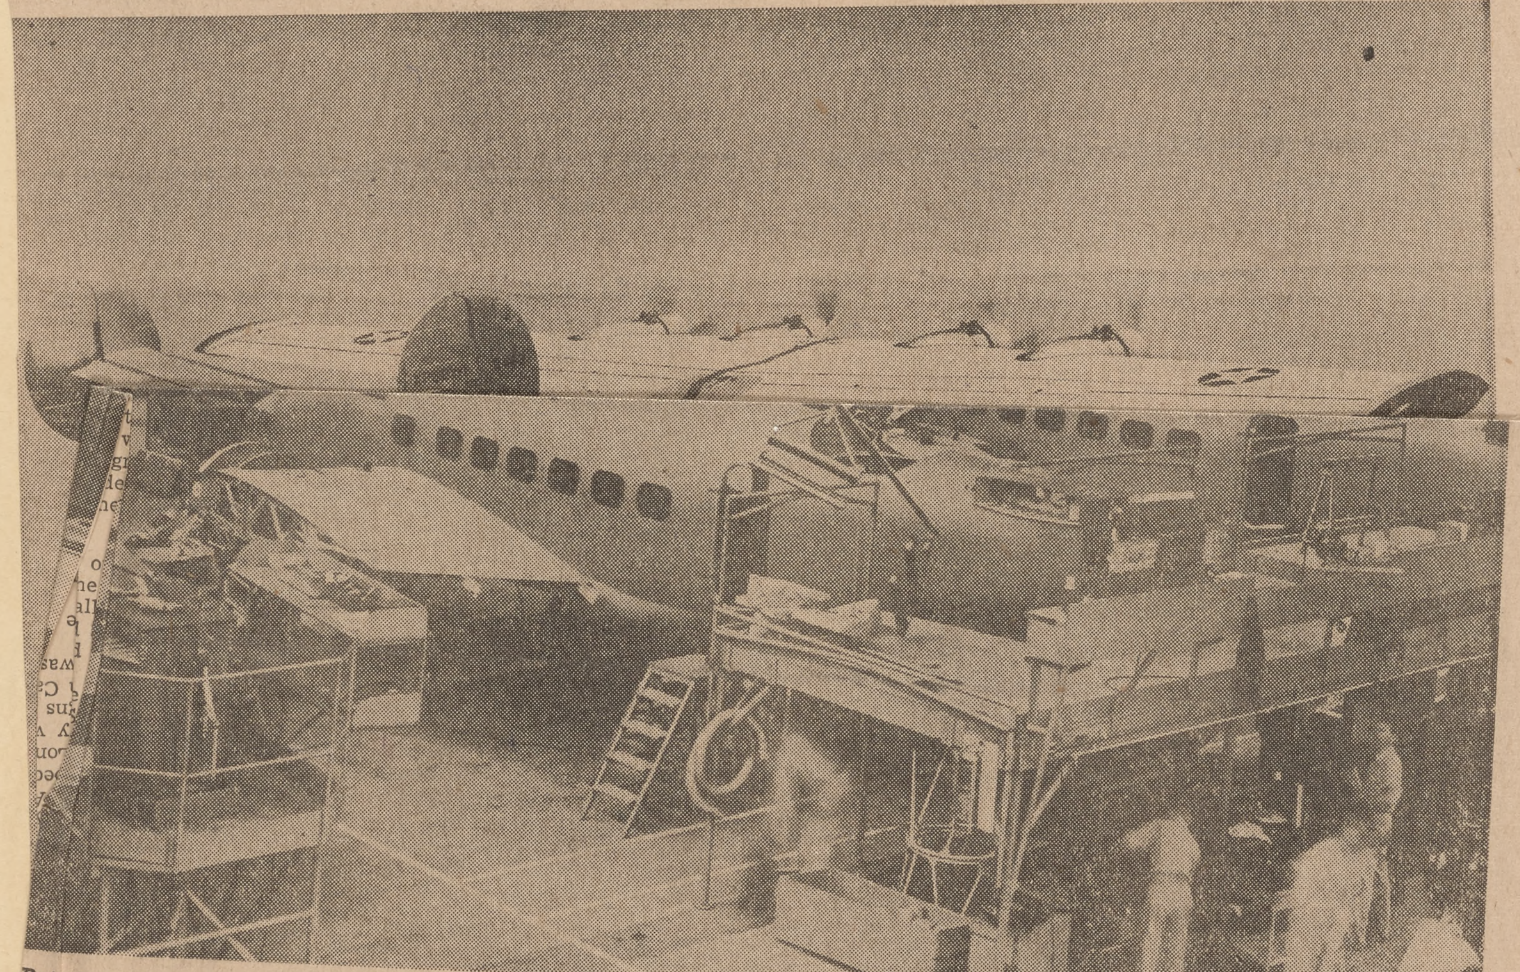
Even though the British should want half

ward from the root to place engines and propellers out of the reach of water in rough seas.

They have four visible gun emplacements for defense fire and at least one more which cannot be seen. Ample living quarters are provided for the crew to relieve the strain of long hours at sea. A secret and unique system of storing and dropping bombs is intended to make them bad news for any enemy surface vessels.

In a paper included in the Naval institute proceedings published last week, Lt. Comdr. A. B. Vosseller, skipper of a squadron of patrol bombers, remarks: "The question of whether bombers can sink battleships is, of course, of little importance, but the incontrovertible fact that ships can be bombed and unquestionably damaged must be considered by those charged with the responsibility for the national defense."

He adds that patrol bombers in formation, with concentrated fire power, ought to be almost immune to attack except by vastly superior numbers of enemy fighters. In other



Patrol and bombing planes are reported rolling off assembly lines in huge volume, as is evidenced by this view in the Lockheed plant. (Associated Press photo.)

Consolidated Plant so Big The Workers Use Bikes

1468

By DON WILEY
Member, Aviation Writers' Assn.

This may sound like the sort of boastful exaggeration the rest of the nation likes to ascribe to California, but so help me it's the literal truth:

The Consolidated Aircraft Corporation's plant at Lindbergh Field, San Diego, is so big the employes use bicycles!

You see the bikes parked in racks at intersections between the factory buildings. You observe dozens of workers pedaling merrily from one building to another, tools or blueprints in wire baskets slung on the handlebars. And every so often you step aside for one of those tricky little motor scooters.

Guess they use the scooters for really long trips—say from one end of the plant to the other.

THEY NEED SPACE

Consolidated needs a big factory, for it builds big ships, and is building them at top speed.

This is the home nest of the famous PBY's, those twin-motored patrol bomber flying boats seen so frequently in the newsreels. The PBY's have given new eyes to the Navy, which already has more than 200 of them, many of which have made amazing 2500 to 3000-mile non-stop mass flights to such distant points as Pearl Harbor and Coco Solo, Panama. If activities at Consolidated are any criterion, the Navy is going to have a lot more of them in the future.

Inside the factory you see long lines of PBY's in various stages of construction. Outside are more ships, undergoing final assembly.

And if Major R. H. Fleet, Consolidated's energetic president, is too busy to go through the factory, he has only to step from his office and glance skyward to see how his PBY's are doing. For the sky over San Diego is seldom free of the patrol bombers droning to and from their base on North Island.

TWO NEW TYPES

Consolidated is also speeding production of two new types, bigger even than the PBY's, which ought to prove sturdy bulwarks of American defense.

One type is a regular aerial battleship—a four-motored monster designated the PB2Y—about which the Navy hasn't yet released any performance or armament figures. The PB2Y is described as a patrol bomber ("PB" stands for patrol bomber) but someone has very aptly called it a "flying flagship." Visitors to the San Francisco Exposition may recall seeing the first PB2Y resting on the Treasure Island lagoon last fall.

The other big fellow is a 40,000 pound (gross weight) land bomber now in production for the Army. Known by the Air Corps as the B-24, this high-wing monoplane has a wing span of 110 feet, will carry a crew of six to nine men and tote a four-ton bomb load.

The Army admits the speed of the B-24 is "more than 300 miles per hour." After a glimpse of the four 1200-horsepower radial motors and the "clean" design of the ship, our guess would be that that figure is mild, to say the least.

Consolidated is busy on big orders of PB2Y's and B-24's.

Nov. 21, '40

26 Consair Bombers in British Hands Prior to March 1, Says Marshall

The 26 huge long-range four-motor bombers being built by Consolidated Aircraft Corp. for British purchase, will be delivered prior to March 1, The Associated Press reported today from Washington, D. C. Gen. George C. Marshall, army chief of staff, was quoted as saying it was his understanding that the first of the planes, which has been making test flights over San Diego, was delivered last Saturday.

The army, in announcing that the 26 bombers were being "made available" for British purchase, disclosed that the Sperry bombsight had been released, and indicated that Boeing "flying fortresses" might be the next installment of aerial assistance for Great Britain.

Range 3000 Miles

The Consolidated bombers, credited with a 3000-mile range, would be capable of carrying a full bomb load to almost any existing target area in Europe. From bases in the British isles, they could strike at any objective within 1500 miles and then return, or they could operate on even longer missions by shuttling between airdromes in England and British bases in the Mediterranean theater.

The release of these bombers was made known by Marshall at a press conference yesterday. He announced that the 26 bombers originally ordered by the army from Consolidated were being made available for purchase by the British as fast as they came off the production line.

Marshall revealed at the same time that the army already had made available to the British the Sperry bombsight—a mechanism used by the United States air corps before the present jealously guarded Norden bombsight replaced it. Some military sources describe the Sperry sight as "very efficient equipment," although it does not match the high efficiency of the newer Norden sight.

Marshall said flatly that no bombers released for British purchase would have the Norden sight, which has been developed by the navy and subsequently adopted by both branches of the armed services.

Given Priority

The chief of staff then announced that the negotiations were under way for the release to the British of 20 B-17C bombers—the long-distance "flying fortresses" made by the Boeing Aircraft Corp. of Seattle.

Asked if these ships would be ones already delivered to the United States army or others scheduled for delivery in the near future, he said that would depend upon whether it was faster to substitute the Sperry for the secret Norden bombsight in existing planes or in machines still on the production line.

In his announcement that the British were being given priority on first deliveries of B-24 bombers, the four-engined ships just beginning to come from the Consolidated plant, Marshall said the United States was receiving in retun sufficient engines to equip 41 of the Boeing B-17C "flying fortresses."

The British ordered these engines from an American plant early in the war, he explained. Unless the army obtained them, he said, it would have no power plants for the 41 "flying fortresses" recently delivered without engines or to be belivered before Jan. 1.

From the viewpoint of the United States, said Marshall, the primary purpose of releasing the "flying fortresses" was to obtain "an actual service test" of the B-17C. In addition, he added, this government would receive "at least the equivalent of these planes."

Union 11/24/40

Navy to Get 2000 Bombers

Half on Order From Consair

WASHINGTON, Nov. 23. (U.P.)—The navy has on order more than 2000 great bomber flying boats to give its air arm a powerful striking force, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Co., Baltimore, and Consolidated Aircraft Corp., San Diego, in the last six weeks. Martin's contract calls for approximately 1100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately 1000 PBY's at a cost of $93,842,500.

ENGINES ORDERED

Engines for the big flying boats were included in a $162,000,000 order to Pratt and Whitney.

These airships. navy air strategists believe, will give the United States control of the Atlantic ocean far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam if necessary.

REFUEL AT SEA

(Consolidated Friday started tests of its new 30-ton airboats being built for delivery to the navy. Six of these big boats will be delivered to Patrol Squadron 12 at the Naval Air station here. The new bombers have a cruising range of 5000 miles with crew of nine and several tons of bombs, and a speed in excess of 200 miles an hour).

Improvements in design of the navy's seaplane type bombers also permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be refueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the more than 2000 planes on order by mid-1941. The navy now has almost 300 similar patrol bombers which it is using on both Atlantic and Pacific patrol.

Navy sources said today that use for patrol purposes of two of the eight Atlantic island bases for which the United States traded 50 destroyers to Great Britain already has compensated for the loss of the destroyers. Patrol bombers now use bases at Bermuda and St. Lucia.

When all eight bases from New Foundland to Trinidad are in use American patrol bombers will be able to meet an invasion threat from Europe or Africa in the enemy's front yard.

COMPLETE FREEDOM

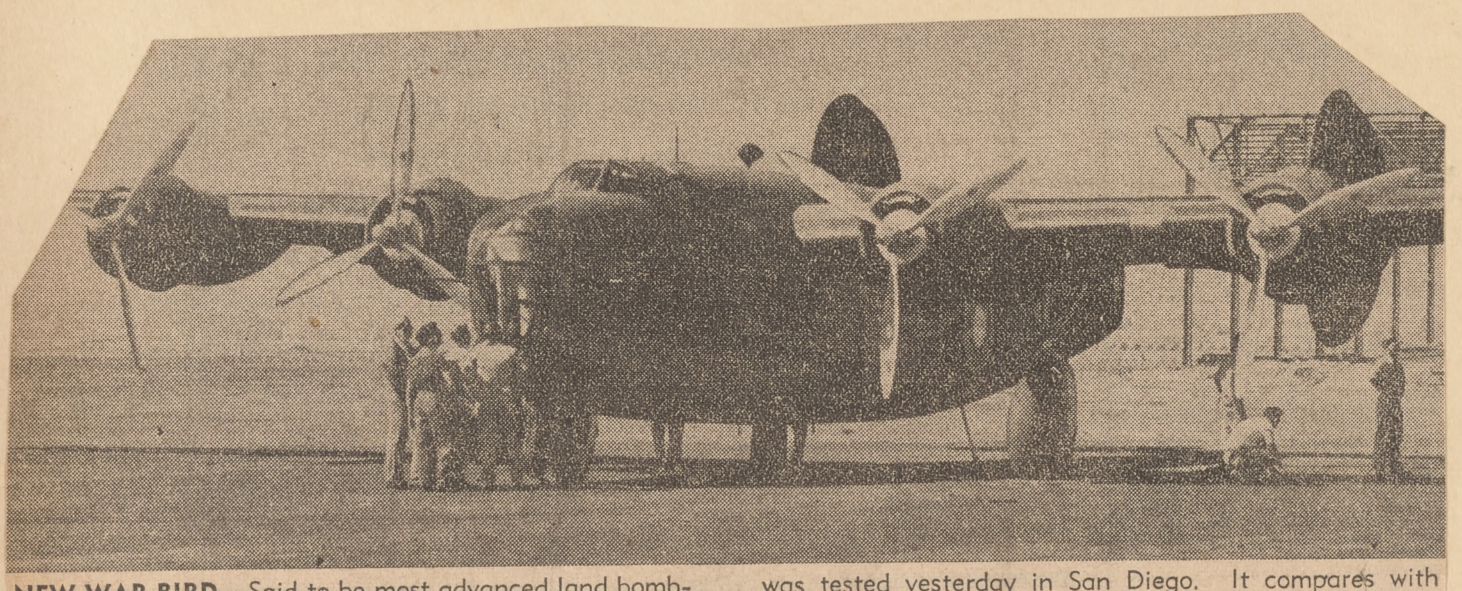
All of the navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities and as long as supplies are available ashore or afloat as near as 1000 to 1500 miles they have almost complete freedom of operation.

The parol bombers also can make forced landings at sea for minor repairs and are in this respect superior to the big four-engined army land bombers. Some of the patrol bombers carry two 1500-horsepower engines and some have four 1000-horsepower engines.

The function of the patrol bombers, in addition to scouting the movements of an enemy force at sea, would be to carry a load of three to five tons of bombs to the enemy's ships, seek to destroy aircraft carriers and then cripple the remainder of his fleet.

Equipped with the navy's prized secret Norden bomb sight, the patrol bombers in sufficient numbers might be able to wipe out an attempt to invade the western hemisphere before the fleet could act.

NEW $18,529,500 CONTRACT FOR CONSAIR



NEW WAR BIRD—Said to be most advanced land bomber in world, this new plane, first of order for Great Britain, was tested yesterday in San Diego. It compares with flying fortresses and contains many new improvements.

S. D. Bombers For British in Egypt, Word

The navy will permit Great Britain to take first deliveries on the long-range patrol bombers now coming off assembly lines of the Consolidated Aircraft Corp. plant at San Diego, The United Press reported today from Washington, D. C. The planes are expected to be used on flights from England to Egypt.

Consolidated officials made no statement, but officials at Washington emphasized that the arrangement does not involve formal negotiations or trade, such as occurred recently when the army released its biggest and newest type bombers.

Authoritative quarters said the huge twin-engined flying boats—PBY-5s—are being assembled on twin lines, one for the United States and the other for Britain, Australia and Canada. The company is understood to have orders for about 200 planes for the navy and a similar number for the others. They cost about $100,000 each.

Priority in Delieveries

The program envisages delieveries to each nation at an equal rate. The United Press informant said some delay has been encountered in obtaining sufficient wings to keep the two assembly lines operating. As a result, an informal arrangement was worked out whereby the British will get the first of the new planes until the wing supply situation is corrected.

The PBY-5s weigh 15 tons, carry a crew of five, have a reputed range of 4000 miles and a speed of about 300 miles an hour.

Aviation experts said the British easily could fly them from the British Isles to Egypt; that their long cruising range would make them especially valuable in the Mediterranean and far eastern areas. They can be serviced by tenders, making land bases unnecessary.

Trib. 11/25/40

FURTHER EXPANSION PLANNED BY CONSOLIDATED, SAYS SOLON

Declaring San Diego "is fortunate to have such a national defense project" as the Consolidated Aircraft Corp. plant, Rep. Dow Harter (D-O), chairman of the aviation subcommittee of the house committee on military affairs, prepared to leave today for March field and Los Angeles, after inspecting the Consolidated plant and conferring with Edgar N. Gott, vice president, and other officials. Gott and Harter became acquainted in Washington, D. C.

Harter intimated still further expansion is planned by Consolidated, but to date no official announcement on a project additional to the present expansion program has been made. En route to San Diego, Harter said, he stopped at the St. Louis division of the Curtiss-Wright Corp., which he described as "expanding," and at Lowry field, Denver, where, he said, the force of 4000 officers and men is expected to be doubled soon.

Accompanied by his wife, Harter spent the week-end visiting with his former Akron, O., neighbor, Ollie Morris, owner and operator of the Carlsbad hotel. This is his first visit to San Diego.

PLANE PARTS SAME UNDER PROPOSAL TO SPEED OUTPUT

LOS ANGELES, Nov. 9 (A.P.)—By making one piece of metal fit several kinds of planes, the American aircraft industry has taken a long step toward speedier production and lowered costs in the air-rearmament drive, says Engineer John T. Thompson.

Standardization in aircraft design—as has long been practiced in auto design—was described in Thompson's paper before the Society of Automotive Engineers' national production meeting.

Thompson, employed by the Glenn L. Martin Co., of Baltimore, declared "judicious standardization applied to aircraft design will form one method by which the mass production of planes may be expedited."

The idea originated in the Los Angeles area, where some 60 percent of all the large airplanes made in the United States are manufactured.

A "western aircraft standard's committee" was formed in the beginning. It was followed by a similar group on the east coast, The idea is now carried out to such extent that certain unrestricted engineering information, such as test reports and research data, is circulated freely among the various companies.

A "pool" for extrusion dies is the major accomplishment of the standards committes to date.

An extruded aircraft structure is a piece of metal which has been forced through a die, or shaping machine. The pool not only enables manufacturers of aircraft to standardize on many common structural parts, but reduces die costs as well.

Union 11/22/40

S. D. Bombers To Raid Berlin

LONDON, Nov. 21 (A.P.)—The Royal Air Force's offensive spirit flamed higher today as its bomber striking force, soon to be strengthened by the release of 26 of the United States army's big four-motored bombers, prepared for bolder and harder strokes against their powerful foe across the channel.

R.A.F. officers left little doubt the long-range Consolidated (San Diego) bombers now to come to Britain will be in the van of the attacks which they intend to extend to eastern Germany and more completely into Italy.

Equipped with the Sperry gyroscopic bombing sight, these gigantic planes also may be used for the nightly bombing "ferry service" to Berlin, they said.

R.A.F. officers said their large fuel capacity, bomb load and altitude keeping abilities made them "ideal for sustained attacks over important targets."

Other officers, who said every sign points to an early opening of a widespread air war on Italy, declared the American-made planes "are the babies to do it with."

Employment of the long-range American-made bombers also will release more British bombers for their most vital task outside the systematic attack on German industry—the steady hammering of German submarine nests along the channel, observers said.

Last night these bases at Lorient, Cherbourg, Dunkerque and Ostend were pounded again by bombers intent on strangling the submarine menace which if not checked may strangle Britain by cutting off her seaborne supplies.

The Ruhr, industrial heart of Germany, also was the objective of a "serious" British raid last night which the air ministry news service said "must inevitably have disorganized essential traffic and destroyed indispensable raw materials" at Duisburg-Ruhrort, the largest river port in the world.

OUR BEST BOMBER GOING TO BRITAIN

New Ship Approved for Export Even While 'Fortress' Sale Was Under Debate

North American Newspaper Alliance.

SAN DIEGO, Calif., Nov. 17—The most ~~powerful~~ long-range bombers in America—and probably the world—are in production here for the Royal Air Force, it was disclosed today, even though President Roosevelt has made known that a "rule-of-thumb" policy had been set whereby Great Britain and Canada were to receive 50 per cent of American defense items now coming off factory lines.

While debate raged whether the United States should make immediately available to England quantities of its B-17 "flying fortresses," this newest bomber, known to the Army as the B-24, actually had been approved for export and test flights on the first of an undisclosed number in the R. A. F. order are now nearing completion.

Made at the Consolidated Aircraft Corporation factory here, the B-24, a 20-ton four-motored craft, is said to incorporate engineering improvements perfected since the army acquired its Boeing "flying fortresses."

Tribune-Sun 11/26/40

DELAY DELIVERY OF PLANES FOR NEW BOMBSIGHTS

Installation of the Sperry bombsight, instead of the highly secret Norden sight, on 20 Boeing "flying fortresses" sought by the British may delay their delivery for several months, it was learned today, The United Press reported from Washington, D. C. Since the flying fortresses originally were designed for the Norden sight, several changes in design and, in some cases, the actual structure of a finished plane would have to be made to permit installation of the Sperry bombsight. Substitution of the Sperry sight is one of the conditions on which the army air corps plans to release the flying fortresses, in addition to 26 heavy Consolidated bombers, to the Royal Air force.

Lifts Backlog To Estimated $324,500,000

Tribune-Sun 11/14/40

Coming within five days of a large order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy today announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

Details Not Disclosed

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

CONSAIR BIG COG IN U. S. DEFENSE, PRAISE OF SOLON

Deliveries to Great Britain first of Consolidated Aircraft Corp. long-range patrol bombers "is in keeping with what has been United States policy for several months to give all aid possible to England," Rep. Dow Harter, Dem., O., stated today as he inspected the huge San Diego plant.

Harter, chairman of the aviation sub-committee of the house committee on military affairs, added that "by permitting early deliveries of planes to England, we can have the advantage of any change which might result after the planes have been in actual usage in the war zone."

The Consolidated plant, he added, "is a very wonderful plant. I am surprised at its capacity. It is an important cog in national defense." Harter recently was re-elected to office. He came here Saturday with his wife from Akron to visit a former Akron neighbor, Ollie Morris, owner of the Carlsbad hotel. While here he decided to confer with Consolidated officials on proggress of bomber production.

Union 11/23/40

Big New Consair Bomber Tested

Test flights of a new type four-motored long-range patrol bomber, of which a number are being built by Consolidated Aircraft Corp. for the navy's patrol wings, were started here yesterday.

Similar in construction to the XPB-2Y1, in which Frank Knox, secretary of the navy, recently flew to Hawaii and return, the 30-ton airboats will be the first squadron of their design to be delivered to the navy. Six are to be delivered to Patrol Squadron 12 at the Naval Air station here.

The new bombers have a cruising range of 5000 miles carrying a crew of nine and several tons of bombs. With a speed in excess of 200 miles an hour they are rated the fastest aircraft of their type in the world.

U. S. Patrol Bombers Will Guard Atlantic by Using Naval Bases Recently Acquired From Britain

By DEVON FRANCIS
Associated Press Aviation Editor

WASHINGTON, Nov. 16—The navy is buttressing defense in the Atlantic with warplanes which can fly half way to Europe in search of an enemy surface fleet. They are designed for long-distance patrol work, to flash back a wireless alarm of any hostile threat. They are designed also for heavy bombing, to make direct attacks on enemy ship concentrations, supply bases and aviation depots. The airplanes are rolling off the assembly line in big volume and their manufacture begins to throw some light on the defense strategy of the navy which faces the problem of hemisphere defense in the absence, for the present, of a two-ocean fleet.

The navy has been secretive about Atlantic defense.

A key to its plans has been the letting of huge contracts for long-range patrol bombers for quick production while shipyards get geared to the infinitely slower job of turning out more surface vessels.

Bases acquired from the British under the administration's destroyer trade and probably other bases which will become available in Latin America, in addition to ports under the American flag, will be used by the new fleet of bombers.

The patrol bomber, essentially an American invention, grew out of the big, multi-motored flying boats which braved the Atlantic crossing back in 1919. One, it will be remembered, did get to Europe. The new flying boats, for all practical purposes, are much like the clipper planes plying between the United States and Portugal. They are smaller in point of tonnaage by more than half but they carry heavy defensive armament and a formidable load of bombs at a cruising speed of more than 200 miles an hour.

The largest single contract for this type of plane recently was placed with the Glenn L. Martin Co., a pioneer flying boat builder, at Baltimore. The $106,125,000 being spent at the Martin Co. will provide approximately 400 of the planes, bi-motored and equipped with an odd-shaped "gull" wing.

Other contracts have been let by the navy from time to time to the Consolidated Aircraft Corp. of San Diego, another veteran builder of both commercial and military flying boats. This company, too, has received a fresh order for long-range bombers.

Even though the British should want half the United States patrol bomber output, several hundred will be available for hemisphere defense in the next 12 months. Already in service are Consolidated flying boats which have taken the Pacific in stride on "routine" flights.

The new 20-ton Martin planes stand out in the defense picture principally because of the rapidity with which they are being produced at the expanded Baltimore plant.

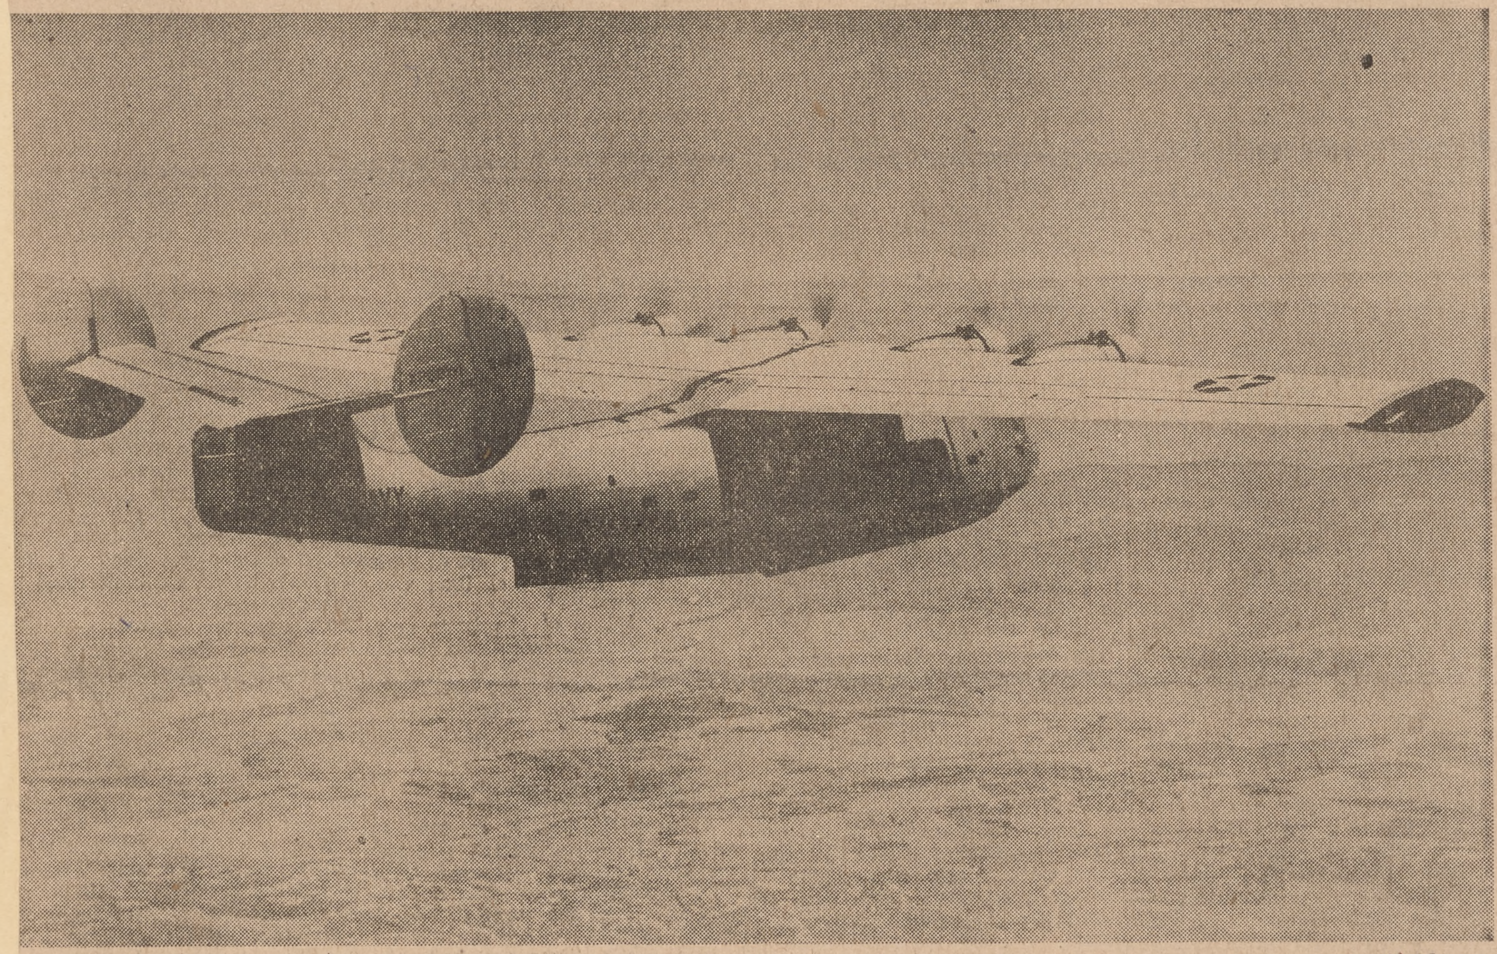
In addition to being exceptionally fast for flying boats with hulls that create "drag" problems at high speed, the Martins, known as P.B.M.-1's, have wings which thrust upward from the root to place engines and propellers out of the reach of water in rough seas.

They have four visible gun emplacements for defense fire and at least one more which cannot be seen. Ample living quarters are provided for the crew to relieve the strain of long hours at sea. A secret and unique system of storing and dropping bombs is intended to make them bad news for any enemy surface vessels.

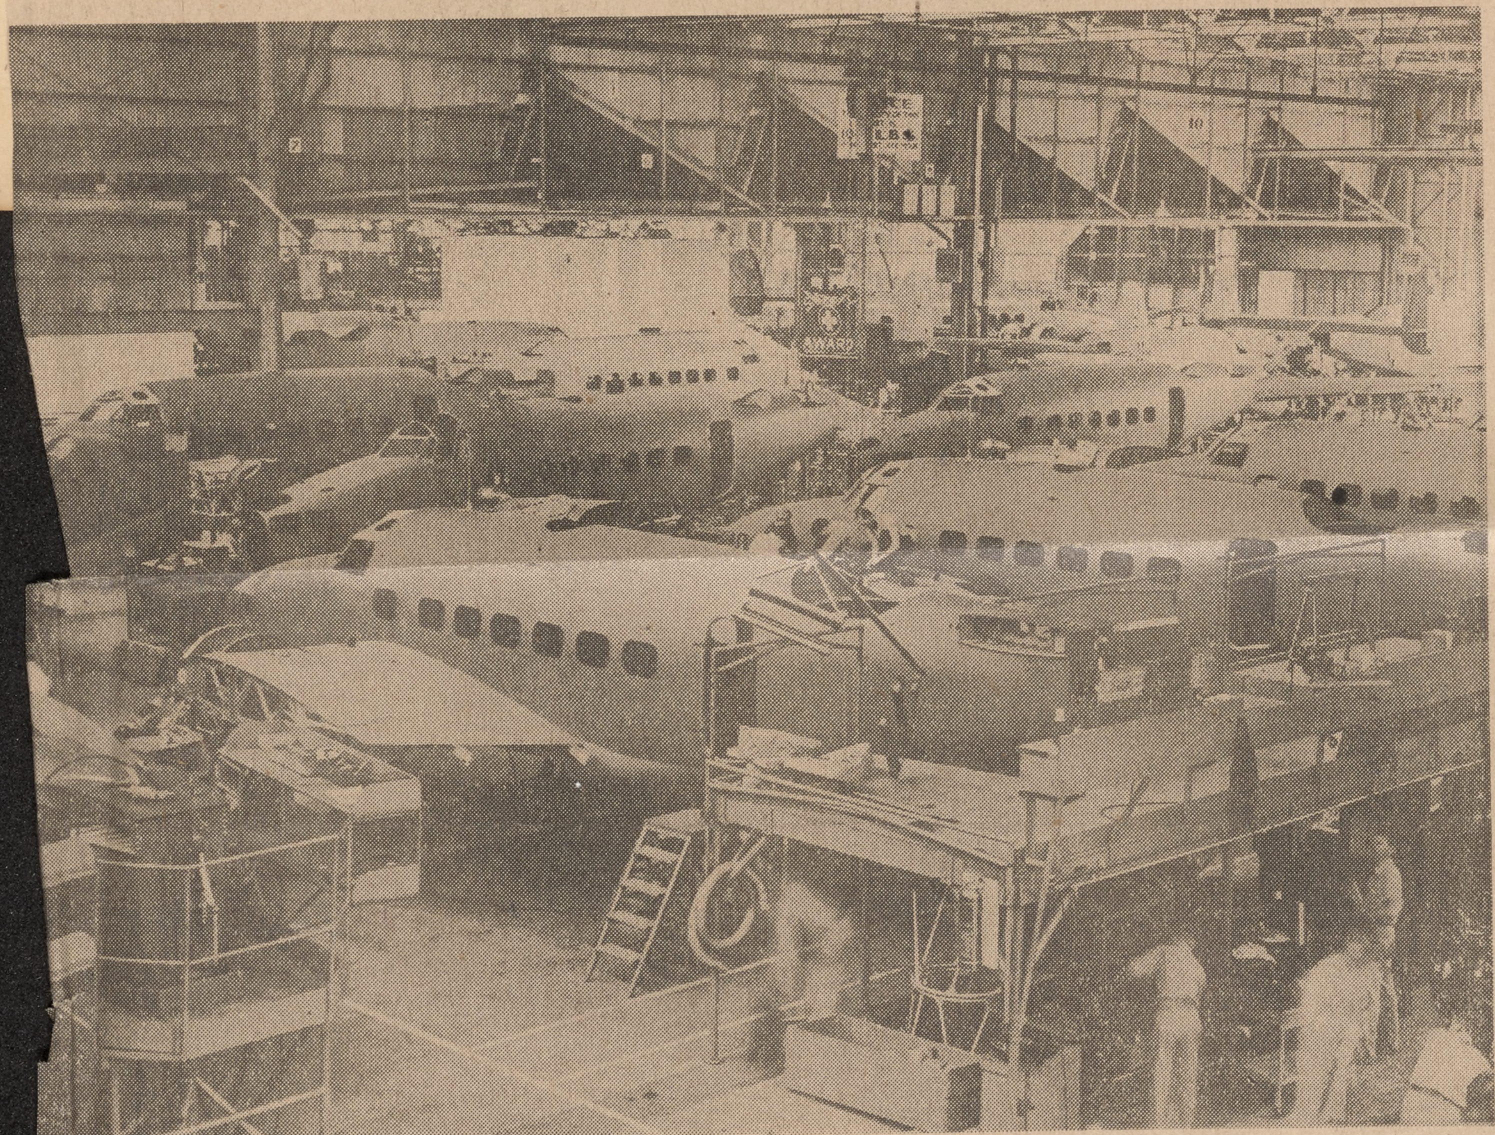
In a paper included in the Naval institute proceedings published last week, Lt. Comdr. A. B. Vosseller, skipper of a squadron of patrol bombers, remarks: "The question of whether bombers can sink battleships is, of course, of little importance, but the incontrovertible fact that ships can be bombed and unquestionably damaged must be considered by those charged with the responsibility for the national defense."

He adds that patrol bombers in formation, with concentrated fire power, ought to be almost immune to attack except by vastly superior numbers of enemy fighters. In other words, it would require the air fighting power of several enemy aircraft carriers to cope successfully with the patrol bombers which, in the next few months, can be marshaled to meet any threat of invasion by sea.

For mid-ocean patrol purposes, the new planes can be refueled at sea by tenders if necessary. Their hulls are built to take the shock of landings and takeoffs in pretty rough water. Armor, for crew protection, surrounds the "bridge" and gun stations. Self-sealing gasoline tanks are insurance against loss of fuel or fire from bullet punctures.



Long range bombers, such as this Consair craft, soon will patrol the Atlantic, using the bases recently made available to U.S. through our destroyer deal with England. (U.S. Navy official photo.)



Patrol and bombing planes are reported rolling off assembly lines in huge volume, as is evidenced by this view in the Lockheed plant. (Associated Press photo.)

Consolidated Plant so Big The Workers Use Bikes

By DON WILEY 1468
Member, Aviation Writers' Assn.

This may sound like the sort of boastful exaggeration the rest of the nation likes to ascribe to California, but so help me it's the literal truth:

The Consolidated Aircraft Corporation's plant at Lindbergh Field, San Diego, is so big the employes use bicycles!

You see the bikes parked in racks at intersections between the factory buildings. You observe dozens of workers pedaling merrily from one building to another, tools or blueprints in wire baskets slung on the handlebars. And every so often you step aside for one of those tricky little motor scooters.

Guess they use the scooters for really long trips—say from one end of the plant to the other.

THEY NEED SPACE

Consolidated needs a big factory, for it builds big ships, and is building them at top speed.

This is the home nest of the famous PBY's, those twin-motored patrol bomber flying boats seen so frequently in the newsreels. The PBY's have given new eyes to the Navy, which already has more than 200 of them, many of which have made amazing 2500 to 3000-mile non-stop mass flights to such distant points as Pearl Harbor and Coco Solo, Panama. If activities at Consolidated are any criterion, the Navy is going to have a lot more of them in the future.

Inside the factory you see long lines of PBY's in various stages of construction. Outside are more ships, undergoing final assembly. And if Major R. H. Fleet, Consolidated's energetic president, is too busy to go through the factory, he has only to step from his office and glance skyward to see how his PBY's are doing. For the sky over San Diego is seldom free of the patrol bombers droning to and from their base on North Island.

TWO NEW TYPES

Consolidated is also speeding production of two new types, bigger even than the PBY's, which ought to prove sturdy bulwarks of American defense.

One type is a regular aerial battleship—a four-motored monster designated the PB2Y—about which the Navy hasn't yet released any performance or armament figures. The PB2Y is described as a patrol bomber ("PB" stands for patrol bomber) but someone has very aptly called it a "flying flagship." Visitors to the San Francisco Exposition may recall seeing the first PB2Y resting on the Treasure Island lagoon last fall.

The other big fellow is a 40,000 pound (gross weight) land bomber now in production for the Army. Known by the Air Corps as the B-24, this high-wing monoplane has a wing span of 110 feet, will carry a crew of six to nine men and tote a four-ton bomb load.

The Army admits the speed of the B-24 is "more than 300 miles per hour." After a glimpse of the four 1200-horsepower radial motors and the "clean" design of the ship, our guess would be that that figure is mild, to say the least.

Consolidated is busy on big orders of PB2Y's and B-24's.

Nov. 21 '40

26 Consair Bombers in British Hands Prior to March 1, Says Marshall

The 26 huge long-range four-motor bombers being built by Consolidated Aircraft Corp. for British purchase, will be delivered prior to March 1, The Associated Press reported today from Washington, D. C. Gen. George C. Marshall, army chief of staff, was quoted as saying it was his understanding that the first of the planes, which has been making test flights over San Diego, was delivered last Saturday.

The army, in announcing that the 26 bombers were being "made available" for British purchase, disclosed that the Sperry bombsight had been released, and indicated that Boeing "flying fortresses" might be the next installment of aerial assistance for Great Britain.

Range 3000 Miles

The Consolidated bombers, credited with a 3000-mile range, would be capable of carrying a full bomb load to almost any existing target area in Europe. From bases in the British isles, they could strike at any objective within 1500 miles and then return, or they could operate on even longer missions by shuttling between airdromes in England and British bases in the Mediterranean theater.

The release of these bombers was made known by Marshall at a press conference yesterday. He announced that the 26 bombers originally ordered by the army from Consolidated were being made available for purchase by the British as fast as they came off the production line.

Marshall revealed at the same time that the army already had made available to the British the Sperry bombsight—a mechanism used by the United States air corps before the present jealously guarded Norden bombsight replaced it. Some military sources describe the Sperry sight as "very efficient equipment," although it does not match the high efficiency of the newer Norden sight.

Marshall said flatly that no bombers released for British purchase would have the Norden sight, which has been developed by the navy and subsequently adopted by both branches of the armed services.

Given Priority

The chief of staff then announced that the negotiations were under way for the release to the British of 20 B-17C bombers—the long-distance "flying fortresses" made by the Boeing Aircraft Corp. of Seattle.

Asked if these ships would be ones already delivered to the United States army or others scheduled for delivery in the near future, he said that would depend upon whether it was faster to substitute the Sperry for the secret Norden bombsight in existing planes or in machines still on the production line.

In his announcement that the British were being given priority on first deliveries of B-24 bombers, the four-engined ships just beginning to come from the Consolidated plant, Marshall said the United States was receiving in retun sufficient engines to equip 41 of the Boeing B-17C "flying fortresses."

The British ordered these engines from an American plant early in the war, he explained. Unless the army obtained them, he said, it would have no power plants for the 41 "flying fortresses" recently delivered without engines or to be belivered before Jan. 1.

From the viewpoint of the United States, said Marshall, the primary purpose of releasing the "flying fortresses" was to obtain "an actual service test" of the B-17C. In addition, he added, this government would receive "at least the equivalent of these planes."

Union 11/24/40

Navy to Get 2000 Bombers

Half on Order From Consair

WASHINGTON, Nov. 23. (U.P.)—The navy has on order more than 2000 great bomber flying boats to give its air arm a powerful striking force, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Co., Baltimore, and Consolidated Aircraft Corp., San Diego, in the last six weeks. Martin's contract calls for approximately 1100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately 1000 PBY's at a cost of $93,842,500.

ENGINES ORDERED

Engines for the big flying boats were included in a $162,000,000 order to Pratt and Whitney.

These airships, navy air strategists believe, will give the United States control of the Atlantic ocean far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam if necessary.

REFUEL AT SEA

(Consolidated Friday started tests of its new 30-ton airboats being built for delivery to the navy. Six of these big boats will be delivered to Patrol Squadron 12 at the Naval Air station here. The new bombers have a cruising range of 5000 miles with crew of nine and several tons of bombs, and a speed in excess of 200 miles an hour).

Improvements in design of the navy's seaplane type bombers also permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be refueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the more than 2000 planes on order by mid-1941. The navy now has almost 300 similar patrol bombers which it is using on both Atlantic and Pacific patrol.

Navy sources said today that use for patrol purposes of two of the eight Atlantic island bases for which the United States traded 50 destroyers to Great Britain already has compensated for the loss of the destroyers. Patrol bombers now use bases at Bermuda and St. Lucia.

When all eight bases from New Foundland to Trinidad are in use American patrol bombers will be able to meet an invasion threat from Europe or Africa in the enemy's front yard.

COMPLETE FREEDOM

All of the navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities and as long as supplies are available ashore or afloat as near as 1000 to 1500 miles they have almost complete freedom of operation.

The parol bombers also can make forced landings at sea for minor repairs and are in this respect superior to the big four-engined army land bombers. Some of the patrol bombers carry two 1500-horsepower engines and some have four 1000-horsepower engines.

The function of the patrol bombers, in addition to scouting the movements of an enemy force at sea, would be to carry a load of three to five tons of bombs to the enemy's ships, seek to destroy aircraft carriers and then cripple the remainder of his fleet.

Equipped with the navy's prized secret Norden bomb sight, the patrol bombers in sufficient numbers might be able to wipe out an attempt to invade the western hemisphere before the fleet could act.

BRITISH GET S.D. BOMBERS, U.S. BOMB SIGHT

Union 11/21/40

Britain to Get 24 S.D. Planes, Army Bombsight

Boeing to Release 20 of 'Flying Fortress' Type

Twenty-six four-motored long-range patrol bombers, one of which completed its flight tests last week, are to be delivered by the Consolidated Aircraft Corp. to the British Royal Flying corps, the war department announced yesterday. The planes will be equipped with the famous secret army bombsight.

Twenty other four-motored bombers, similar in type to the army's famed "flyng fortress," are to be delivered to Great Britain by the Boeing plant at Seattle.

PRIORITY GRANTED

The Associated Press reported from Washington that Gen. George C. Marshall, army chief of staff, had granted a priority delivery of the Consolidataed planes to Great Britain in an exchange of priority of engines ordered by the British.

The Boeing-built bombers are to be turned over to the R. A. F. when a basis of release, now being negotiated, has been reached.

The Boeing and Consolidated bombers, each capable of cruising more than 3000 miles carrying four tons of heavy demolition bombs, will be able to reach any section of Germany from flying bases in the British isles and return easily without refueling, it is said.

Consolidated authorities refused comment on the plane delivery.

CAMOUFLAGE PLANNED

The 26 Consolidated bombers, when released from the final assembly plant, will be painted with the R.A.F. insignia and camouflaged similarly to the plane tested last week.

The other 20 bombers are of the B-17 type and will be fitted with the secret bombsight before being sent abroad.

The bombers, urgently desired by Britain for long-distance raids on Germany and Mediterranean objectives, will thus have the added advantage of a bombsight unequalled by any other warring power, International News Service reported.

The only other comparable one is also a U. S. product and vital military secret. Manufactured by the Norden Co. and developed by the navy, it is now standard equipment on planes in both military branches. The latter sight is not being released, Gen. Marshall said.

U. S. HAS OBSERVERS

In revealing the deals to give Great Britain immediate supplies of super-bombers, Gen. Marshall at a press conference also disclosed that the U. S. army has some of its aviators flying in British war planes as observers, but only on those that fly over the British isles and over the English channel.

"We have a string of observers with the British army," Gen. Marshall said.

U. S. artillery, anti-aircraft, ordnance and other officers are with the British army. Observers have been sent to Egypt to gather information there, he revealed. Later, Secretary of the Navy Frank Knox told newsmen the navy also has observers with the British navy.

And U. S. naval aircraft already have begun using Bermuda and St. Lucia, two of the British base-sites recently approved by the U. S. in their patrolling of the Atlantic neutrality zone, he said.

While details on areas to be used at Trinidad in the Caribbean sea are yet to be arranged, all of the harbors acquired by President Roosevelt in the historic transfer of 50 U. S. destroyers, are now usable for the United States fleet, Knox

THE

Italy Marked For Raids by S. D. Bombers

San Diego-made Consolidated four-motor army bombers will rain death and destruction over Europe, according to plans of the British to use the 26 planes ordered from here in bolder and harder strokes against their foes across the English channel. The Associated Press, in a dispatch from London, said R.A.F. officers left little doubt the long-range Consolidated bombers will be in the van of the attacks which they intend to extend to eastern Germany and more completely into Italy.

Equipped with the Sperry gyroscopic bombing sight, these gigantic planes also may be used for the nightly bombing "ferry service" to Berlin, they said.

R.A.F. officers said their large fuel capacity, bomb load and altitude-keeping abilities made them "ideal for sustained attacks over important targets."

"Are Babies To Do It"

Other officers, who said every sign points to an early opening of a widespread air war on Italy, declared the American-made planes "are the babies to do it with."

Employment of the long-range American-made bombers also will release more British bombers for their most vital task outside the systematic attack on German industry—the steady hammering of German submarine nests along the channel, observers said.

Last night these bases at Lorient, Cherbourg, Dunkerque and Ostend were pounded again by bombers intent on strangling the submarine menace which if not checked may strangle Britain by cutting off her seaborne supplies.

The Ruhr, industrial heart of Germany, also was the objective of a "serious" British raid last night which the air ministry news service said "must inevitably have disorganized essential traffic and destroyed indispensable raw materials" at Duisburg-Ruhrort, the largest river port in the world.

$342,169 Added To Consair List

The gigantic backlog of the Consolidated Aircraft Corp. was increased $342,169 today by the war department, in a new contract to cover increased costs of specification changes in airplanes now under construction, The Associated Press reported from Washington, D. C. Among the $19,620,000 total orders placed by the army today for equipment and supplies for the air corps, ordnance department and quartermaster corps were: Ford Motor Co., Detroit, trucks, $1,387,500, and passenger cars, $625,000; Standard Oil Co., San Francisco, airplane fuel, $101,250; Shell Oil Co., Inc., St. Louis, airplane fuel, $103,044, and Duncan & Son, Inc., Seattle, saddles, $100,000. Delivery dates were not disclosed.

Aircraft News 11/14/40

FOUR-MOTOR RAF BOMBER IN TEST FLIGHT

SAN DIEGO. — While debate rages as to whether the Army Air Corps' flying fortresses have been or are to be sent to Great Britain, a camouflaged giant four-motored bomber with Royal Air Force markings was given its first test flight from Lindbergh Field here last Monday.

Performance characteristics it was reliably reported, reflect aerodynamic improvements perfected by the aircraft industry since the flying fortresses were accepted by the Army Air Corps, indicating it is the most advanced land bomber in the world.

MAY FLY ATLANTIC

A large number — the exact amount is undisclosed—is under production at Consolidated for the Royal Air Force and the planes probably will be fiown across the Atlantic to Great Britain as fast as they roll off the assembly lines here.

Capable of carrying four tons of bombs at a speed of 300 miles per hour more than 3000 miles nonstop, the Consolidated bombers are expected to be employed by Great Britain in ever-increasing quantities next spring in long-distance battering of enemy objectives.

The plane used in the test was painted a mottled brown and green, with the top of the 110-foot wing made to resemble fields of grass and grain. Pilot Georgge Newman was in charge.

CARRIES LIGHT CANNON

Length of the fuselage is 64 feet, overall height is 19 feet and the three-bladed propellers are 12 feet in diameter. Six to nine men are required to operate it, depending on tactical requirements.

The engines are 18-cylinder twin-row radial air-cooled and the all-metal fuselage is equipped with hatches and windows in the nose, tail, turtle deck, back and bottom, affording machine gun and light cannon protection on all sides. The landing gear is of tricycle type.

---

26 Turned Out By Consair; 1 Delivered

The army high command today acted to release 46 of the largest United States bombing planes, 26 of which are being built by the Consolidated Aircraft Co. here, to Great Britain, it is announced in dispatches of the Associated Press from Washington.

In Two Categories

The dispatches also carried the information that one of two high-accuracy bomb sights developed in the United States already has been released for use by the British.

The 46 bombing planes for which release has been announced fall into two categories, Gen. George C. Marshall, army chief of staff, informed The Associated Press. They are:

Twenty-six four-engine planes coming from the production line at he Consair plant, the first of which as understood to have been delivered to the British last Saturday, after the army had granted a delivery priority in exchange for priority of engines ordered by the British.

Twenty planes built by the Boeing Co. and already fully equipped, to be turned over to Britain when a basis of release, now being negotiated, has been reached.

Both makes of planes are long-range craft, able to reach any part of Germany from the British Isles. They weigh about 40,000 pounds each without bomb loads.

The planes built at the local plant, said to have undergone test flights already, reportedly are equipped with Pratt & Whitney engines.

S. D. Bomber Hops To Join British

Trib. Sun 11/29/40

Camouflaged and destined ultimately to be used in the defense of Great Britain, the first of a fleet of Consolidated bombers took off from San Diego bay early today for an unannounced east coast destination. The giant craft, of the Model 28 type and similar to the United States navy's PBY bombers, left at 4:35 a.m. from the coast guard air base after being towed from the Consolidated factory to the seaplane ramp on Lindbergh field.

Observers ashore could hear the roar of the craft's two 1000-horsepower motors, but it was too dark to see the plane. Aboard the ship. which has a 104-foot wingspread, are Lt. W. C. Cleveland, naval reserve, and Douglas Kelly, local flier, as pilots, and Russell Rogers and I. G. Ross, observers. Rogers was pilot of Richard Archbold's round-the-world Consolidated-built flying boat Guba.

Delivery is to be taken by the Canadian government on the east coast. The Associated Press reported but company officials refused to say where. It is rumored a Canadian Airways crew will take it over at New York, ferrying it to Halifax, N. S., for the transatlantic flight.

The plane, camouflaged an olive green, was reported over El Paso at 9:37 a.m. (MST), after averaging well over 170 miles per hour. Meanwhile, another olive green bomber took off from the bay in mid-morning for a two-hour test flight. It landed off the seaplane ramp shortly before 11 a.m.

Are We Ready?

11/14/40

The Collecive Bargaining Agency for all Consolidated employees is now preparing the records for the coming Wage Review. Of course, due to the heavy expense involved, complete and elaborate records to support the employees' claim for an increase in wages, will be made up only for the members of the Collective Bargaining Agency which is Lodge 1125. This means that the claims for wage increases by the members of Lodge 1125 will be better and more ably presented than those of the other employees, and therefore the Lodge wishes to state once more that the individual employees' claim for a pay increase will be handled in a manner that will bring the greatest return.

Submitted by L. A. Perry, Recording Secretary, Lodge 1125.

San Diego Firm Gets Plane Contract

Aircraft News 11/14/40

WASHINGTON.—The Navy this week awarded a $75,313,000 contract to Consolidated Aircraft Corp., San Diego, for an undisclosed number of airplanes.

The contract was cleared by the defense advisory commission. The Navy would not state the type or number of the planes, but it was pointed out that Consolidated is one of the major producers of large patrol bombers.

Defense Chiefs Here to Inspect Plane Plants

Aircraft Output Nears High Peak, Says Rep. Snyder

Asserting that "American aircraft manufacturing plants are doing a remarkable job in speeding up their part of the national defense program," Rep. J. Buell Snyder (D-Pa), chairman of the house committee on army appropriations, arrived at dusk yesterday from March field, Riverside, in a Douglas army transport plane.

The Pennsylvania solon was accompanied by John Pugh, secretary of the house army and navy appropriations committee, and Maj. Thomas E. Lewis of the army general staff. Snyder is on a tour of inspection of military cantonments and aircraft factories in the south and west.

AHEAD OF SCHEDULE

"American aircraft plants will produce a total of 1100 military planes in November and this number will be materially increased in the months to come," Rep. Snyder said. "Contrary to what many radio commentators have said, the production of planes for the national defense program is far ahead of schedule. The aircraft industry has performed wonders in the last year and it has not hit its full stride.

"Congress, and I am sure the war department, have made no plans for creating any new aircraft manufacturing plants in the midwestern states or of moving plants to that section from their present locations on the Pacific coast. I understand that the Boeing company is planning to extend its manufacturing facilities at Wichita, Kan., in a plant, however, that this concern acquired some time ago.

"On my present inspection tour I inspected the mechanized cavalry units at Ft. Knox, Ky., and army cantonment construction at Little Rock, Ark., and Ft. Sill, Okla. Little Rock is preparing to house 20,000 troops and Ft. Sill 25,000 troops.

FILL PROCEED TO L. A.

"Thie chief objective of the trip is to visit aircraft plants engaged in the manufacture of planes for the army air corps, to see how they have expanded and to investigate their possible production output as of July 1, 1941."

This morning Rep. Snyder will inspect the Consolidated, Ryan and Solar plants. He will leave at noon for Los Angeles for an inspection

---

ARRIVE BY AIR FOR STUDY OF MILITARY FACILITIES

REP. J. BUELL SNYDER — JOHN PUGH — MAJ. THOMAS E. LEWIS

. . . Pennsylvania solon, chairman of the house committee on army appropriations, arrived yesterday on an inspection trip accompanied by Pugh, secretary of the house army and navy appropriations committee, and Maj. Lewis of the army general staff. They will visit aircraft plants here.

BRITISH TO GET 26,375 U. S. AIRPLANES

Aircraft News 11/14/40

WASHINGTON.—Great Britain will receive approximately 26,375 American made planes before July, 1942, under the arrangement for a 50-50 split of American defense production between this country and Britain, informed officials have asnounced.

American plane plants will be geared to produce more than 66,000 planes before that time, aeronautical sources indicated. The Army and Navy already have approximately 40,000 planes on order.

COST $2,000,000,000

It was estimatedt hat the British orders would total almost $2,000,000,000. Orders on hand from Britain for 14,375 planes will cost about $1,000,000,000. The additional 12,000 planes which the priorities board of the defense commission has authorized the British to negotiate for would cost about the same amount. They will include a larger proportion of expensive heavy bombers.

Just how fast British deliveries will be arranged remained unsettled. Fighter plane production was between 900 and 950 in September and October. Of these the British were said to have received about 40 per cent.

INCREASE EXPECTED

The rate of increase in those two months was small, but aeronautical trade experts estimated that production would jump to between 1000 and 1500 planes monthly in January.

There are no figures on arms and ammunition production, making it impossible to determine how much of those supplies Britain is getting in this country. Total British defense orders here amount to about $2,000,000,000. With a little more than half going for planes, something less than $1,000,000,000 probably is being spent for arms and ammunition.

Arms and ammunition production capacities are regarded as secret information by the War and Navy departments.

Trib. Sun 11/28/40

$342,169 Added To Consair List

The gigantic backlog of the Consolidated Aircraft Corp. was increased $342,169 yesterday by the war department, in a new contract to cover increased costs of specification changes in airplanes now under construction, The Associated Press reported from Washington, D. C. Among the $19,620,000 total orders placed by the army yesterday for equipment and supplies for the air corps, ordnance department and quartermaster corps were: Ford Motor Co., Detroit, trucks, $1,387,500, and passenger cars, $625,000; Standard Oil Co., San Francisco, airplane fuel, $101,250; Shell Oil Co., Inc., St. Louis, airplane fuel, $103,044, and Duncan & Son, Inc., Seattle, saddles, $10,000. Delivery dates were not disclosed.

The new order raises Consolidated's backlog to nearly $325,000,000. On Nov. 9 the navy awarded Consair a $75,513,000 contract for planes, followed by another order Nov. 14 for $18,529,500. These two orders raised the backlog to approximately $324,500,000.

Trib. Sun 11/28/40

Consair Inspected By Under-Secretary

Inspection of Consolidated Aircraft Corp. plant was made today by James V. Forrestal, under-secretary of the navy, who arrived here by plane late yesterday from Washington, D. C., via Seattle and Los Angeles. He was accompanied by Capt. S. M. Kraus, of the navy bureau of aeronautics.

Forrestal is on his second visit to San Diego in recent weeks. He was expected to depart this afternoon.

Aircraft Mechanic 11/14/40

Backlog at Consolidated Well Over $306,000,000

The navy has awarded a new $75,313,000 contract for planes to the Consolidated Aircraft Corp., the Associated Press reported from Washington, D. C. The new order brings the firm's backlog to an estimated $306,000,000.

Details Withheld

Types, numbers, delivery dates and other details were withheld, but it was understood that the order was for additional long-range, four-motored scouting craft such as the company has been turning out for the navy, wor[illegible] rom Washington states. Consolidated officials said they had no statement to make.

The order came as the firm pushed constructoin work on another large addition to its factory on Lindbergh field, following the completion of a $2,000,000 addition which was dedicated Labor Day

In addition to manufacturing planes for the army and navy, Consolidated also is turning out planes for Great Britain and Australia. The first of seven 20-ton, long-range four-motored bombers reported destined for Great Britain is receiving its test flights. The Australian government just two months ago announced its decision to purchase 11 flying boats from Consolidated at a cost of $3,500,000, for delivery this winter.

Consolidated now employs slightly more than 13,000, it was reported at the plant. The company is on a 10-hour day, five-day week—The Tribune-Sun.

Southern California Prosperity

A few years ago some optimistic Chamber of Commerce announced that Southern California would soon become the "Air Capital" of the United States. There was much lifting of eyebrows, and many a shoulder shrug from readers of that statement.

But this time the "Boosters" were right—plenty right. If we were not witnessing the development of this industry with our own eyes, the figures shown in the chart would appear fantastic and would challenge our credulity. But facts are facts, and no overstatement is necessary to make us realize the great progress already made, and the tremendous possibilities of the future.

The figures show that this "infant" industry has already become one of the biggest factors contributing to the prosperity of Southern California. Where is there any other enterprise with a backlog of orders amounting to over a billion and a half dollars? And the present monthly payroll of nearly ten millions of dollars paid to approximately 65,000 employees will, in all probability, be doubled within a year, with a corresponding increase in personnel.

No wonder residents and business men throughout this entire area are more than ever looking to the Aircraft Industry as a vehicle to prosperity for themselves and everybody in Southern California.

Britain to Get 24 S.D. Planes, Army Bombsight

Boeing to Release 20 of 'Flying Fortress' Type

Twenty-six four-motored long-range patrol bombers, one of which completed its flight tests last week, are to be delivered by the Consolidated Aircraft Corp. to the British Royal Flying corps, the war department announced yesterday. The planes will be equipped with the famous secret army bombsight.

Twenty other four-motored bombers, similar in type to the army's famed "flyng fortress," are to be delivered to Great Britain by the Boeing plant at Seattle.

PRIORITY GRANTED

The Associated Press reported from Washington that Gen. George C. Marshall, army chief of staff, had granted a priority delivery of the Consolidataed planes to Great Britain in an exchange of priority of engines ordered by the British.

The Boeing-built bombers are to be turned over to the R. A. F. when a basis of release, now being negotiated, has been reached.

The Boeing and Consolidated bombers, each capable of cruising more than 3000 miles carrying four tons of heavy demolition bombs, will be able to reach any section of Germany from flying bases in the British isles and return easily without refueling, it is said.

Consolidated authorities refused comment on the plane delivery.

CAMOUFLAGE PLANNED

The 26 Consolidated bombers, when released from the final assembly plant, will be painted with the R.A.F. insignia and camouflaged similarly to the plane tested last week.

The other 20 bombers are of the B-17 type and will be fitted with the secret bombsight before being sent abroad.

The bombers, urgently desired by Britain for long-distance raids on Germany and Mediterranean objectives, will thus have the added advantage of a bombsight unequalled by any other warring power, International News Service reported.

The only other comparable one is also a U. S. product and vital military secret. Manufactured by the Norden Co. and developed by the navy, it is now standard equipment on planes in both military branches. The latter sight is not being released, Gen. Marshall said.

U. S. HAS OBSERVERS

In revealing the deals to give Great Britain immediate supplies of super-bombers, Gen. Marshall at a press conference also disclosed that the U. S. army has some of its aviators flying in British war planes as observers, but only on those that fly over the British isles and over the English channel.

"We have a string of observers with the British army," Gen. Marshall said.

U. S. artillery, anti-aircraft, ordnance and other officers are with the British army. Observers have been sent to Egypt to gather information there, he revealed. Later, Secretary of the Navy Frank Knox told newsmen the navy also has observers with the British navy.

And U. S. naval aircraft already have begun using Bermuda and St. Lucia, two of the British base-sites recently approved by the U. S. in their patrolling of the Atlantic neutrality zone, he said.

While details on areas to be used at Trinidad in the Caribbean sea are yet to be arranged, all of the harbors acquired by President Roosevelt in the historic transfer of 50 U. S. destroyers, are now usable for the United States fleet, Knox explained.

Preliminary work of surveying and planning for construction at the bases is going forward rapidly, under an allotment of $25,000,000, and the projects will be rapidly completed, he said.

But it was the far-reaching transaction consummated by the war department with Great Britain on dispatch of a big bomber fleet that took the spotlight in the steadily-closer cooperation between the American and British governments.

"We have completed negotiations with the British government, giving them priority on the delivery of 26 four-engined, heavy bombers called B-24, from the Consolidated plant in San Diego," Gen. Marshall said in an unemotional tone that increased the dramatic potent of his announcement.

"The United States," he continued, "is to accept a delay in the start of its deliveries on present contract of approximately three months. In consideration for this priority, the British government has released to us sufficient engines to equip 41 of the 'flying fortress' type of four-engine bombers, which the army had already accepted delivery on without engines or would have received by Jan. 1.

THE

Italy Marked For Raids by S. D. Bombers

San Diego-made Consolidated four-motor army bombers will rain death and destruction over Europe, according to plans of the British to use the 26 planes ordered from here in bolder and harder strokes against their foes across the English channel. The Associated Press, in a dispatch from London, said R.A.F. officers left little doubt the long-range Consolidated bombers will be in the van of the attacks which they intend to extend to eastern Germany and more completely into Italy.

Equipped with the Sperry gyroscopic bombing sight, these gigantic planes also may be used for the nightly bombing "ferry service" to Berlin, they said.

R.A.F. officers said their large fuel capacity, bomb load and altitude-keeping abilities made them "ideal for sustained attacks over important targets."

"Are Babies To Do It"

Other officers, who said every sign points to an early opening of a widespread air war on Italy, declared the American-made planes "are the babies to do it with."

Employment of the long-range American-made bombers also will release more British bombers for their most vital task outside the systematic attack on German industry—the steady hammering of German submarine nests along the channel, observers said.

Last night these bases at Lorient, Cherbourg, Dunkerque and Ostend were pounded again by bombers intent on strangling the submarine menace which if not checked may strangle Britain by cutting off her seaborne supplies.

The Ruhr, industrial heart of Germany, also was the objective of a "serious" British raid last night which the air ministry news service said "must inevitably have disorganized essential traffic and destroyed indispensable raw materials" at Duisburg-Ruhrort, the largest river port in the world.

The gigantic backlog of the Consolidated Aircraft Corp. was increased $342,169 today by the war department, in a new contract to cover increased costs of specification changes in airplanes now under construction, The Associated Press reported from Washington, D. C. Among the $19,620,000 total orders placed by the army today for equipment and supplies for the air corps, ordnance department and quartermaster corps were: Ford Motor Co., Detroit, trucks, $1,387,500, and passenger cars, $625,000; Standard Oil Co., San Francisco, airplane fuel, $101,250; Shell Oil Co., Inc., St. Louis, airplane fuel, $103,044, and Duncan & Son, Inc., Seattle, saddles, $100,000. Delivery dates were not disclosed.

Aircraft News 11/14/40

FOUR-MOTOR RAF BOMBER IN TEST FLIGHT

SAN DIEGO. — While debate rages as to whether the Army Air Corps' flying fortresses have been or are to be sent to Great Britain, a camouflaged giant four-motored bomber with Royal Air Force markings was given its first test flight from Lindbergh Field here last Monday.

Performance characteristics, it was reliably reported, reflect aerodynamic improvements perfected by the aircraft industry since the flying fortresses were accepted by the Army Air Corps, indicating it is the most advanced land bomber in the world.

MAY FLY ATLANTIC

A large number — the exact amount is undisclosed—is under production at Consolidated for the Royal Air Force and the planes probably will be flown across the Atlantic to Great Britain as fast as they roll off the assembly lines here.

Capable of carrying four tons of bombs at a speed of 300 miles per hour more than 3000 miles nonstop, the Consolidated bombers are expected to be employed by Great Britain in ever-increasing quantities next spring in long-distance battering of enemy objectives.

The plane used in the test was painted a mottled brown and green, with the top of the 110-foot wing made to resemble fields of grass and grain. Pilot Georgge Newman was in charge.

CARRIES LIGHT CANNON

Length of the fuselage is 64 feet, overall height is 19 feet and the three-bladed propellers are 12 feet in diameter. Six to nine men are required to operate it, depending on tactical requirements.

The engines are 18-cylinder twin-row radial air-cooled and the all-metal fuselage is equipped with hatches and windows in the nose, tail, turtle deck, back and bottom, affording machine gun and light cannon protection on all sides. The landing gear is of tricycle type.

---

26 Turned Out By Consair; 1 Delivered

The army high command today acted to release 46 of the largest United States bombing planes, 26 of which are being built by the Consolidated Aircraft Co. here, to Great Britain, it is announced in dispatches of the Associated Press from Washington.

In Two Categories

The dispatches also carried the information that one of two high-accuracy bomb sights developed in the United States already has been released for use by the British.

The 46 bombing planes for which release has been announced fall into two categories, Gen. George C. Marshall, army chief of staff, informed The Associated Press. They are:

Twenty-six four-engine planes coming from the production line at the Consair plant, the first of which was understood to have been delivered to the British last Saturday, after the army had granted a delivery priority in exchange for priority of engines ordered by the British.

Twenty planes built by the Boeing Co. and already fully equipped, to be turned over to Britain when a basis of release, now being negotiated, has been reached.

Both makes of planes are long-range craft, able to reach any part of Germany from the British Isles. They weigh about 40,000 pounds each without bomb loads.

The planes built at the local plant, said to have undergone test flights already, reportedly are equipped with Pratt & Whitney engines.

Trib. Sun 11/24/40

S. D. Bomber Hops To Join British

Camouflaged and destined ultimately to be used in the defense of Great Britain, the first of a fleet of Consolidated bombers took off from San Diego bay early today for an unannounced east coast destination. The giant craft, of the Model 28 type and similar to the United States navy's PBY bombers, left at 4:35 a.m. from the coast guard air base after being towed from the Consolidated factory to the seaplane ramp on Lindbergh field.

Observers ashore could hear the roar of the craft's two 1000-horsepower motors, but it was too dark to see the plane. Aboard the ship, which has a 104-foot wingspread, are Lt. W. C. Cleveland, naval reserve, and Douglas Kelly, local flier, as pilots, and Russell Rogers and I. G. Ross, observers. Rogers was pilot of Richard Archbold's round-the-world Consolidated-built flying boat Guba.

Delivery is to be taken by the Canadian government on the east coast. The Associated Press reported but company officials refused to say where. It is rumored a Canadian Airways crew will take it over at New York, ferrying it to Halifax, N. S., for the transatlantic flight.

The plane, camouflaged an olive green, was reported over El Paso at 9:37 a.m. (MST), after averaging well over 170 miles per hour. Meanwhile, another olive green bomber took off from the bay in midmorning for a two-hour test flight. It landed off the seaplane ramp shortly before 11 a.m.

Defense Chiefs Here to Inspect Plane Plants

Aircraft Output Nears High Peak, Says Rep. Snyder

Asserting that "American aircraft manufacturing plants are doing a remarkable job in speeding up their part of the national defense program," Rep. J. Buell Snyder (D-Pa), chairman of the house committee on army appropriations, arrived at dusk yesterday from March field, Riverside, in a Douglas army transport plane.

The Pennsylvania solon was accompanied by John Pugh, secretary of the house army and navy appropriations committee, and Maj. Thomas E. Lewis of the army general staff. Snyder is on a tour of inspection of military cantonments and aircraft factories in the south and west.

AHEAD OF SCHEDULE

"American aircraft plants will produce a total of 1100 military planes in November and this number will be materially increased in the months to come," Rep. Snyder said. "Contrary to what many radio commentators have said, the production of planes for the national defense program is far ahead of schedule. The aircraft industry has performed wonders in the last year and it has not hit its full stride.

"Congress, and I am sure the war department, have made no plans for creating any new aircraft manufacturing plants in the midwestern states or of moving plants to that section from their present locations on the Pacific coast. I understand that the Boeing company is planning to extend its manufacturing facilities at Wichita, Kan., in a plant, however, that this concern acquired some time ago.

"On my present inspection tour I inspected the mechanized cavalry units at Ft. Knox, Ky., and army cantonment construction at Little Rock, Ark., and Ft. Sill, Okla. Little Rock is preparing to house 20,000 troops and Ft. Sill 25,000 troops.

FILL PROCEED TO L. A.

"Thie chief objective of the trip is to visit aircraft plants engaged in the manufacture of planes for the army air corps, to see how they have expanded and to investigate their possible production output as of July 1, 1941."

This morning Rep. Snyder will inspect the Consolidated, Ryan and Solar plants. He will leave at noon for Los Angeles for an inspection

---

ARRIVE BY AIR FOR STUDY OF MILITARY FACILITIES

REP. J. BUELL SNYDER — JOHN PUGH — MAJ. THOMAS E. LEWIS

. . . Pennsylvania solon, chairman of the house committee on army appropriations, arrived yesterday on an inspection trip accompanied by Pugh, secretary of the house army and navy appropriations committee, and Maj. Lewis of the army general staff. They will visit aircraft plants here.

BRITISH TO GET 26,375 U. S. AIRPLANES

Aircraft News 11/14/40

WASHINGTON. — Great Britain will receive approximately 26,375 American made planes before July, 1942, under the arrangement for a 50-50 split of American defense production between this country and Britain, informed officials have asnounced.

American plane plants will be geared to produce more than 66,000 planes before that time, aeronautical sources indicated. The Army and Navy already have approximately 40,000 planes on order.

COST $2,000,000,000

It was estimatedt hat the British orders would total almost $2,000,000,000. Orders on hand from Britain for 14,375 planes will cost about $1,000,000,000. The additional 12,000 planes which the priorities board of the defense commission has authorized the British to negotiate for would cost about the same amount. They will include a larger proportion of expensive heavy bombers.

Just how fast British deliveries will be arranged remained unsettled. Fighter plane production was between 900 and 950 in September and October. Of these the British were said to have received about 40 per cent.

INCREASE EXPECTED

The rate of increase in those two months was small, but aeronautical trade experts estimated that production would jump to between 1000 and 1500 planes monthly in January.

There are no figures on arms and ammunition production, making it impossible to determine how much of those supplies Britain is getting in this country. Total British defense orders here amount to about $2,000,000,000. With a little more than half going for planes, something less than $1,000,000,000 probably is being spent for arms and ammunition.

Arms and ammunition production capacities are regarded as secret information by the War and Navy departments.

Trib Sun 11/28/40

Consair Inspected By Under-Secretary

Inspection of Consolidated Aircraft Corp. plant was made today by James V. Forrestal, under-secretary of the navy, who arrived here by plane late yesterday from Washington, D. C., via Seattle and Los Angeles. He was accompanied by Capt. S. M. Kraus, of the navy bureau of aeronautics.

Forrestal is on his second visit to San Diego in recent weeks. He was expected to depart this afternoon.

Trib. Sun 11/28/40

$342,169 Added To Consair List

The gigantic backlog of the Consolidated Aircraft Corp. was increased $342,169 yesterday by the war department, in a new contract to cover increased costs of specification changes in airplanes now under construction, The Associated Press reported from Washington, D. C. Among the $19,620,000 total orders placed by the army yesterday for equipment and supplies for the air corps, ordnance department and quartermaster corps were: Ford Motor Co., Detroit, trucks, $1,387,500, and passenger cars, $625,000; Standard Oil Co., San Francisco, airplane fuel, $101,250; Shell Oil Co., Inc., St. Louis, airplane fuel, $103,044, and Duncan & Son, Inc., Seattle, saddles, $10,000. Delivery dates were not disclosed.

The new order raises Consolidated's backlog to nearly $325,000,000. On Nov. 9 the navy awarded Consair a $75,513,000 contract for planes, followed by another order Nov. 14 for $18,529,500. These two orders raised the backlog to approximately $324,500,000.

Aircraft Mechanic 11/14/40

Backlog at Consolidated Well Over $306,000,000

The navy has awarded a new $75,313,000 contract for planes to the Consolidated Aircraft Corp., the Associated Press reported from Washington, D. C. The new order brings the firm's backlog to an estimated $306,000,000.

Details Withheld

Types, numbers, delivery dates and other details were withheld, but it was understood that the order was for additional long-range, four-motored scouting craft such as the company has been turning out for the navy, wo[illegible]om Washington states. Consolidated officials said they had no statement to make.

The order came as the firm pushed constructoin work on another large addition to its factory on Lindbergh field, following the completion of a $2,000,000 addition which was dedicated Labor Day

In addition to manufacturing planes for the army and navy, Consolidated also is turning out planes for Great Britain and Australia. The first of seven 20-ton, long-range four-motored bombers reported destined for Great Britain is receiving its test flights. The Australian government just two months ago announced its decision to purchase 11 flying boats from Consolidated at a cost of $3,500,000, for delivery this winter.

Consolidated now employs slightly more than 13,000, it was reported at the plant. The company is on a 10-hour day, five-day week—The Tribune-Sun.

Aircraft Mechanic 11/14/40

Southern California Prosperity

A few years ago some optimistic Chamber of Commerce announced that Southern California would soon become the "Air Capital" of the United States. There was much lifting of eyebrows, and many a shoulder shrug from readers of that statement.

But this time the "Boosters" were right—plenty right. If we were not witnessing the development of this industry with our own eyes, the figures shown in the chart would appear fantastic and would challenge our credulity. But facts are facts, and no overstatement is necessary to make us realize the great progress already made, and the tremendous possibilities of the future.

The figures show that this "infant" industry has already become one of the biggest factors contributing to the prosperity of Southern California. Where is there any other enterprise with a backlog of orders amounting to over a billion and a half dollars? And the present monthly payroll of nearly ten millions of dollars paid to approximately 65,000 employees will, in all probability, be doubled within a year, with a corresponding increase in personnel.

No wonder residents and business men throughout this entire area are more than ever looking to the Aircraft Industry as a vehicle to prosperity for themselves and everybody in Southern California.

Company	Employees	Backlog	Recent Orders	Est. Monthly Payroll	Planned Expansion	Plan to Employ

VITAL STATISTICS AS OF OCT. 1, 1940 (See Prepared Chart)

Editor's Note: The information is from authoritative sources. The blank spaces represent lack of authentic information. As more contracts are made our information will be more complete and more accurate. We plan to frequently print in chart form for quick reading and fast comparison the standing of the companies in relative size and activity. Guesses and rumors are not reported.

1. Interstate is on the verge of blooming into a large company. Plan to build 900 small planes.

2 Unable to verify number of employees or to get breakdown of the Santa Monica and El Segundo plants as to backlog for each.

3. Authentic information lacking. News stories not verified.

Aircraft Mechanic 11/14/40

—BULLETIN BOARD— CONSOLIDATED

NOTICE TO ALL EMPLOYEES

Subject: Personnel Changes

The following personnel changes will be effective Nov. 11, 1940:

Mr. Glenn Hotchkiss is relieved of his duties as Foreman of the Hull Department to become Superintendent of Building No. 2 and the Yard.

Mr. George Wire transferred from Foreman of the Hull Department nights to Foreman of the Hull Department days.

Mr. Frank Popadowski, Foreman of the Hull Department days, to Foreman of the Hull Department nights.

JAS. L. KELLEY,
Factory Manager.

Boxing and Wrestling

THE PLANT BOXING AND WRESTLING CHAMPIONSHIPS will be held Dec. 7, 14, and 21, at the Coliseum. Please sign up at the Welfare Office or with anyone in the Boxing and Wrestling Club. A.A.U. rules will be used.

Ice Skating and Hockey

ICE SKATING AND HOCKEY meeting at Glacier Gardens, foot of Eighth Ave., 12 noon. All men interested contact these men in your departments for further information:

ART FIELD, Engineering Kellogg, Day Production;

POGGI, Engineering English, Night Production;

JOHN STYN, Night Experimental;

KEITH SANFORD, Day Experimental;

JACK BLAAUW, Hull No. 1;

THOMPSON and BILL PETTIT, Hull No. 1;

RICHARD and JOHN RAY, Night Metal Bench;

CUZINSKI, Day Metal Bench;

JERMYN, Night Wing.

Consolidated has special rates between 6:00 and 7:30 p. m., every Friday and Sunday for ice skating at the Glacier Gardens.

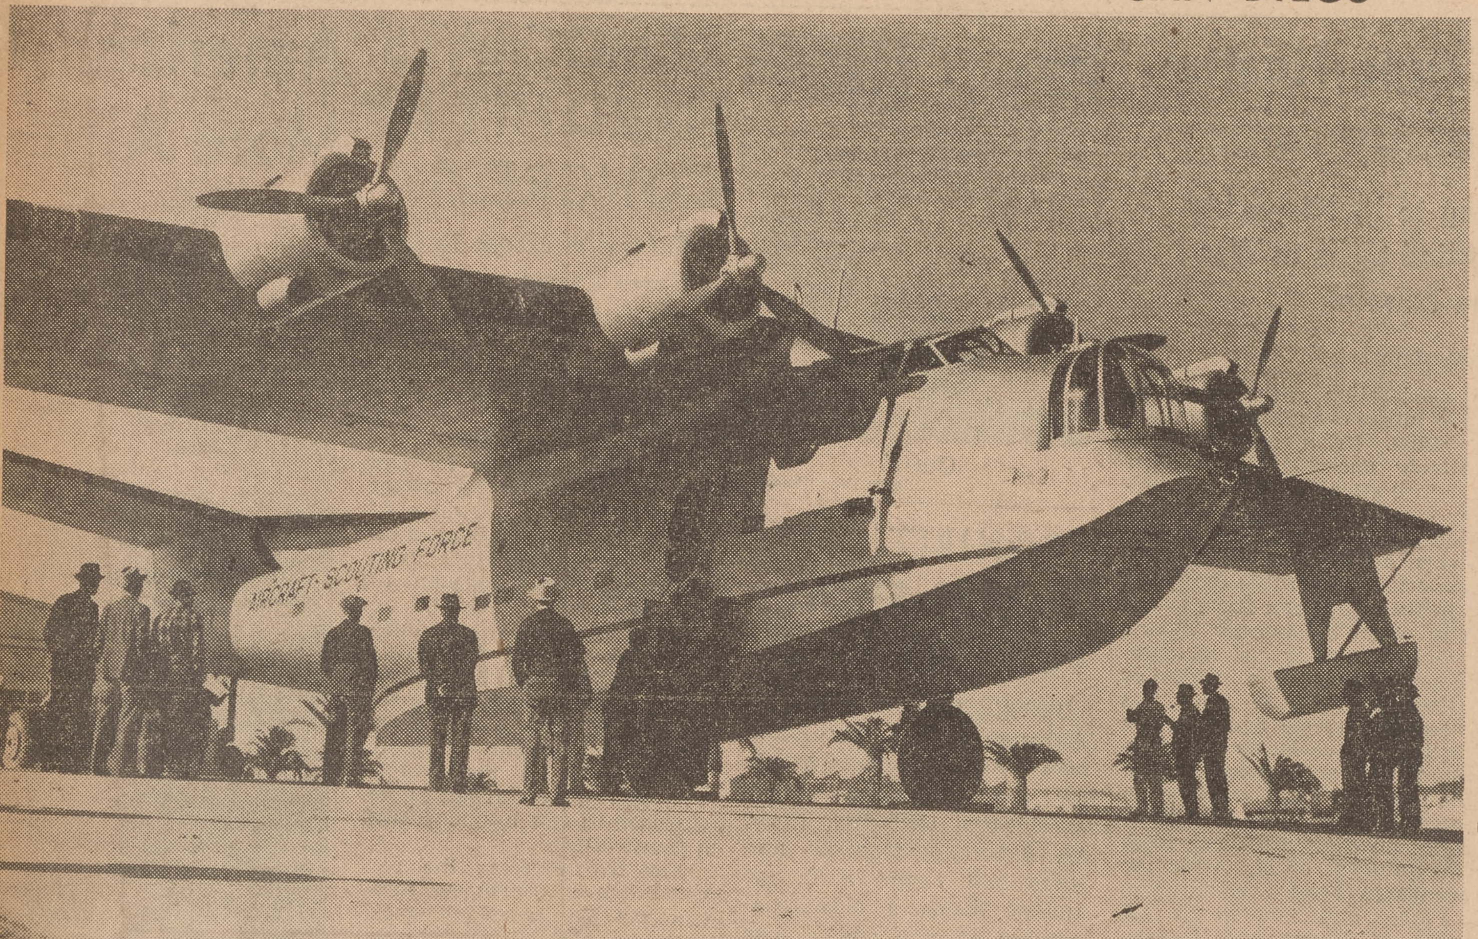
Forrestal Here On Consair Visit

On an inspection tour of west coast aircraft factories which are engaged in the manufacture of planes for the navy, James V. Forrestal, under-secretary of the navy, arrived by plane late yesterday from Washington, D. C., via Seattle and Los Angeles. He was accompanied by Capt. Sidney M. Kraus of the bureau of aeronautics.

Landing at the Naval Air station at 5:10 from Mines field, Los Angeles, Forrestal was greeted by Vice Adm. W. F. Halsey, Rear Adm. Charles A. Blakely, 11th Naval district commandant, and chamber of commerce executives. He went to Hotel del Coronado.

At Seattle Forrestal inspected the Boeing factory and at Los Angeles the Douglas and North American aircraft plants. He will visit the Consolidated plant here today.

SKY GIANT SUCCESSFULLY TRIES WINGS AT SAN DIEGO



AIR LEVIATHAN—Here is prototype of first "battleship of the air" which has undergone tests successfully.

Los Angeles Times - 11/24/40

Huge New Air Battleship Given First Test Flights

One of Navy's Six Most Powerful Bombers, Built at San Diego, Tries Out Its Wings

SAN DIEGO, Nov. 23.—Test flights on the first of six four-motored, 25-ton "battleships of the air," most powerful bombers in the Navy, have been started here by a Consolidated Aircraft Corp. crew, with delivery to a Navy trial board due next month, it was learned today.

Equipped with a supercharger enabling operations at extremely high altitudes, the craft will be assigned to the recently commissioned Patrol Squadron 13, commanded by Lieut. Comdr. Stephen B. Cooke, at the San Diego naval air station.

CARRIES MACHINE GUNS

All six, the first group of a Navy mass production order, are expected to be delivered to the 100-man squadron by February or March, it was indicated.

Capable of flying 5000 miles nonstop, the air Leviathan has two machine-driven revolving turrets, one in the bow and another topside, mounting heavy-caliber machine guns. Additional protection from fighter planes is afforded by manually operated gun stations.

The engines are 1200 h.p. Pratt & Whitney radial air-cooled, housed in a 115-foot wing.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

VOLUME 1 SAN DIEGO, CALIFORNIA, NOVEMBER 21, 1940 NUMBER 6

WAGE REVIEW STARTS DEC. 2 AT CONSAIR

A large attendance was reported at last Monday's meeting, at which time approximately 150 new members were received into the union. Tuesday night's meeting was attended by approximately 350 members at which time over 250 new members were admitted to the union.

Nominations received at both day and night shifts to date are as follows:

President: L. A. Perry, R. B. Felton, W. J. Chudleigh, and Bros. Shields and Burney.

Vice-President: J. L. Castle, J. S. Burney, H. Gillan, A. J. Fischer, and Bro. Granstead.

Financial Secretary: W. J. Chudleigh, R. B. Felton, A. J. Fischer, H. A. Abbey, Bro. McIllivich, L. A. Perry, and F. H. Cole.

Recording Secretary: L. A. Perry, F. M. Martin, Al Hogan, and Bro. Morris.

Treasurer: Herman Stellar, Al Cox, and Bro. Wilder.

Conductor: A. Peterson, F. Martin, A. J. Fischer, and Bro. McCune.

Sentinel: H. W. Clark, R. B. Felton, H. A. Abbey, A. Peterson, and Bro. Swaed.

Trustees: A. Hogan, J. J. Braun, P. McManus, L. Larsen.

Executive Board: H. Torres, J. Coe, R. B. Felton, J. D. Barnes, H. A. Abbey.

Brother Parker was elected as member of Wage Review Board from the Night Shift to serve with Bro. Chudleigh.

Motion made at the night shift meeting on last Monday that nomination of officers for the whole lodge be held over to special meeting which will be held at 2 p. m., Sunday, Nov. 24th, when a public agent also will be nominated. This was held to be out of order and unconstitutional at the meeting of the day shift Tuesday night, Nov. 19th, as nomination for officers must be made at two regular meetings to be held in November.

The nominations were closed from the day shift, but can still be placed before the union at next Monday's meeting of the night shift, which is held in Turner Hall at 10 a. m. Special meeting for Sunday cannot be legally held.

The discharge and lay off of the members was discussed and it was suggested that, where the employee concerned considered that the lay off or discharge was unjust and that he was being discriminated against, he should contact his shop committeeman immediately as re-instatements were much easier to secure if acted upon as soon as possible.

Matters pertaining to the immediate wage increase for employees in the lower brackets who have been employed since Aug. 31, 1940, will be discussed at a full committee meeting with the management which has been planned for Monday.

Wage review problems were discussed and plans were made for the proper presentation.

Information blanks have been distributed to the employees of Local 1125 requiring the following information: Name of Employee, Clock Number, Address. Do you feel that you are entitled to a wage increase? How much per hour? Reason for increase? Give details of the work you are now doing.

If you have not received one of these blanks, contact your shop committeeman and get this information to him as soon as possible.

Shop Committeemen—Day Side

W. J. Chudleigh, tool room.
Harry Hudson, sheet metal.
J. D. Barnes, machine shop.
M. J. Castle, metal bench.
C. E. Danner, finish.
Hammett, tool bending.
H. E. Leonard, experimental.
S. W. Adams, M. T.
R. J. Bragg, hull department.
Carl E. Heilbach, wood shop.
Don Greene, final assembly.
J. B. Waskey, wing.
L. A. Perry, wing.
Kobets, tank.

The names of night shift committeemen have not been secured at this time.

The following communication for Consolidated management was read:

San Diego, Cal., Nov. 19, 1940.
Memo to: All Foremen
Subject: Wage Review.

In order to proceed with our next wage review starting 2 December, 1940, you are requested to keep separate all record sheets of employees who have been hired since 31 August, 1940. These record sheets will be reviewed after our regular wage review period.

The order of departments to be reviewed will be as follows:

1. Tool Room and Wood Shop.
2. Machine Shop.
3. Welding.
4. Sheet Metal.
5. Hull Department.
6. Drop Hammer and Tank.
7. Wing Department.
8. Metal Bench.
9. Final Assembly.
10. Paint Shop.
11. Sub Ass'y and Spare Parts.
12. Maintenance.
13. Draw Bench.
14. Heat Treat. and Spotweld.
15. Tubing.
16. Experimental.
17. Loft.
18. Productoin Department.
19. Shipping and Receiving.

Factory Manager.

Union 11/29/40

War-Bound S. D. Bomber to Hop

The first of a large order of patrol-bomber type seaplanes ordered by Britain will leave the Consolidated Aircraft Corp. plant before dawn this morning bound for the east coast and embattled England.

The ship is a model 28 type, similar to the famous navy P.B.Y. planes. It is equipped with two 1000-horsepower engines and has a wing span of 104 feet. It has been camouflaged for its flight to the war zone.

Lt. W. Cleveland, naval reserve, and Douglas Kelley, local flier, will be pilots. Russ Rogers, who flew the Archibald plane Guba around the world, will act as observer, according to report from Consolidated officials.

Another observer aboard will be I. G. Ross, Canadian pilot, who may be slated for the job of taking the plane across the Atlantic after the crew supplied by Consolidated makes delivery on the east coast.

Consolidated Bomber Arrives in New York

PORT WASHINGTON, N. Y., Nov. 30 (A.P.)—The first of a fleet of Consolidated 28 patrol bomber type seaplanes destined for Great Britain arrived today from San Diego, by way of Fort Worth.

Presumably, the plane will be flown later to Halifax for delivery to Canadian authorities who will fly or transport it to Great Britain

---

Navy Bombers Make Another Flight to Hawaii

Aero Digest Oct. 39

A flight of fourteen Consolidated patrol-bombers commanded by Lieut. Comdr. Stuart H. Ingersoll, arrived in Honolulu one day last month after a non-stop flight of 2500 miles from San Diego.

The planes, with 98 officers and men aboard, were sent to Hawaii to replace another squadron which was expected to fly from Honolulu to Manila to take up neutrality patrol in Philippine waters. They were from Squadron 13, based at the North Island naval air station, San Diego Bay.

AMERICAN EXPORT AIRLINES WILL USE NEW SIKORSKY

Natl. Aircraft Counsellor 10-22-40

The board of directors of American Export Airlines, Inc., announced last week that Durston G. Richardson has been elected vice-president in charge of operations. Mr. Richardson has been associated with this company for two years.

American Export Airlines was recently granted a Civil Aeronautics Board certificate of convenience and necessity to establish transatlantic air service between the United States and Europe using New York and Lisbon as terminals. The company plans to pioneer non-stop service on this route as soon as its three new Sikorsky S-44a four-engined flying boats are ready. These are now under construction at the United Aircraft Corporation Sikorsky plant at Bridgeport.

Meanwhile, the airlines will use their Consolidated Model 28 flying boat (an adaption of the PBY long-range bomber) which, like the Sikorskys, was originally developed for the Navy. Horta, Azores, will be used as an intermediate port for the preliminary mail and express service.

Under Mr. Richardson's direction, technical details for co-ordinating certain facilities of the new airlines with those of the parent company, American Export Lines, Inc., have been perfected. This represents the first time in history that a transoceanic airline and steamship service, operating under a single house flag, have thus pooled technical resources.

American Export Lines today operates the only regularly scheduled American flag steamship service between the United States and Europe and, like the airline, uses New York and Lisbon as its terminals. Thus, the flying boats and surface vessels will follow identical routes.

According to Mr. Richardson, the airlines will station a trained meteorologist, representing its own weather bureau, aboard each of the

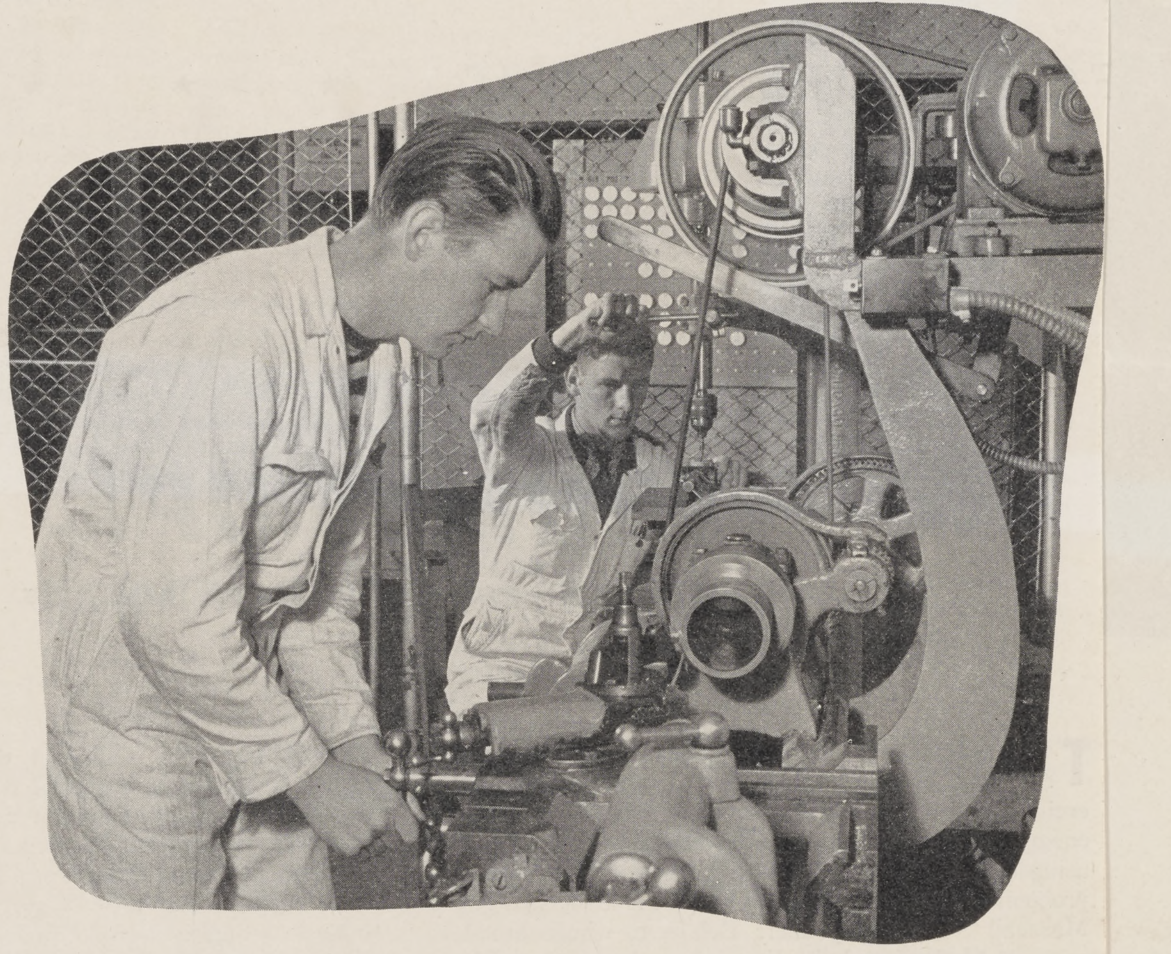
AVIATION - November 1940



Employment managers give preference to men with aviation training. These youngsters are learning machine shop work at the school of California Flyers.

How Aircraft Factories Find Their Men

Airplane plants on the West Coast have increased their manpower from 15,000 to 45,000 within a year. Thousands more will be hired. This is where they come from.*

NOW nibbling away at a backlog of more than a billion dollars, the Southern California aircraft industry is already "over the hump" in its personnel procurement program. This in the face of new factory expansions, such as the $20,000,000 building program now under way by Douglas! We don't mean to say that the personnel managers can coast from here on in. But it is interesting to point out that from a total of 15,000 workers in 1939, payrolls have been upped to more than 45,000 in 1940. And the expansion now under way does not seem to require more than a total of 100,000 aircraft workers in this area by the end of 1941. The formula for employee training has been well established and it should be possible to follow it successfully in meeting any future need of our national defense program.

The story of how this army of 30,000 factory workers has been put to work in approximately the space of one year is a bit involved, but some indication of how it was done, and of how future needs will be met, is given by quoting the enrollment figures of almost 2,000 students at a single private aircraft school in this area, Curtiss-Wright Technical Institute, Glendale. Also, the public high schools and junior colleges of Southern California, with the help of the federal government, have more than 9,000 students under instruction in various aircraft courses.

Aircraft personnel men are working closely with both private and public schools. Generally speaking the private schools provide the thoroughly trained workers who quickly become lead men and supervisors. The public schools train thousands of men in short job training courses which fit them for jobs

---

*This is the second article of a series on factory training methods, the first of which appeared in the October issue.

S. D. B

Great Britain, according to informed sources, soon is to receive seven bombers, of this type, from Consolidated Aircraft Corp. The long-range, four-motored ship was given its initial test last week. The plane, similar to the XB-24 developed by Consolidated for the United States army in February, weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. Four 1200-hp, 18-cylinder, radial air-cooled Pratt-Whitney engines power the bomber, said to be capable of carrying four tons of bombs. First duty of the plane will be to ferry R.A.F. pilots to England from Canada and to return pilots unsuitable for combat service who in turn will fly combat planes to England. Until pressed into service as a bomber, the plane's armament will be limited to increase speed.

ntract
Million
nsair

Coming within five days of a large order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy yesterday announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

U. S. 2-Ocean Bomber Fleet Being Built

2,000 Navy Flying Boats With 4,000-Mile Range to Patrol Both Coasts

Designed to Cripple Invader Far at Sea

Craft Will Be Ready by Mid-1941; New Bases Extend Striking Power

By The United Press

WASHINGTON, Nov. 23.—The Navy has on order more than two thousand great bomber flying boats to give its air arm a more powerful striking force in the Atlantic and Pacific Oceans, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Company, Baltimore, and Consolidated Aircraft Corporation, San Diego, in the last six weeks. The Martin contract calls for approximately 1,100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately one thousand PBY's at a cost of $93,842,500.

Engines for the big flying boats were included in a $162,000,000 order to Pratt & Whitney.

These craft, with an operating range of 4,000 miles, Navy air strategists believe, will give the United States control of the Atlantic far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam, if necessary.

Planes for Use With Fleet

Improvements in design of the Navy's seaplane-type bombers also will permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be fueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the planes on order by mid-1941. The Navy now has almost three hundred similar bombers which it is using on both Atlantic and Pacific patrol.

All of the Navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities, and as long as supplies are available, ashore or afloat as near as 1,000 to 1,500 miles, have almost complete freedom of operation.

Forrestal Here On Consair Visit

On an inspection tour of west coast aircraft factories which are engaged in the manufacture of planes for the navy, James V. Forrestal, under-secretary of the navy, arrived by plane late yesterday from Washington, D. C., via Seattle and Los Angeles. He was accompanied by Capt. Sidney M. Kraus of the bureau of aeronautics.

Landing at the Naval Air station at 5:10 from Mines field, Los Angeles, Forrestal was greeted by Vice Adm. W. F. Halsey, Rear Adm. Charles A. Blakely, 11th Naval district commandant, and chamber of commerce executives. He went to Hotel del Coronado.

At Seattle Forrestal inspected the Boeing factory and at Los Angeles the Douglas and North American aircraft plants. He will visit the Consolidated plant here today.

18. Productoin Department.
19. Shipping and Receiving.

JAS. L. KELLEY,
Factory Manager.

A large attendance was reported at last Monday's meeting, at which time approximately 150 new members were received into the union. Tuesday night's meeting was attended by approximately 350 members at which time over 250 new members were admitted to the union.

Nominations received at both day and night shifts to date are as follows:

President: L. A. Perry, R. B. Felton, W. J. Chudleigh, and Bros. Shields and Burney.

Vice-President: J. L. Castle, J. S. Burney, H. Gillan, A. J. Fischer, and Bro. Granstead.

Financial Secretary: W. J. Chudleigh, R. B. Felton, A. J. Fischer, H. A. Abbey, Bro. McIllivich, L. A. Perry, and F. H. Cole.

Recording Secretary: L. A. Perry, F. M. Martin, Al Hogan, and Bro. Morris.

Treasurer: Herman Stellar, Al Cox, and Bro. Wilder.

Conductor: A. Peterson, F. Martin, A. J. Fischer, and Bro. McCune.

Sentinel: H. W. Clark, R. B. Felton, H. A. Abbey, A. Peterson, and Bro. Swaed.

Trustees: A. Hogan, J. J. Braun, P. McManus, L. Larsen.

Executive Board: H. Torres, J. Coe, R. B. Felton, J. D. Barnes, H. A. Abbey.

Brother Parker was elected as member of Wage Review Board from the Night Shift to serve with Bro. Chudleigh.

Motion made at the night shift meeting on last Monday that nomination of officers for the whole lodge be held over to special meeting which will be held at 2 p. m., Sunday, Nov. 24th, when a public agent also will be nominated. This was held to be out of order and unconstitutional at the meeting of the day shift Tuesday night, Nov. 19th, as nomination for officers must be made at two regular meetings to be held in November.

The nominations were closed from the day shift, but can still be placed before the union at next Monday's meeting of the night shift, which is held in Turner Hall at 10 a. m. Special meeting for Sunday cannot be legally held.

The discharge and lay off of the members was discussed and it was suggested that, where the employee concerned considered that the lay off or discharge was unjust and that he was being discriminated against, he should contact his shop committeeman immediately as re-instatements were much easier to secure if acted upon as soon as possible.

Matters pertaining to the immediate wage increase for employees in the lower brackets who have

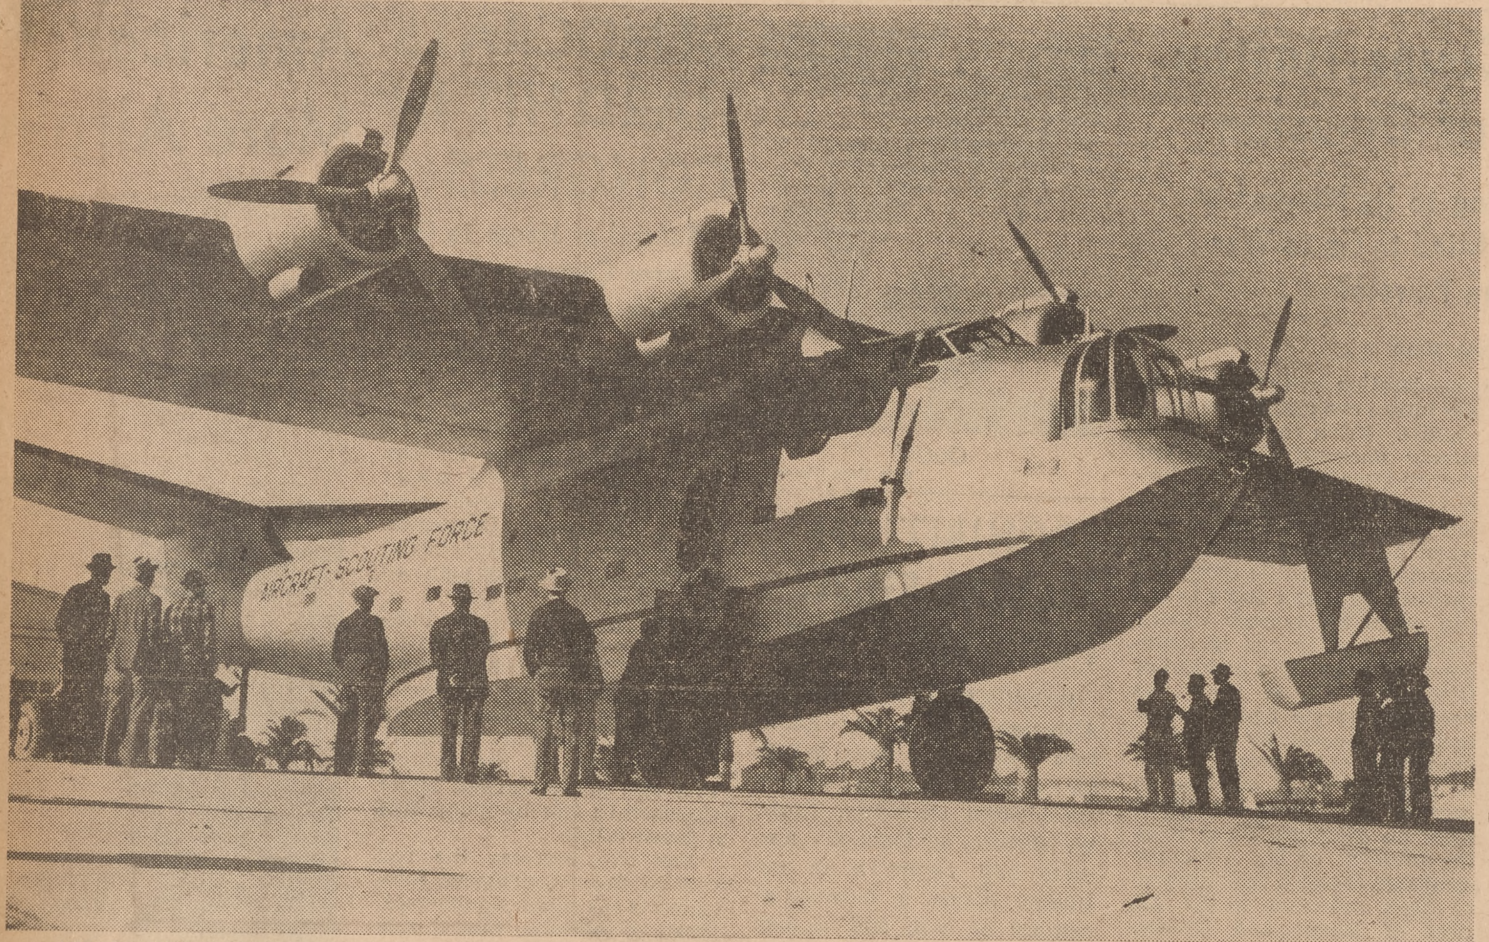
SKY GIANT SUCCESSFULLY TRIES WINGS AT SAN DIEGO



AIR LEVIATHAN—Here is prototype of first "battleship of the air" which has undergone tests successfully.

Los Angeles Times - 11/24/40

Huge New Air Battleship Given First Test Flights

One of Navy's Six Most Powerful Bombers, Built at San Diego, Tries Out Its Wings

SAN DIEGO, Nov. 23.—Test flights on the first of six four-motored, 25-ton "battleships of the air," most powerful bombers in the Navy, have been started here by a Consolidated Aircraft Corp. crew, with delivery to a Navy trial board due next month, it was learned today.

Equipped with a supercharger enabling operations at extremely high altitudes, the craft will be assigned to the recently commissioned Patrol Squadron 13, commanded by Lieut. Comdr. Stephen B. Cooke, at the San Diego naval air station.

CARRIES MACHINE GUNS

All six, the first group of a Navy mass production order, are expected to be delivered to the 100-man squadron by February or March, it was indicated.

Capable of flying 5000 miles nonstop, the air Leviathan has two machine-driven revolving turrets, one in the bow and another topside, mounting heavy-caliber machine guns. Additional protection from fighter planes is afforded by manually operated gun stations.

The engines are 1200 h.p. Pratt & Whitney radial air-cooled, housed in a 115-foot wing.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

Union 11/29/40

War-Bound S. D. Bomber to Hop

The first of a large order of patrol-bomber type seaplanes ordered by Britain will leave the Consolidated Aircraft Corp. plant before dawn this morning bound for the east coast and embattled England.

The ship is a model 28 type, similar to the famous navy P.B.Y. planes. It is equipped with two 1000-horsepower engines and has a wing span of 104 feet. It has been camouflaged for its flight to the war zone.

Lt. W. Cleveland, naval reserve, and Douglas Kelley, local flier, will be pilots. Russ Rogers, who flew the Archibald plane Guba around the world, will act as observer, according to report from Consolidated officials.

Another observer aboard will be I. G. Ross, Canadian pilot, who may be slated for the job of taking the plane across the Atlantic after the crew supplied by Consolidated makes delivery on the east coast.

Navy Bombers Make Another Flight to Hawaii

A flight of fourteen Consolidated patrol-bombers commanded by Lieut. Comdr. Stuart H. Ingersoll, arrived in Honolulu one day last month after a non-stop flight of 2500 miles from San Diego.

The planes, with 98 officers and men aboard, were sent to Hawaii to replace another squadron which was expected to fly from Honolulu to Manila to take up neutrality patrol in Philippine waters. They were from Squadron 13, based at the North Island naval air station, San Diego Bay.

FOR NOVEMBER 1940

★ ★ ★ ★ ★

BY SPECIAL CABLE TO AVIATION MAGAZINE
Kingston-On-Thames, October 15th.

THUMBS UP!

—is the "all well" symbol of the British these days.

THE Marshal of The Royal Air Force, Sir John Salmond, when Chief of Airstaff after defense exercises five or six years ago, said that some of the enemy bombers will always get through. He is now using his high intelligence and great experience on the problem of stopping them. With him is associated Air Marshall Sir Philip Joubert Delaferte, whose broadcasts in England and the States have been among the most heartening and impressive of official utterances on the air war. Marshal of the R.A.F., the Viscount Trenchard, has all along preached bombing the other fellow to stop him from starting. That policy is also being actively pursued. The idea before the war was to develop sea interceptor fighters, but that was purely a defensive weapon and all here agree that defense is the first stage of defeat, as it was in France. Offense is the only reliable defense. Hit first and keep on hitting constantly.

In daylight and clear weather little harm is done to London or other important centers by Nazi bombs. Remember that London is not England, Scotland, Wales or North Ireland. When the Germans start in the early morning from France, Belgium, Holland, Germany, or even Denmark or Norway, they are met often far out at sea by our fighters and brought down in the proportion of anything between three and ten Germans to one of ours. And every German brought down is dead or a prisoner. Most of our pilots escape by parachute. When clouds are thick and low, enterprising Germans sometimes get through and bomb wildly and disappear, but they are followed by sound locators and the anti-aircraft guns, working with predictor machinery. The sound locators fire at the sound through the clouds and box the raiders in a barrage which always drives them away. Above the clouds they are beset by the fighters. On clear moonlight nights the sound locators track the sound of enemy engines. Their course is plotted by a special staff at the fighter command. Heavily-armed night fighters are warned by radio to go in that direction and hunt for them. Searchlights show them up. The rest is easy. On thick nights things are not so good. Searchlights are useless and fighters cannot find the enemy without help from the ground, so the guns fire by sound through the clouds. But if the clouds are low, star shells and tracers show the whereabouts of the enemy to the fighters above, and they go looksee, often with good results. Without being over-optimistic I do believe that there are new weapons being developed which will enable the R.A.F. to sink the enemy in the dark as well as in daylight. So far they are only being tried out experimentally. The Germans are trying all sorts of bombs, both big and little, high explosives, incendiaries, delay action, or time bombs, land mines, and a good proportion of duds that don't go off.

The real heroes of defense are the chaps who dig up the time bombs and hurry them to wide open spaces. The other heroes are the amateur firemen, the ambulance folk, the gunners, searchlighters, and sound locators. Even the night-flying pilots have cushy jobs by comparison. But they all admire one another so they are all happy. London still carries on and is not noticeably altered in shape. If it were all destroyed England would still carry on. Sirens, however, are a nuisance.

The roof-spotter system on factories and offices works directly with the listening posts and depends on individual judgment. The results have been excellent in keeping up man-hours and the production of munitions, and in preserving life.

Pacific Coast Editor, Aviation

riveters or sheet metal workers. y also train an appreciable number aircraft mechanics. At the same there are many private schools ing job courses. As a matter of t, there are more than 50 private rcraft schools in California. They ange all the way from imposing institutions covering many thousands of square feet of floor space in modern fire-proof buildings, down to the school which is currently doing a good job of training hundreds of riveters in the chicken houses of an abandoned chicken ranch in the San Fernando Valley.

It is doubtless a good thing for the industry, and for the private schools, that the temporary load of job training can be carried by the public school system. The private schools are the very heart of the whole training system, as they provide the close relation with the industry and the concentration on specialized courses which will always be needed for training serious recruits to the aircraft manufacturing industry. The real value of the private schools is found in their long courses of ten months or more of concentrated study on aircraft production subjects. By giving the bulk of job training work to the public schools the better private schools are kept more nearly free to concentrate on their long courses. Also, this public school activity tends to discourage the mushroom private job training schools which, except in certain specialized cases, are not helpful to the factories or to the better private schools.

Factory personnel men prefer to hire the graduates of long-term courses such as are given by the better private schools, and if such men were always available they would never hire the job-trained men. However, the private and public schools together cannot supply the current demand for thoroughly trained men and it has been necessary to compromise. This compromise consists of taking men who are trained to do just one thing and do it well. Usually these men are trained for rivet work. A large portion of such training is being given by the public schools although, to meet urgent needs, at least one manufacturer has contracted with private schools to train large numbers of riveters at the manufacturer's expense. In any case these riveters are encouraged to continue their training during leisure hours after they have been put to work. Between such extension training, on-the-job instruction and encouragement by lead men and supervisors, these "green" workers are moved ahead as fast as possible, making room for more riveters at the bottom of the personnel ladder.

Factory personnel men have worked very closely with both public and private schools in helping to set up courses, in supplying experienced teachers from among qualified factory men, and in encouraging enrollment in such courses on the part of factory employees. Frequently the night school instructors are men who are working a full shift in the factory. In many cases school instructors are released by the manufacturer with a guarantee of their jobs back with full seniority rights when the emergency training program is over.

Since the employee training program has been largely turned over to the schools, public and private, instead of being administered by the manufacturers direct within their own plants, we will briefly outline the school situation on the Pacific Coast. Certain California public schools have been outstanding in their development of aviation courses. Such schools as the California Polytechnic Institute at San Luis Obispo, George Washington High School and Frank Wiggins Trade School, Los Angeles; Sacramento Junior College, Pasadena Junior College, and a number of others have shown great initiative in providing aviation training. Frank Wiggins Trade School, for example, a Los Angeles city school, has more than 250 students studying courses in aircraft drafting, welding, sheet metal, machine shop, and engineering. Such courses have now been set up in almost all Southern California high schools and junior colleges as a result of the National Defense Program for vocational education, initiated by the U.S. Office of Education. Such training is being financed during the current quarter out of an appropriation of $15,000,000 covering all national defense education, al-

(Turn to page 112)

Great Britain, according to informed sources, soon is to receive seven bombers, of this type, from Consolidated Aircraft Corp. The long-range, four-motored ship was given its initial test last week. The plane, similar to the XB-24 developed by Consolidated for the United States army in February, weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. Four 1200-hp, 18-cylinder, radial air-cooled Pratt-Whitney engines power the bomber, said to be capable of carrying four tons of bombs. First duty of the plane will be to ferry R.A.F. pilots to England from Canada and to return pilots unsuitable for combat service who in turn will fly combat planes to England. Until pressed into service as a bomber, the plane's armament will be limited to increase speed.

Consair

Coming within five days of a large order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy yesterday announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

U. S. 2-Ocean Bomber Fleet Being Built

2,000 Navy Flying Boats With 4,000-Mile Range to Patrol Both Coasts

Designed to Cripple Invader Far at Sea

Craft Will Be Ready by Mid-1941; New Bases Extend Striking Power

By The United Press

WASHINGTON, Nov. 23.—The Navy has on order more than two thousand great bomber flying boats to give its air arm a more powerful striking force in the Atlantic and Pacific Oceans, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Company, Baltimore, and Consolidated Aircraft Corporation, San Diego, in the last six weeks. The Martin contract calls for approximately 1,100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately one thousand PBY's at a cost of $93,842,500.

Engines for the big flying boats were included in a $162,000,000 order to Pratt & Whitney.

These craft, with an operating range of 4,000 miles, Navy air strategists believe, will give the United States control of the Atlantic far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam, if necessary.

Planes for Use With Fleet

Improvements in design of the Navy's seaplane-type bombers also will permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be fueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the planes on order by mid-1941. The Navy now has almost three hundred similar bombers which it is using on both Atlantic and Pacific patrol.

All of the Navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities, and as long as supplies are available, ashore or afloat as near as 1,000 to 1,500 miles, have almost complete freedom of operation.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

Union 11/29/40

War-Bound S. D. Bomber to Hop

The first of a large order of patrol-bomber type seaplanes ordered by Britain will leave the Consolidated Aircraft Corp. plant before dawn this morning bound for the east coast and embattled England.

The ship is a model 28 type, similar to the famous navy P.B.Y. planes. It is equipped with two 1000-horsepower engines and has a wing span of 104 feet. It has been camouflaged for its flight to the war zone.

Lt. W. Cleveland, naval reserve, and Douglas Kelley, local flier, will be pilots. Russ Rogers, who flew the Archibald plane Guba around the world, will act as observer, according to report from Consolidated officials.

Another observer aboard will be I. G. Ross, Canadian pilot, who may be slated for the job of taking the plane across the Atlantic after the crew supplied by Consolidated makes delivery on the east coast.

Navy Bombers Make Another Flight to Hawaii

Aero Digest Oct. 39

A flight of fourteen Consolidated patrol-bombers commanded by Lieut. Comdr. Stuart H. Ingersoll, arrived in Honolulu one day last month after a non-stop flight of 2500 miles from San Diego.

The planes, with 98 officers and men aboard, were sent to Hawaii to replace another squadron which was expected to fly from Honolulu to Manila to take up neutrality patrol in Philippine waters. They were from Squadron 13, based at the North Island naval air station, San Diego Bay.

Looking up the production line when the French Bombers were being built. Notice separate nose, center, and tail sections each built as an individual unit

BOMBERS IN QUANTITY

When engineers in competing organizations say, "They do a fine production job,"—that's news. The Martin engineering staff is praised throughout the industry for it's efficient work.

By Jay P. AuWerter,

Assistant Editor

THREE bombers a day is some production rate—but not to the Glenn L. Martin Co. They were doing this and even more at the time when production on the famous French Martin Bomber was in full swing.

To stand at the end of the assembly line and watch the finished ships roll off, the tremendous amount of planning and experience necessary for such a record is not readily noticed. It has come about only through a vast amount of training and personnel cooperation all striving for a goal that is the aim of every aircraft plant.

The successful production of an airplane depends on certain fundamental factors. The ship must be well designed not only for optimum performance but also for ease of production.

The first two of these points is left to the design engineers, while the carrying out of the second becomes the job of the various production departments. Their task is obviously a big one and when done well the company shows a profit; if it is not done well, the figures are in red.

In order for production to flow most effectively through the plant there must be perfect coordination among the production departments, with advice from engineers on certain phases of design. To accomplish this at the Martin plant, a planned series of meetings is held throughout the whole period of production of a model and in these all irregularities are ironed out.

Intensive engineering on a new model begins on the day the contract has been agreed upon between the customer and the company. As soon as agreement on the type of ship, its price and other features has been reached production planning and scheduling is started. The contract date for delivery is always the deadline for production and the scheduling of the ships for construction is made backwards from this day. Every step in the process must finish on time.

Final Engineering Design

When the final design of the airplane has been agreed upon a schedule is set up for the engineering department to follow in releasing blueprints of the various plane parts for production. As designs are ready to be released a meeting is called between the planning, tool design and engineering departments. At this conference the design is thoroughly investigated and a final agreement reached on any changes necessary for ease of production. To speed or facilitate production the engineering department then releases copies of the design to both the production planning department and the tool design department simultaneously.

Scheduling for Production

One of the most important steps in the production program is the determination of what parts are to be subcontracted. In periods of rapid expansion

AIRLINES

AVIATION - November 1940

Factory Training

(Continued from page 33)

gh the bulk of this money will bably be spent for training of aircraft workers. Present instruction is divided about evenly between instruction of unemployed candidates for aircraft jobs, and those who are already at work in the aircraft factories. Instruction is given in aeronautical engineering, production engineering, tool planning, tool designing, aircraft lofting, toolmaking, die making, machine operation, welding, pattern making, template making, tool and jig building, aircraft service mechanics, and all-around mechanics. Limited teacher training courses are also given in order to provide needed teachers and to standardize instruction.

In Los Angeles proper there are now more than 1,500 students under instruction in connection with this program. In Burbank, largely due to the activity of Lockheed Aircraft Corp., there are more than 4,000 active students, with the expectation that a peak of more than 10,000 will be reached early next year. In San Diego, a special effort has been made to meet the needs of Consolidated Aircraft Corp. The city of San Diego is building a $367,000 school plant for the San Diego Vocational School, which is operating under the National Defense plan. Larry Boeing, former Consolidated man, has been granted a leave of absence to act as head of the aeronautics department of this school. Sixteen hundred graduates of this school have been placed in San Diego industry during the first nine months of 1940, about 1,500 of them being employed by Consolidated. J. H. Waterbury, personnel director for Consolidated Aircraft Corp., has cooperated fully by providing 24 experienced men as instructors in sheet metal layout, riveting, welding, etc. Blueprint reading, shop mathematics, machine shop, and general aircraft construction and assembly, are also taught. Enrollment in this school exceeds 1,000 and about 260 men are graduated each week, major emphasis being on the short job training courses.

A review of private school activities does not permit mentioning even all of the outstanding private schools, due to the large number operating in this area. However, the better private schools all have in common the fact that they are working very closely with the aircraft personnel managers to provide men thoroughly trained to move into positions of responsibility in production. Graduates of such schools are generally capable of devoting all their time and attention to the problems of the aircraft plant which employs them, without having to devote long hours to further outside studies in school extension courses.

The private schools generally have an advantage over the public schools in being located on an airport or adjacent to an aircraft plant. Also, they teach only aeronautical subjects and the student can obtain as much information pertaining to his prospective job in a period of ten months as he could get in two years of public school.

We have mentioned the Curtiss-Wright Technical Institute of Aeronautics, located on Grand Central Air Terminal, Glendale. With an enrollment now around the 2,000 mark, this is probably the largest private aviation school in America.

Also in Glendale is the Aeronautical Institute of Technology, which specializes in aircraft production engineering and production methods. This school has close connections with a number of large manufacturers and has grown rapidly, now having an enrollment in the neighborhood of 1,000 students.

California Flyers, Inc., located on Los Angeles Municipal Airport, is an example of a fine type of private school, located almost in the backyard of the major aircraft plants. North American Aviation and the El Segundo Division of Douglas Aircraft Co. are both on this field, giving students an unusual opportunity of observing manufacturing operations as well as test flying. This institution conducts flight instruction, but the major emphasis is on aircraft manufacturing courses, with about 200 students under instruction.

American School of Aircraft Instruments, devoted entirely to instruction of instrument men, is an example of the specialization of some of the private schools. Located in Glendale, this school has grown rapidly in line with the need for instrument specialists. Another special school, recently opened in Hollywood, is the Academy of Aerial Photography, for instruction in all branches of aerial photography. One might think this out of line with the aircraft production problem, but investigation shows that a tremendous volume of aerial photography is done by all major aircraft plants.

The Boeing School of Aeronautics, Oakland, a division of United Air Lines, also has a direct relationship with Boeing Aircraft Co., Seattle, and has supplied many production men for Boeing and other factories. The Boeing School specializes in long term training of the most thorough kind.

The Ryan School of Aeronautics, San Diego, is unique in that it is a subsidiary of the Ryan Aeronautical Co. Thus the graduates of the Ryan School have, for the most part, gone directly into production work for the Ryan factory. The relationship also makes it possible to give students actual factory experience during the advanced stages of their school work.

There are several notable examples of short-term, job training schools which have been unusually successful. These include the Warren School of Aeronautics, Los Angeles, which has specialized in low-cost practical training, turning out graduates who have won wide favor with aircraft personnel men. Then the Fletcher Aircraft Schools of Santa Monica, Burbank, and South Gate, have worked with Douglas and Lockheed to give large volume short-term courses to prospective employees. Lockheed alone has put about 1,500 men through the Fletcher Schools and through the Powers Aircraft School, Van Nuys.

Summarizing the special activities of the various aircraft plants in this area, space permits only a sketchy outline. The Boeing Aircraft Co., Seattle, has faced a special problem due to its location far from a major source of skilled labor, and far from a major aircraft school. Boeing has received close cooperation from various California aircraft manufacturers in supplying key men. Local Seattle schools have supplied large numbers of job trained men. On-the-job training has closed the gap between the skilled and unskilled, experienced and inexperienced men.

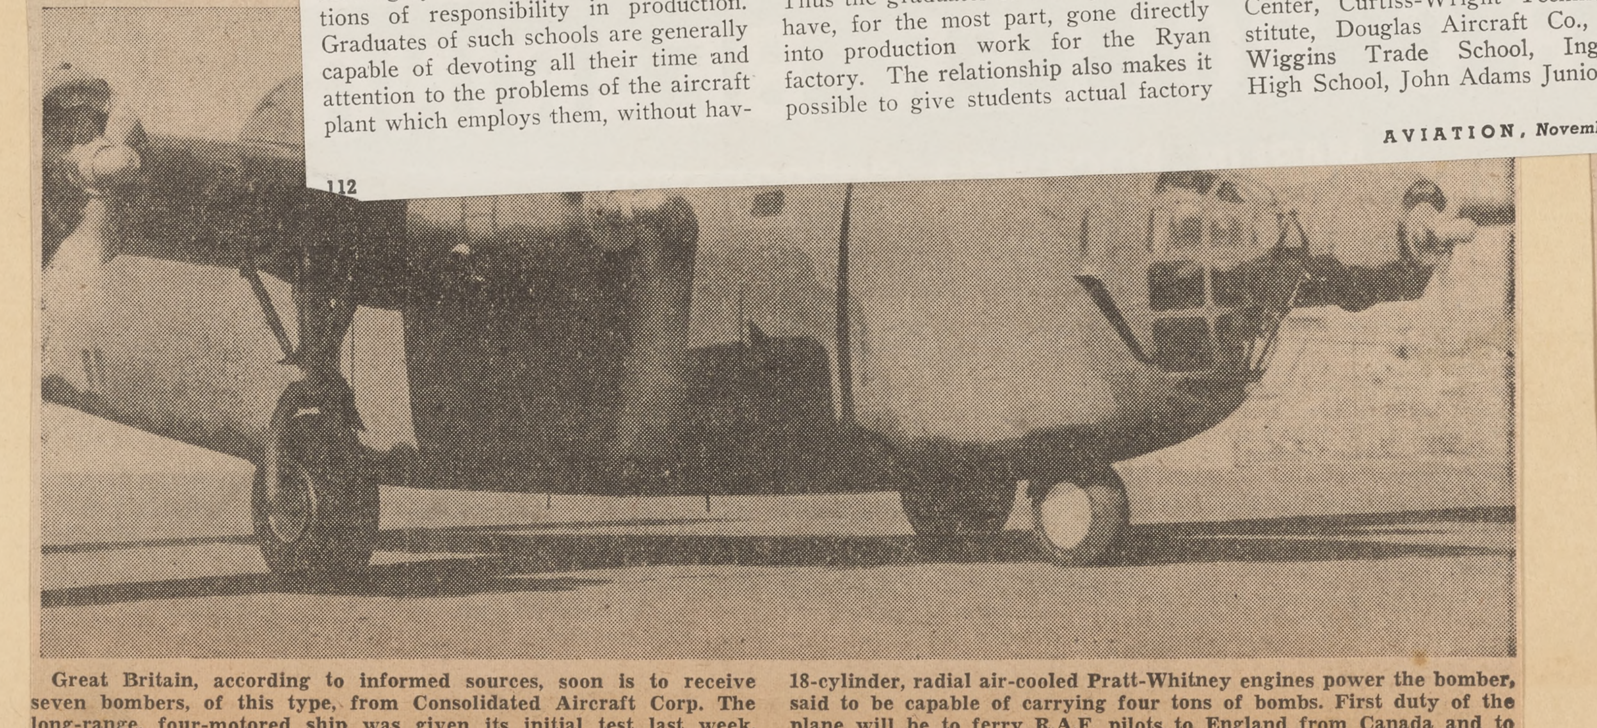
Consolidated Aircraft Corp., San Diego, is close enough to the Los Angeles area to draw easily on the available trained aircraft workers from that area. The bulk of new employees, however, have come from San Diego by way of the San Diego Vocational School or the Ryan School of Aeronautics.

The Douglas Aircraft Co., Santa Monica, has faced a tremendous problem in upping the payroll from 7,000 to 18,000 people in one year. W. G. Jerrems, personnel director, and C. T. Reid, director of education, have combined all available facilities in staging a mass education program probably not matched by any other aircraft manufacturer in this country. As a result a total of 35 courses have been taught by Douglas personnel in public schools, private schools, or in the plant itself. These courses include: aviation for stenographers, blueprint reading, aircraft template development, aircraft assembly, drafting, aircraft tool design, aircraft hydraulic design, aircraft mechanical drawing, metal fitting fabrication, wood pattern making, aircraft plumbing, riveting, sheet metal layout, sheet metal work, shop mathematics, stress analysis, technical sketching, lofting, and welding. These courses and their various subdivisions are offered at: Santa Monica Adult Education Center, Curtiss-Wright Technical Institute, Douglas Aircraft Co., Frank Wiggins Trade School, Inglewood High School, John Adams Junior High

olds

L.A.

S. D. BOMBER



Great Britain, according to informed sources, soon is to receive seven bombers, of this type, from Consolidated Aircraft Corp. The long-range, four-motored ship was given its initial test last week. The plane, similar to the XB-24 developed by Consolidated for the United States army in February, weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. Four 1200-hp, 18-cylinder, radial air-cooled Pratt-Whitney engines power the bomber, said to be capable of carrying four tons of bombs. First duty of the plane will be to ferry R.A.F. pilots to England from Canada and to return pilots unsuitable for combat service who in turn will fly combat planes to England. Until pressed into service as a bomber, the plane's armament will be limited to increase speed.

Contract 8 Million For Consair

Coming within five days of a large order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy yesterday announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

U. S. 2-Ocean Bomber Fleet Being Built

2,000 Navy Flying Boats With 4,000-Mile Range to Patrol Both Coasts

Designed to Cripple Invader Far at Sea

Craft Will Be Ready by Mid-1941; New Bases Extend Striking Power

By The United Press

WASHINGTON, Nov. 23.—The Navy has on order more than two thousand great bomber flying boats to give its air arm a more powerful striking force in the Atlantic and Pacific Oceans, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Company, Baltimore, and Consolidated Aircraft Corporation, San Diego, in the last six weeks. The Martin contract calls for approximately 1,100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately one thousand PBY's at a cost of $93,842,500.

Engines for the big flying boats were included in a $162,000,000 order to Pratt & Whitney.

These craft, with an operating range of 4,000 miles, Navy air strategists believe, will give the United States control of the Atlantic far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam, if necessary.

Planes for Use With Fleet

Improvements in design of the Navy's seaplane-type bombers also will permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be fueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the planes on order by mid-1941. The Navy now has almost three hundred similar bombers which it is using on both Atlantic and Pacific patrol.

All of the Navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities, and as long as supplies are available, ashore or afloat as near as 1,000 to 1,500 miles, have almost complete freedom of operation.

Consair Plane Leaves N. Y. for Nova Scotia

12/3/40

Forrestal Here On Consair Visit

On an inspection tour of west coast aircraft factories which are engaged in the manufacture of planes for the navy, James V. Forrestal, under-secretary of the navy, arrived by plane late yesterday from Washington, D. C., via Seattle and Los Angeles. He was accompanied by Capt. Sidney M. Kraus of the bureau of aeronautics.

Landing at the Naval Air station at 5:10 from Mines field, Los Angeles, Forrestal was greeted by Vice Adm. W. F. Halsey, Rear Adm. Charles A. Blakely, 11th Naval district commandant, and chamber of commerce executives. He went to Hotel del Coronado.

At Seattle Forrestal inspected the Boeing factory and at Los Angeles the Douglas and North American aircraft plants. He will visit the Consolidated plant here today.

WAGE REVIEW STARTS DEC. 2 AT CONSAIR

been employed since Aug. 31, 1940, will be discussed at a full committee meeting with the management which has been planned for Monday.

Wage review problems were discussed and plans were made for the proper presentation.

Information blanks have been distributed to the employees of Local 1125 requiring the following information: Name of Employee, Clock Number, Address. Do you feel that you are entitled to a wage increase? How much per hour? Reason for increase? Give details of the work you are now doing.

If you have not received one of these blanks, contact your shop committeeman and get this information to him as soon as possible.

Shop Committeemen—Day Side

W. J. Chudleigh, tool room.
Harry Hudson, sheet metal.
J. D. Barnes, machine shop.
M. J. Castle, metal bench.
C. E. Danner, finish.
Hammett, tool bending.
H. E. Leonard, experimental.
S. W. Adams, M. T.
R. J. Bragg, hull department.
Carl E. Heilbach, wood shop.
Don Greene, final assembly.
J. B. Waskey, wing.
L. A. Perry, wing.
Kobets, tank.

The names of night shift committeemen have not been secured at this time.

The following communication for Consolidated management was read:

San Diego, Cal., Nov. 19, 1940.
Memo to: All Foremen
Subject: Wage Review.

In order to proceed with our next wage review starting 2 December, 1940, you are requested to keep separate all record sheets of employees who have been hired since 31 August, 1940. These record sheets will be reviewed after our regular wage review period.

The order of departments to be reviewed will be as follows:

1. Tool Room and Wood Shop.
2. Machine Shop.
3. Welding.
4. Sheet Metal.
5. Hull Department.
6. Drop Hammer and Tank.
7. Wing Department.
8. Metal Bench.
9. Final Assembly.
10. Paint Shop.
11. Sub Ass'y and Spare Parts.
12. Maintenance.
13. Draw Bench.
14. Heat Treat. and Spotweld.
15. Tubing.
16. Experimental.
17. Loft.
18. Productoin Department.
19. Shipping and Receiving.

JAS. L. KELLEY,
Factory Manager.

A large attendance was reported at last Monday's meeting, at which time approximately 150 new members were received into the union. Tuesday night's meeting was attended by approximately 350 members at which time over 250 new members were admitted to the union.

Nominations received at both day and night shifts to date are as follows:

President: L. A. Perry, R. B. Felton, W. J. Chudleigh, and Bros. Shields and Burney.

Vice-President: J. L. Castle, J. S. Burney, H. Gillan, A. J. Fischer, and Bro. Granstead.

Financial Secretary: W. J. Chudleigh, R. B. Felton, A. J. Fischer, H. A. Abbey, Bro. McIllivich, L. A. Perry, and F. H. Cole.

Recording Secretary: L. A. Perry, F. M. Martin, Al Hogan, and Bro. Morris.

Treasurer: Herman Stellar, Al Cox, and Bro. Wilder.

Conductor: A. Peterson, F. Martin, A. J. Fischer, and Bro. McCune.

Sentinel: H. W. Clark, R. B. Felton, H. A. Abbey, A. Peterson, and Bro. Swaed.

Trustees: A. Hogan, J. J. Braun, P. McManus, L. Larsen.

Executive Board: H. Torres, J. Coe, R. B. Felton, J. D. Barnes, H. A. Abbey.

Brother Parker was elected as member of Wage Review Board from the Night Shift to serve with Bro. Chudleigh.

Motion made at the night shift meeting on last Monday that nomination of officers for the whole lodge be held over to special meeting which will be held at 2 p. m., Sunday, Nov. 24th, when a public agent also will be nominated. This was held to be out of order and unconstitutional at the meeting of the day shift Tuesday night, Nov. 19th, as nomination for officers must be made at two regular meetings to be held in November.

The nominations were closed from the day shift, but can still be placed before the union at next Monday's meeting of the night shift, which is held in Turner Hall at 10 a. m. Special meeting for Sunday cannot be legally held.

The discharge and lay off of the members was discussed and it was suggested that, where the employee concerned considered that the lay off or discharge was unjust and that he was being discriminated against, he should contact his shop committeeman immediately as re-instatements were much easier to secure if acted upon as soon as possible.

Matters pertaining to the immediate wage increase for employees in the lower brackets who have

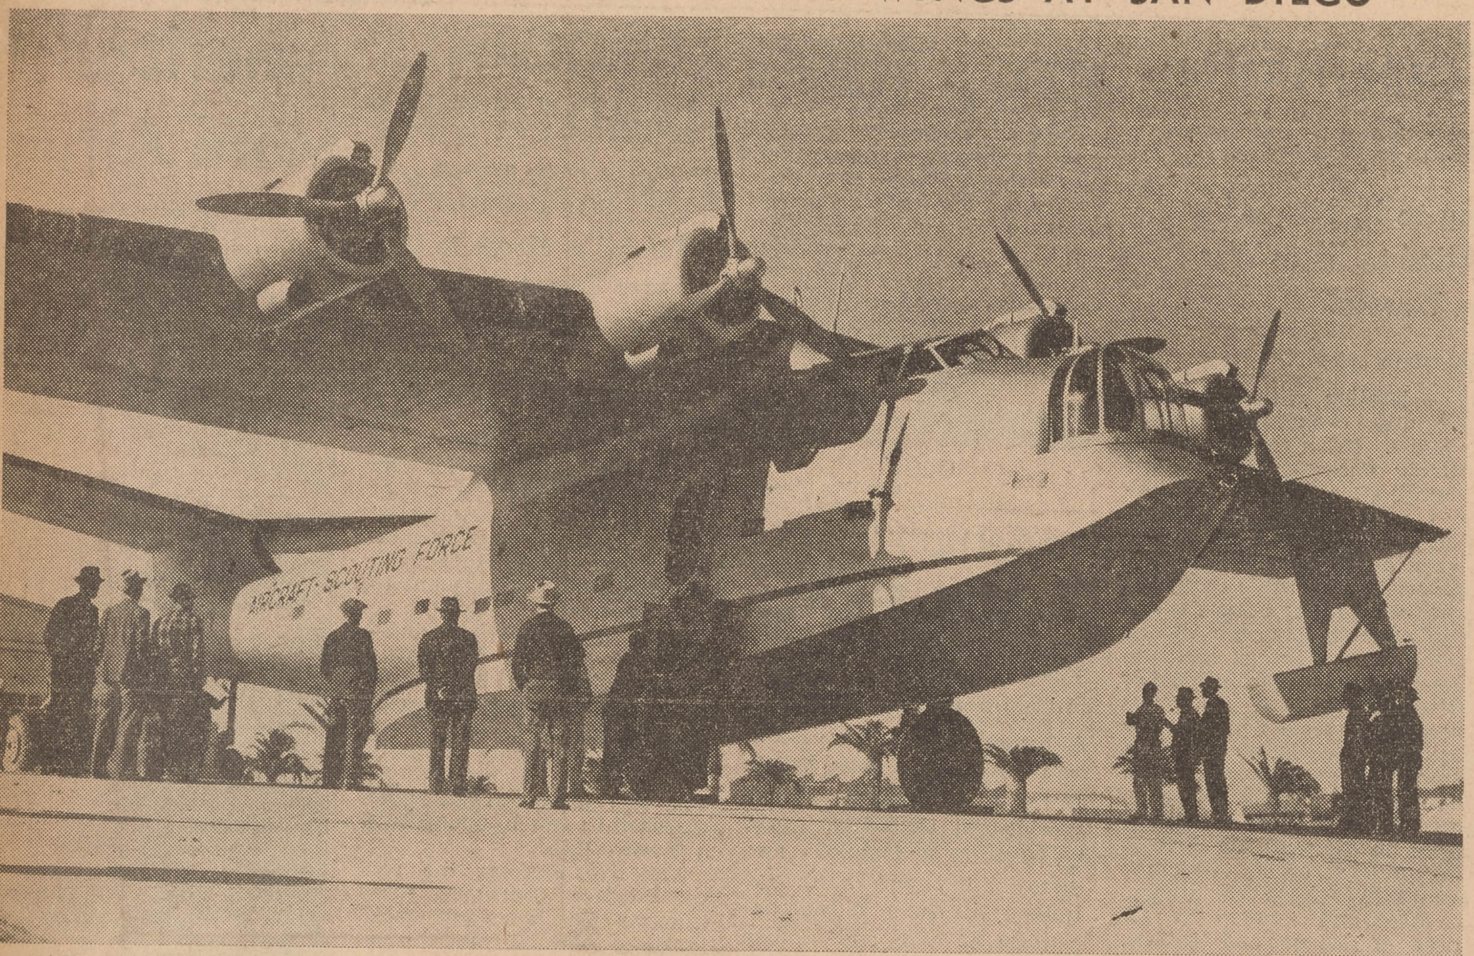
SKY GIANT SUCCESSFULLY TRIES WINGS AT SAN DIEGO



AIR LEVIATHAN—Here is prototype of first "battleship of the air" which has undergone tests successfully.

Los Angeles Times - 11/24/40

Huge New Air Battleship Given First Test Flights

One of Navy's Six Most Powerful Bombers, Built at San Diego, Tries Out Its Wings

SAN DIEGO, Nov. 23.—Test flights on the first of six four-motored, 25-ton "battleships of the air," most powerful bombers in the Navy, have been started here by a Consolidated Aircraft Corp. crew, with delivery to a Navy trial board due next month, it was learned today.

Equipped with a supercharger enabling operations at extremely high altitudes, the craft will be assigned to the recently commissioned Patrol Squadron 13, commanded by Lieut. Comdr. Stephen B. Cooke, at the San Diego naval air station.

CARRIES MACHINE GUNS

All six, the first group of a Navy mass production order, are expected to be delivered to the 100-man squadron by February or March, it was indicated.

Capable of flying 5000 miles nonstop, the air Leviathan has two machine-driven revolving turrets, one in the bow and another topside, mounting heavy-caliber machine guns. Additional protection from fighter planes is afforded by manually operated gun stations.

The engines are 1200 h.p. Pratt & Whitney radial air-cooled, housed in a 115-foot wing.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

Navy Bombers Make Another Flight to Hawaii

Aero Digest Oct. 39

A flight of fourteen Consolidated patrol-bombers commanded by Lieut. Comdr. Stuart H. Ingersoll, arrived in Honolulu one day last month after a non-stop flight of 2500 miles from San Diego.

The planes, with 98 officers and men aboard, were sent to Hawaii to replace another squadron which was expected to fly from Honolulu to Manila to take up neutrality patrol in Philippine waters. They were from Squadron 13, based at the North Island naval air station, San Diego Bay.

AMERICAN EXPORT AIRLINES WILL USE NEW SIKORSKY

Nat'l. Aircraft Counsellor 10-22-40

The board of directors of American Export Airlines, Inc., announced last week that Durston G. Richardson has been elected vice-president in charge of operations. Mr. Richardson has been associated with this company for two years.

American Export Airlines was recently granted a Civil Aeronautics Board certificate of convenience and necessity to establish transatlantic air service between the United States and Europe using New York and Lisbon as terminals. The company plans to pioneer non-stop service on this route as soon as its three new Sikorsky S-44a four-engined flying boats are ready. These are now under construction at the United Aircraft Corporation Sikorsky plant at Bridgeport.

Meanwhile, the airlines will use their Consolidated Model 28 flying boat (an adaption of the PBY long-range bomber) which, like the Sikorskys, was originally developed for the Navy. Horta, Azores, will be used as an intermediate port for the preliminary mail and express service.

Under Mr. Richardson's direction, technical details for co-ordinating certain facilities of the new airlines with those of the parent company, American Export Lines, Inc., have been perfected. This represents the first time in history that a transoceanic airline and steamship service, operating under a single house flag, have thus pooled technical resources.

American Export Lines today operates the only regularly scheduled American flag steamship service between the United States and Europe and, like the airline, uses New York and Lisbon as its terminals. Thus, the flying boats and surface vessels will follow identical routes.

According to Mr. Richardson, the airlines will station a trained meteorologist, representing its own weather bureau, aboard each of the "Four Ace" passenger liner erated by the steamship con These men have been assig make constant observatio winds aloft and to relay t formation b tervals to th er Bureau aircraft on

Great Britain, according to informed sources, soon is to receive seven bombers, of this type, from Consolidated Aircraft Corp. The long-range, four-motored ship was given its initial test last week. The plane, similar to the XB-24 developed by Consolidated for the United States army in February, weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. Four 1200-hp, 18-cylinder, radial air-cooled Pratt-Whitney engines power the bomber, said to be capable of carrying four tons of bombs. First duty of the plane will be to ferry R.A.F. pilots to England from Canada and to return pilots unsuitable for combat service who in turn will fly combat planes to England. Until pressed into service as a bomber, the plane's armament will be limited to increase speed.

Contract 3 Million onsair

within five days of a order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy yesterday announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

U. S. 2-Ocean Bomber Fleet Being Built

2,000 Navy Flying Boats With 4,000-Mile Range to Patrol Both Coasts

Designed to Cripple Invader Far at Sea

Craft Will Be Ready by Mid-1941; New Bases Extend Striking Power

By The United Press

WASHINGTON, Nov. 23.—The Navy has on order more than two thousand great bomber flying boats to give its air arm a more powerful striking force in the Atlantic and Pacific Oceans, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Company, Baltimore, and Consolidated Aircraft Corporation, San Diego, in the last six weeks. The Martin contract calls for approximately 1,100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately one thousand PBY's at a cost of $93,842,500.

Engines for the big flying boats were included in a $162,000,000 order to Pratt & Whitney.

These craft, with an operating range of 4,000 miles, Navy air strategists believe, will give the United States control of the Atlantic far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam, if necessary.

Planes for Use With Fleet

Improvements in design of the Navy's seaplane-type bombers also will permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be fueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the planes on order by mid-1941. The Navy now has almost three hundred similar bombers which it is using on both Atlantic and Pacific patrol.

All of the Navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities, and as long as supplies are available, ashore or afloat as near as 1,000 to 1,500 miles, have almost complete freedom of operation.

Consair Plane Leaves N. Y. for Nova Scotia

12/3/40

Forrestal Here On Consair Visit

On an inspection tour of west coast aircraft factories which are engaged in the manufacture of planes for the navy, James V. Forrestal, under-secretary of the navy, arrived by plane late yesterday from Washington, D. C., via Seattle and Los Angeles. He was accompanied by Capt. Sidney M. Kraus of the bureau of aeronautics.

Landing at the Naval Air station at 5:10 from Mines field, Los Angeles, Forrestal was greeted by Vice Adm. W. F. Halsey, Rear Adm. Charles A. Blakely, 11th Naval district commandant, and chamber of commerce executives. He went to Hotel del Coronado.

At Seattle Forrestal inspected the Boeing factory and at Los Angeles the Douglas and North American aircraft plants. He will visit the Consolidated plant here today.

VOLUME 1 — SAN DIEGO, CALIFORNIA, NOVEMBER 21, 1940 — NUMBER 6

WAGE REVIEW STARTS DEC. 2 AT CONSAIR

A large attendance was reported at last Monday's meeting, at which time approximately 150 new members were received into the union. Tuesday night's meeting was attended by approximately 350 members at which time over 250 new members were admitted to the union.

Nominations received at both day and night shifts to date are as follows:

President: L. A. Perry, R. B. Felton, W. J. Chudleigh, and Bros. Shields and Burney.

Vice-President: J. L. Castle, J. S. Burney, H. Gillan, A. J. Fischer, and Bro. Granstead.

Financial Secretary: W. J. Chudleigh, R. B. Felton, A. J. Fischer, H. A. Abbey, Bro. McIllivich, L. A. Perry, and F. H. Cole.

Recording Secretary: L. A. Perry, F. M. Martin, Al Hogan, and Bro. Morris.

Treasurer: Herman Stellar, Al Cox, and Bro. Wilder.

Conductor: A. Peterson, F. Martin, A. J. Fischer, and Bro. McCune.

Sentinel: H. W. Clark, R. B. Felton, H. A. Abbey, A. Peterson, and Bro. Swaed.

Trustees: A. Hogan, J. J. Braun, P. McManus, L. Larsen.

Executive Board: H. Torres, J. Coe, R. B. Felton, J. D. Barnes, H. A. Abbey.

Brother Parker was elected as member of Wage Review Board from the Night Shift to serve with Bro. Chudleigh.

Motion made at the night shift meeting on last Monday that nomination of officers for the whole lodge be held over to special meeting which will be held at 2 p. m., Sunday, Nov. 24th, when a public agent also will be nominated. This was held to be out of order and unconstitutional at the meeting of the day shift Tuesday night, Nov. 19th, as nomination for officers must be made at two regular meetings to be held in November.

The nominations were closed from the day shift, but can still be placed before the union at next Monday's meeting of the night shift, which is held in Turner Hall at 10 a. m. Special meeting for Sunday cannot be legally held.

The discharge and lay off of the members was discussed and it was suggested that, where the employee concerned considered that the lay off or discharge was unjust and that he was being discriminated against, he should contact his shop committeeman immediately as re-instatements were much easier to secure if acted upon as soon as possible.

Matters pertaining to the immediate wage increase for employees in the lower brackets who have been employed since Aug. 31, 1940, will be discussed at a full committee meeting with the management which has been planned for Monday.

Wage review problems were discussed and plans were made for the proper presentation.

Information blanks have been distributed to the employees of Local 1125 requiring the following information: Name of Employee, Clock Number, Address. Do you feel that you are entitled to a wage increase? How much per hour? Reason for increase? Give details of the work you are now doing.

If you have not received one of these blanks, contact your shop committeeman and get this information to him as soon as possible.

Shop Committeemen—Day Side

W. J. Chudleigh, tool room.
Harry Hudson, sheet metal.
J. D. Barnes, machine shop.
M. J. Castle, metal bench.
C. E. Danner, finish.
Hammett, tool bending.
H. E. Leonard, experimental.
S. W. Adams, M. T.
R. J. Bragg, hull department.
Carl E. Heilbach, wood shop.
Don Greene, final assembly.
J. B. Waskey, wing.
L. A. Perry, wing.
Kobets, tank.

The names of night shift committeemen have not been secured at this time.

The following communication for Consolidated management was read:

San Diego, Cal., Nov. 19, 1940.
Memo to: All Foremen
Subject: Wage Review.

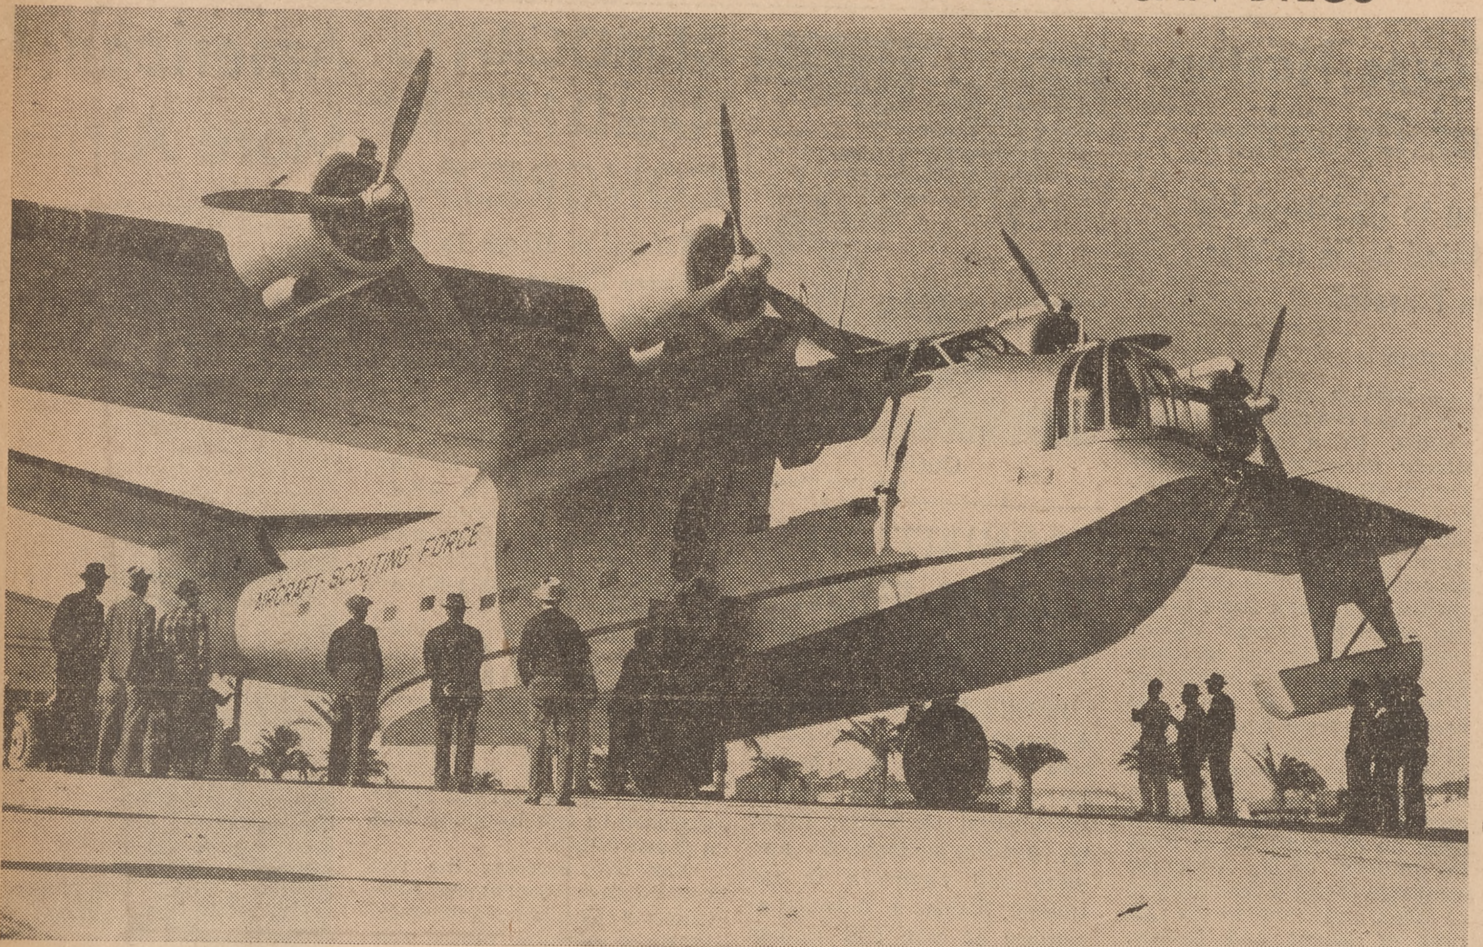
In order to proceed with our next wage review starting 2 December, 1940, you are requested to keep separate all record sheets of employees who have been hired since 31 August, 1940. These record sheets will be reviewed after our regular wage review period.

The order of departments to be reviewed will be as follows:

1. Tool Room and Wood Shop.
2. Machine Shop.
3. Welding.
4. Sheet Metal.
5. Hull Department.
6. Drop Hammer and Tank.
7. Wing Department.
8. Metal Bench.
9. Final Assembly.
10. Paint Shop.
11. Sub Ass'y and Spare Parts.
12. Maintenance.
13. Draw Bench.
14. Heat Treat. and Spotweld.
15. Tubing.
16. Experimental.
17. Loft.
18. Productoin Department.
19. Shipping and Receiving.

JAS. L. KELLEY,
Factory Manager.

SKY GIANT SUCCESSFULLY TRIES WINGS AT SAN DIEGO



AIR LEVIATHAN—Here is prototype of first "battleship of the air" which has undergone tests successfully.

Los Angeles Times - 11/24/40

Huge New Air Battleship Given First Test Flights

One of Navy's Six Most Powerful Bombers, Built at San Diego, Tries Out Its Wings

SAN DIEGO, Nov. 23.—Test flights on the first of six four-motored, 25-ton "battleships of the air," most powerful bombers in the Navy, have been started here by a Consolidated Aircraft Corp. crew, with delivery to a Navy trial board due next month, it was learned today.

Equipped with a supercharger enabling operations at extremely high altitudes, the craft will be assigned to the recently commissioned Patrol Squadron 13, commanded by Lieut. Comdr. Stephen B. Cooke, at the San Diego naval air station.

CARRIES MACHINE GUNS

All six, the first group of a Navy mass production order, are expected to be delivered to the 100-man squadron by February or March, it was indicated.

Capable of flying 5000 miles nonstop, the air Leviathan has two machine-driven revolving turrets, one in the bow and another topside, mounting heavy-caliber machine guns. Additional protection from fighter planes is afforded by manually operated gun stations.

The engines are 1200 h.p. Pratt & Whitney radial air-cooled, housed in a 115-foot wing.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

Union 11/29/40

War-Bound S. D. Bomber to Hop

The first of a large order of patrol-bomber type seaplanes ordered by Britain will leave the Consolidated Aircraft Corp. plant before dawn this morning bound for the east coast and embattled England.

The ship is a model 28 type, similar to the famous navy P.B.Y. planes. It is equipped with two 1000-horsepower engines and has a wing span of 104 feet. It has been camouflaged for its flight to the war zone.

Lt. W. Cleveland, naval reserve, and Douglas Kelley, local flier, will be pilots. Russ Rogers, who flew the Archibald plane Guba around the world, will act as observer, according to report from Consolidated officials.

Another observer aboard will be I. G. Ross, Canadian pilot, who may be slated for the job of taking the plane across the Atlantic after the crew supplied by Consolidated makes delivery on the east coast.

Consolidated Bomber Arrives in New York

PORT WASHINGTON, N. Y., Nov. 30 (A.P.)—The first of a fleet of Consolidated 28 patrol bomber type seaplanes destined for Great Britain arrived today from San Diego, by way of Fort Worth.

Presumably, the plane will be flown later to Halifax for delivery to Canadian authorities who will fly or transport it to Great Britain

---

Navy Bombers Make Another Flight to Hawaii

Aero Digest Oct. 39

A flight of fourteen Consolidated patrol-bombers commanded by Lieut. Comdr. Stuart H. Ingersoll, arrived in Honolulu one day last month after a non-stop flight of 2500 miles from San Diego.

The planes, with 98 officers and men aboard, were sent to Hawaii to replace another squadron which was expected to fly from Honolulu to Manila to take up neutrality patrol in Philippine waters. They were from Squadron 13, based at the North Island naval air station, San Diego Bay.

AMERICAN EXPORT AIRLINES WILL USE NEW SIKORSKY

Natl. Aircraft Counsellor 10-22-40

The board of directors of American Export Airlines, Inc., announced last week that Durston G. Richardson has been elected vice-president in charge of operations. Mr. Richardson has been associated with this company for two years.

American Export Airlines was recently granted a Civil Aeronautics Board certificate of convenience and necessity to establish transatlantic air service between the United States and Europe using New York and Lisbon as terminals. The company plans to pioneer non-stop service on this route as soon as its three new Sikorsky S-44a four-engined flying boats are ready. These are now under construction at the United Aircraft Corporation Sikorsky plant at Bridgeport.

Meanwhile, the airlines will use their Consolidated Model 28 flying boat (an adaption of the PBY long-range bomber) which, like the Sikorskys, was originally developed for the Navy. Horta, Azores, will be used as an intermediate port for the preliminary mail and express service.

Under Mr. Richardson's direction, technical details for co-ordinating certain facilities of the new airlines with those of the parent company, American Export Lines, Inc., have been perfected. This represents the first time in history that a transoceanic airline and steamship service, operating under a single house flag, have thus pooled technical resources.

American Export Lines today operates the only regularly scheduled American flag steamship service between the United States and Europe and, like the airline, uses New York and Lisbon as its terminals. Thus, the flying boats and surface vessels will follow identical routes.

According to Mr. Richardson, the airlines will station a trained meteorologist, representing its own weather bureau, aboard each of the "Four Ace" passenger liners operated by the steamship company. These men have been assigned to make constant observations of winds aloft and to relay this information by radio at regular intervals to the United States Weather Bureau and to the company's aircraft on the course overhead.

Company meteorologists have been stationed for training aboard each of the two United States Coast Guard vessels now stationed in mid-Atlantic for the purpose of assembling and reporting flying weather data.

Mr. Richardson, who served as a flying officer in the Army Corps during the last war, has been continuously associated with aviation since that time.

In 1920 he was a pilot on the first American overseas airline operated by Aeromarine Airways, Inc., between Key West and Havana and Miami-Nassau. For ten years he served as an official in charge of international airline operations covering Central and South American countries.

Natl. Aircraft Counsellor

* * *

CONSOLIDATED AIRCRAFT CORPORATION: Chiefly known because of the brilliant performance of its huge flying boats, Consolidated still dominates this field of naval aviation. Company currently has a backlog of more than $150,000,000 for four-motored bombers and patrol boats. Outstanding capitalization consists of 23,820 shares of $3.00 par Convertible Preferred and 576,160, shares of $1.00 par value Common stock. Common is currently selling at around $23 per share. Consolidated, the writer believes, offers excellent profit possibilities from the long range view. Plant is located at San Diego, where Consolidated has grown within a few short years to be the city's largest industrial organization.

10-22-40

* * *

AVIATION - November 1940

School, Santa Monica, Santa Monica Technical School, United Aircraft School, Venice High School, Westwood Correspondence School, and the Willis Business College.

This brief outline will serve to illustrate the steps taken by one major manufacturer to meet the personnel training problem. Approximately 2,000 Douglas employees are currently enrolled in these courses, in addition to prospective employees undergoing instruction.

An interesting and significant problem is that faced by Interstate Aircraft & Engineering Corp., a subcontractor machining aircraft parts. About 300 machinists are employed at this plant, with the number being steadily expanded. It is no longer possible to hire experienced machinists in any quantity, and training machinists is a long and tedious process which has been begun too late in this country to satisfy the immediate need. Lawrence Ley, shop superintendent at Interstate, has solved this problem through combining a high degree of supervision with a system of progressive advancement for new men, or boys. The really experienced and capable all-around machinists available have been about evenly divided between the tool room and the shop. Those in the shop are used almost exclusively as lead men, to supervise work set-ups and to instruct green men in specific operations. Under such instruction it is possible to reach a high rate of production with comparatively inexperienced help. Boys out of high school but with thorough high school machine shop instruction, are hired and put to work on the burring bench. After several months of burring work, and as they show aptitude and opportunities open up, these boys are advanced to thread mills, where they are under close supervision. After a few months of thread mill work they go on to production mill work where, with careful supervision, they soon develop into good production men. This does not produce the all-around machinists such as are trained by the apprentice plan, but it does provide production machinists in the shortest possible space of time, and with maximum production efficiency while advancing.

A similar problem has been met by the Kinner and Menasco aircraft engine companies of Glendale and Burbank, respectively. Both have relied on accelerated training of younger men, under close shop supervision, to fill out the ranks of machine shop personnel. Also, a higher degree of machine specialization is necessary under this plan, restricting workers to the operation of equipment on which they have had experience.

Under R. Randall Irwin, industrial relations manager, the Lockheed Aircraft Corp. has conducted a long-range employee selection and training program. The Lockheed program starts with unusual care in selection of employees off the hiring line. It includes every conceivable avenue of employee training, including paying tuition of untrained employees through short courses in private schools, as previously mentioned, and also including unusually close cooperation with the public school system. Lockheed has also, largely at its own expense, initiated engineering brush-up courses for making aircraft engineers out of engineers trained and experienced in other fields, such as civil or structural engineering. Such courses are being given with the cooperation of the California Institute of Technology.

North American Aviation, Inc., has increased the payroll from 3,700 to 6,600 in a year and is now shooting for a total of 10,000 employees at the El Segundo plant (12,000 will be employed in the new Dallas factory). Under the direction of Major Howe Thayer, education director, North American has cooperated with many of the public and private schools already mentioned to provide adequate employee training.

Northrop Aircraft, Inc., has already advanced from zero to more than 1,200 employees this year, and expects to have 3,000 at work in the near future. A nucleus of this new staff were seasoned men from neighboring aircraft plants. The balance consists of new men obtained through the various established schools.

One thing worth mentioning in connection with the method used by Ryan Aeronautical Co. in obtaining students from the Ryan School of Aeronautics, is that the school has inaugurated a three-shift, 24-hr. per day training program in order to meet the factory's requirements for trained men.

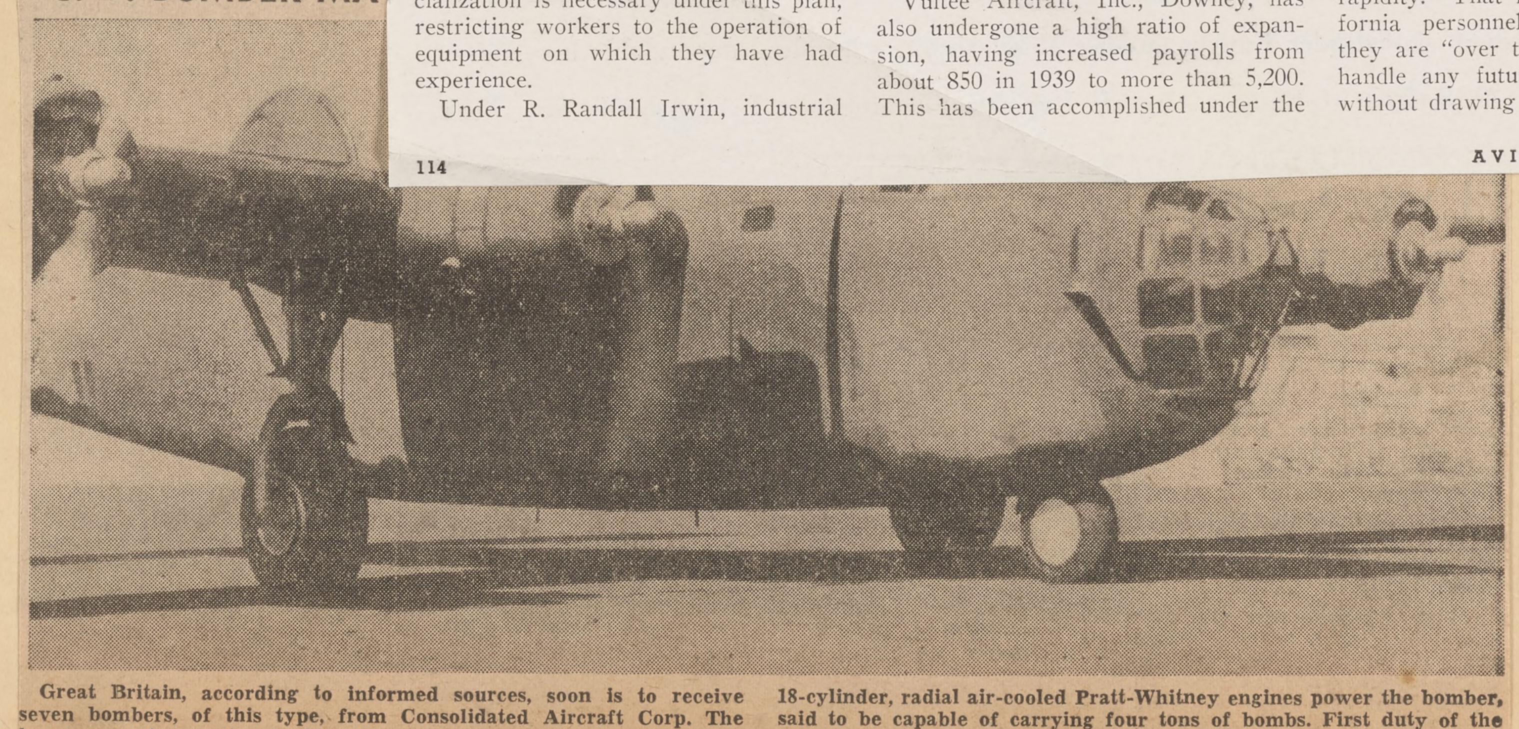
Solar Aircraft Co., San Diego, employs a high percentage of welders in manufacturing the special Solar manifolds which are standard throughout the industry. These welders have been obtained from various schools and then carefully checked through a system set up in the Solar plant, which includes qualifying each welder to meet Army-Navy requirements.

Vega Aircraft Co., Burbank, as a subsidiary of Lockheed, has relied directly on the Lockheed organization to provide necessary executive supervision for expansion of the payroll, which has leaped from less than 100 to approximately 3,000.

Vultee Aircraft, Inc., Downey, has also undergone a high ratio of expansion, having increased payrolls from about 850 in 1939 to more than 5,200. This has been accomplished under the supervision of Gerald Tuttle, personnel manager, and George Ford, director of education and training. Mr. Ford has worked closely with various public schools in setting up courses and providing instructors. At Nashville, where Vultee recently took over the new Stinson factory, he found that the city had a charter provision preventing training anyone more than 21 years of age in the public school system. It was possible to modify this provision in line with the opportunity afforded Nashville residents of immediate employment upon completion of suitable aircraft training work. Vultee now has more than 50 employees who are doing part-time teaching in public or private aircraft training schools. Ford finds the greatest shortage right now in the field of experienced machinists, tool, jig, and die makers. He prefers a minimum short course of eight weeks and then wants the trainee to concentrate on learning to do one thing well, such as riveting, sheet metal layout, hand forming, assembly, etc. rather than trying to compress a whole education into such a short period. As with other personnel men, Ford would prefer the man with all-around training of ten months or more, if he could get him. Having to take the short-term trainee, he then encourages him to take extension courses at least one or two nights a week. All new men are put through a course of work training to advance them as rapidly as possible and make more room at the bottom for new men. Machinist candidates are started on bench work and later worked out into the shop under the close supervision of set-up men. Sheet metal workers are started on the simplest possible operations and advanced as they learn; riveters are started as buckers and on the simplest type of riveting, a green man always being placed with an experienced man. Promising lead men are selected for foreman training on company time, such training being given by Ford. Vultee expects to have 10,000 men at work in the Downey plant in the near future, and 6,000 at work in Nashville.

One lesson emphasized by many personnel men is that sheer manpower is not the answer to accelerating production. It is better sometimes not to expand too fast, or at least not faster than it is possible to train the key men who must supervise the green men coming in under them. Once those key men have been properly prepared for their added responsibilities it is possible to pyramid personnel with much greater rapidity. That is why Southern California personnel managers feel that they are "over the hump" and able to handle any future expansion program without drawing a deep breath.

S. D. BOMBER MA



Great Britain, according to informed sources, soon is to receive seven bombers, of this type, from Consolidated Aircraft Corp. The long-range, four-motored ship was given its initial test last week. The plane, similar to the XB-24 developed by Consolidated for the United States army in February, weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. Four 1200-hp, 18-cylinder, radial air-cooled Pratt-Whitney engines power the bomber, said to be capable of carrying four tons of bombs. First duty of the plane will be to ferry R.A.F. pilots to England from Canada and to return pilots unsuitable for combat service who in turn will fly combat planes to England. Until pressed into service as a bomber, the plane's armament will be limited to increase speed.

Wage review problems were discussed and plans were made for the proper presentation.

Information blanks have been distributed to the employees of Local 1125 requiring the following information: Name of Employee, Clock Number, Address. Do you feel that you are entitled to a wage increase? How much per hour? Reason for increase? Give details of the work you are now doing.

If you have not received one of these blanks, contact your shop committeeman and get this information to him as soon as possible.

Shop Committeemen—Day Side

W. J. Chudleigh, tool room.
Harry Hudson, sheet metal.
J. D. Barnes, machine shop.
M. J. Castle, metal bench.
C. E. Danner, finish.
Hammett, tool bending.
H. E. Leonard, experimental.
S. W. Adams, M. T.
R. J. Bragg, hull department.
Carl E. Heilbach, wood shop.
Don Greene, final assembly.
J. B. Waskey, wing.
L. A. Perry, wing.
Kobets, tank.

The names of night shift committeemen have not been secured at this time.

The following communication for Consolidated management was read:

San Diego, Cal., Nov. 19, 1940.
Memo to: All Foremen
Subject: Wage Review.

In order to proceed with our next wage review starting 2 December, 1940, you are requested to keep separate all record sheets of employees who have been hired since 31 August, 1940. These record sheets will be reviewed after our regular wage review period.

The order of departments to be reviewed will be as follows:

1. Tool Room and Wood Shop.
2. Machine Shop.
3. Welding.
4. Sheet Metal.
5. Hull Department.
6. Drop Hammer and Tank.
7. Wing Department.
8. Metal Bench.
9. Final Assembly.
10. Paint Shop.
11. Sub Ass'y and Spare Parts.
12. Maintenance.
13. Draw Bench.
14. Heat Treat. and Spotweld.
15. Tubing.
16. Experimental.
17. Loft.
18. Productoin Department.
19. Shipping and Receiving.

JAS. L. KELLEY,
Factory Manager.

A large attendance was reported at last Monday's meeting, at which time approximately 150 new members were received into the union. Tuesday night's meeting was attended by approximately 350 members at which time over 250 new members were admitted to the union.

Nominations received at both day and night shifts to date are as follows:

President: L. A. Perry, R. B. Felton, W. J. Chudleigh, and Bros. Shields and Burney.

Vice-President: J. L. Castle, J. S. Burney, H. Gillan, A. J. Fischer, and Bro. Granstead.

Financial Secretary: W. J. Chudleigh, R. B. Felton, A. J. Fischer, H. A. Abbey, Bro. McIllivich, L. A. Perry, and F. H. Cole.

Recording Secretary: L. A. Perry, F. M. Martin, Al Hogan, and Bro. Morris.

Treasurer: Herman Stellar, Al Cox, and Bro. Wilder.

Conductor: A. Peterson, F. Martin, A. J. Fischer, and Bro. McCune.

Sentinel: H. W. Clark, R. B. Felton, H. A. Abbey, A. Peterson, and Bro. Swaed.

Trustees: A. Hogan, J. J. Braun, P. McManus, L. Larsen.

Executive Board: H. Torres, J. Coe, R. B. Felton, J. D. Barnes, H. A. Abbey.

Brother Parker was elected as member of Wage Review Board from the Night Shift to serve with Bro. Chudleigh.

Motion made at the night shift meeting on last Monday that nomination of officers for the whole lodge be held over to special meeting which will be held at 2 p. m., Sunday, Nov. 24th, when a public agent also will be nominated. This was held to be out of order and unconstitutional at the meeting of the day shift Tuesday night, Nov. 19th, as nomination for officers must be made at two regular meetings to be held in November.

The nominations were closed from the day shift, but can still be placed before the union at next Monday's meeting of the night shift, which is held in Turner Hall at 10 a. m. Special meeting for Sunday cannot be legally held.

The discharge and lay off of the members was discussed and it was suggested that, where the employee concerned considered that the lay off or discharge was unjust and that he was being discriminated against, he should contact his shop committeeman immediately as re-instatements were much easier to secure if acted upon as soon as possible.

Matters pertaining to the immediate wage increase for employees in the lower brackets who have

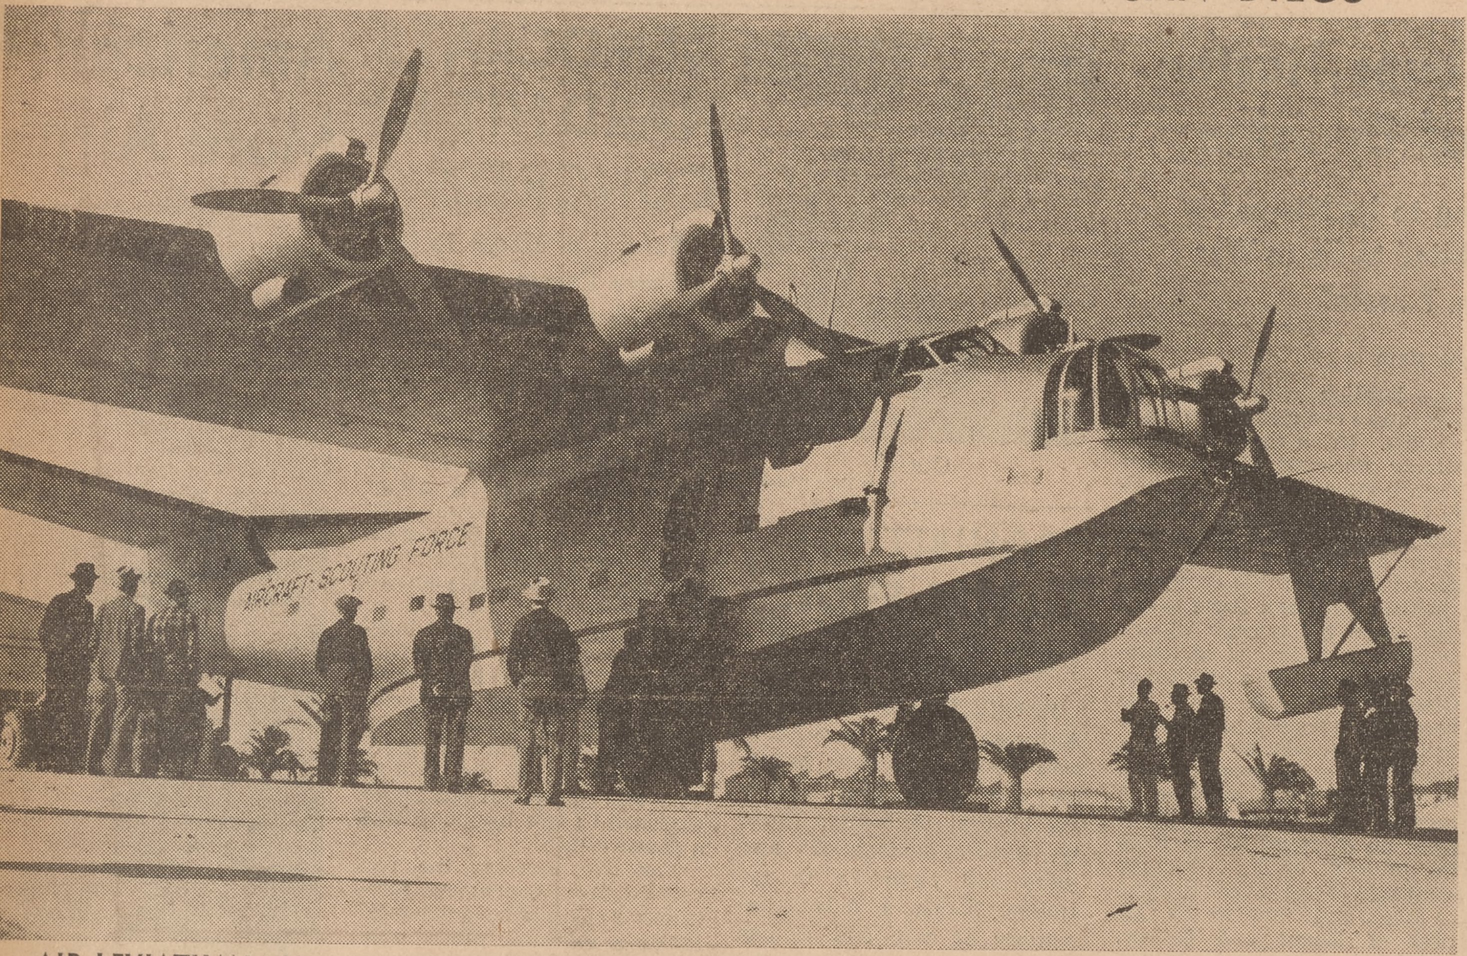
SKY GIANT SUCCESSFULLY TRIES WINGS AT SAN DIEGO



AIR LEVIATHAN—Here is prototype of first "battleship of the air" which has undergone tests successfully.

Los Angeles Times - 11/24/40

Huge New Air Battleship Given First Test Flights

One of Navy's Six Most Powerful Bombers, Built at San Diego, Tries Out Its Wings

SAN DIEGO, Nov. 23.—Test flights on the first of six four-motored, 25-ton "battleships of the air," most powerful bombers in the Navy, have been started here by a Consolidated Aircraft Corp. crew, with delivery to a Navy trial board due next month, it was learned today.

Equipped with a supercharger enabling operations at extremely high altitudes, the craft will be assigned to the recently commissioned Patrol Squadron 13, commanded by Lieut. Comdr. Stephen B. Cooke, at the San Diego naval air station.

CARRIES MACHINE GUNS

All six, the first group of a Navy mass production order, are expected to be delivered to the 100-man squadron by February or March, it was indicated.

Capable of flying 5000 miles nonstop, the air Leviathan has two machine-driven revolving turrets, one in the bow and another topside, mounting heavy-caliber machine guns. Additional protection from fighter planes is afforded by manually operated gun stations.

The engines are 1200 h.p. Pratt & Whitney radial air-cooled, housed in a 115-foot wing.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

Union 11/29/40

War-Bound S. D. Bomber to Hop

The first of a large order of patrol-bomber type seaplanes ordered by Britain will leave the Consolidated Aircraft Corp. plant before dawn this morning bound for the east coast and embattled England.

The ship is a model 28 type, similar to the famous navy P.B.Y. planes. It is equipped with two 1000-horsepower engines and has a wing span of 104 feet. It has been camouflaged for its flight to the war zone.

Lt. W. Cleveland, naval reserve, and Douglas Kelley, local flier, will be pilots. Russ Rogers, who flew the Archibald plane Guba around the world, will act as observer, according to report from Consolidated officials.

Another observer aboard will be I. G. Ross, Canadian pilot, who may be slated for the job of taking the plane across the Atlantic after the crew supplied by Consolidated makes delivery on the east coast.

Navy Bombers Make Another Flight to Hawaii

Aero Digest Oct, 39

A flight of fourteen Consolidated patrol-bombers commanded by Lieut. Comdr. Stuart H. Ingersoll, arrived in Honolulu one day last month after a non-stop flight of 2500 miles from San Diego.

The planes, with 98 officers and men aboard, were sent to Hawaii to replace another squadron which was expected to fly from Honolulu to Manila to take up neutrality patrol in Philippine waters. They were from Squadron 13, based at the North Island naval air station, San Diego Bay.

AMERICAN EXPORT AIRLINES WILL USE NEW SIKORSKY

Nat'l. Aircraft Counsellor 10-22-40

The board of directors of American Export Airlines, Inc., announced last week that Durston G. Richardson has been elected vice-president in charge of operations. Mr. Richardson has been associated with this company for two years.

American Export Airlines was recently granted a Civil Aeronautics Board certificate of convenience and necessity to establish transatlantic air service between the United States and Europe using New York and Lisbon as terminals. The company plans to pioneer non-stop service on this route as soon as its three new Sikorsky S-44a four-engined flying boats are ready. These are now under construction at the United Aircraft Corporation Sikorsky plant at Bridgeport.

Meanwhile, the airlines will use their Consolidated Model 28 flying boat (an adaption of the PBY long-range bomber) which, like the Sikorskys, was originally developed for the Navy. Horta, Azores, will be used as an intermediate port for the preliminary mail and express service.

Under Mr. Richardson's direction, technical details for co-ordinating certain facilities of the new airlines with those of the parent company, American Export Lines, Inc., have been perfected. This represents the first time in history that a transoceanic airline and steamship service, operating under a single house flag, have thus pooled technical resources.

American Export Lines today operates the only regularly scheduled American flag steamship service between the United States and Europe and, like the airline, uses New York and Lisbon as its terminals. Thus, the flying boats and surface vessels will follow identical routes.

According to Mr. Richardson, the airlines will station a trained meteorologist, representing its own weather bureau, aboard each of the "Four Ace" passenger liners operated by the steamship company. These men have been assigned to make constant observations of winds aloft and to relay this information by radio at regular intervals to the United States Weather Bureau and to the company's aircraft on the course overhead.

Company meteorologists have been stationed for training aboard each of the two United States Coast Guard vessels now stationed in mid-Atlantic for the purpose of assembling and reporting flying weather data.

Mr. Richardson, who served as a flying officer in the Army Corps during the last war, has been continuously associated with aviation since that time.

In 1920 he was a pilot on the first American overseas airline operated by Aeromarine Airways, Inc., between Key West and Havana and Miami-Nassau. For ten years he served as an official in charge of international airline operations covering Central and South American countries.

Nat'l Aircraft Counsellor

AVIATION - November 1940

School, Santa Monica, Santa Monica Technical School, United Aircraft School, Venice High School, Westwood Correspondence School, and the Willis Business College.

This brief outline will serve to illustrate the steps taken by one major manufacturer to meet the personnel training problem. Approximately 2,000 Douglas employees are currently enrolled in these courses, in addition to prospective employees undergoing instruction.

An interesting and significant problem is that faced by Interstate Aircraft & Engineering Corp., a subcontractor machining aircraft parts. About 300 machinists are employed at this plant, with the number being steadily expanded. It is no longer possible to hire experienced machinists in any quantity, and training machinists is a long and tedious process which has been begun too late in this country to satisfy the immediate need. Lawrence Ley, shop superintendent at Interstate, has solved this problem through combining a high degree of supervision with a system of progressive advancement for new men, or boys. The really experienced and capable all-around machinists available have been about evenly divided between the tool room and the shop. Those in the shop are used almost exclusively as lead men, to supervise work set-ups and to instruct green men in specific opera-

relations manager, the Lockheed Aircraft Corp. has conducted a long-range employee selection and training program. The Lockheed program starts with unusual care in selection of employees off the hiring line. It includes every conceivable avenue of employee training, including paying tuition of untrained employees through short courses in private schools, as previously mentioned, and also including unusually close cooperation with the public school system. Lockheed has also, largely at its own expense, initiated engineering brush-up courses for making aircraft engineers out of engineers trained and experienced in other fields, such as civil or structural engineering. Such courses are being given with the cooperation of the California Institute of Technology.

North American Aviation, Inc., has increased the payroll from 3,700 to 6,600 in a year and is now shooting for a total of 10,000 employees at the El Segundo plant (12,000 will be employed in the new Dallas factory). Under the direction of Major Howe Thayer, education director, North American has cooperated with many of the public and private schools already mentioned to provide adequate employee training.

Northrop Aircraft, Inc., has already advanced from zero to more than 1,200 employees this year, and expects to have 3,000 at work in the near future. A nucleus of this new staff were seasoned from neighboring aircraft plants.

supervision of Gerald Tuttle, personnel manager, and George Ford, director of education and training. Mr. Ford has worked closely with various public schools in setting up courses and providing instructors. At Nashville, where Vultee recently took over the new Stinson factory, he found that the city had a charter provision preventing training anyone more than 21 years of age in the public school system. It was possible to modify this provision in line with the opportunity afforded Nashville residents of immediate employment upon completion of suitable aircraft training work. Vultee now has more than 50 employees who are doing part-time teaching in public or private aircraft training schools. Ford finds the greatest shortage right now in the field of experienced machinists, tool, jig, and die makers. He prefers a minimum short course of eight weeks and then wants the trainee to concentrate on learning to do one thing well, such as riveting, sheet metal layout, hand forming, assembly, etc. rather than trying to compress a whole education into such a short period. As with other personnel men, Ford would prefer the man with all-around training of ten months or more, if he could get him. Having to take the short-term trainee, he then encourages him to take extension courses at least one or two nights a week. All new men are put through a course of work training to advance them as rapidly as possible and make more room at the bottom for new men.

U. S. 2-Ocean Bomber Fleet Being Built

2,000 Navy Flying Boats With 4,000-Mile Range to Patrol Both Coasts

Designed to Cripple Invader Far at Sea

Craft Will Be Ready by Mid-1941; New Bases Extend Striking Power

By The United Press

WASHINGTON, Nov. 23.—The Navy has on order more than two thousand great bomber flying boats to give its air arm a more powerful striking force in the Atlantic and Pacific Oceans, it was learned tonight.

Contracts for the patrol bombers were awarded the Glenn L. Martin Company, Baltimore, and Consolidated Aircraft Corporation, San Diego, in the last six weeks. The Martin contract calls for approximately 1,100 PBM's at a total cost of $106,125,396. Consolidated will supply approximately one thousand PBY's at a cost of $93,842,500.

Engines for the big flying boats were included in a $162,000,000 order to Pratt & Whitney.

These craft, with an operating range of 4,000 miles, Navy air strategists believe, will give the United States control of the Atlantic far beyond the halfway mark between this country and Europe. They will provide a powerful attacking force in the Pacific, operating from bases at Pearl Harbor, Cavite, P. I., and the islands of Wake, Midway and Guam, if necessary.

Planes for Use With Fleet

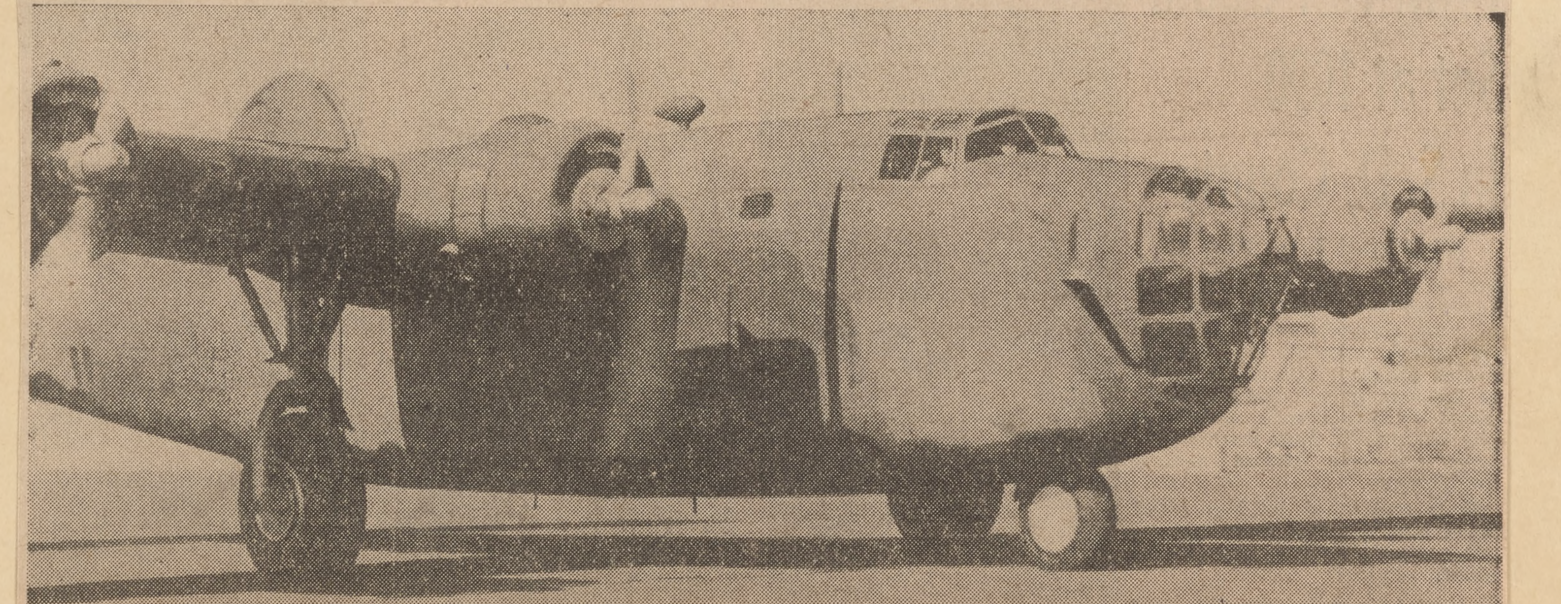
Improvements in design of the Navy's seaplane-type bombers also will permit their use directly with the fleet instead of making them dependent on island or mainland bases. They can land or take off from rough water and be fueled, provisioned and loaded from tenders at sea during bad weather.

The present production schedule calls for delivery of the last of the planes on order by mid-1941. The Navy now has almost three hundred similar bombers which it is using on both Atlantic and Pacific patrol.

All of the Navy's patrol bombers, on hand and on order, have accommodations for maintaining a crew over long periods. They have sleeping and cooking facilities, and as long as supplies are available, ashore or afloat as near as 1,000 to 1,500 miles, have almost complete freedom of operation.

Union 11/8/40

S. D. BOMBER MAY BE USED TO FERRY PILOTS FROM CANADA TO ENGLAND



Great Britain, according to informed sources, soon is to receive seven bombers, of this type, from Consolidated Aircraft Corp. The long-range, four-motored ship was given its initial test last week. The plane, similar to the XB-24 developed by Consolidated for the United States army in February, weighs 20 tons, has a cruising radius of 3000 miles and a speed of 300 miles an hour. Four 1200-hp, 18-cylinder, radial air-cooled Pratt-Whitney engines power the bomber, said to be capable of carrying four tons of bombs. First duty of the plane will be to ferry R.A.F. pilots to England from Canada and to return pilots unsuitable for combat service who in turn will fly combat planes to England. Until pressed into service as a bomber, the plane's armament will be limited to increase speed.

New Contract Of 18 Million For Consair

Coming within five days of a large order which skyrocketed the firm's backlog above the $300,000,000 mark, the navy yesterday announced award of a contract for $18,529,500 to Consolidated Aircraft Corp. for planes and parts, The Associated Press reported from Washington, D. C.

As with the previous order, no delivery dates or other details were made public.

The new order raises the Consolidated backlog to an estimated $324,500,000. Last Saturday the firm was awarded a navy department contract for $75,313,000, which raised the backlog to approximately $306,000,000.

Consair Plane Leaves N. Y. for Nova Scotia

First S.D.-N.Y. Sleeper Plane Service Starts

With 21 passengers aboard, the San Diego Continental, big two-motored Douglas transport, lifted its silver wings at 5:50 p.m. yesterday at Lindbergh field on the maiden voyage of a San Diego to New York sleeper service. The plane is scheduled to arrive in New York at 2:03 p.m. today.

The flight followed christening ceremonies at the field, at which Mrs. Edgar N. Gott, wife of Consolidated Aircraft Corp.'s vice president, broke a bottle of champagne on the nose of the Western Air Express mainliner, officially naming it the San Diego Continental.

GUESTS TAKE BOW

Speaking from a platform before the huge plane, Earl Prudden, vice president of Ryan Aeronautical Co., introduced distinguished guests to an audience of 150 for whom seats had been provided in a near-by hangar. More than 200 spectators crowded close to the airfield to view the plane and witness the christening ceremony.

Guest speakers included Tom Bomar, chamber of commerce, who reviewed air progress in San Diego; Thomas Wolfe, airlines vice president of traffic; Maj. Gen. William P. Upshur, commander, fleet marine force; Maj. Gott, Hampton Macomber, Los Angeles, airlines district traffic manager; Tom Glassford, San Diego district traffic manager, and Leo H. Dwerlkotte, first vice president of Western Air Express.

SAN DIEGO PILOT

Herb Richards, popular San Diego flier, was at the controls as the plane took off. It rose gracefully from the runway at the take-off signal from Councilman Louis F. Weggenman, circled out over Ocean Beach and flew back over the field, flashing its landing lights in a farewell salute as it headed for Los Angeles.

A buffet supper was served for guests in the hangar after the christening. Numerous chamber of commerce, civic, service and industrial representatives attended the inauguration of the new service, which Maj. Gott termed the "final link in establishing San Diego as a major air terminal."

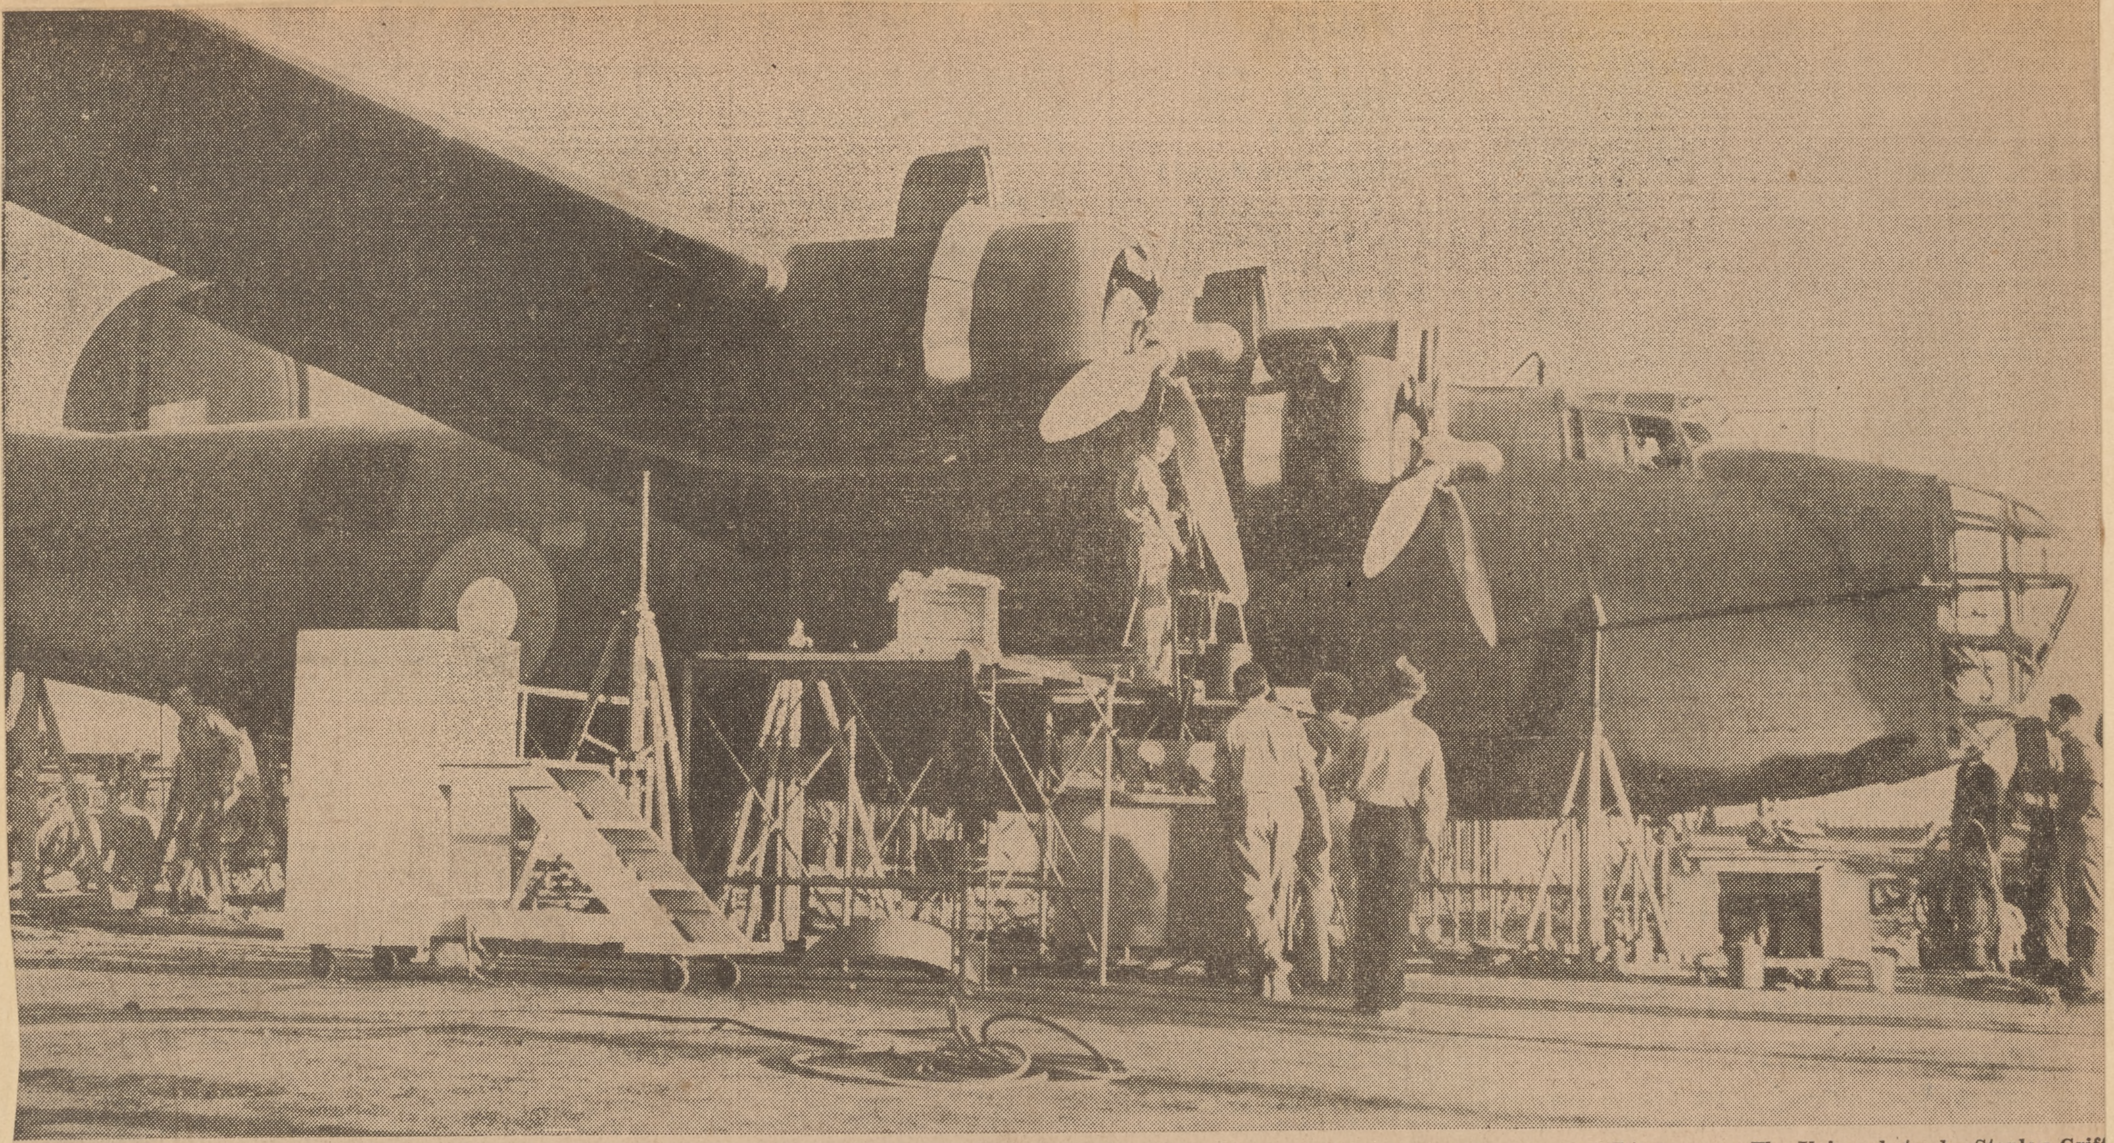
First transcontinental passenger aboard the plane was Lt. C. R. Bender, coast guard, who was returning to Norfolk, Va. Lt. Bender ferried the big plane to San Diego for the inaugural flight.

SAN DIEGO UNION: MONDAY MORNING, DEC. 2,

MAINLINER CHRISTENED FOR NEW RUN

MRS. EDGAR N. GOTT

. . . "I christen thee the San Diego Continental."



This giant bomber, one of the 26 released by the army to England recently, will spread its wings soon and fly across the Atlantic to help Britain answer Germany's threat of aerial domination. It is getting its final touches at Consolidated Aircraft Corp. here. This and others on this page are The Union photos by Stanley Griff and released by the war department, Washington, D. C.

Consair Bomber Off; Second for Britain

Trib Sun 12/3/40

With Doug Kelley, veteran San Diego flier, again at the controls as one of the two pilots, the second Consolidated Model 28 two-engined patrol bomber in a large British order, took off from the bay at dawn today for Halifax, N. S., via Fort Worth, Tex., and Point Washington, N. Y.

Kelley barely had returned from New York after flying the first airboat across the continent last Friday and Saturday when he received orders to ferry another craft today. Co-pilot is Ed Greer, of Tampa, Fla., and a radio operator and flight engineer complete the crew. Elapsed time on the first leg of the cross-country journey, to Fort Worth, is expected to be about seven hours.

One Every Four Days

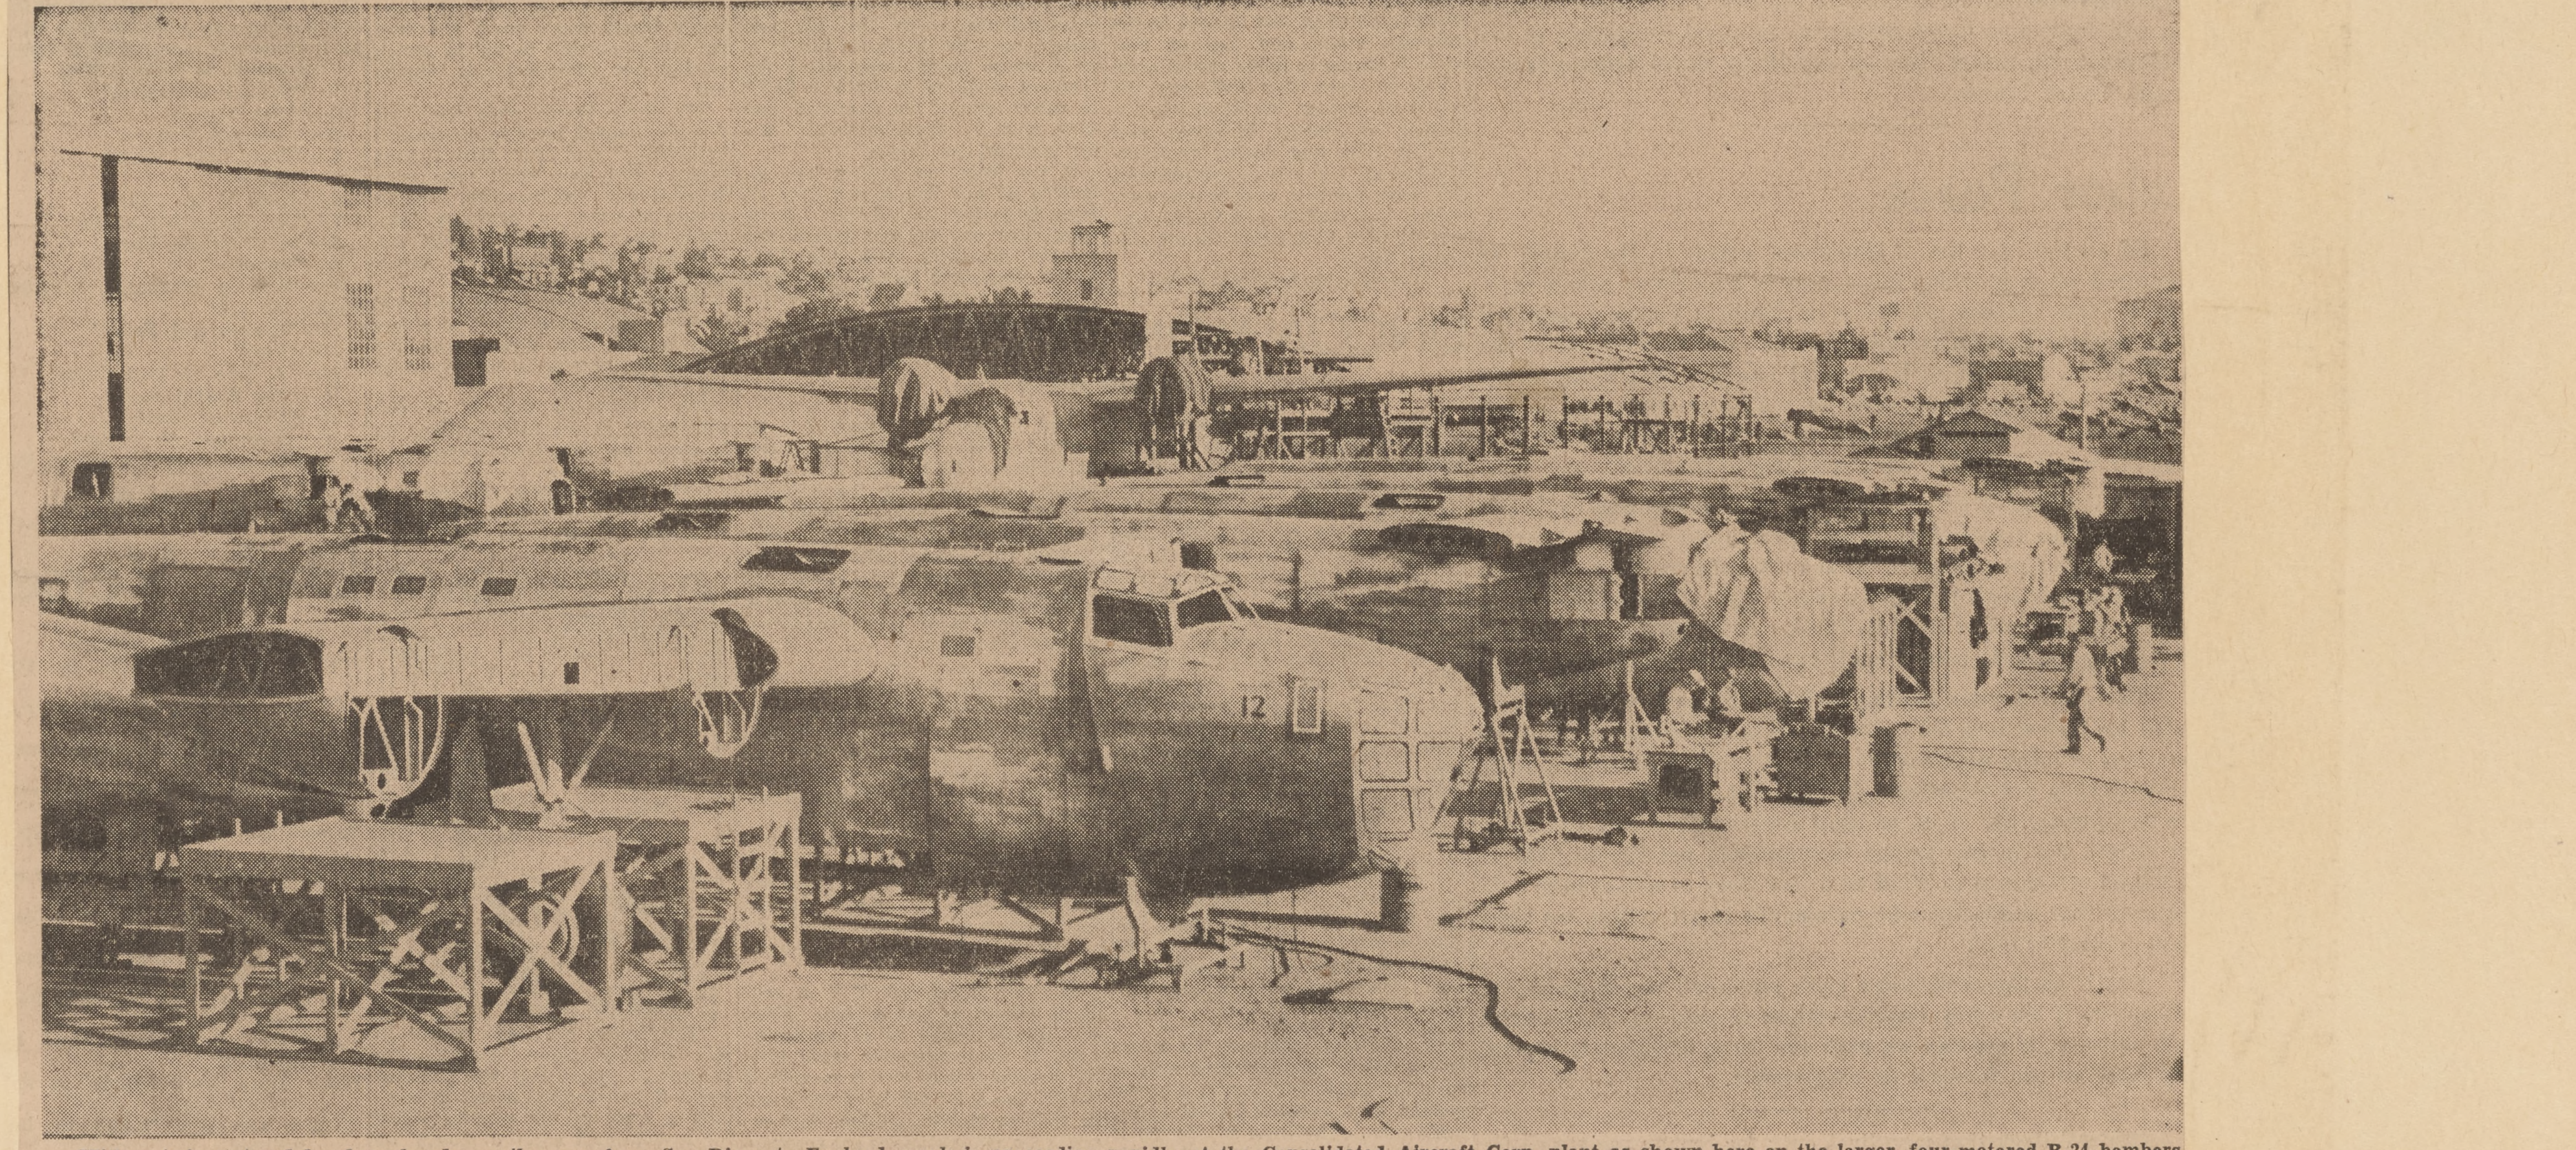
Meanwhile, Lt. W. L. Cleveland, navy reserve flier, who was chief pilot of the first bomber flight, accompanied I. G. Ross, Canadian aviator, from New York to Halifax with the Consolidated seaplane yesterday, and is en route back to San Diego for further assignments, it was reported at the plant.

Schedule of take-offs of the bombers from Halifax across the North Atlantic to Great Britain is confidential.

Departure from San Diego of the airboats, similar to the United States navy's PBY-5, will occur about every four days, with the interval narrowing as production is stepped up in the expanding Consolidated plant.

Consolidated Rushing Work on Four-Motored, Long Range Bombing Planes for Royal Air Force

Trib 11/30/40



With a twin-motored bomber already on the way from San Diego to England, work is proceeding rapidly at the Consolidated Aircraft Corp. plant as shown here on the larger, four-motored B-24 bombers, of which 26 have been released by the army for the Royal Air Force. They are said to be capable of 200 miles an hour, with a cruising radius of 3000 miles and can carry four tons of bombs. They are powered by four 1200-h.p. motors and have accommodations for a crew of nine. When completed the bombers will weigh approximately 40,000 pounds. Their wing span is 110 feet and the fuselage is 64 feet in length. The patrol bomber which left yesterday spent last night at Ft. Worth, Tex. It will be taken over by a Canadian crew on the east coast.—(Photo by Stanley Griffin, Tribune-Sun staff photographer, censored and released by the war department, Washington, D. C.)

S. D. Union - November 30, 1940

Consair Bomber Off for England

Off to reduce the air-strength disparity between England and Germany, a Consolidated patrol bomber seaplane left shortly before dawn yesterday for the east coast and Britain. It made an overnight halt at Ft. Worth, Tex.,

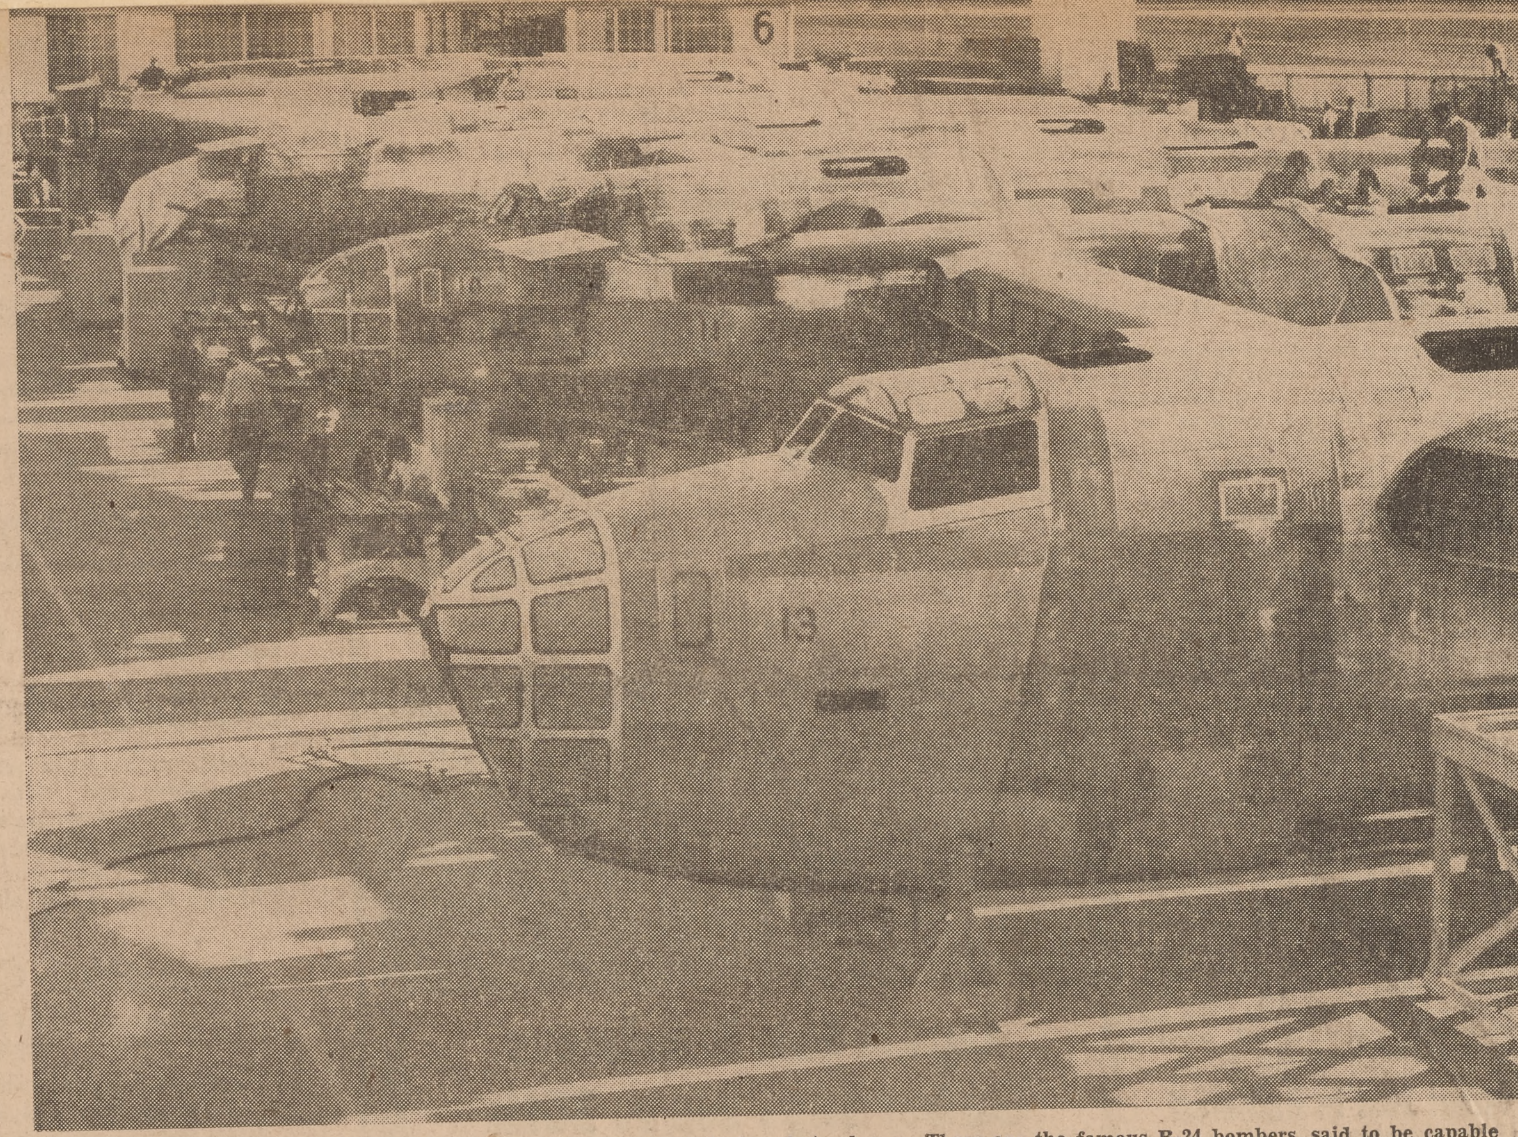
Photos on Page B

and is to continue to the east coast today. It is to be turned over to Canadian Air force officers when it reaches the east coast.

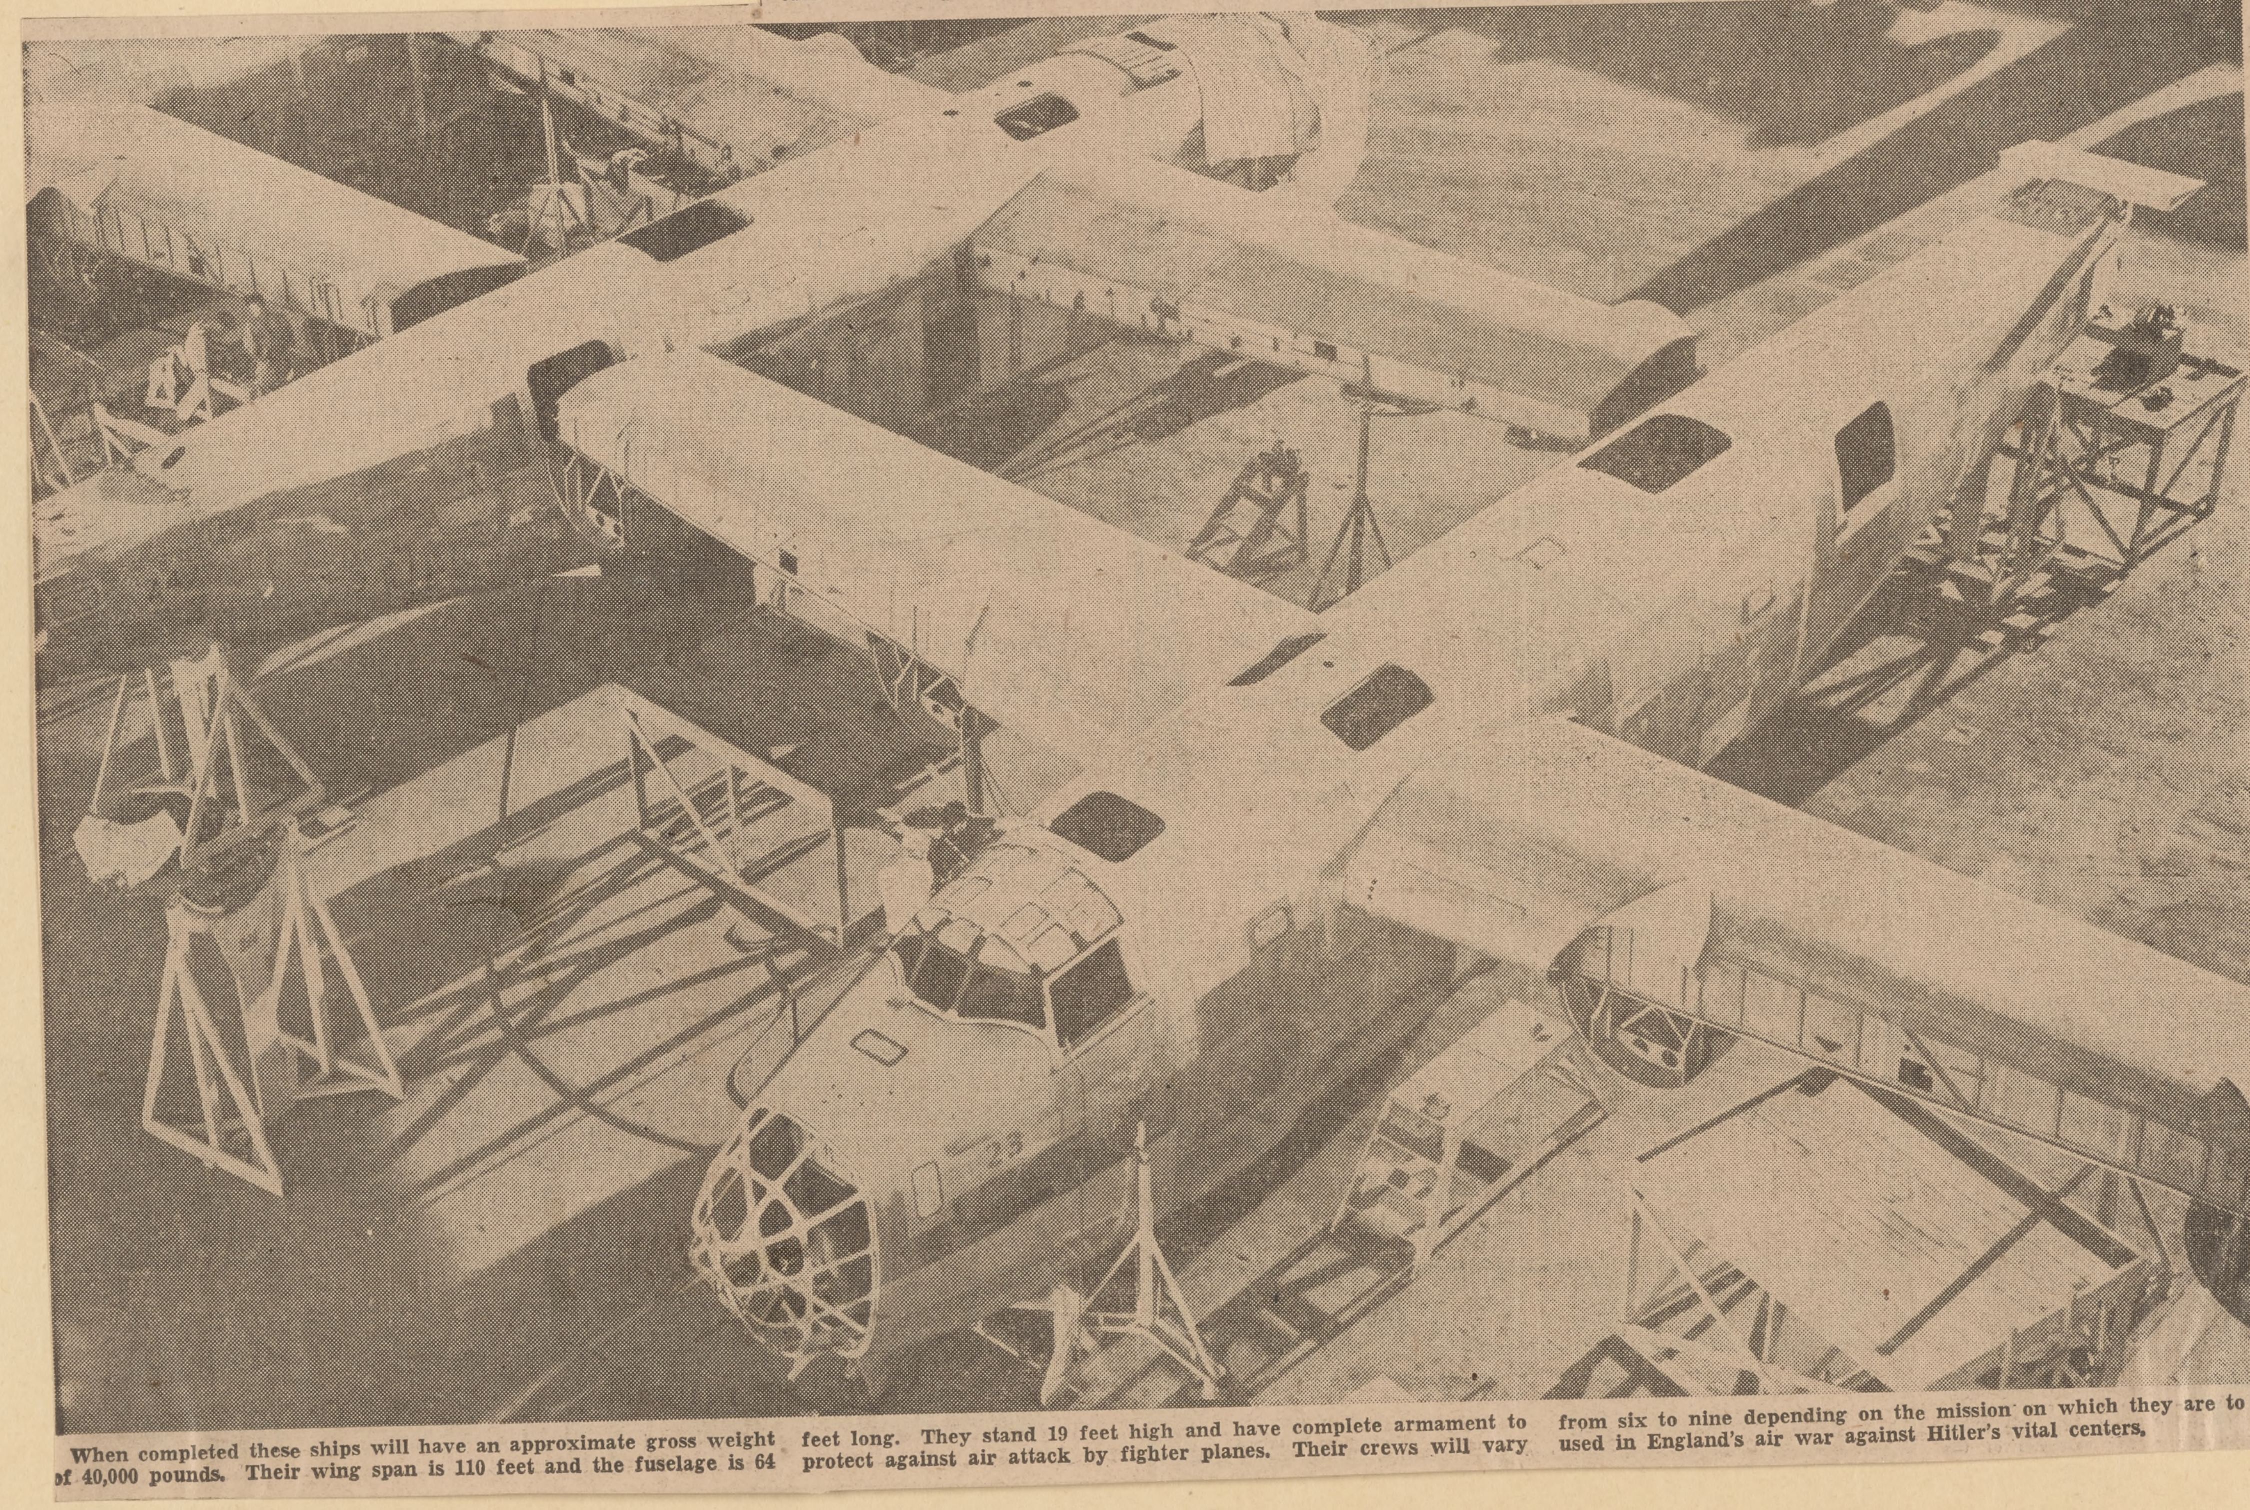
It is the first of a large order placed by England, is powered with two 1000-horsepower engines and is similar to the famous navy PBY's.

Consolidated officials said that planes will be leaving soon at short intervals for delivery to British airmen who will fly them across the Atlantic.

Among those aboard the plane which left yesterday were Lt. W. C. Cleveland, naval reserve, and Douglas Kelley, pilots; Russ Rogers and I. G. Ross, observers.



When the army released bombers it had on order here it didn't just turn over blueprints but ships actually under construction as this photo shows. These are the famous B-24 bombers, said to be capable of 300 miles an hour with a cruising range of 3000 miles and can tuck four tons or more of explosives in their bomb racks. To furnish power there are four 1200-horsepower engines on the wings.



When completed these ships will have an approximate gross weight of 40,000 pounds. Their wing span is 110 feet and the fuselage is 64 feet long. They stand 19 feet high and have complete armament to protect against air attack by fighter planes. Their crews will vary from six to nine depending on the mission on which they are to be used in England's air war against Hitler's vital centers.

Tribune - Sun 12/2/40

County Faces Influx of 100,000, Warning; Housing Crisis Predicted

San Diego county faces a possible increase of 100,000 persons during 1941, The International News Service reported from Sacramento, where further consideration of establishment of a state defense council, authorized by state legislation, was to be given by the senate governmental efficiency committee in a closed session today.

A parade of three state officials, Atty. Gen. Earl Warren, Sam Mays, planning board chairman, and Adjut. Gen. R. E. Mittelstaedt, yesterday appeared before the committee ond urged such a council be approved by the legislature.

Gov. Olson's advisory council on defense is unauthorized by the legislature and the chief executive has asked solons to set up a permanent defense organization molded on the lines of the national defense council.

May declared 'already there are signs of a chaotic condition developing in the matter of housing."

"In San Diego county, for instance," said say, "a possible increase of 100.000 persons is expected within the next year. There is no organization available to coordinate federal and local housing activities, resulting in confusion.

"The same situation confronts Vallejo and other bay area cities."

Warren declared there is a need for a defense council to plan in advance for such possibilities as sabotage of utilities. He pointed out California's water and power comes from long distances, with the necessity for a plan to coordinate activities of enforcement agencies involved.

Trib - Sun 12/4/40

Huge Increase In Plane Orders

An increase of $385,000,000 is reported for the last month in unfilled orders of American aviation manufacturers by Aviation magazine, according to The Associated Press. This brings the total of unfilled orders to $3,500,000,000, while a year ago the backlog of all companies showed a total of $500,000,000, then a record high.

Craft on order are said to include 39,000 fighting planes, of which 25,000 are for the United States and 14,000 for Great Britain.

The various backlogs, given in millions of dollars, follow: Allison (General Motors), 100; Aviation Corp., 20; Beech, 22; Bell, 60; Boeing, 203; Brewster, 100; Cessna, 11; Consolidated, 300; Continental Motors, 35; Curitss-Wright, 520; Douglas, 400; Fairchild, 15; Ford, 122; Grumman, 20; Lockheed, 211; Martin, 322; North American, 225; Northrop, 24; Packard, 217; Republic, 65; Ryan, 12; United Aircraft, 430; Vultee, 95.

Consair Bomber Leaves For Halifax, N. Y. Report

The Consolidated bombers which flew from San Diego to New York last week, took off today for Halifax, N. S., The Associated Press reported. The plane, first of several to be sent from here to England is en route to the "Royal Air Force, British Air Ministry, London," but whether the craft, which carried an American crew of five from San Diego, would be flown from Canada to England could not be learned. The plane left here early Friday and arrived at Port Washington, Long Island, Saturday after an overnight stop at Ft. Worth, Tex. Trib - Sun 12/2/40

21 Passengers on N. Y. Sleeper Plane In 1st Direct Flight From S. D.

Due at New York at 2:03 p. m. today, the San Diego Continental, big twin-motored Douglas transport christened at Lindbergh field yesterday afternoon, sped eastward with 21 passengers aboard on its maiden flight from San Diego to New York, inaugurating Western Air Express mainliner sleeping service between the two cities. The plane left Lindbergh field at 5:50 p. m.

At the christening ceremonies, Mrs. Edgar N. Gott, wife of a Consolidated Aircraft Corp. vice president, broke a bottle of champagne on the nose of the craft, which was ferried to San Diego for the inaugural flight by Lt. C. R. Bender, coast guard pilot. Bender is returning to Norfolk, Va., aboard the plane.

Speaking from a platform before the huge plane, Earl Prudden, vice president of Ryan Aeronautical Co., introduced distinguished guests to an audience of 150 for whom seats had been provided in a near-by hangar. More than 200 spectators crowded close to the airfield to view the plane and witness the christening ceremony.

Review Air Progress

Guest speakers included Tom Bomar, chamber of commerce, who reviewed air progress in San Diego; Thomas Wolfe, airlines vice president of traffic; Maj. Gen. William P. Upshur, commander, fleet marine force; Maj. Gott, Hampton Macomber, Los Angeles, airlines district traffic manager; Tom Glassford, San Diego district traffic manager, and Leo H. Dwerlkotte, first vice president of Western Air Express.

Herb Richards, popular San Diego flier, was at the controls as the plane took off. It rose gracefully from the runway at the take-off signal from Councilman Louis F. Weggenman, circled out over Ocean Beach and flew back over the field, flashing its landing lights in a farewell salute as it headed for Los Angeles.

A buffet supper was served for guests in the hangar after the christening. Numerous chamber of commerce, civic, service and industrial representatives attended the inauguration of the new service, which Maj. Gott termed the "final link in establishing San Diego as a major air terminal."

First Order to Consair From New S. D. Firm

The first order of self-sealing gas cells was delivered to the Consolidated Aircraft Co. recently by the recently organized Heron Manufacturing Co., Percy Heron, president, announced.

Heron said that Consolidated became the first customer of the city's newest aircraft parts manufacturing concern, which has its offices and plant at 2162 Belt st. Other orders are in prospect, Heron said. Heron Co. officers include Heron, president; Mrs. Heron, vice president; Charlotte Heron, secretary, and H. J. Jahries, treasurer.

BRITAIN GETS FIRST 4000-MI. U.S. BOMBERS

WASHINGTON—The Navy will permit Great Britain to take first deliveries on a new type of long-range patrol bomber now coming off assembly lines of the Consolidated Aircraft plant at San Diego, Cal., it was learned several days ago.

Officials emphasized that the arrangement does not involve formal negotiations or trade such as occurred recently when the Army released its biggest and newest type bombers.

Authoritative quarters said that the huge twin-engined flying boats —PBY-5'S— are being assembled on twin lines, one for the United States and the others for Britain, Australia and Canada. The company is understood to have orders for about 200 planes for the Navy and a similar number for the others. They cost about $100,000 each.

The program envisages deliveries to each nation at an equal rate. The United Press informant said that some delay has been encountered in obtaining sufficient wings to keep the two assembly lines operating. As a result an informal arrangement was worked out.

WINGS FOR AMERICA

by Don Wiley

MEMBER, AVIATION WRITERS ASS'N

This is the last of a series describing the national defense work of California aircraft factories.

1968

* * *

This may sound like the sort of boastful exaggeration the rest of the nation likes to ascribe to California, but so help me it's the literal truth:

The Consolidated Aircraft Corporation's plant at Lindberg Field, San Diego, is so big the employes use bicycles!

You see the bikes parked in racks at intersections between the factory buildings. You observe dozens of workers pedaling merrily from one building to another, tools or blueprints in wire baskets slung on the handlebars. And every so often you step aside for one of those tricky little motor scooters.

Guess they use the scooters for really long trips—say from one end of the plant to the other.

THEY NEED SPACE

Consolidated needs a big factory, for it builds big ships, and is building them at top speed.

This is the home nest of the famous PBY's, those twin-motored patrol bomber flying boats seen so frequently in the newsreels. The PBY's, have given new eyes to the Navy, which already has more than 200 of them, many of which have made amazing 2500 to 3000-mile non-stop mass flights to such distant points as Pearl Harbor and Coco Solo, Panama. If activities at Consolidated are any criterion, the Navy is going to have a lot more of them in the future.

Inside the factory you see long lines of PBY's in various stages of construction. Outside are more ships, undergoing final assembly. And if Major R. H. Fleet, Consolidated's energetic president, is too busy to go through the factory he has only to step from his office and glance skyward to see how his PBY's are doing. For the sky over San Diego is seldom free of the patrol bombers droning to and from their base on North Island

as president for two consecutive years, an honor rarely bestowed in Kiwanis circles. For the past three years he had operated the Shell Service Station in Arbuckle.

Possessed of a splendid personality of unusual geniality, Harry had a smile and word of cheer for everyone. Children and adults, alike, were his friends and he dispensed good humor on all sides. His generosity was unquestioned, giving freely to those less fortunate. Not only in Arbuckle and Williams, but in the entire coun-y will his cheerfulness and umor be missed and his early de-parture mourned.

Besides his devoted and loving wife, he is survived by the fol-owing brothers and sisters: Her-bert Shrock of Winfield, Kansas, Eva Purdy of Huston, Texas, Aug-sta Drumm of Kansas City, Mis-ouri, and Jennie Christy of Wil-iams, the latter of whom had estowed upon him since his arly boyhood, the devotion of a other. There also several nieces nd nephews surviving.

Mr and Mrs. Tully Harmeson of hico visited over Thanksgiving ith relatives

Aircraft News 11/28/40

HUGE NEW AIR BATTLESHIP IN 1ST TEST FLIGHT

SAN DIEGO.—Test flights on the first of six four-motored 25-ton "battleships of the air," most powerful bombers in the Navy, were started this week by a Consolidated Aircraft Corp. crew, with delivery to a Navy trial board due next month.

Equipped with a supercharger enabling operations at extremely high altitudes, the craft will be assigned to the recently commissioned Patrol Squadron 13, commanded by Lieut. Comdr. Stephen B. Cooke, at the San Diego naval air station.

CARRIES MACHINE GUNS

All six, the first group of a Navy mass production order, are expected to be delivered to the 100-man squadron by February or March, it was indicated.

Capable of flying 5000 miles nonstop, the air Leviathan has two machine-driven revolving turrets, one in the bow and another topside, mounting heavy caliber machine guns. Additional protection from fighter planes is afforded by manually operated gun stations.

The engines are 1200 h.p. Pratt & Whitney radial air-cooled, housed in a 115-foot wing.

NONSTOP FLIGHTS

The plane is similar to the $1,000,000 experimental prototype flagship of the Aircraft Scouting Force, used to transport Secretary of the Navy Frank Knox across the Pacific to Hawaii and back on his recent inspection trip. This airboat last year made two nonstop flights across the continent, from San Diego to Anacostia, D.C., and return.

Cost of each of the six bombers, the first four-motored patrol planes in the Navy, will be about $300,000, including engines, it was reported authoritatively.

Industry Backlog

Unfilled orders of the aircraft industry are now in excess of $3,000,000,000, an increase of nearly one billion dollars in the past month. A year ago the industry was boasting of a $400,000,000 record backlog—the greater portion of which consisted of British and French war orders. While the Army's aircraft purchasing program is completed, less than half of the 7,000 planes authorized for the Navy have been contracted, although negotiations for the remainder are under way. Brewster, Fairchild and Grumman are among those who are expected to share in the new Navy orders. Meanwhile Great Britain is negotiating repeat orders with several companies. The following table gives the latest approximate unfilled orders of 23 prominent producers of planes or aircraft engines.

Allison	$60,000,000
Aviation Corp.	20,000,000
Beech	22,000,000
Bell	60,000,000
Boeing	190,000,000
Brewster	60,000,000
Cessna	11,000,000
Consolidated	220,000,000
Continental	15,000,000
Curtiss-Wright	550,000,000
Douglas	400,000,000
Fairchild	15,000,000
Ford	9,000,000
Grumman	20,000,000
Lockheed	225,000,000
Martin	220,000,000
North American	225,000,000
Northrop	20,000,000
Packard	187,000,000
Republic	65,000,000
Ryan	10,000,000
United Airc.	450,000,000
Vultee	90,000,000
	$3,144,000,000

Union 12/5/40

Risk From Planes Slight, Says Gott

Hazard from planes flying low over buildings adjacent to Lindbergh field is "more mental than actual," Edgar N. Gott, Consolidated Aircraft Corp. vice president, advised Joe Dryer by letter yesterday.

Dryer and Austin W. Cordtz complained to the city council that planes skim low over their buildings on approaching the municipal airport, and asked for relief. The council referred their communications to the harbor commission.

In a copy of Gott's letter to Dryer that was received by Walter W. Cooper, city manager, the aircraft executive reported that it is not possible to make a change in the method of approaching the field, and advised Dryer that his building is in a direct line with one of the prevailing runways, and that pilots must use judgment and not overshoot the field.

However, he said that when the runways are extended, for each 1000 feet added, pilots will be able to fly 100 feet higher over Dryer's 2368 Kettner blvd. building.

Plane Backlogs Pass Billion Mark

Backlogs of southern California aircraft factories, working on military planes for Great Britain and the United States, total $1,287,352,586 a United Press survey showed yesterday.

The aviation committee of the Los Angeles chamber of commerce revealed that Los Angeles and San Diego factories employ 71,236 workers and have monthly payrolls of more than $10,000,000.

At San Diego, Consolidated reported $323,000,000 and Ryan $10,800,000.

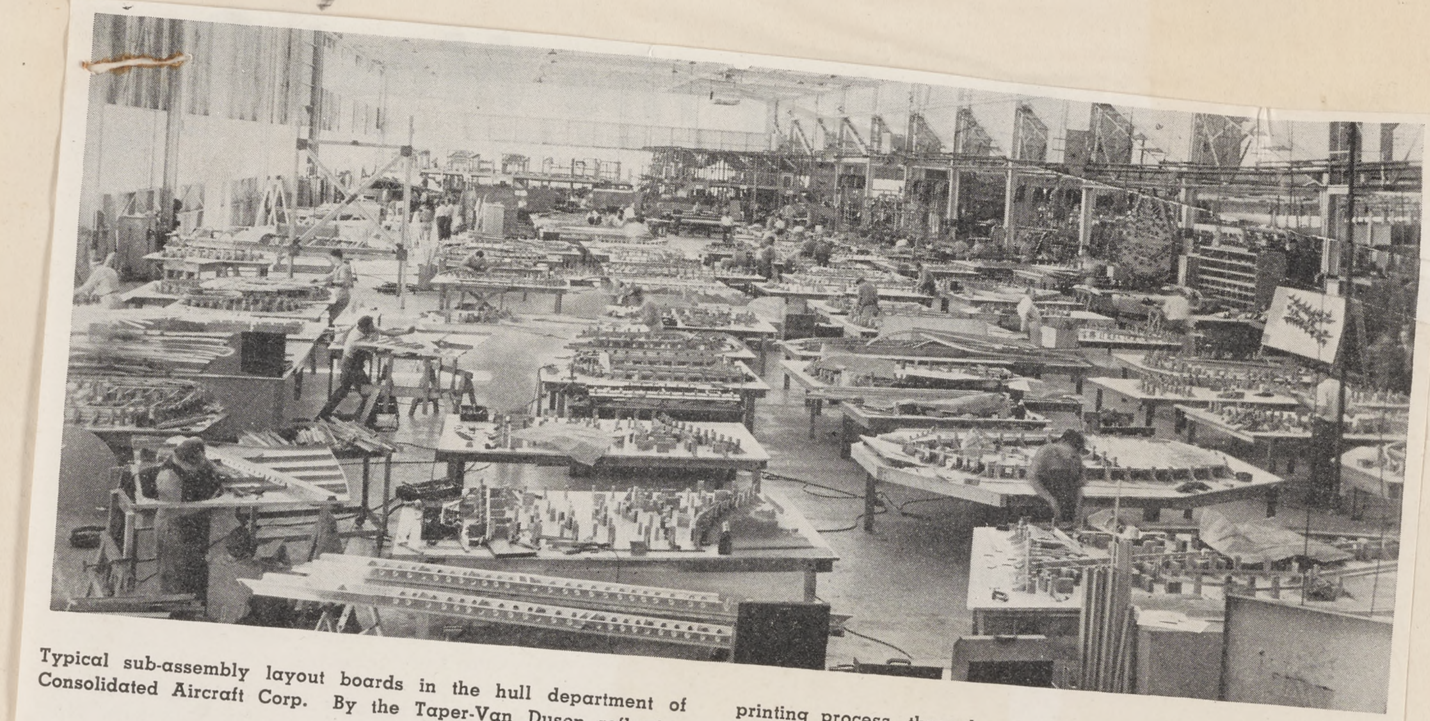
AVIATION - November 1940

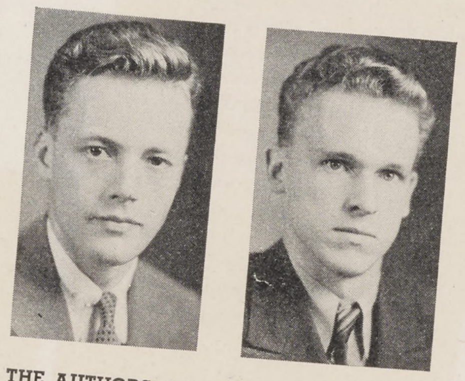


Typical sub-assembly layout boards in the hull department of Consolidated Aircraft Corp. By the Taper-Van Dusen reflection printing process, these boards are all laid out for attachment of form blocks without pencil markings or hand operations.

Multiple Duplication of Assembly Fixtures by the Taber-Van Dusen Method

"SPEED UP!" That is the cry which is driving the entire aircraft industry to superhuman efforts in meeting present national defense needs for more and better aircraft. It has become apparent that the most vital factor in the present situation is not money, or men, but time. We must build airplanes much faster than anything we have yet accomplished. And what is of equal importance, we must shorten the time interval between development of the design and translation of the design drawings into completed airplanes coming off the assembly line. The tooling-up interval must be reduced. One day saved in tooling may be worth ten airplanes. And ten airplanes may be the difference between winning or losing a battle of world importance.

A great problem of tooling has been the construction of assembly fixtures for shaping the many frames and subassemblies which go into the complex structure of the completed airplane. Construction of such fixtures has been a tedious process which amounted to a serious bottleneck in the production scheme. We are all familiar with the wide application of ship lofting methods to aircraft production.



THE AUTHORS: left, Philip Taber, engineering department, Consolidated Aircraft, and instructor in lofting, San Diego State College; right, L. W. Van Dusen, production department, Consolidated Aircraft Corp.

It has been the practice of all major aircraft builders to lay out hull lines and other contours of the airplane full scale on loft boards. These full-scale layouts are made with extreme accuracy and from them it is possible to scale off various dimensions for the construction of fixtures and assembly jigs. This process of working from full-scale layouts has made interchangeability of parts practical and so has speeded production materially, once the jigs and fixtures were available.

But there has been a big time lag, usually of many weeks, between completion of the full-scale loft layouts and the completion of production fixtures. Such fixtures are usually of wood, in the form of a flat plate, or table, with form blocks located on it for positioning the parts to be assembled into a frame or structural unit. Each such table has to be laid out with the greatest accuracy with reference to the original full-scale loft lines in order to insure the all-important interchangeability of parts. For production purposes a group of six, ten, or more identical fixtures is often provided for simultaneous production of multiples of a given assembly, such as a rib, hull frame, etc. Yet even under the most favorable conditions it

Consair Wage Rate Decision on Dec. 10

Consair Management in a conference with the Union Shop Committee Monday states their willingness to accede to Union demands that a new employee receive an automatic increase in pay after three months of employment.

Both Consolidated and the Union have marshaled their facts and figures in preparation for final negotiation on amount of initial increase. For Consolidated the figures show that they have hired 7,691 men since Jan. 1, 50 percent of them are married and the average pay rate for the entire group at this time is slightly over 53c per hour.

The Union's facts and figures show that since Jan. 1st the cost of living, particularly rents, have advanced some 20 per cent and that due to rapid expansion in the personnel the matter of promotion in work and pay according to skill has not kept pace with the former Company policy, and that the Company policy developed around the Wage Review Board, has been not to consider the cases of the men hired in less than ninety days before a Review period, and then hold them over until another four months rolled around, with the result that the average man working in the shop more than three months, feels that he is not being rewarded for increased skill and productiveness.

Wage Review Notes

Late news on the coming Wage Review is that the newly certified group of employees, namely, the Timekeepers, will be up in the front of the Wage Review because of the fact that to date they, along with the Inspectors have been left out of the picture when Wage Board started to jack up the wage rates for the workers on actual production.

Janitors are to have a Committeeman of their own choosing to set in on the Wage Board in an effort by the Union to see that no group of employees can feel that they are not being properly represented.

Reviewing of employee's records is to be divided, so that the night shift men will have their own representative and their own Foreman, for their records, and the day shift will likewise have theirs.

Men on temporary transfer to the Final Assembly Dept. will be reviewed with their own Dept. when it comes up, and therefore will have more and better consideration at the coming Wage Review.

San Diego Bombers to See Service in Egypt

The navy will permit Great Britain to take first deliveries on the long-range patrol bombers now coming off assembly lines of the Consolidated Aircraft Corp. plant at San Diego, the United Press reported today from Washington, D. C. The planes are expected to be used on flights from England to Egypt.

Consolidated officials made no statement, but officials at Washington emphasized that the arrangement does not involve formal negotiations or trade, such as occurred recently when the army released its biggest and newest type bombers.

Authoritative quarters said the huge twin-engined flying boats—PBY-5s—are being assembled on twin lines, one for the United States and the other for Britain, Australia and Canada. The company is understood to have orders for about 200 planes for the navy and a similar number for the others. They cost about $100,000 each.

Priority in Deliveries

The program envisages deliveries to each nation at an equal rate. The United Press informant said some delay has been encountered in obtaining sufficient wings to keep the two assembly lines operating. As a result, an informal arrangement was worked out whereby the British will get the first of the new planes until the wing supply situation is corrected.

The PBY-5s weigh 15 tons, carry a crew of five, have a reputed range of 4000 miles and a speed of about 300 miles an hour.

Aviation experts said the British easily could fly them from the British Isles to Egypt; that their long cruising range would make them especially valuable in the Mediterranean and far eastern areas. They can be serviced by tenders, making land bases unnecessary.—Union-Tribune.

WINGS FOR AMERICA

by Don Wiley

MEMBER, AVIATION WRITERS ASS'N

This is the last of a series describing the national defense work of California aircraft factories.

1968

* * *

This may sound like the sort of boastful exaggeration the rest of the nation likes to ascribe to California, but so help me it's the literal truth:

The Consolidated Aircraft Corporation's plant at Lindberg Field, San Diego, is so big the employes use bicycles!

You see the bikes parked in racks at intersections between the factory buildings. You observe dozens of workers pedaling merrily from one building to another, tools or blueprints in wire baskets slung on the handlebars. And every so often you step aside for one of those tricky little motor scooters.

Guess they use the scooters for really long trips—say from one end of the plant to the other.

THEY NEED SPACE

Consolidated needs a big factory, for it builds big ships, and is building them at top speed.

This is the home nest of the famous PBY's, those twin-motored patrol bomber flying boats seen so frequently in the newsreels. The PBY's, have given new eyes to the Navy, which already has more than 200 of them, many of which have made amazing 2500 to 3000-mile non-stop mass flights to such distant points as Pearl Harbor and Coco Solo, Panama. If activities at Consolidated are any criterion, the Navy is going to have a lot more of them in the future.

Inside the factory you see long lines of PBY's in various stages of construction. Outside are more ships, undergoing final assembly. And if Major R. H. Fleet, Consolidated's energetic president, is too busy to go through the factory he has only to step from his office and glance skyward to see how his PBY's are doing. For the sky over San Diego is seldom free of the patrol bombers droning to and from their base on North Island

EVEN BIGGER SHIPS

Consolidated is also speeding production of two new types, bigger even than the PBY's, which ought to prove sturdy bulwarks of American defense.

One type is a regular aerial battleship—a four-motored monster designated the PB2Y — about which the Navy hasn't yet released any performance or armament figures. The PB2Y is described as a patrol bomber ("PB" stands for patrol bomber) but someone has very aptly called it a "flying battleship." Visitors to the San Francisco Exposition may recall seeing the first PB2Y resting on the Treasure Island lagoon last Fall.

NEW ARMY BOMBER

The other big fellow is a 40,000 pound (gross weight) land bomber now in production for the Army. Known by the Air Corps as the B-24, this high-wing monoplane has a wing span of 110 feet, will carry a crew of six to nine men and tote a four-ton bomb load.

The Army admits the speed of the B-24 is "more than 300 miles per hour." After a glimpse of the four 1200-horsepower radial motors and the "clean" design of the ship, our guess would be that figure is mild, to say the least.

Consolidated is busy on big orders of PB2Y's and B-24's.

IT OPENED HIS EYES

Your correspondent happened to tour Consolidated recently with a group of aeronautical executives from the East. One of them glanced at the long lines of aircraft being completed in the open air and exclaimed:

"God Lord, look at that! Imagine being able to do all that work outdoors . . . "

For this gentleman came from a part of the nation where winter confines aircraft production to tightly-built, heated factories. And it was a shock to him to realize that Consolidated, which has 867,000 square feet of covered factory space(and is constructing an additional 700,000 square feet) has an almost equal amount of uncovered but paved working space and is able to do 30 per cent of its assembly work outdoors.

Looks like there is something to this California sunshine after all!

Risk From Planes Slight, Says Gott

Hazard from planes flying low over buildings adjacent to Lindbergh field is "more mental than actual," Edgar N. Gott, Consolidated Aircraft Corp. vice president, advised Joe Dryer by letter yesterday.

Dryer and Austin W. Cordtz complained to the city council that planes skim low over their buildings on approaching the municipal airport, and asked for relief. The council referred their communications to the harbor commission.

In a copy of Gott's letter to Dryer that was received by Walter W. Cooper, city manager, the aircraft executive reported that it is not possible to make a change in the method of approaching the field, and advised Dryer that his building is in a direct line with one of the prevailing runways, and that pilots must use judgment and not overshoot the field.

However, he said that when the runways are extended, for each 1000 feet added, pilots will be able to fly 100 feet higher over Dryer's 2368 Kettner blvd. building.

Industry Backlog

Unfilled orders of the aircraft industry are now in excess of $3,000,000,000, an increase of nearly one billion dollars in the past month. A year ago the industry was boasting of a $400,000,000 record backlog—the greater portion of which consisted of British and French war orders. While the Army's aircraft purchasing program is completed, less than half of the 7,000 planes authorized for the Navy have been contracted, although negotiations for the remainder are under way. Brewster, Fairchild and Grumman are among those who are expected to share in the new Navy orders. Meanwhile Great Britain is negotiating repeat orders with several companies. The following table gives the latest approximate unfilled orders of 23 prominent producers of planes or aircraft engines.

Allison	$60,000,000
Aviation Corp.	20,000,000
Beech	22,000,000
Bell	60,000,000
Boeing	190,000,000
Brewster	60,000,000
Cessna	11,000,000
Consolidated	220,000,000
Continental	15,000,000
Curtiss-Wright	550,000,000
Douglas	400,000,000
Fairchild	15,000,000
Ford	9,000,000
Grumman	20,000,000
Lockheed	225,000,000
Martin	220,000,000
North American	225,000,000
Northrop	20,000,000
Packard	187,000,000
Republic	65,000,000
Ryan	10,000,000
United Airc.	450,000,000
Vultee	90,000,000
	$3,144,000,000

Plane Backlogs Pass Billion Mark

Backlogs of southern California aircraft factories, working on military planes for Great Britain and the United States, total $1,287,352,586 a United Press survey showed yesterday.

The aviation committee of the Los Angeles chamber of commerce revealed that Los Angeles and San Diego factories employ 71,236 workers and have monthly payrolls of more than $10,000,000.

At San Diego, Consolidated reported $323,000,000 and Ryan $10,800,000.

Taber-Van Dusen

(*Continued from page 71*)

is not possible for more than a limited few men to work around a loft layout at any one time, and the period required to produce a series of assembly fixtures frequently mounted up to many weeks or months. Various methods have been tried for reducing this time-consuming process, including development of wood or metal templates from the loft lines, such templates then being used for reproduction of a series of assembly fixtures. Another process has involved the use of photography, achieving some time reduction through employment of a monster camera to photograph loft lines and then print duplicate layouts on sensitized table surfaces to which the form blocks are then attached. These various efforts have been an improvement over earlier methods, but they left much to be desired in the way of further reduction of time spent in building fixtures, and in certain other respects such as accuracy and cost of equipment. Development of the Taber-Van Dusen method of duplicating loft lines on assembly fixture layouts has proved so successful under actual production conditions that it is now in use throughout the huge plant of Consolidated Aircraft Corp., San Diego. The process has proved thoroughly satisfactory from the standpoint of absolute accuracy, low cost, and ease of operation with relatively unskilled help, and without the use of elaborate or expensive equipment. Tests have shown a reduction in time of duplicating certain assembly fixtures, in favor of the Taber-Van Dusen method, of from 3,000 man-hours originally required to only 400 man-hours.

By the new method, utilizing the principle of reflection printing, a full-sized negative is made direct from the original lofted layout. This is done by placing the original loft board in a dark-room, laying a full size sheet of a special rigid sensitized translucent material over the board, and exposing it to light. When the sensitized surface is developed the result is a full-sized negative of the original board. From this can be made as many exact prints of duplicate layouts as are desired. These prints are made directly on the fixture tables, in the dark-room, and they are then all available at once for attachment of the positioning blocks. By this method the master pattern for block location on each fixture board can be printed with extreme rapidity on as many boards as are required. The position blocks, in turn, may be provided in any multiples needed and can then be fitted to the lines of the print with great speed and accuracy. The materials for the Taber-Van Dusen method are inexpensive and the only apparatus needed is a dark room. The process is adaptable to any industry requiring accurate reproduction of layout fixtures in considerable numbers.

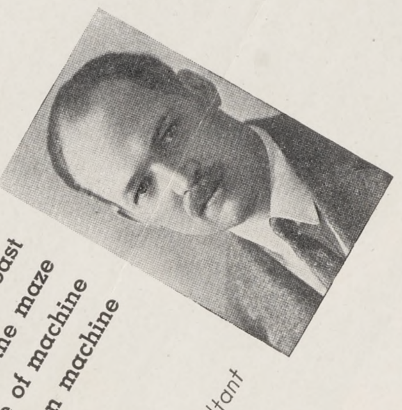
The vital importance of this development to the present problem of speeding aircraft production will be apparent.

Charles F. McReynolds
9121 Dalton Ave., L.A.

Getting the Most Out

As aircraft orders pile up to dizzy heights, an increasing volume of work is turned over to sub-contractors. West Coast factories have found that the only clear way out of the maze of confusion in the small shops is through the use of machine loading charts. This is the first of three articles on machine loading.

By C. W. S. Parsons



M.E., Consultant

A VITAL PART of the aircraft industry is that institution known to airplane manufacturers as "outside production." It is an institution because it began when aircraft making was born in this country more than a quarter of a century ago, and it developed with the industry. It is the creation of enterprising men.

These men in the outside machine shops are master mechanics. Through the years they have stood ready to puzzle out and fashion in metal the intricacies of design that satisfy the souls of aeronautical engineers pursuing the will o' the wisp of least air resistance, and the phantom of new and untried mechanical techniques. They have struggled with odd angular conceptions in three-dimensional space thought out by technical men whose hitherto known propensity was to make everything rectangular, symmetrical, and balanced.

Primarily these men have machined castings, forgings and pieces of bar stock and tubing to make a big share of the twenty odd thousand parts outside of rivets in a modern, all-metal airplane. In addition, these men doing outside production have taken on building sub-assemblies and performing specialized operations such as welding, plating, grinding, heat treating, and to a less extent sheetmetal work. They do production tooling. But mainly these men with job shops have carried perhaps 75 percent of the parts-machining load.

As 1940 broke, the load on the shops was building up fast by reason of French and British airplane contracts. It was no longer a question of hand to mouth operation on one shift with a fraction of the available equipment. By spring the shops were hunting for men capable of coping with the vagaries of dural under cutting tools. Second and third shifts appeared. Business zoomed. But with it came grief. Orders piled up. "Past due" work tangled operations. Shop supervision was harassed by a young army of follow-up men from the aircraft factories making daily rounds trying to pry loose parts needed for ships waiting on assembly lines.

If the war orders were educational in intent certainly the industry was finding out plenty. From the shops came the cry that the trouble lay with the factories. Orders were coming in bunches. Many were past due when received. The factories were not furnishing the material on time to meet the due dates. Nor the tooling! It was costly to build up man power and then lay off men because there was not enough work for them. The temptation was great to take any orders offered, regardless of due dates, to be sure of continuous operation.

In some instances the overload was terrific in spite of certain machines standing idle from time to time. Time wasted tearing down set-ups to run a few parts on "hot orders" became a serious problem. Stop-orders holding up partially fabricated parts while engineers huddled over design changes added to the confusion. Some factories failed to furnish excess parts to provide for normal spoilage, creating controversies over whether to set up machines specially to fill the shortages or to wait until other orders for the same parts came through.

The shops strained themselves to the limit to please their sources of bread and butter. But many found themselves caught in the web of overnight expanding aircraft factory organization, where former personal relationships and more informal methods of procedure no longer

San Diego Bombers to See Service in Egypt

The navy will permit Great Britain to take first deliveries on the long-range patrol bombers now coming off assembly lines of the Consolidated Aircraft Corp. plant at San Diego, the United Press reported today from Washington, D. C. The planes are expected to be used on flights from England to Egypt.

Consolidated officials made no statement, but officials at Washington emphasized that the arrangement does not involve formal negotiations or trade, such as occurred recently when the army released its biggest and newest type bombers.

Authoritative quarters said the huge twin-engined flying boats—PBY-5s—are being assembled on twin lines, one for the United States and the other for Britain, Australia and Canada. The company is understood to have orders for about 200 planes for the navy and a similar number for the others. They cost about $100,000 each.

Priority in Deliveries

The program envisages deliveries to each nation at an equal rate. The United Press informant said some delay has been encountered in obtaining sufficient wings to keep the two assembly lines operating. As a result, an informal arrangement was worked out whereby the British will get the first of the new planes until the wing supply situation is corrected.

The PBY-5s weigh 15 tons, carry a crew of five, have a reputed range of 4000 miles and a speed of about 300 miles an hour.

Aviation experts said the British easily could fly them from the British Isles to Egypt; that their long cruising range would make them especially valuable in the Mediterranean and far eastern areas. They can be serviced by tenders, making land bases unnecessary.—Union-Tribune.

Trib - Sun 12/4/40

First of 26 Huge Consair Bombers Scheduled for Delivery to Britain Before March 1

Above picture shows one of Consolidated's Model 32 four-engine land bombers destined for Great Britain. Great range, speed, and bomb load are attributes of this huge bomber.

SPEED 300 MILES; CAPACITY LOAD ABOUT FOUR TONS

Delivery to England of the first of 26 Consolidated Model-32 four-engined land bombers, which would have become the United States army's B-24's, is expected before March 1, 1941, according to report at the Consolidated Aircraft Corp. plant. Announcement of the delivery program, planned to benefit both the British purchasers and the United States defense program, came from Washington, D. C., Nov. 20.

These large bombers are similar to the Consolidated prototype Model 32, first flown late in 1939, which marked Consolidated's return to the landplane field. These planes have incorporated in them the latest military features designed to meet the combat requirements learned from the present European conflict.

Predictions Justified

While performance figures are confidential, it is more than likely that these planes equal (and probably exceed) the official statement issued in reference to the prototype, which stated, "This airplane, on preliminary examination, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of more than 300 miles an hour; a range of approximately 3000 miles, and a bomb-carrying capacity of approximately four tons."

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop, or they can operate by shuttling between England and British bases.

Protection Adequate

Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, four-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear. Fowler flaps aid this high-speed aircraft in take-offs and landings. Their landing gear is of the tricycle type, with single wheel forward.

Approximate dimensions are: Wing span, 110 feet; fuselage length, 64 feet; height, 19 feet. The number of the crew varies with the mission to be performed.

Open Drive To 'Sell' S. D. In Brochures

Initial step in a campaign to exploit San Diego's ideal climatic advantages and waterfront facilities, valuable to year-round production of aircraft, was taken when the chamber of commerce aviation department released the first of 11,500 illustrated brochures.

Designed for distribution to more than 1000 concerns manufacturing aircraft plane parts, the 36-page brochures were produced by the chamber's aviation department in cooperation with Consolidated Aircraft Corp., Ryan Aeronautical Co. and Solar Aircraft Co.

Letters from R. H. Fleet, Consolidated's president; T. Claude Ryan, president of the Ryan firm, and Edmund T. Price, Solar president, stressing advantages found here for aircraft production, serve as a preface to the booklet.

Release of the "sales" documents coincided with an announcement, approved by chamber directors, that various committees of the chamber "all are engaged in work directed toward making San Diego's future secure."

Following distribution of the brochures to firms throughout the United States, the chamber has announced "the same type of consistent follow-up which was successful in selling the Consolidated Aircraft Corp. would be undertaken."

T. F. Bomar, aviation department manager, said no brochures are available for local distribution."

Risk From Planes Slight, Says Gott

Hazard from planes flying low over buildings adjacent to Lindbergh field is "more mental than actual," Edgar N. Gott, Consolidated Aircraft Corp. vice president, advised Joe Dryer by letter yesterday.

Dryer and Austin W. Cordtz complained to the city council that planes skim low over their buildings on approaching the municipal airport, and asked for relief. The council referred their communications to the harbor commission.

In a copy of Gott's letter to Dryer that was received by Walter W. Cooper, city manager, the aircraft executive reported that it is not possible to make a change in the method of approaching the field, and advised Dryer that his building is in a direct line with one of the prevailing runways, and that pilots must use judgment and not overshoot the field.

However, he said that when the runways are extended, for each 1000 feet added, pilots will be able to fly 100 feet higher over Dryer's 2368 Kettner blvd. building.

Consair Gets 1st Heron Self-Sealing Gas Cells

Delivery of its first order of self-sealing gas cells to Consolidated Aircraft Corp. was announced yesterday by the recently-organized Heron Manufacturing Co. through its president, Percy Heron.

Heron said that Consolidated became the first customer of the city's newest aircraft parts manufacturing concern, which has its offices and plant at 2162 Belt st. Other orders are in prospect, Heron said. Heron Co. officers include Heron, president; Mrs. Heron, vice president; Charlotte Heron, secretary, and H. J. Jahries, treasurer.

TRIBUNE-SUN, San Diego, California, Monday, December 9,

RUSH $7,000,000 CONSAIR UNIT; 30,000 ON PAYROLL BY JULY

A huge new parts plant for Consolidated Aircraft Corp., virtually doubling Consolidated's present size and costing nearly $7,000,000, will be built and placed in operation here within the next six and one-half months, according to announcement by Consair officials.

"The new plant will fit solidly into the line production program on Consolidated flying boats and large land bombers," states the announcement, which discloses that the parts plant will be located about one and one-third miles north of the existing factory on Lindbergh field. It will add 1,553,000 square feet of covered manufacturing area, virtually doubling the 10-fold expansion of Consolidated during the last five years.

"With an accelerated construction program, the entire new parts plant is scheduled to be completed and in full operation by June, 1941," it was reported.

Eight Buildings in Plan

"This plant is composed of a group of eight buildings with a total roofed area of 1,553,000 square feet, plus loading platform of 64,000 square feet, with cost to run between $6,500,000 and $7,000,000. The factory site is 52 acres in size, with an adjacent area of 72 acres, which is to be used for parking facilities."

The combined personnel to operate both plants is estimated at 30,000. New buildings will be similar in type to present Consolidated structures. All buildings, including the original and new plant, are entirely of the latest type and design, especially engineered for modern aircraft manufacturing. The oldest factory building at Lindbergh field is less than 5½ years old, making Consolidated's combined facilities probably the most modern and efficient in existence. Equipment for the new plant has been ordered and is in the process of being delivered. To make immediate use of production equipment, many of the machines will be set up and operated under lean-to tents at the Lindbergh field plant site, then transferred to the new buildings as quickly as they are ready for occupancy.

All to Be Roofed

The present plant on Lindbergh field is employing its paved yard areas for some 30 percent of its operations, made possible by the equable climatic conditions of San Diego. The new plant, however, will conduct all of its operations under roof. The new plant will be a highly specialized production unit devoted to the manufacture of component parts and assemblies for wings and tail surfaces construction, with completely independent facilities for all operations requisite to their manufacture. All yard areas will be paved. The spur railroad sidings will be of depressed track construction, for quick car-floor-level loading and unloading.

The largest battery of drop hammers and hydraulic presses under one roof on the Pacific coast will be used in the new drop hammer building, which will also house a complete pattern shop, foundry and die-storage departments. The huge hammers will be mounted on improved shock-proof foundations similar to those now employed under the drop hammers at the Lindbergh field site. While working in complete conjunction with the Lindbergh field plant, the new parts plant will be a complete unit.

Larsen General Contractor

B. O. Larsen, of San Diego, is general contractor for the new project. R. E. Hazard & Sons, of San Diego, have charge of filling and grading of the site, moving in dirt from a hill at the intersection of Midway dr. and West Pt. Loma blvd. Architects are Ellis Gray Taylor and Ellis Wing Taylor.

Consolidated, which is building planes for the army and navy and Great Britain and Australia, has a backlog of approximately $325,000,000. On Labor day, Sept. 2, Consair officials formally dedicated a new addition to its plant on Lindbergh field. Since then, additional buildings at the municipal airport were started by the firm, and these, it is estimated, will be completely occupied by Jan. 15. Included are another final assembly building, 360 by 720 feet in size, and a single building, 200 by 1500 feet, to be devoted to small parts assembly. Consolidated officials state that the previous expansion and the buildings to be completed by Jan. 15 will increase the firm's manufacturing area, over the 1935 plant, by some 10 times, or 1000 percent.

Aircraft News 12/5/40

BRITISH GET CONSOLIDATED BOMBERS SOON

In a move to benefit both the British purchasers and the United States defense program, an announcement from Washington on November 20 disclosed that the first of 26 Consolidated Model 32 4-Engine Land Bombers, which have become the United States Army's B-24's, are to be delivered to the English. Delivery is expected before March 1, 1941.

These large bombers are similar to the Consolidated prototype Model 32, first flown late in 1939, which marked Consolidated's return to the landplane field. These planes have incorporated in them the latest military features designed to meet the combat requirements learned from the present European conflict. While performance figures are confidential, it is more than likely that these planes equal (and probably exceed) the official statement issued in reference to the prototype, which stated, "This airplane, on preliminary examination, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour; a range of approximately 3,000 miles; and a bomb-carrying capacity of approximately 4 tons."

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop, or they can operate by shuttling between England and British bases. Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, 4-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear. Fowler flaps aid this high-speed aircraft in take-offs and landings. Their landing gear is of the trycycle type, with single wheel forward.

Approximate dimensions are: wing span — 110 feet; fuselage length—64 feet; height—19 feet. The number of crew varies with the mission to be performed.

L.A. Times 12/8/40

Consolidated Plans $7,000,000 Parts Plant

SAN DIEGO, Dec. 7. (AP)—Consolidated Aircraft Corp. will double its facilities with construction of a $7,000,000 parts plant, Edgar N. Gott, vice-president, announced today.

Eight new buildings will be erected about a mile north of the present Lindbergh Field plant. Principal units will comprise three huge parts structures and a three-story drop hammer building which will house the largest battery of drop hammers and hydraulic presses on the Pacific Coast, Gott reported.

Combined Consolidated personnel is expected to soar to 30,000 when the new division is put in operation.

Consolidated has a backlog exceeding $325,000,000 for Army and Navy bombers, and warplanes for Britain.

NEW FLYING BOAT FOR CANADA HERE

N.Y. Times 12/1/40

Bomber Alights in Sound After Fast Trip From Coast

Special to THE NEW YORK TIMES.

PORT WASHINGTON, L. I., Nov. 30—The first Consolidated-2C patrol-bomber type flying boat, to be delivered to Great Britain, lay at anchor in Manhasset Bay tonight, under a strong guard of Nassau County police, crew members and private guards. It arrived here this afternoon unexpectedly after a fast one-stop flight from San Diego, Calif. Canadian officials will take delivery of the machine here. Its next port of call is a secret, but it is believed to be somewhere in Canada.

The plane left San Diego early yesterday morning and its only stop was on the waters of Lake Worth, Fort Worth, Texas, where the crew spent the night. Flying time to that point was seven hours.

At 12,000 feet, above an overcast sky, the 1,475 miles from Fort Worth to this port were made in 7 hours 25 minutes, making the average speed 201 miles an hour. There was a strong helping wind and over one stretch 244 miles an hour was averaged. For four hours no crew member was able to see the ground because of clouds.

Total flying time from the Coast was 14 hours 25 minutes.

Pilots William L. Cleveland and Douglas Kelly set the plane down here at 1:55 P. M. Boats put out from the Gulf Seaplane hangar and

DANGER IN FENCE AT MARINE BASE, CONSAIR CHARGES

Protest to plans of marine corps authorities to erect an eight-foot high fence along the boundary between San Diego airport and the marine corps base was received at the harbor commission meeting yesterday afternoon from Consolidated Aircraft Corp. officials and army air corps inspectors at the plant. They declared the proposed fence would be a serious menace to fliers landing or taking off in the huge new four-motored bombers.

The commission filed a communication from Joseph E. Dryer protesting low flying over his business establishment by planes gliding in to a landing at Lindbergh field. An opinion was expressed by Lt. C. G. Bowman, commmanding the coast guard air base here, that there "is no hope of alleviating this condition until a control tower is built and a competent field manager established."

The commission received a communication from Rear Adm. C. A. Blakely, commandant 11th naval district, grandting the city a 20-foot right-of-way through the marine corps base for laying a floodlight cable. Attending the commission meeting was a group of high school students, participating in Civic Affairs day.

Consair Plans Expansion to Cost $7,000,000

New Buildings Will Double Size Of Aircraft Plant

A $7,000,000 construction program which virtually will double the size of Consolidated Aircraft Corp. was announced yesterday by Edgar N. Gott, vice president.

Eight new buildings will be erected along Pacific highway, between Barnett ave. and Rosecrans st. Principal units will compose a huge parts plant, and a three-story drop hammer building which will house the largest battery of drop hammers and hydraulic presses on the Pacific coast.

30,000 WORKERS SEEN

Combined Consolidated personnel is expected to soar to 30,000 when the new division is put in operation, officials said.

B. O. Larsen, contractor, reported his organization is ready to start work on a $6,500,000 contract. Consair officials said ground will be broken soon, and the new buildings are scheduled for completion next June.

Gott said the new parts plant will add 1,553,000 square feet of covered manufacturing area, virtually doubling Consolidated's 10-fold expansion since 1935. Recently constructed buildings on the Lindbergh field site, including another final assembly building, were dedicated formally last Sept. 2, making a 1000 percent expansion for the firm in five years.

SITE INCLUDES 52 ACRES

The new buildings north of Lindbergh field will be located on a factory site of 52 acres, with 72 acres of adjacent parking area. They will be similar in type to present Consolidated structures. In addition to the 1,553,000 square feet of roofed area, there will be 64,000 square feet of loading platform.

Larsen reported that of the eight buildings, three large units will be 400 by 750 feet each. The smaller structures will include an office building, 750 by 50 feet; the drop hammer building, 400 to 60 feet; a paint shop, a warehouse and a boiler plant.

COST-PLUS CONTRACT

The contract was awarded through the Defense Plans Corp., Washington, and will be executed on a cost-plus-fee basis, Larsen said.

Consolidated's backlog exceeds $325,000,000, and includes the building of bombers for the army, navy and for Britain.

"The new plant will fit solidly into the line production program on Consolidated flying boats and large land bombers," Gott said. "All buildings, including the original and new plant, are entirely of the latest type and design, especially engineered for modern aircraft manufacturing. The oldest factory building is less than 5½ years old,

Scarred Cruiser At Montevideo

Seven Dead Aboard British Auxiliary; Nazi Raider Said Severely Damaged

MONTEVIDEO, Uruguay, Dec. 7 (I.N.S.)—The British auxiliary cruiser Carnarvon Castle, scarred by several shell hits limped into Montevideo late today from the scene of a battle with a speedy German naval raider which was declared to have been even "more heavily damaged." The bodies of seven members of the converted cruisr's complment were reported taken ashore, but the 20,122-ton vessel's wounded had been transferred at sea to a British warship which was understood to be rushing them to Britain's Falkland islands naval base aff southern Argentina.

CASUALTIES SECRET

Casualties suffered by the Carnarvon Castle in the long-range, 90 minute battle off the Brazilian coast Thursday were not disclosed officially.

Water Main Breaks in Bay

Navy Divers Seek Leak in Big Pipe

San Diego temporarily has lost one of its heaviest water consumers, as navy divers sought to find—and repair—a break in the 16-inch cast-iron main extending under the bay from the foot of Market st. to North Island.

The break, according to Fred Rhodes, city public works director, occurred at night, and the extensive naval establishments on North Island immediately turned to the California Water & Telephone Co for water.

WOMEN AIRCRAFT WORKERS NOT NEEDED, ASSERTS GOTT

Although women eventually may be needed in industry to assist in the nation's defense program, the present limited national emergency does not warrant serious consideration of such a plan now, Maj. Edgar N. Gott, Consolidated Aircraft Corp vice president, said yesterday.

The aircraft firm has no intention of employing women at present, other than in clerical capacities, Gott said.

PRODUCTION MAY LAG

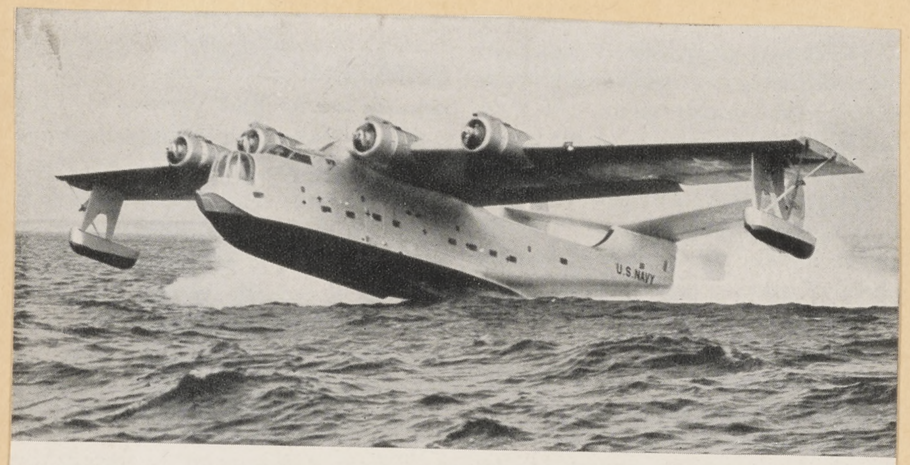
"It is possible production may be slowed down by the wholesale conscripting of men from plane plants, in which more than a third of San Diego's draft registrants are employed," Gott said. "On the other hand, should general or widespread deferment of aircraft workers become an established policy, the rush for jobs in that industry, at the expense of other essential activities, would be overwhelming.

"Instances where men have given up well-paying jobs in non-defense industries to take employment in local aircraft plants at lower pay in hope of avoiding the draft already have been reported.

NO DRAFT ALARM YET'

"I don't doubt that some men have gone into the aircraft industry in the hope of being deferred," Gott remarked, "but they probably do not realize that employment in an aviation plant will not exempt them from military service unless they are key, essential employes.

"Our company is not asking deferment for any men other than those who cannot readily be replaced. There is no alarm in the aircraft industry over key men being drafted, at least at present."



U. S. Navy patrol bomber PB2Y caught at instant of take-off. This powerful Consolidated Model-29 flying boat uses gasoline to power its four ignition engines.

RUSH $7,000,000 CONSAIR UNIT; 30,000 ON PAYROLL BY JULY

A huge new parts plant for Consolidated Aircraft Corp., virtually doubling Consolidated's present size and costing nearly $7,000,000, will be built and placed in operation here within the next six and one-half months, according to announcement by Consair officials.

"The new plant will fit solidly into the line production program on Consolidated flying boats and large land bombers," states the announcement, which discloses that the parts plant will be located about one and one-third miles north of the existing factory on Lindbergh field. It will add 1,553,000 square feet of covered manufacturing area, virtually doubling the 10-fold expansion of Consolidated during the last five years.

"With an accelerated construction program, the entire new parts plant is scheduled to be completed and in full operation by June, 1941," it was reported.

Eight Buildings in Plan

"This plant is composed of a group of eight buildings with a total roofed area of 1,553,000 square feet, plus loading platform of 64,000 square feet, with cost to run between $6,500,000 and $7,000,000. The factory site is 52 acres in size, with an adjacent area of 72 acres, which is to be used for parking facilities."

The combined personnel to operate both plants is estimated at 30,000. New buildings will be similar in type to present Consolidated structures. All buildings, including the original and new plant, are entirely of the latest type and design, especially engineered for modern aircraft manufacturing. The oldest factory building at Lindbergh field is less than 5½ years old, making Consolidated's combined facilities probably the most modern and efficient in existence. Equipment for the new plant has been ordered and is in the process of being delivered. To make immediate use of production equipment, many of the machines will be set up and operated under lean-to tents at the Lindbergh field plant site, then transferred to the new buildings as quickly as they are ready for occupancy.

All to Be Roofed

The present plant on Lindbergh field is employing its paved yard areas for some 30 percent of its operations, made possible by the equable climatic conditions of San Diego. The new plant, however, will conduct all of its operations under roof. The new plant will be a highly specialized production unit devoted to the manufacture of component parts and assemblies for wings and tail surfaces construction, with completely independent facilities for all operations requisite to their manufacture. All yard areas will be paved. The spur railroad sidings will be of depressed track construction, for quick car-floor-level loading and unloading.

The largest battery of drop hammers and hydraulic presses under one roof on the Pacific coast will be used in the new drop hammer building, which will also house a complete pattern shop, foundry and die-storage departments. The huge hammers will be mounted on improved shock-proof foundations similar to those now employed under the drop hammers at the Lindbergh field site. While working in complete conjunction with the Lindbergh field plant, the new parts plant will be a complete unit.

Larsen General Contractor

B. O. Larsen, of San Diego, is general contractor for the new project. R. E. Hazard & Sons, of San Diego, have charge of filling and grading of the site, moving in dirt from a hill at the intersection of Midway dr. and West Pt. Loma blvd. Architects are Ellis Gray Taylor and Ellis Wing Taylor.

Consolidated, which is building planes for the army and navy and Great Britain and Australia, has a backlog of approximately $325,000,000. On Labor day, Sept. 2, Consair officials formally dedicated a new addition to its plant on Lindbergh field. Since then, additional buildings at the municipal airport were started by the firm, and these, it is estimated, will be completely occupied by Jan. 15. Included are another final assembly building, 360 by 720 feet in size, and a single building, 200 by 1500 feet, to be devoted to small parts assembly. Consolidated officials state that the previous expansion and the buildings to be completed by Jan. 15 will increase the firm's manufacturing area, over the 1935 plant, by some 10 times, or 1000 percent.

OHIO GOAL TODAY OF BIG BOMBER HERE SUNDAY

Due to arrive at Dayton, O., today for vibration tests there, a 325-mile-an-hour Douglas A20A attack bomber left North Island Sunday, piloted by Maj. E. R. McReynolds, army air corps inspector in the San Diego area and assistant chief inspector for the west coast. McReynolds flew the plane here Saturday from the Douglas plant at Santa Monica. The craft, of a type originally ordered by France and now being manufactured for Great Britain, is powered by two 1650-horsepower Wright engines, and has a landing speed of 110 miles an hour.

In another Douglas plane, a B18A, Capt. H. W. Bowman, assistant executive officer in the air corps chief's office at Washington, and Capt. F. M. S. Miller, in charge of public relations in the same office, left Lindbergh field for Florida after an overnight stay.

The officers are surveying public relations problems for the air corps chief. While here, they saw aircraft industry and army officials.

A B10B bomber left for Sacramento from Lindbergh field, piloted by Lt. William Miller, former San Diego athlete, and Lt. E. E. Garnett jr., son of a San Diegan. On board was a load of freight from North island.

Compton Begins Naval Inspection Here Today

Inspection of local naval activities by Lewis Compton, assistant secretary of the navy, is scheduled to begin today, with Consolidated Aircraft Corp. first on the list.

The secretary yesterday completed inspection of the navy's San Pedro activities.

This afternoon, following his first day's round of San Diego stations, he will be the guest of Rear Adm. and Mrs. C. A. Blakely at a reception at naval air station.

Tomorrow the destroyer base, naval training station, and the naval radio station on Pt. Loma will be visited; luncheon will be served at the training station and the day will be concluded with calls at the naval fuel depot and the marine corps base.

Wednesday, the secretary will inspect headquarters of the 11th naval district. That noon he will be the guest of honor at a joint chamber of commerce, Advertising club and Realty board luncheon at the Plata Real, U. S. Grant hotel, and inspection of the naval hospital and of marine activities at La Jolla and Camp Elliott will end the day.

Compton will leave for Washington, D. C., late in the afternoon.

Union 12/13/40

Gen. Upshur to Study Airport Fence Plan

Protests of Consolidated Aircraft Corp. and other aircraft organizations using the municipal airport against navy plans to construct a fence along the easterly boundary of the marine corps base brought a reply to the harbor commission yesterday from Maj. Gen. William P. Upshur, commander fleet marine force.

Taking cognizance of the protests that the fence would constitute a hazard in the operation of aircraft, Gen. Upshur notified the commission that "before any action is taken careful thought will be given to the hazards involved and the civil aeronautics administration will be consulted."

15 Patrol Bombers On Mystery Sea Hop

HONOLULU, Dec. 11 (A.P.)—Squadron VP-26, comprising about 15 long-range navy patrol bombers, left Pearl Harbor at dawn Tuesday for an unannounced destination, it was learned today.

Navy officers declined comment but unofficial sources indicated the planes might be bound for Manila.

Tulsa Offered As Consair Site

Trib-Sun 12/17/40

Reportedly seeking to interest Consolidated Aircraft Corp. in establishing an assembly plant in Tulsa, W. G. Skelly, oil executive, and Russell Rhodes, chamber of commerce official of the Oklahoma city, arrived in the city yesterday for an indefinite stay.

A Consolidated spokesman said he had no comment to offer on the reported proposal other than that Skelly and Rhodes had visited the plant. The Oklahoma men would not discuss the nature of their business here. Fort Worth and Dallas, among others, have contacted Consolidated officials on similar proposals.

Consolidated will have reached its limit of expansion here when recently announced plans to double the firm's facilities with construction of a $7,000,000 parts plant, the Consair spokesman indicated, adding that any additional building in San Diego or elsewhere would be undertaken by the war department and not the corporation.

Union 12/17/40

Tulsa Men Seek Consair Branch

W. G. Skelly, Oklahoma oil executive and Russell Rhodes, Tulsa chamber of commerce official, came here yesterday reportedly to interest the Consolidated Aircraft Corp. in establishment of an assembly plant in Tulsa.

Neither Skelly nor Rhodes would discuss the nature of their business here, and a Consolidated spokesman said he had no comment other than to confirm that Skelly visited the plant. Various cities previously have contacted Consolidated officials on similar proposals, including Ft. Worth and Dallas, Tex.

The Consair spokesman said the company had probably reached the limit of its expansion here in recently announced plans to double the firm's facilities with construction of a $7,000,000 parts plant. A company official said any additional building here or elsewhere probably would be undertaken by the war department and not the corporation.

concrete floor.

SANDBAGS COST $5000

The actual loading was accomplished with 5, 10, and 20-pound sandbags specially made. Thousands of these were necessary, and their cost alone amounted to $5000. They were made locally under contract. The sand to fill these bags came from Oceanside. It had first to be carefully washed and dried to remove the salt. Had it not been washed, the salt would have absorbed moisture on a damp day, the sand would have gained weight, and the accuracy of the tests would have been destroyed.

For loading and unloading the sandbags for the various tests, timber platforms were erected alongside the huge wing. Enough lumber was used in these to build four medium-sized houses. The ¾-inch planking used over the wing to protect it during the loading and unloading would have built a two-car garage for each of the four houses!

There seems to be little limit to the tasks undertaken by the skilled artisans employed in the building of these airplanes, and the most difficult problem generally finds one or more persons fully qualified to lend expert knowledge or aid in its solution. Should you require an old-time blacksmith who knows the art of welding by hand forging, you'll find one in the welding department, assisting in the most modern methods of welding. If it's a deep sea diver you want, one qualified for 300-foot depths is to be found in the final assemply beaching gear crew, or if it's a cable or wire maker you can soon locate

establishing several records as it did so, and arrived once more in San Diego in excellent condition. Only minor overhaul and checkup was necessary, though the plane had covered approximately 25,000 miles on its return trip from New Guinea alone.

A third plane of this type was flown from San Diego to Felixstowe, England. This was the first flight delivery of a military airplane across the Atlantic. Because the airplane arrived in such a clean and tidy condition after its long flight, one British correspondent remarked that perhaps the clever crew wiped the spots off before the photographers arrived!

TRIPS HOME PLANNED

COPENHAGEN, Sept. 23 (A.P.)—Lucien Memminger, United States consul-general, and his staff today completed arrangements for the return home of the last of some 1500 Americans, mostly tourists stranded in Denmark by European hostilities. More than 1000 got away aboard Scantic Line ships.

MONEY-BACK GLAND TABLET
Restores Vigorous Health

We guarantee to bring you back to health and happiness or we refund every cent. That's how sure we are that we have the best gland tablet known. Thousands of tests have proved this to our full satisfaction. Now WITHOUT RISK you can prove it to yours.

Glendage in convenient tablet form is considered the best in modern science. It contains the extracts from the glands of healthy animals, and its purpose is to stimulate all the glands to healthy activity. The effect is astonishing, almost magical. The entire body takes on a normal condition. Vigorous health is necessary for success in all activity today.

Asthma, Diabetes, Rheumatism, Constant Tiredness, Low Blood Pressure, Nervousness, etc., are ailments frequently caused by gland disorders. You owe it to yourself and family to try this new gland tablet. Glendage is entirely unlike others. It is a real gland product and carries an unlimited Money Back guarantee if it does not give complete satisfaction. 30-day treatment, $3.00. At Owl and other drug stores.—Adv.

Consolidated Bomber is Formidable

In a move planned to benefit both the British purchasers and the United States defense program, an announcement from Washington on Nov. 20 disclosed that the first of 26 Consolidated Model 32 4-engine Land Bombers, which have become the United States Army's 8-24's, are to be delivered to the English. Delivery is expected before March 1, 1941.

These large bombers are similar to the Consolidated prototype Model 32, first flown late in 1939, which marked Consolidated's return to the landplane field. These planes have incorporated in them the latest military features designed to meet the combat requirements learned from the present European conflict. While performance figures are confidential, it is more than likely that these planes equal (and probably exceed) the official statement issued in reference to the prototype, which stated, "This airplane, on preliminary examination, gives evidence of living up to the advancements in aerodynamics and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb-carrying capacity of approximately 4 tons."

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop or they can operate by shuttling between England and British bases. Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, 4-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear.

Approximate dimensions are: wing span, 110 feet; fuselage length, 64 feet; height, 19 feet. The number of the crew varies with the mission to be performed.

U. S. Plane Backlog Totals 3½ Billions

An increase of $385,000,000 is reported for the last month in unfilled orders of American aviation manufacturers by Aviation magazine, according to The Associated Press. This brings the total of unfilled orders to $3,500,000,000, while a year ago the backlog of all companies showed a total of $500,000,000, then a record high.

Craft on order are said to include 39,000 fighting planes, of which 25,000 are for the United States and 14,000 for Great Britain.

The various backlogs, given in millions of dollars, follow: Allison (General Motors), 100; Aviation Corp., 20; Beech, 22; Bell, 60; Boeing, 203; Brewster, 100; Cessna, 11; Consolidated, 300; Continental Motors, 35; Curitss-Wright, 520; Douglas, 400; Fairchild, 15; Ford, 122; Grumman, 20; Lockheed, 211; Martin, 322; North American, 225; Northrop, 24; Packard, 217; Republic, 65; Ryan, 12; United Aircraft, 430; Vultee, 95.

PLANE FOR BRITAIN LEAVES

Bomber Takes Off for Halifax —4 Others Arrive Here

Bound for Halifax, N. S., where it will be delivered to the British Royal Air Force a Consolidated bomber took off from Port Washington, L. I., yesterday. The big craft, built by the Consolidated Aircraft Corporation of San Diego, Calif., was flown to Port Washington last Saturday. Its only stop en route from San Diego to New York was at Fort Worth, Texas.

Whether the plane would be flown to England or dismantled at Halifax and crated for shipping on surface vessels could not be learned. A five-man crew, headed by Ean Ross and including William L. Cleveland, co-pilot; B. E. Harris, radio operator, and H. P. Jewell and M. Gudloe, flight engineers, flew the plane here from the West Coast and continued with it on the trip to Halifax.

Five other bombing planes detined for use in the British Royal Air Force also arrived in New York yesterday from factories on the West Coast. They were four Lockheed "Hudson" bombers and one twin-engine Douglas DB-7.

Consair, Boeing Bombers British Hope for Success in Attacking Axis

WASHINGTON, Dec. 5 (I.N.S.)—America's major contribution to Great Britain in her war for survival will be long-range, four-engine bombers bristling with fire power, a high-ranking army officer stated tonight.

Special emphasis upon production of such an air dreadnaught is now being placed, with a view to participation of waves of these bombers in a blitzkrieg upon Germany and Italy next spring.

Consolidated and Boeing bombers were revealed as the war plane now most eagerly sought from the United States by the British, though they also want Curtiss, Bell, Lockheed and lighter types of 400-mile-an-hour fighters.

Production of Consolidated and Boeing bombers has yet to reach large volume, but by spring they will be rolling out of the factories in substantial numbers. About 25 Boeing "flying fortresses" a month are now being turned out, it was learned, and the Consolidated Aircraft Corp., has just produced its first super-bomber for the American and British governments.

26 CONSAIRS TO BE DELIVERED BY MARCH

War department officials privately resented reports that the United States is slow getting under way in war plane production. Their argument was that the United States did not swing into gigantic national preparedness until about six months ago; that facilities for designing and testing prior to that time were negligible, appropriations small and there was no great urge to aid Britain.

With about $60,000,000 in research laboratories now going up, and private manufacturers settled upon several types of fighting planes for quantity production, the army high command was far from apologetic for progress being made.

On the Consolidated and Boeing long-range bombers they said they must be very good or the British would not be so eager to have a lot of them. Pursuant to the deal with Britain recently announced by Gen. George C. Marshall, army chief of staff, 20 Boeing "flying fortresses" are to be rushed to Britain. Twenty-six Consolidated bombers are to be delivered by March. All of these bombers are being equipped with the famous Sperry bombsight, long a jealously guarded U.S. military secret.

In focusing upon the bomber as the weapon to do the damage to Germany and Italy, when the British are prepared to launch their great offensive, military experts pointed out the long-range plane is a weapon also peculiarly desirable for defense of the United States.

The bombers would be depended upon to scuttle enemy warships and transports at sea in cooperation with surface warships, should the United States be attacked, it was pointed out.

PLANES SENT TO BRITAIN TOTAL 70 MILLIONS

From official department of commerce records it was learned that 948 powered land planes had been exported to Great Britain during the 12 months ended last Oct. 31. To Canada during the same period went 360 land planes and six seaplanes.

Thus, a total of 1314 powered planes were exported in the 12-month period to Britain and Canada in America's aid "short of war." In addition, there were exported to Canada 61 partial planes for assembly in Canada, while 72 partial planes went to Britain. Also, 24 planes without engines were exported to Britain.

Value of all the planes exported to Britain was given by the commerce department as $70,522,570, including those already powered, those without engines and the partial planes for assembly abroad. The corresponding total value for plane shipments to Canada was $14,403,946.

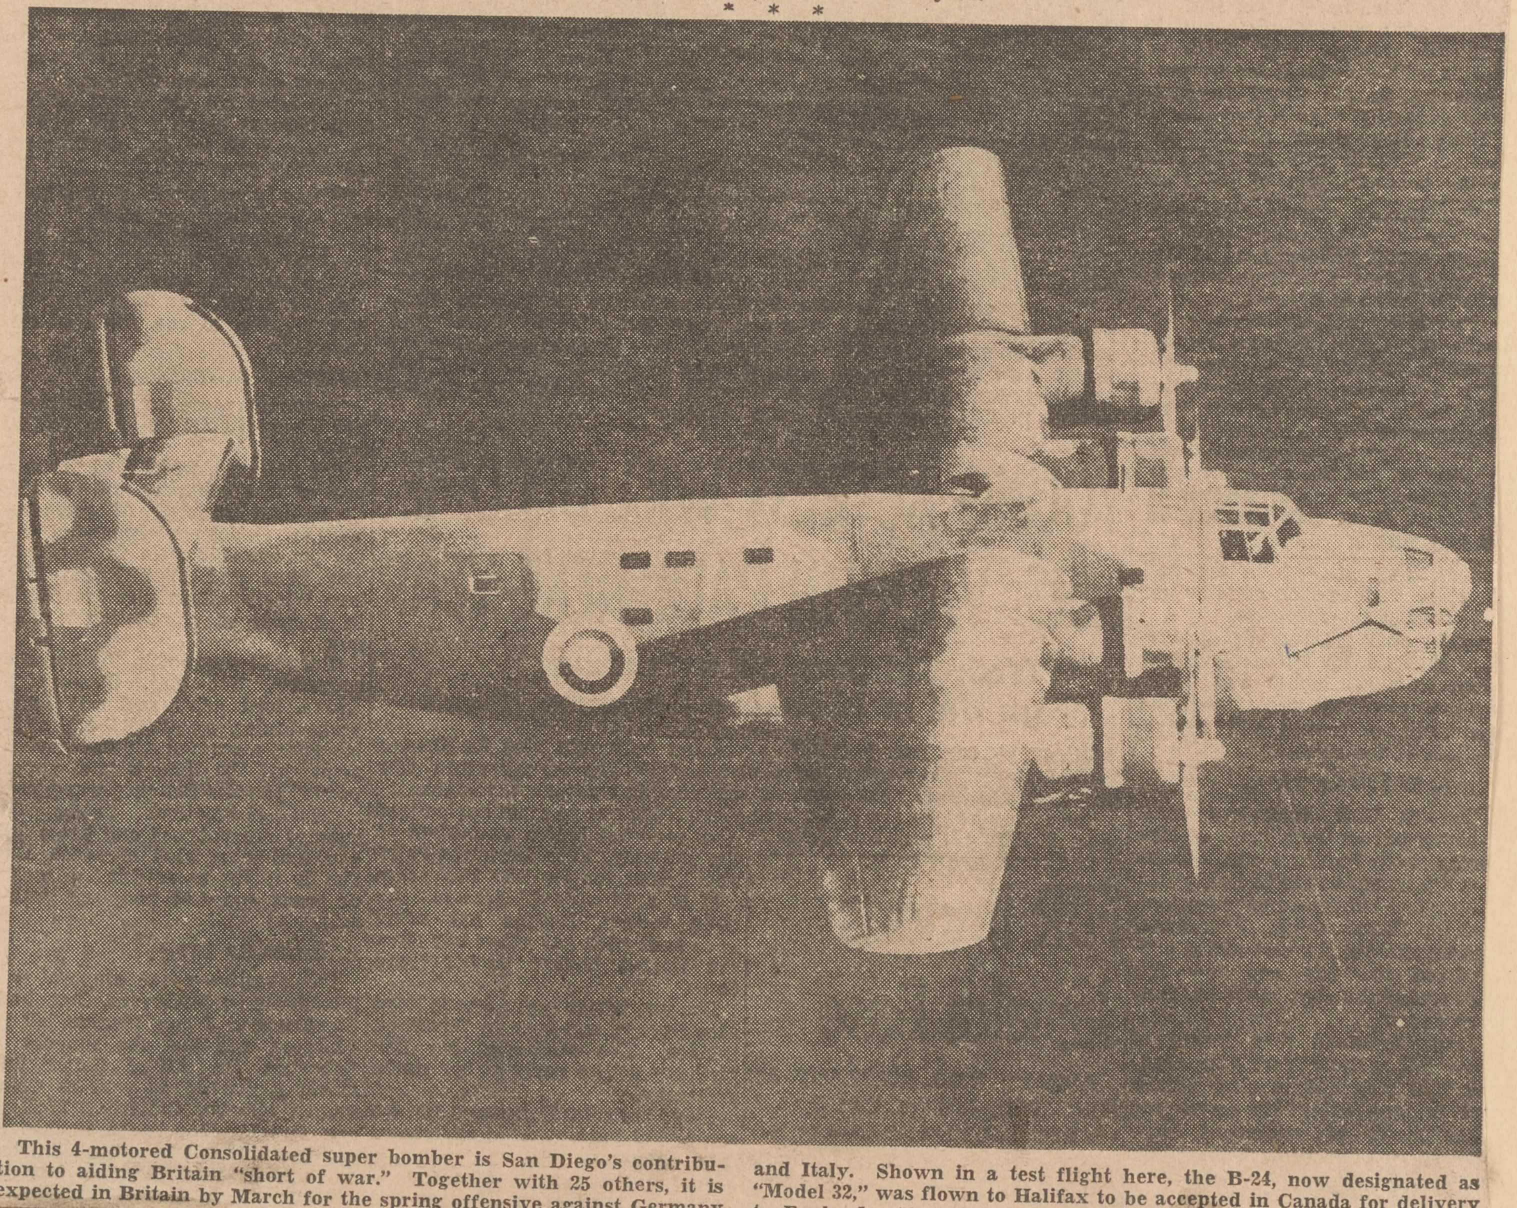
During the year 1053 airplane engines were exported to Great Britain and 929 to Canada having a total value of $19,000,000. Small quantities of engine parts, instruments and accessories were also shipped.

Col. John H. Jouett, president of the Aeronautical Chamber of Commerce revealed that, to take care of U.S. and foreign needs, American manufacturers had spent $83,356,580 on plant expansion and plan an additional $232,188,472 worth of facilities by next June.

Payrolls have expanded from 60,000 last January to 164,920 now. By June, he estimated, the industry will have 382,000 shop employes, plus other thousands employed by sub-contractors. Estimates were that 500,000 persons would be employed in the aircraft industry by June.

Deliveries of equipment for 1940 were estimated at $625,000,000, against $225,000,000 last year.

* * *



This 4-motored Consolidated super bomber is San Diego's contribution to aiding Britain "short of war." Together with 25 others, it is expected in Britain by March for the spring offensive against Germany and Italy. Shown in a test flight here, the B-24, now designated as "Model 32," was flown to Halifax to be accepted in Canada for delivery to England. (Associated Press photo.)

Trib-Sun 12/14/40

May Force Cut In San Diego Draft Quota

Possible effect of the draft on the ranks of skilled aircraft workers was discussed at a meeting here yesterday of personnel directors of San Diego's three major plane plants with Lt.-Comdr. Maurice Sparling, southern California selective service coordinator.

Should a national crisis develop in which a great amount of manpower would be immediately required for the armed services, it may be necessary for aircraft factories to hire women, one employment manager declared.

Not Necessary Now

It was stressed, however, that the present limited national emergency does not warrant serious consideration of such a plan now.

Local aircraft executives at the meeting were J. D. Larimer and B. Waterbury, of Consolidated; M. Marco, of Ryan, and William Gilbert, of Solar.

A two-headed dilemma faced both draft officials and aircraft factories, it was pointed out.

On the one hand is the possible slowing down of production in case of wholesale conscripting of men from plane plants, in which more than a third of San Diego's draft registrants are employed.

On the other hand, should general or widespread deferment of aircraft workers become an established policy, the rush for jobs in that industry, at the expense of other essential activities, would be overwhelming, draft officials said.

Lower Pay Accepted

Instances where men have given up well-paying jobs in non-defense industries to take employment in local aircraft plants at lower pay in hope of avoiding the draft already have been reported.

"I don't doubt that some men have gone into the aircraft industry in the hopes of being deferred," Maj. E. N. Gott, Consolidated Aircraft Corp, vice president, commented today. "They probably do not realize that employment in an aviation plant will not exempt them from military service unless they are key, essential employes.

"Our company is not asking deferment for any men other than those who cannot readily be replaced. There is no alarm in the aircraft industry over key men being drafted, at least at present."

Arranged by Lipton

Yesterday's meeting was arranged by Lewis Lipton, secretary of Draft Board 161, at the request of Sparling, who has been here for several days from Los Angeles headquarters, to assist in coordinating policies of local boards, especially in the matter of deferment of necessary men.

The aircraft executives were assured that nothing would be done by th [illegible] rupt the work of

Revised Drink Laws Proposed

A three-point program designed to close ordinance loop-holes through which inequalities crawl in treatment by the city of establishments serving intoxicating drinks, and framed to block another avenue leading to juvenile delinquency, has been recommended by James H. Bell, social welfare director, to Fred Rhodes, city manager.

Should the manager concur, Bell urged that Rhodes present the suggestions to the city council for submission to the city attorney to whip into legal phraseology for passage as ordinance amendments.

Summarized, he suggested that:

1—Cocktail bars and cafes which have no provision for, and which do not permit, dancing, be licensed to provide entertainment.

2—Minors be prohibited from entering dine-dance halls in hotels regardless of size of the hotels.

3—Organizations sponsoring nonprofit dances for school children be exempt from payment of $3 dance-permit fees.

Striking at the root of the problem that the first recommendation is designed to correct, Bell reported that strolling musicians frequent

(Continued on Page 2, Col. 3)

LIMITED VARIETY OF PARKING SIGNS HAMPERS COURTS

"No Parking!"

But law enforcement officers then would have to give themselves a ticket if they parked emergency vehicles there.

"Unloading and Loading Zone;"

Marshals and police, deputy sheriffs and California Highway patrol officers who take prisoners to municipal courts must park longer than permitted in such a zone.

"One Hour Parking!"

Fine, except John Citizen probably would get there first, and then where would the officers park?

"For Official Cars Only!"

Judge Eugene Daney jr., presiding municipal court judge, and Chester E. Cleator, marshal, yesterday asked the city council to authorize painting such a reserved strip on the courthouse curb to solve the problem created by moving municipal courts into the building.

But, according to Fred Sick, city clerk, existing ordinances first would have to be amended as there is no provision under which the city council could solve the current emergency created by inability of emergency cars to find emergency parking places.

RELIGIOUS EDUCATION EVENT TODAY

The seventh annual program in Balboa park opening Religious Education week here will be held at 3:30 this afternoon. Preceding the program a one-hour organ recital by Royal A. Brown will include religious music.

Dr. Walter Hepner, State college president, will speak on "Use of Religion in Education." Other speakers will be Ralph Grover, Christian Youth council president, and the Rev. Orno E. Tyler, San Diego Ministerial association president. Helen Donofrio Borgens will sing, and Homer Grimes will lead a young people's chorus.

Sponsored by San Diego County Council of Religious Education, with ministerial association cooperation, the observance which begins today will be continued through next Sunday in a home, church and community program.

The home program will stress the hope that every home in San Diego may give one evening a week to "family fellowship," when all members of the family remain at home in a program of mutual enjoyment and understanding; and that each member of the family will establish a home-worship period.

Sunday school teachers will visit homes of pupils next week and Bible teacher-training classes will be established in some of the churches. The community program will include store window displays downtown.

U. S. Funds Denied For Vicente Dam

Abolition of public works administration and defeat of the President's lend-spend program have blocked, at least temporarily, San Diego's hopes for federal funds to aid in construction of San Vicente dam, Fred D. Pyle, city hydraulic engineer, said yesterday.

Formal notification of denial by PWA of the city's request for a $1,575,000 grant just has been received, and Pyle said now the only apparent alternative would be a bond issue.

A total of $3,500,000 would be necessary to build the dam to the 190-foot level, which would permit the impounding of more than 24,000,000,000 gallons to make it second only in size to El Capitan reservoir, which has a 38,000,000,000-gallon capacity, said Pyle. The municipal water commission is on record favoring submission of a San Vicente bond issue when an opportune time arises, said the engineer, but he expressed belief that should a special city election be called soon, the proposal would not be offered then.

Pyle said $630,000 remains in the Sutherland dam fund, and that by vote of the people this could be used to nick the needed sum.

CLUBHOUSE PLANS TO BE IRONED OUT

San Diego Women's club's plans to construct a clubhouse on the southwest corner of Third ave. and Maple st. have hit another technical snag that is expected to be ironed out at a city planning commission meeting Thursday.

The building as now proposed, said Harry Haelsig, assistant city planning engineer, would cover 70 percent of the lot, 10 percent in excess of the permissable 60-percent coverage. The club's petition for an exception was on the planning commission's docket for consideration last Thursday, but has been put over until this week because the commission was unable to muster a quorum for its meeting last week.

Previously, the commission and women's club's representatives negotiated for several weeks before an agreement was reached on a building setback for the improvement.

Buildings' Removal Expected Soon

Immediate removal of two old buildings adjacent to the new Market st. police headquarters, on land acquired by the city through condemnation, appeared probable yesterday when Fred Rhodes, city manager, reported the city attorney's office had advised him the way is clear to tear them down.

Addison Housh, councilman, last week attacked the delay in removing the structures, but was advised by John Thornton, supervisor of public proceedings, that the period for appeal from the judgment under which the city acquired title had just expired.

Rhodes said he will ask the harbor department to tear the structures down for the material the department can salvage.

Vets Select San Diego

San Diego was chosen as the 1940 convention city of the Regular Veterans' association as that body closed its third annual convention in New York yesterday. The Associated Press reported. Corp. Carl Gardner, retired marine officer of Morristown, N. J., was elected association commander.

Local Aircraft Factory Makes Aviation History In Four Years of Operation on Waterfront

By N. V. DAVIDSON

Just four years ago this month, San Diego's largest single family of workers, the employes of Consolidated Aircraft Corp., began to "turn to" on what was destined to become, through subsequent contracts, the largest order for twin-engined flying boats ever placed by the U. S. government. During this time, virtually as fast as the plant and personnel could turn out these cruisers of the air, navy pilots and crews, manning them proceeded to build up a remarkable series of massed flight records which have received acclaim throughout the world as an outstanding achievement.

Some 209 of these twin-engined Consolidated Model 28s (designated by the navy as PBYs), have poured forth from the productive efforts of the artisans and engineers working together under the roof of San Diego's largest manufacturing plant. In addition, during the four short years, the remainder of the army contract for 50 "two-seater" pursuit airplanes, the PB2As, was completed and delivered.

Others built included a group of twin-engined P2Y-3As for the Argentine government; a model 82-5 for the British air manistry, which became the first military airplane ever to be flight-delivered across the Atlantic; another model 28, which was purchased by the Russian government and flown over 19,000 miles of Arctic wastes in search of the lost transpolar fliers; Mr. Archbold's famous Guba, and a special survey plane for transatlantic work for the American Export Airlines.

EXPERIMENTAL SHIPS BUILT

As though this were not enough, from behind the carefully guarded doors of the experimental building emerged two large experimental projects. These were the huge four-engined "flying battleship," the XPB2Y-1, upon which was expended in engineering, building and testing nearly $1,000,000, and the recent highly advanced twin-engined flying boat, the Model 31. This latest creation of the local plant set a precedent in large aircraft work in that it was designed, engineered, built, tested and flown in just under 10 months, exemplifying a remarkable coordination of skill and talent.

This program of aircraft building during the past four years at the local plant has given Consolidated a unique distinction among large aircraft builders. Taking as an arbitrary measure of "bigness" any airplane of a wing span of 100 feet or more, and including the airplane equivalent of spread furnished, Consolidated has constructed more than three times as many such airplanes as all other manufacturers combined. This includes those built during the World war period.

Consolidated came into existence after the war, in 1923, and figuring from that time, has constructed approximately four times as many as all other U. S. manufacturers combined. Since a good share of these have been the navy's PBYs, much of the credit is due the plant's force within the four years since Consolidated started here.

EMPLOYMENT INCREASED

Because the greater portion of this production of aircraft has been of a military nature, it has been accomplished behind closed doors, and the company's continual activity has not been realized by those outside. At no time in the four years has the personnel dropped below 1120 persons. Last March this figure was reached when it was difficult to obtain materials because of huge quantities being ordered by the whole industry. During the intervening months a steady increase has swelled the figure to about 1900. Former employes, of course, are given the first opportunity of employment as the total is increased. Based upon the present backlog of work, which is well over $17,000,000, the personnel will probably level off at around 2000 persons.

Taking advantage of a brief breathing spell just prior to the receipt of the latest contracts, a considerable program of rearrangement and placing of new equipment

(Continued on Page 2, Col. 1)

WASHINGTON ST. EXTENSION SET

Acquired for $16,071, all or part of 19 parcels of land have been obtained by the city for the 100-foot right-of-way for Washington st. extension from Fifth to Eighth aves., and the state division of highways daily is expected to advertise for bids for the 425-foot bridge that will be stretched across Sixth ave. canyon.

John Thorton, city supervisor of public proceedings, and E. H. Brooks, right-of-way agent, already have acquired three of nine additional parcels which must be obtained before the extension can be carried on through to Tenth ave.

This second unit will involve construction of another bridge and an extensive fill, and no tentative date has been set for start of the second span. When the long-discussed improvement finally is completed, a new east-west thoroughfare will have been opened and will, according to officials, relieve materially traffic congestion in the Fifth and University aves. district.

Despite the magnitude of the task, title to all of the land needed

Consolidated Bomber is Formidable

In a move planned to benefit both the British purchasers and the United States defense program, an announcement from Washington on Nov. 20 disclosed that the first of 26 Consolidated Model 32 4-engine Land Bombers, which have become the United States Army's 8-24's, are to be delivered to the English. Delivery is expected before March 1, 1941.

These large bombers are similar to the Consolidated prototype Model 32, first flown late in 1939, which marked Consolidated's return to the landplane field. These planes have incorporated in them the latest military features designed to meet the combat requirements learned from the present European conflict. While performance figures are confidential, it is more than likely that these planes equal (and probably exceed) the official statement issued in reference to the prototype, which stated, "This airplane, on preliminary examination, gives evidence of living up to the advancements in aerodynamics and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb-carrying capacity of approximately 4 tons."

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop or they can operate by shuttling between England and British bases. Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, 4-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear.

Approximate dimensions are: wing span, 110 feet; fuselage length, 64 feet; height, 19 feet. The number of the crew varies with the mission to be performed.

Union 12/5/40

U. S. Plane Backlog Totals 3½ Billions

An increase of $385,000,000 is reported for the last month in unfilled orders of American aviation manufacturers by Aviation magazine, according to The Associated Press. This brings the total of unfilled orders to $3,500,000,000, while a year ago the backlog of all companies showed a total of $500,000,000, then a record high.

Craft on order are said to include 39,000 fighting planes, of which 25,000 are for the United States and 14,000 for Great Britain.

The various backlogs, given in millions of dollars, follow: Allison (General Motors), 100; Aviation Corp., 20; Beech, 22; Bell, 60; Boeing, 203; Brewster, 100; Cessna, 11; Consolidated, 300; Continental Motors, 35; Curitss-Wright, 520; Douglas, 400; Fairchild, 15; Ford, 122; Grumman, 20; Lockheed, 211; Martin, 322; North American, 225; Northrop, 24; Packard, 217; Republic, 65; Ryan, 12; United Aircraft, 430; Vultee, 95.

PLANE FOR BRITAIN LEAVES

Bomber Takes Off for Halifax —4 Others Arrive Here

Bound for Halifax, N. S., where it will be delivered to the British Royal Air Force a Consolidated bomber took off from Port Washington, L. I., yesterday. The big craft, built by the Consolidated Aircraft Corporation of San Diego, Calif., was flown to Port Washington last Saturday. Its only stop en route from San Diego to New York was at Fort Worth, Texas.

Whether the plane would be flown to England or dismantled at Halifax and crated for shipping on surface vessels could not be learned. A five-man crew, headed by Ean Ross and including William L. Cleveland, co-pilot; B. E. Harris, radio operator, and H. P. Jewell and M. Gudloe, flight engineers, flew the plane here from the West Coast and continued with it on the trip to Halifax.

Five other bombing planes detined for use in the British Royal Air Force also arrived in New York yesterday from factories on the West Coast. They were four Lockheed "Hudson" bombers and one twin-engine Douglas DB-7.

Consair, Boeing Bombers British Hope for Success in Attacking Axis

12/6/40 Union

WASHINGTON, Dec. 5 (I.N.S.)—America's major contribution to Great Britain in her war for survival will be long-range, four-engine bombers bristling with fire power, a high-ranking army officer stated tonight.

Special emphasis upon production of such an air dreadnaught is now being placed, with a view to participation of waves of these bombers in a blitzkrieg upon Germany and Italy next spring.

Consolidated and Boeing bombers were revealed as the war plane now most eagerly sought from the United States by the British, though they also want Curtiss, Bell, Lockheed and lighter types of 400-mile-an-hour fighters.

Production of Consolidated and Boeing bombers has yet to reach large volume, but by spring they will be rolling out of the factories in substantial numbers. About 25 Boeing "flying fortresses" a month are now being turned out, it was learned, and the Consolidated Aircraft Corp., has just produced its first super-bomber for the American and British governments.

26 CONSAIRS TO BE DELIVERED BY MARCH

War department officials privately resented reports that the United States is slow getting under way in war plane production. Their argument was that the United States did not swing into gigantic national preparedness until about six months ago; that facilities for designing and testing prior to that time were negligible, appropriations small and there was no great urge to aid Britain.

With about $60,000,000 in research laboratories now going up, and private manufacturers settled upon several types of fighting planes for quantity production, the army high command was far from apologetic for progress being made.

On the Consolidated and Boeing long-range bombers they said they must be very good or the British would not be so eager to have a lot of them. Pursuant to the deal with Britain recently announced by Gen. George C. Marshall, army chief of staff, 20 Boeing "flying fortresses" are to be rushed to Britain. Twenty-six Consolidated bombers are to be delivered by March. All of these bombers are being equipped with the famous Sperry bombsight, long a jealously guarded U.S. military secret.

In focusing upon the bomber as the weapon to do the damage to Germany and Italy, when the British are prepared to launch their great offensive, military experts pointed out the long-range plane is a weapon also peculiarly desirable for defense of the United States.

The bombers would be depended upon to scuttle enemy warships and transports at sea in cooperation with surface warships, should the United States be attacked, it was pointed out.

PLANES SENT TO BRITAIN TOTAL 70 MILLIONS

From official department of commerce records it was learned that 948 powered land planes had been exported to Great Britain during the 12 months ended last Oct. 31. To Canada during the same period went 360 land planes and six seaplanes.

Thus, a total of 1314 powered planes were exported in the 12-month period to Britain and Canada in America's aid "short of war." In addition, there were exported to Canada 61 partial planes for assembly in Canada, while 72 partial planes went to Britain. Also, 24 planes without engines were exported to Britain.

Value of all the planes exported to Britain was given by the commerce department as $70,522,570, including those already powered, those without engines and the partial planes for assembly abroad. The corresponding total value for plane shipments to Canada was $14,403,946.

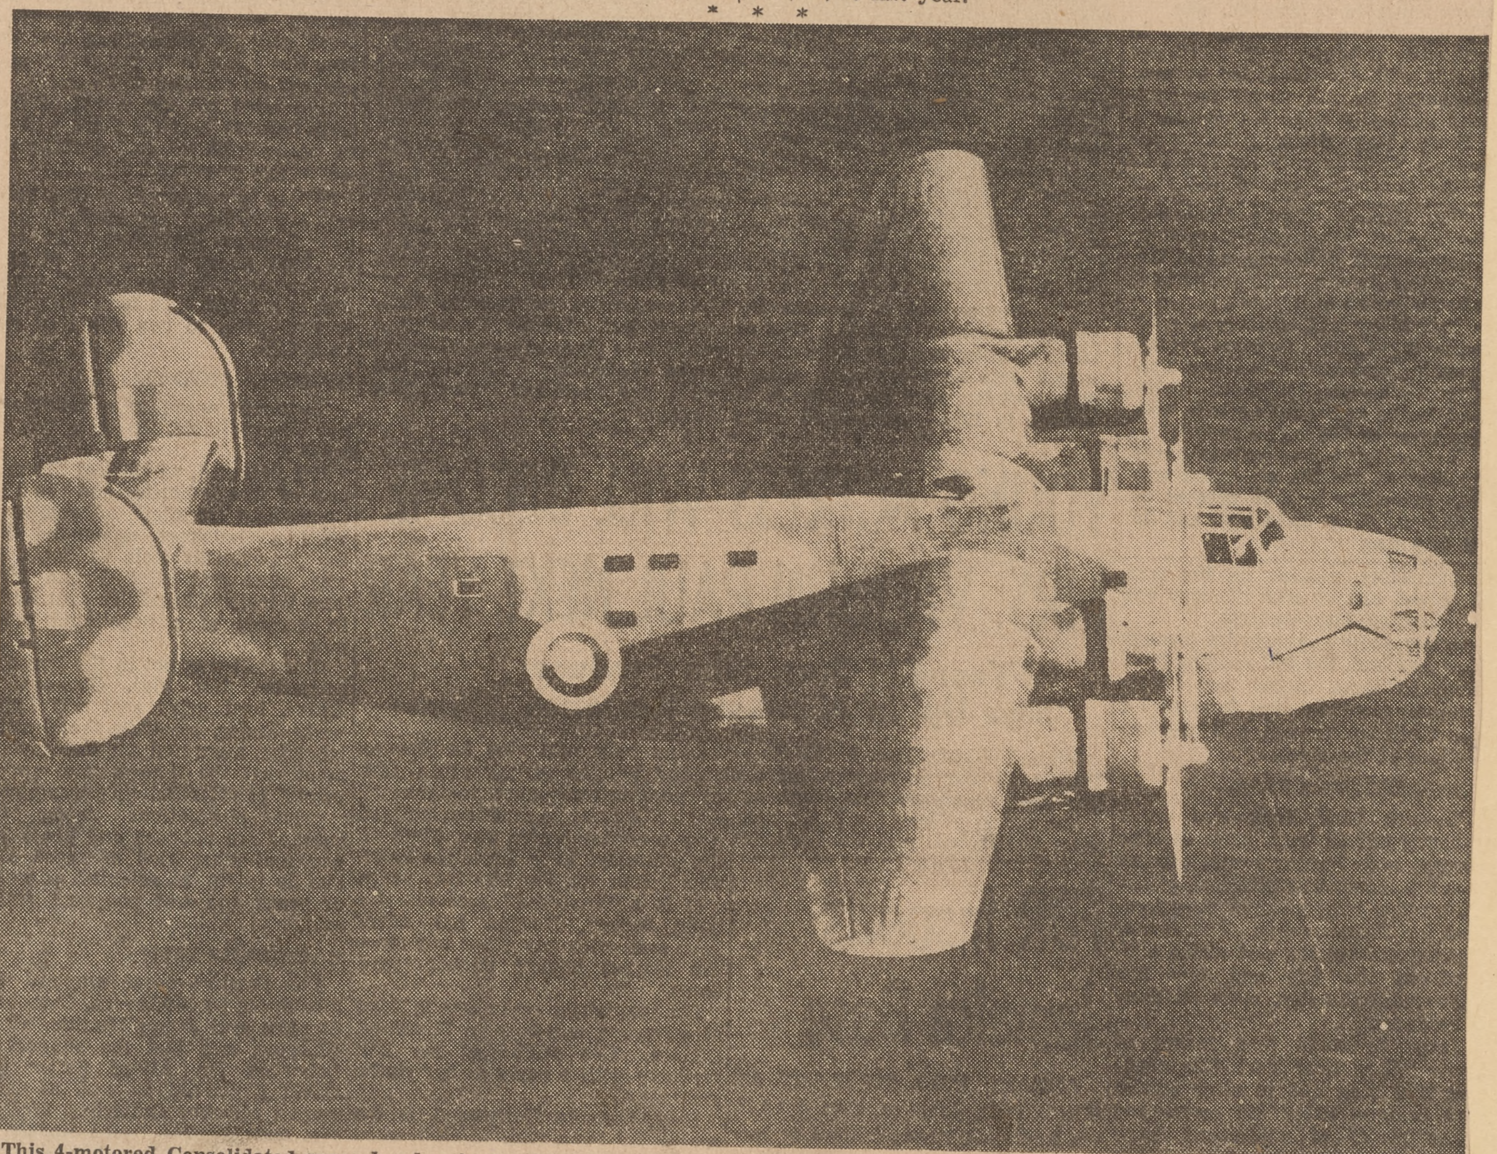
During the year 1053 airplane engines were exported to Great Britain and 929 to Canada having a total value of $19,000,000. Small quantities of engine parts, instruments and accessories were also shipped.

Col. John H. Jouett, president of the Aeronautical Chamber of Commerce revealed that, to take care of U.S. and foreign needs, American manufacturers had spent $83,356,580 on plant expansion and plan an additional $232,188,472 worth of facilities by next June.

Payrolls have expanded from 60,000 last January to 164,920 now. By June, he estimated, the industry will have 382,000 shop employes, plus other thousands employed by sub-contractors. Estimates were that 500,000 persons would be employed in the aircraft industry by June.

Deliveries of equipment for 1940 were estimated at $625,000,000, against $225,000,000 last year.

* * *



This 4-motored Consolidated super bomber is San Diego's contribution to aiding Britain "short of war." Together with 25 others, it is expected in Britain by March for the spring offensive against Germany and Italy. Shown in a test flight here, the B-24, now designated as "Model 32," was flown to Halifax to be accepted in Canada for delivery to England. (Associated Press photo.)

Trib-Sun 12/14/40

May Force Cut In San Diego Draft Quota

Possible effect of the draft on the ranks of skilled aircraft workers was discussed at a meeting here yesterday of personnel directors of San Diego's three major plane plants with Lt.-Comdr. Maurice Sparling, southern California selective service coordinator.

Should a national crisis develop in which a great amount of manpower would be immediately required for the armed services, it may be necessary for aircraft factories to hire women, one employment manager declared.

Not Necessary Now

It was stressed, however, that the present limited national emergency does not warrant serious consideration of such a plan now.

Local aircraft executives at the meeting were J. D. Larimer and B. Waterbury, of Consolidated; M. Marco, of Ryan, and William Gilbert, of Solar.

A two-headed dilemma faced both draft officials and aircraft factories, it was pointed out.

On the one hand is the possible slowing down of production in case of wholesale conscripting of men from plane plants, in which more than a third of San Diego's draft registrants are employed.

On the other hand, should general or widespread deferment of aircraft workers become an established policy, the rush for jobs in that industry, at the expense of other essential activities, would be overwhelming, draft officials said.

Lower Pay Accepted

Instances where men have given up well-paying jobs in non-defense industries to take employment in local aircraft plants at lower pay in hope of avoiding the draft already have been reported.

"I don't doubt that some men have gone into the aircraft industry in the hopes of being deferred," Maj. E. N. Gott, Consolidated Aircraft Corp, vice president, commented today. "They probably do not realize that employment in an aviation plant will not exempt them from military service unless they are key, essential employes.

"Our company is not asking deferment for any men other than those who cannot readily be replaced. There is no alarm in the aircraft industry over key men being drafted, at least at present."

Arranged by Lipton

Yesterday's meeting was arranged by Lewis Lipton, secretary of Draft Board 161, at the request of Sparling, who has been here for several days from Los Angeles headquarters, to assist in coordinating policies of local boards, especially in the matter of deferment of necessary men.

The aircraft executives were assured that nothing would be done by the draft to interrupt the work of the assembly lines now rushing manufacture of airplanes and parts.

Sparling quoted C. A. Dykstra, national selective service director, as saying that defense-production needs would be given priority over the army's call for manpower to train in the draft camps. No men will be drafted from the defense industries unless they can be reasonably replaced, he said.

This would mean, the officer explained, that skilled mechanics, of whom there is said to be a shortage, would not be called to camp as long as the need exists for their services in making airplanes or for doing other essential defense work.

Broad employment problems also were discussed at the meeting. The personnel directors pointed out that it costs $200 to fit each new worker into plant operations and this is a considerable expense if men so employed are to be drafted in a short time.

Change Welcome

In exploring the probability that the county's draft quota might be lowered, especially for local boards where defense workers make up a majority of registrants, Lipton said that the quotas as announced are subject to revision. He pointed out that under Director Dykstra's ruling some boards may find more than half their registrants listed as men necessary for production of munitions. To expect these boards to furnish the same proportion of their registrants for the army as boards having few or no defense workers is obviously unfair, he noted. For this reason he said he anticipated drastic reductions in the quotas of such boards.

Following yesterday's meeting, Sparling gave a brief outline of his activities here. He said he has been visiting various local boards in an effort to prevent wide variations in deferment matters. Otherwise, he said, some boards might put all defense workers in Class 1-A if they are single or without dependents, while another might classify such registrants as necessary men and defer them. He said the selective service is being administered to defer anyone with dependents, provided there is real and not fake dependency.

For employers who fear inroads of the draft into their concerns, he suggested they consider a yardstick evolved by selective service headquarters.

"Such employers should find out which of their men are within the draft age," he said. "Then they should deduct those with dependents and those physically unfit for army service. The draft call for the next year may then be computed [illegible] 5 percent of [illegible]

MANILA GOAL IN 'SECRET' FLIGHT OF NAVY BOMBERS

Trib-Sun 12/13/40

Subs on Way With Consair Ships From S.D.

HONOLULU, Dec. 13 (U.P.)—Twelve naval patrol bombers and a division of submarines which left Honolulu under strict official secrecy are en route to the Philippine islands, it was revealed today.

The bombers, which took off from here last Monday were due at Manila Sunday or Monday, it was learned. Normal arrival time there would be today, but navy officers explained the flight had been scheduled in unusually "easy stages."

The bombers, it was understood, were of the latest type of San Diego-made Consolidated patrol bombers, carrying twin engines of 1500 horspower each.

A submarine division usually is made up of six craft.

The bombers' schedule called for stops at Midway, Wake and Guam islands en route to Manila. They were to have rested last night at Guam before hopping for Manila.

The submarines have been en route to the Philippines since Dec. 7, it was learned. It was understood navy officials expected them to arrive simultaneously at Manila without advance publicity.

Daily Mirror (London) 11-21-41

U.S. SEES WITH R.A.F.

U.S. observers are flying in British warplanes over Britain and the Channel.

General Marshall, U.S. Army Chief of Staff, revealed this in Washington last night.

He said that so far the observers had not flown over Germany.

The U.S. Army High Command last night gave Britain priority on delivery of twenty-six four-engined bombers being manufactured by the Consolidated Aircraft Company.

At the same time, they announced negotiations to give Britain twenty more four-engined bombers already completed by the Boeing Aircraft Company.

One of the two United States "high accuracy" bomb sights has been released to Britain.

It is the "Sperry" sight which U.S. planes no longer use. The U.S. retains the "Norden" sight.

Britain has released to the United States sufficient engines to equip forty-one Boeing "Flying Fortress" bombers.—Associated Press.

THE NEW YORK TIMES,

2,500 U. S. PLANES IN USE IN BRITAIN

Communiques Are Silent on Performance of Most of Craft in War Service

TESTS SHOW WEAKNESSES

Improvements in Design and Armor Suggested—British Develop Air Cannon

LONDON, Dec. 3 (UP)—An estimated 2,500 United States-built aircraft of all types have already been delivered here and are taking part in the Battle of Britain. Nearly half are Harvard trainer non-combat ships.

The British generally praise the quality and performance of American planes, but except for the Lockheed Hudsons, whose merits frequently are mentioned in communiqués, official silence is maintained about the performance of the types in service here.

Received coolly at first, the Hudsons now are rated ace-high by the Coastal Command, which uses them, and are considered as effective as Great Britain's prized all-purpose Blenheims.

Need of Improvement Shown

War experience, however, has hsown the need for improvements in design and armor in American planes.

At first the Hudsons were considered good for improvised civilian craft, but they since have been used for long-range reconnaissance and bombing, and even dive-bombing, and have passed all tests successfully, British pilots report. One pilot who used a Hudson to dive-bomb ships said it was something like entering an auto race with an omnibus and winning.

Pilots have expressed a liking also for Brewster single-engined fighters, which they described as so easily manoeuvrable that they can turn on a dime. The presence of Brewsters and Douglas Boston BB-7s here was confirmed when the Duke of Kent inspected them last September.

Other Types Now in Service

Other types of American planes whose delivery has been reported in the press locally are the Curtiss Hawk 75-A, known in the United States as the PT-36 single-seater fighter; the Curtiss Hell-Diver two-seater scout bomber and the Northrup A-17 attack bomber.

Reports from British representatives or manufacturers describe describe delivery of other types including the Grumman fighter, Bell Airacobra fighter, Consolidated flying-boat and Consolidated four-motored bombers, Lockheed P-38 twin-motored interceptor, Vought-Sikorsky naval dive bombers and the Flying Fortress.

Many British fighting planes are being equipped with cannon and armor plating, it was revealed today.

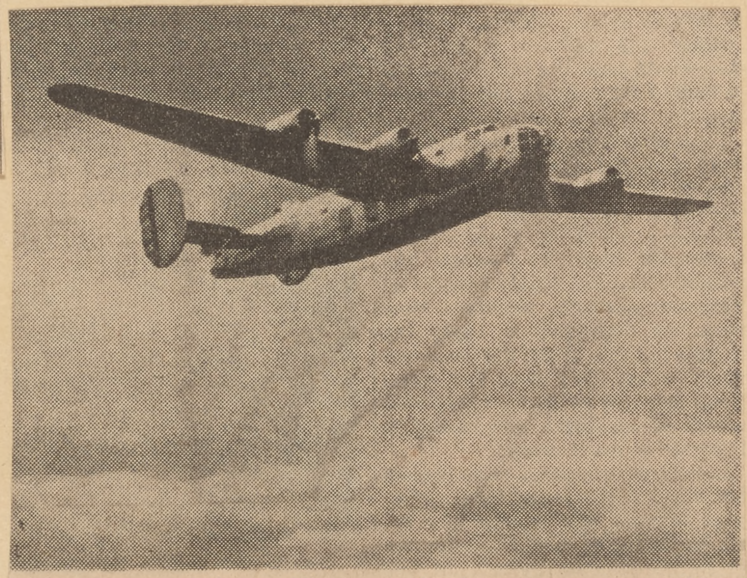
The British cannot are said to be better than the German, which fire 300 three-quarter-inch shells a minute.

A British export is said to have altered the fighting plane designs to povide for the cannon without loss of speed or manoeuvreability. Details of the new plane are secret, but it is known that experts have been trying to develop an airplane cannon that can easily hit an enemy plane at 1,000 yards.

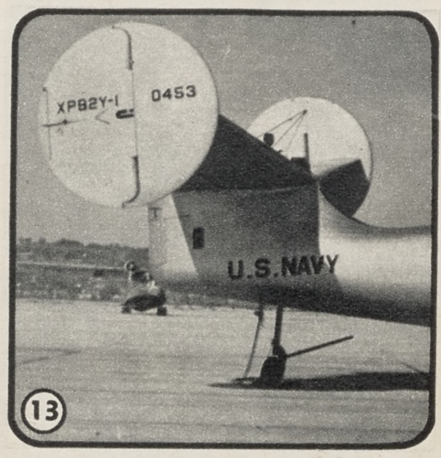
BOMBERS FOR BRITAIN AWAITING SHIPMENT FROM BROOKLYN

Craft of various types lined up at Floyd Bennett Field preparatory to crating. In contrast to the camouflaged war planes is the silver Lockheed Lodestar transport destined for service on a South African airline.

Times Wide World



Said to be one of the world's largest bombers, the new Consolidated four-engine land plane, designated by the Army as the B-24, is powered with four Pratt & Whitney 14-cylinder radial engines.



In these times of aerial blitzkrieg, you should know that this is the tail of a:

(a) pursuit plane
(c) trainer
(b) fighter
(d) patrol bomber

'LOOK - 12/17/40

LONG-RANGE BOMBERS BUILDING FOR BRITAIN

Consolidated Says Planes Will Carry Four Tons 3,000 Miles

Special to THE NEW YORK TIMES.

SAN DIEGO, Calif., Dec. 3—A new plan of offensive for British airmen was pictured today by the Consolidated Aircraft Corporation in a statement that its new four-engined bombers for Britain would "probably exceed" these specifications: 300 miles per hour speed, 3,000-mile range, four-ton bomb-carrying capacity.

"These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop, or they can operate by shuttling between England and British bases," the statement added. "Their speed and defense and attack armament give them adequate protection from all angles."

Delivery of the twenty-six consolidated ships which are said to corespond generally in performance to the Boeing "flying fortress," another plane ordered by Britain, is scheduled before March 1. The planes, measuring 110 feet across their "high aspect ratio wing," which was designed to give maximum lift with minimum drag, will be flown directly to England from Canada. The first of these twenty-ton, sixty-four-foot planes is expected to fly east about Dec. 15.

BIG BOMBERS FOR BRITAIN

NEARLY READY IN U.S.

From Our Own Correspondent

NEW YORK, Monday.

It is reported from San Diego, California, to-day, that work on an undisclosed number of bombers for the R.A.F. has reached an advanced stage at the Consolidated Aircraft Corporation's factory.

Known as B-24, this 20-ton four-engined machine is believed to be the most powerful long-range bomber in the United States, and incorporates many improvements on the so-called Flying Fortress type.

The same firm are making 600 twin-engine seaplane bombers for Britain.

L.A. Times - 12-6-40

Flat Plane Motor Hailed

'Pancake' Type of Engine to Be Lighter, More Powerful, Inventor Says

SAN DIEGO, Dec. 5. (AP)—J. L. Weaver said today his aircraft concern will start work next week on a recently designed "pancake" type plane engine which will be given the Army for laboratory tests next spring.

Weaver, formerly a Consolidated Aircraft Corp. inspector, began developing the motor eight years ago as a hobby with the intention of creating an engine with fewer parts and more power. Weaver said the engine could be produced at a cost from 65 to 75 per cent less than standard engines now in use.

NEW OILING SYSTEM

Some of the features incorporated in the engine, which derives its name from its general flat appearance, include cylinders which Weaver said would not wear out and a streamlined oiling system which the inventor stated would require neither oil pumps nor oil lines and would permit lubricant to remain clean for the life of the motor, thus minimizing frequent overhaul and adjustment.

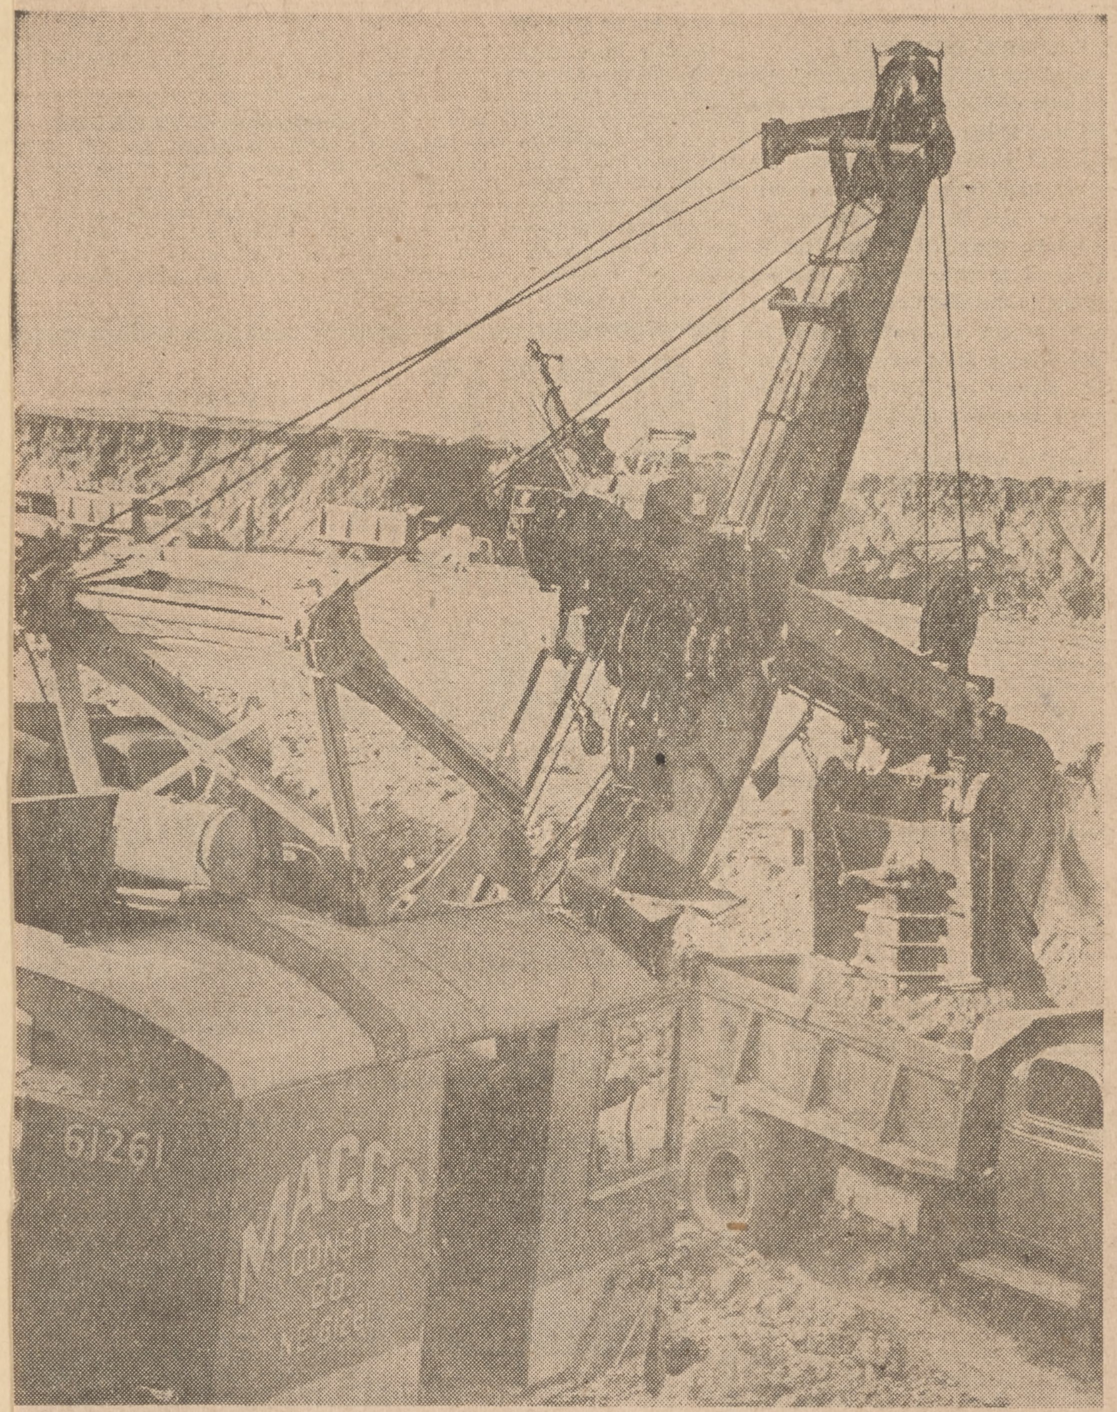
Weaver said this type power unit would lend its compact shape ideally for mounting directly into the wing section, permitting the wing itself to act as the engine cowling. He said mounting of large engines on the loading edge of wings had given designers trouble in perfecting streamlining.

'CONTINUOUS GLIDING'

Weaver believes he has worked out the problem of dynamic balance or vibration to a smoothness that will give a plane the effect of continuous gliding.

He said a four-cylinder engine weighing only 115 pounds and designed to develop 100 horsepower at 3600 revolutions at 30,000 feet would be especially suited for military training planes. For larger planes the horsepower would be increased by installing 12 or more cylinders. Weaver said engines in most training ships, developing 125 horsepower, weighed from 350 to 375 pounds.

Faith Moves Mountains; S. D. Defense Workers Do Pretty Good Job Too



It doesn't take long for one of these huge steam shovels to fill a truck. Big hills rapidly are disappearing in a cacaphonic symphony of power shovels and trucks on San Diego's navy housing job.

Power Shovels Biting Away Eastern Pt. Loma

Faith, they say, can move mountains, but so can the drive for national defense.

All you have to do to prove this is to go out to Ingraham st. and W. Pt. Loma blvd. and watch the eastern end of Pt. Loma melt away in the mouths of giant power shovels.

FOR HOUSING PROJECT

The hill is going by the truckload to the navy's new housing project between Rosecrans st. and Barnett ave. near the Naval Training station, and to Consolidated Aircraft's new factory site bounded by Pacific highway, Rosecrans st., Barnett ave. and the Santa Fe tracks.

First nibbling on this hill was done several years ago and the dirt went to make the Mission bay causeway. When the people who move the earth got contracts for filling in lands for the housing and aircraft jobs, they turned again to the promontory.

EASY DIGGING

Roads were built to the top of the hill and giant power shovels were dragged up. With their engines roaring in a symphony of power, the shovels began to feed the seemingly insatiable maws of scores of trucks. Some of the shovels snatch up more than two yards of earth at a clip.

It is considered fairly easy "digging ground for the shovels as there is no rock formation in the hill.

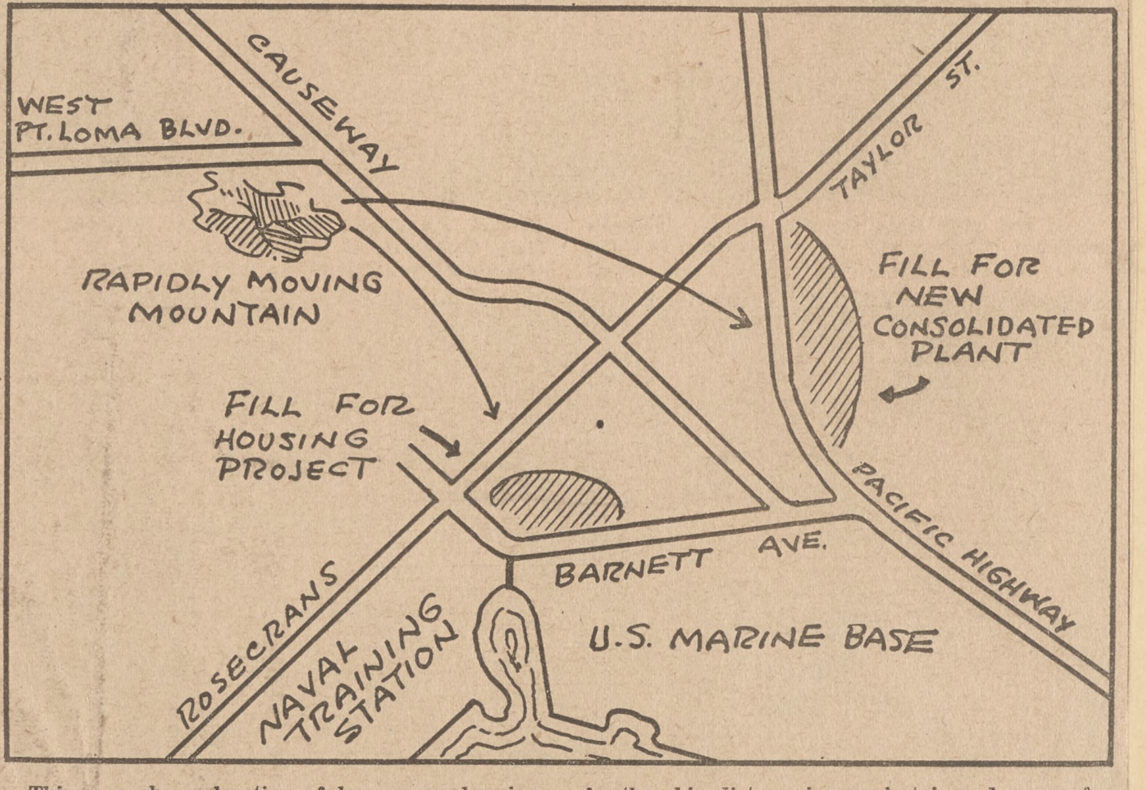
The old right-of-way of the street car company's abandoned Mission Beach line is being used as a truck road for the Consolidated job.

TRAFFIC DIRECTED

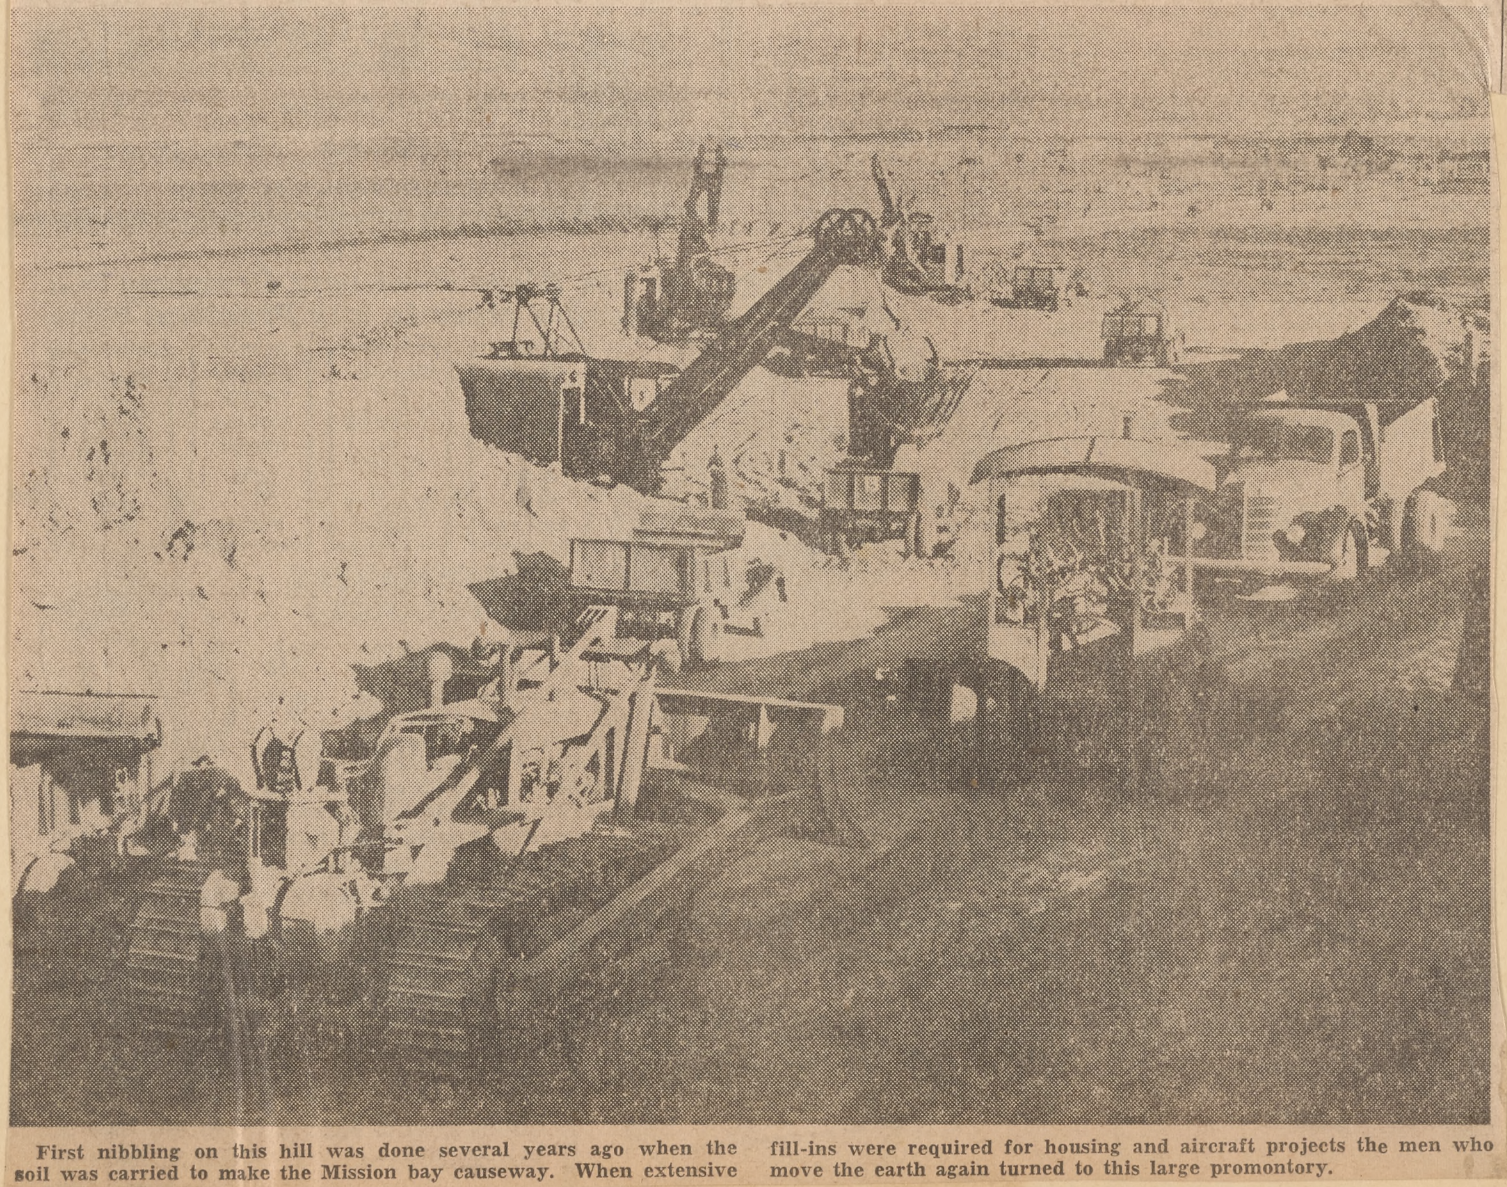
Special traffic men have been posted where the trucks make their turns across Pacific highway and Ingraham st., and also at Ingraham and Rosecrans so hurrying trucks

(Continued on Page 2-B, Col. 7)

Mohammed and Uncle Sam may use different methods, but the result of moving mountains is the same. Here are some of the steam shovels employed on the defense housing project near Ingraham st. and Pt. Loma blvd., where residences will be built for the navy.



This map shows location of huge navy housing project near Ingraham st. and W. Pt. Loma blvd.



First nibbling on this hill was done several years ago when the soil was carried to make the Mission bay causeway. When extensive fill-ins were required for housing and aircraft projects the men who move the earth again turned to this large promontory.

Another big dirt-moving project is under way for the navy adjacent to the foot of Thirty-second st.

Basket Fund Goes Over With Bang When Consair Workers 'Chip In'

There will be Christmas cheer and enough to eat in the homes of 140 San Diego families tomorrow because other San Diegans, a little more fortunately blessed, opened their hearts bountifully to the appeal of the Christmas Basket Fund.

In the behalf of those to whom the day might otherwise have been an empty mockery, The Tribune-Sun and Fighting Bob post, American Legion, sponsors of the annual fund, wish to thank the many who contributed, in money and in food, to make the baskets possible. The newspaper and Al Fern, post basket fund chairman, wish to thank also the post and auxiliary members who trudged faithfully through rain and storm last night and again today, distributing the baskets.

Consolidated Aircraft night-shift workers of the welding, draw-bench, metal, hull and machine shop departments put the fund over with a bang at almost the last minute. In a movement started by the workers themselves, members of the five departments, from apprentices and office boys on up, began "chipping" in for a basket contribution. When they had finished, there was $66.58! And then the fixed equipment department brought in another $6.25.

Other cash contributions continued to come in right to the last, too. And Mrs. Mary Treadway, 908 A st., made up a large quantity of jams and jellies to be added to the baskets.

As the fund closed today, its cash status (not including the large amounts of foodstuffs turned in) stood as follows:

Previously	$247.42
Consair Workers	66.58
Ethel M. Smith	10.00
Girl Scout Troop 25	1.50
Friend	1.00
Anonymous	1.00
Consair Workers	6.25
Total	$333.75

U.S. Releases Heavy Bombers

No plane ever used in active operations is comparable to 26 machines which the U.S. Army has released for Britain.

They are four-engined Consolidated bombers, built for the U.S. Air Force, it was announced yesterday in Washington.

Similar to the "Flying Fortresses," they have a loaded range of at least 3,000 miles, and are due for delivery this month and next month.

The U.S. is anxious to see results of the bombers in action, General Marshall said at Washington.—B.U.P.

Seven Million Dollars for Expansion at Consair

Consair Building Eight New Units; One Building to House Gigantic Drop Hammer

Exemplifying democracy at work in the National Defense Program, Consolidated Aircraft Corporation disclosed today that plans had been made and ground will be broken soon for the construction of a huge new Parts Plant at San Diego, which will virtually double Consolidated's present size. The new plant will fit solidly into the line production program on Consolidated flying boats and large land bombers.

On Labor Day, September 2nd last, Consolidated officials formally dedicated the new buildings on the Lindbergh Field site, making a step in the 1939-40 construction program. Meanwhile additional buildings at Lindbergh Field, though not officially announced, were started. These, it is estimated, will be completely occupied by January 15th. Included are another Final Assembly Building, 360x720 feet in size, and a single building, 200x1500 feet, to be devoted to small parts assembly. The previous expansion and the buildings to be completed by Janpary 15th will increase Consolidated's manufacturing area (over the original 1935 plant) by some 10 times, or more than 1,000 percent—a phenomenal growth of five years!

The new announcement discloses that a huge parts plant will be located about one and one-third miles north of the Lindbergh Field site, and will add 1,553,000 square feet of covered manufacturing area, virtually doubling the tenfold expansion which is nearing completion at this time. With an accelerated construction program, the entire new parts plant is scheduled to be completed and in full operation by June, 1941. This plant is composed of a group of eight buildings with a total roofed area of 1,553,000 square feet, plus loading platform of 64,000 square feet. Cost is to run between six and one-half and seven millions of dollars. The factory site is 52 acres in size, with an adjacent area of 72 arces which is to be used for parking facilities. Combined personnel to operate both plants is estimated at 30,000. New buildings will be similar in type to present Consolidated structures. All buildings, including the original and new plant, are entirely of the latest type and design, especially engineered for modern aircraft manufacturing. The oldest factory building is less than five and a half years old, making Consolidated's combined facilities probably the most modern and efficient in existence. The equipment for the new plant has been ordered and is in the process of being delivered. To make immediate use of production equipment, many of the machines will be set up and operated under lean-to tents at the Lindbergh Field plant site, then transferred to the new buildings as quickly as they are ready for occupancy. The present plant on Lindbergh Field is employing its paved yard areas for some 30 percent of its operations, made possible by the equable climatic conditions of San Diego. The new plant, however, will conduct all of its operations under roof. This new plant will be a highly specialized production unit devoted to the manufacture of component parts and assemblies for wings and tail surfaces construction, with completely independent facilities for all operations requisite for their manufacture. All yard areas will be paved. The spur railroad sidings will be of depressed track construction, for quick car-floor-level loading and unloading.

The largest battery of droy hammers and hydraulic presses under one roof on the Pacific Coast will be used in the new drop hammer building, which will also house a complete pattern shop, foundry and die-storage departments. The huge hammers will be mounted on improved shock-proof foundations similar to those now employed under the drop hammers at the Lindbergh Field site. While working in complete conjunction with the Lindbergh Field plant, the new parts plant will be a complete unit.

B. O. Larsen, San Diego, is general contractor.

R. E. Hazard & Sons, San Diego, filling and grading of site.

Ellis Cray Taylor and Ellis Wing Taylor, architects.

NEW YORK WORLD-TELEGRAM,

Consol. Aircraft Votes $2 Share On Common Stock

First Since 1938, When $1 Was Paid; Other Companies Act

Consolidated Aircraft Corp. declared a $2 common dividend, payable Dec. 26 to holders of record Dec. 20. The previous payment was $1 in December, 1938.

American Brake Shoe & Foundry Co. voted an extra of 60 cents along with an interim 40-cent common payment, both due Dec. 28 on stock of record Dec. 19. Payments for 1940 come to $2.10, against $1.25 in 1939.

Federation Bank & Trust Co. voted a 60-cent dividend, payable Dec. 26 on stock of record Dec. 16. The previous payment was 40 cents July 2, this year.

Skenandoa Rayon Corp. declared an initial 25-cent common dividend, payable Dec. 27 to holders of record Dec. 16.

E. W. Bliss Co. declared $1.50 on 6 per cent preferred, and $1.25 on 5 per cent preferred, on account of arrears both payable Dec. 27, record Dec. 18. Similar payments were made Sept. 6.

Marshall Field & Co. declared a $1 year-end common dividend, payable Dec. 31 to holders of record Dec. 21. Also voted regular common quarterly of 10 cents, payable Jan. 31 on stock of record Jan. 15.

Mahoning Coal Railroad Co. assigned a $15 dividend on the common shares, payable Dec. 30 to holders of record Dec. 23. This brings 1940 payments to $37.50, against $32.75 in 1939.

Wheeling & Lake Erie Railway Co. voted an extra of $1.50 in addition to the regular quarterly of $1 on the common, both payable Dec. 23 to holders of record Dec. 21. This puts 1940 payments at $5.50, against $4 in 1939.

Air Reduction Co. declared the

San Diego Gains as Defense Millions Swell Population

L.A. Times 12-16-40

Estimates Say 45,530 New Civilians Expected by July 1, to Say Nothing of 16,000 in Uniform

BY ED AINSWORTH

San Diego—the first city established in California—1769.

San Diego—the "first city" of California in size—before long now!

That's the time table of the most ambitious community in the State today as it expands like a champion in a county fair pie-eating contest. So amazing has been the growth of San Diego in the last few months, with the movement apparently just getting started, that some of the city's rabid boosters are crying:

"Out of our way, San Francisco and Los Angeles! Give us a clear track. We're going to pass you both!"

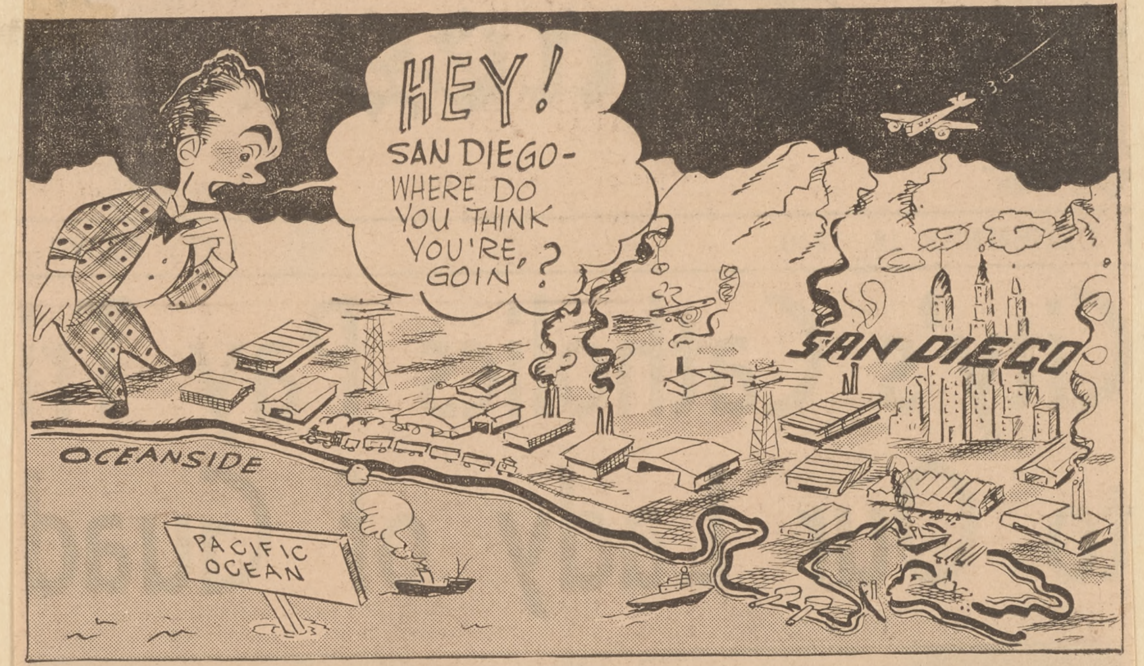
Maybe this sounds fantastic.

But San Diego has historic foundation for hoping to be the "first" city of the Golden West in more ways than one.

It got a head start on all the others. But it had a lapse. It took a nap. It drowsed in its "million-dollar sunshine." And before it woke up those two upstarts, first San Francisco and then Los Angeles, had outdistanced it.

Even so, it took a jealous saint and the State of Iowa to bring about such a result. When Father Serra and Don Gaspar de Portola established the pueblo of San Diego in 1769, Portola went on up the coast to locate Monterey Bay. But no Monterey Bay could he discover. As a result he

Turn to Page 2, Column 2



San Diego, California's 'First City,' Steps Ahead as Defense Millions Swell Population

Continued from First Page

blundered on up the coast, found San Francisco Bay. Later on, superstitious Spaniards said that St. Francis had "passed a miracle" and caused Monterey Bay to vanish temporarily so his own bay could be found.

IOWA MIGRATION

Thus, San Francisco got under way with a saintly boost.

And, of course, when Iowa moved in on Los Angeles how could San Diego help but fall behind?

For a while, though, there wasn't much difference, at that.

In 1860 San Diego with 731 population was only one-sixth the size of Los Angeles, which had 4385 inhabitants, while magnificent San Francisco had 56,802. by 1870 San Diego had grown to be almost half as large as Los Angeles—the score being 2300 to 5278, while San Francisco had mushroomed to 149,473.

picious gulls are preparing to move north — there isn't wing room any more.

As for the southern city's population: San Diego zoomed upward as noted from a paltry 147,995 in 1930 to its 202,038 in 1940, which was just the start. T. C. Macaulay, secretary-manager of the Chamber of Commerce, refuses to estimate the growth since April (when the census was taken) for fear of being considered untruthful, but refers all questions to City Planning Director Glenn Rick (who, by the way, is being stolen by a startled Los Angeles to become its planning director Jan. 1.) Rick says his charts and things show San Diego now has about 220,000 civilian population.

Consolidated Aircraft, however, is planning to add 18,000 employees by July 1, 1941; Ryan Aeronautical Co. will put on another 1000, and Solar and Rohr will increase their personnel by some 650. With their families

marines is being established near Camp Kearney. A marine rifle range of 400 acres near Torrey Pines means an outlay of $1,000,000. A Coast Artillery camp being established at Torrey Pines on about 800 acres will take care of 10,000 men. Ft. Rosecrans is having some $800,000 spent on it.

The Army in the area is spending about $4,000,000 on sites and cantonments, about double that on armament. Navy and defense housing projects in various parts of the city mean an expenditure of some $15,000,000. These will provide literally thousands of living units in duplex and quadruple home establishments.

Building permits in San Diego up to the end of November were $12,950,016, as compared with $8,241,862 for all of 1939.

County Assessor Crowell D. Eddy reported yesterday that store and warehouse buildings are being partitioned off to pro-

VOLUME 1 SAN DIEGO, CALIFORNIA, DECEMBER 12, 1940 NUMBER 9

American Aircraft Mechanic

WAGE REVIEW UNDER WAY AT CONSAIR

Again proving that wages and working conditions can be better adjusted by arbitration and discussion, with no loss of time and without interference with production, the Wage Review Board, meeting with Consolidated officials have tentatively agreed upon an increase in the starting rate for the employees in the lower wage brackets. The tentative increases agreed upon are as follows:

At time of going to press the Aircraft Mechanic was unable to secure an official verification of the following wage rates but they are believed official and if agreed upon the below increases will become effective on Friday, December 13, 1940.

Employees hired on or before

22 June 1940 ...... per hour 60c
26 July 1940 ...... per hour 58c
30 Sept. 1940 .... per hour 54c
4 Nov. 1940 .... per hour 52c
Starting wage 50c

The tentative order of departments to be reviewed will be as follows:

1. Tool Room and Wood Shop
2. Machine Shop
3. Timekeepers
4. Welding
5. Sheet Metal
6. Hull Department
7. Drop Hammer
8. Tank
9. Wing Department
10. Metal Bench
11. Final Assembly
12. Finish Paint Shop
13. Inspection
14. Maintenance
15. Janitor
16. Draw Bench
17. Heat Treat. and Spotweld.
18. Tubing
19. Experimental
20. Engineering Department
21. Production Department
22. Shipping & Receiving.

December Wage Review

Tackling the bookkeeping end of the Review first, W. J. Chudleigh and V. L. Parker, permanent members of the Wage Board, have employed a full time stenographer to assist them in making up the individual employee wage rate lists for the various Depts. prior to the actual reviewing.

It is estimated that this method of handling the book work will shorten the Review by two weeks and thus bring increases into the men's hands much earlier than was formerly experienced.

S. D. Possible Lighter-Than-Air Base, Compton Indicates on Visit Here

Trib-Sun 12-17-40

Experiments now are under way in this naval area in the use of speedy "mosquito boats" with a view toward developing them and suitable crews to augment protection of fleet and shore, while at the same time this area is among several in the United States being studied as a possible base for lighter-than-air craft.

This is the statement today of Lewis Compton, assistant secretary of the navy, who with a party, made an inspection of local naval and defense bases.

Most of the "mosquito boats" mentioned by the official now are said under remodeling here and soon will be tried out as their tactical use.

Pleased With Progress

The secretary accompanied by Mrs. Compton, Comdr. Ralph Riggs, naval aid, and Capt. Lew Atkins, naval construction engineer, his personal aid, arrived in San Diego this morning, and with local naval officials began inspection of projects in this area. The official party was met here by Rear Adm. C. A. Blakeley, commandant, 11th naval district Comdr. J. T. Mathews, (CE-C) public works department of the local district, and Lt. W. S. Hays, aid to Blakeley and T. C. Macaulay, executive secretary of the chamber of commerce.

Rosendahl on Board

Senior member of the board which is studying location of lighter-than-air bases is Capt. C. E. Rosendahl, former commander of naval dirigibles for which a mooring mast was established on Torrey Pines mesa.

Asked concerning possible development of United States bases at Cocos and Galapagos islands, he said he had no information on the subject other than that the navy department always was interested in possible base positions, especially in strategic locations. He denied having heard rumors of a trade of United States ships for base positions off the Mexican coast.

As to how long the center of fleet activities would be in the Hawaiian area, Compton stated that this activity must change to meet the strategic positions as they arose.

Disavows Alarm

He ascribed no significance to the fact that as soon as the west coast shipping strike was settled and shipping of lumber for defense projects made possible, the lumber supply was tied up by a strike.

"I do definitely view with alarm, however, anything that will tend to stop or delay any of the national defense programs," he said.

The visiting party today were to inspect Consolidated Aircraft Corp. plant and tonight will be guests in the commissioned officer's mess at the air station, at which Adm. and Mrs. Blakeley will be hosts.

Continuing their inspections tomorrow and Wednesday, they will entrain Wednesday afternoon for the return to Washington.

Turkey Money For Consair Workers' Yule

Trib-Sun 12-20-40

Maj. R. H. Fleet, president, Consolidated Aircraft Corp., today announced his company will follow its usual practice of giving each person employed prior to Dec. 15, 1940, from the president to the office boy, a $5 Christmas check to cover the cost of a holiday turkey with all trimmings. This, said Fleet, probably will create a boom market of considerable proportions for turkeys, as Consolidated's 14,000 employes will receive $70,000 in Christmas checks.

"We cannot allow the holiday season to pass without an expression of appreciation on the part of the company for the splendid cooperation it has received from employes throughout the year," said Fleet.

In addition, the company's pre-Christmas payroll disbursements the week ending Dec. 21 was $550,000.

100,000 PLANES WILL BE BUILT

Consolidated Will Build Bombers

11/8/40

Although not yet announced officially, Consolidated Aircraft of San Diego will build 2,000 4-engined B-24 bombers, which is by far the largest contract ever placed for twin-engined airplanes.

The Consolidated factory, now being expanded to double its present size, will employ 35,000 men within 6 months.

12,000 More For Britain; Many Here

11/8/40.

In connection with the decision of President Roosevelt to permit American manufacturers to build 12,000 additional airplanes for Great Britain, it became known yesterday that a large portion of this contract will go to the Glenn L. Martin Company in Baltimore.

Contracts for the balance of the bombers will go to Douglas at Santa Monica, Consolidated at San Diego and Boeing at Seattle.

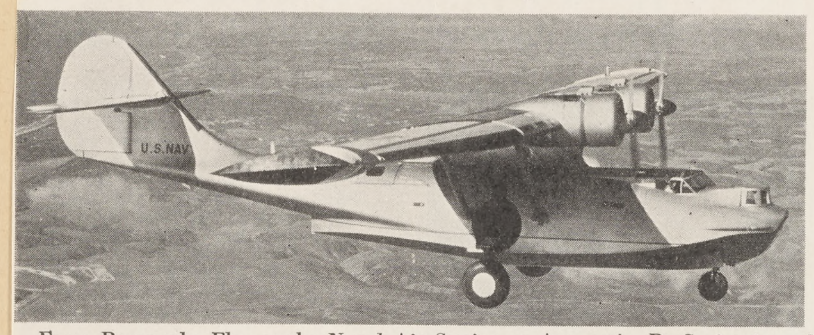
The new light bomber to be produced by the Martin company will be known as the "Baltimore."

The "Baltimore" is still a secret ship, but it is admitted it has been designed to meet the definite needs of the British, as revealed by tactical experience in the European War. Already in production at the Martin company in the meanwhile is a large order of 167-B4's — the same type of high-speed attack bomber built in quantity last year for the French.

It is under a unique form of contract that the "Baltimore" will be built for the Royal Air Force. The British Government has agreed to take all the ships of this type which Martin can produce before the end of next year. The limiting factor would be the requirements of the United States air forces.

Originally, it had been intended that the new bomber would be called the "Montreal," but Commodore Baker explained the name would have little meaning and the decision was made to change it to "Baltimore" to honor the city whence it is to come. With engineering work virtually complete on the craft, it will be placed in production shortly, according to Martin officials.

Largest Amphibian Ready for Trials



From Pensacola, Fla., to the Naval Air Station at Anacostia, D. C., in six and one-half hours, the Navy's new long-range patrol ship, the XPBY-5A now will undergo a series of performance trials which will test her qualities as the world's largest amphibian. Leaving San Diego, Cal., where the ship was built by Consolidated Aircraft Corp., the plane made a trans-continental flight in easy stages, making overnight stops at Randolph Field, Tex., and at Pensacola, arriving at Anacostia on Dec. 16.

Crew members on the flight were Lt. Carl E. Giese, pilot; Lt. Roy Jackson, co-pilot; K. L. Frye, machinist mate, first class; S. C. Dills, machinist mate, second class; J. R. Wilson, chief radioman, and G. R. Tibbs, machinist of the Consolidated corporation. American Aviation 1-1-40

Consolidated 28, Developed as Amphibian, Is Successful in Rough Water Attempts

Having undergone company tests at Consolidated Aircraft Corp., San Diego, Cal., the world's largest amphibian plane arrived at Naval Air Station, Anacostia, D. C., on Dec. 16 to begin trials under the eye of the Navy. Designated by Consolidated as the model 28-5A, basically the model 28 flying boat, the new long-range patrol plane is known to the Navy as the XPBY-5A.

The new plane is equipped with a tricycle landing gear, fully retractable. Side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. Nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered.

Powered by two Pratt & Whitney Wasps, the XPBY-5A has a span of 104 ft. and measures 65 ft. in length. Technical information and performance details are under wraps. A Consolidated statement indicated that flight characteristics of the model 28 flying boat have been unaffected by the incorporation of the landing gear. "There was found no loss of speed with the landing gear in the retracted position," the statement said.

For rough water taxiing the extended gear serves as a sea anchor and assists in control on rough open water, and in making an approach for mooring or ramp with an adverse wind. More engine power may be applied for short turns without undue acceleration, it was reported. Turns on the water are said to be achieved with far less skidding, and the danger of scraping the keel on the ramp is eliminated. There is no necessity for a beaching crew, as the ship can climb a ramp or beach under its own power, or descend in the same manner, completely controlled by the brakes. The ship also may operate from remote sand beaches without benefit of special ramps or facilities for handling.

This feature is believed to be of value in making the XPBY-5A adaptable for use in areas such as the new naval bases in Alaska and the west Indies, where another routine requirement is rough water landings and take-offs.

Side wheels are above water when the ship rises on the step in making a take-off, and automatic means have been provided to eject all water in the closed bow wheel hatch before the plane is in the air.

"In action the huge amphibian alights with a smooth absorption of its descending velocity, exhibiting no tendency to bounce or porpoise," the Consolidated statement said. "When alighting on land, the ship's tendency in a side landing is to straighten out; and the brakes may be applied to the utmost without adverse effect. This technique simply increases the load on the nose wheel," it continued.

"No special procedure is needed for take-off or landing. The wheels may be locked, elevators pulled full back and both engines given full take-off throttle without the possibility of the nose wheel rising from the ground," it added.

L.A. Times 12/19/40

HUGE AIRCRAFT PLANT TO RISE

SAN DIEGO, Dec. 18. (Exclusive)—The Federal government will erect a $14,446,929.27 aircraft parts plant here, to be leased by Consolidated Aircraft Corp. from the Defense Plant Corporation, an R.F.C. subsidiary ,company officials announced today.

In addition to this project, the Navy Department also informed Consolidated authorities that another agreement had been reached to expend $3,090,000 for improvements at the present factory.

Location of the huge new plant addition in San Diego has put at rest recurring rumors of Consolidated's establishment of a branch plant in the Midwest or South, caused by visits here of delegations from Tulsa, Dallas, Houston and Ft. Worth.

The new parts factory will be situated only a mile from the present plant.

ORIGINS

OF LEADING COMPANIES

National Aircraft Counsellor 11/8/40

NO. 5

CONSOLIDATED AIRCRAFT

By DEREK WHITE

Just 40 minutes by air south of Los Angeles, on San Diego Bay, is the plant of Consolidated Aircraft Corporation, builders of giant Naval Patrol flying boats and four-engined Bombers. The company is now engaged in an expansion to end all expansions, in expectation of additional orders which may dwarf their present backlog of more than $225,000,000.

Less than eight months ago, plant area was 447,332 square feet. This was increased by 87 per cent, which brought total floor space to 843,332 square feet. The company recently announced plans to double existing plant size which means that Consolidated will soon have a factory which covers nearly 2,000,000 square feet.

STARTS WITH $25,000

Consolidated Aircraft has been built from an initial capital of only $25,000, mainly through the efforts of Major Reuben H. Fleet, president. The company, largest builders of commercial and Naval flying boats in the world, was organized in 1923 in East Greenwich, Conn., and first operations were carried on in rented space only 100 ft. by 150 ft. in size.

First order ever received was for 50 two-place tandem trainers. Quarters then occupied were too small to permit construction of these ships, so the company moved to Buffalo, N. Y., where 28,000 square feet of space was rented in an empty factory building which contained plenty of additional room for expansion. As the company grew, additional space was added, until by February, 1934, plant area covered 197,298 square feet.

During first years of operations the company devoted much time to the development of large flying boats, one of these early types being the Commodore, the prototype of which was the first monoplane flying boat in the world. Fourteen Commodores were built, of which 13 are still flying, one having been burned in a hangar fire. These first boats were built so strongly that one, having occasion to make a forced landing on the island of Cuba, landed safely without injuring a passenger, and was easily repaired.

NAVY MODEL DEVELOPED

From the Commodore series was evolved the Navy model P2Y. By 1935 the company's principal business was the building of large flying boats for the U. S. Navy. Testing of these boats at Buffalo was almost impossible during six months of the year, because of ice on Lake Erie, and it was for this reason that Consolidated moved to San Diego. This decision was one of the most important ones made by company executives.

Southern California weather conditions made year-round testing possible, and at the same time the move gave the company the opportunity to build a modern plant to fit their business, rather than continue to fit their business to existing buildings which prevented economical and fast production.

The first San Diego factory had floor area of 246,841 square feet, and was the newest and most modern airplane plant in existence. Manufacturing operations were started in San Diego in 1936, and during that year the Consolidated company built and sold $4,085,978 worth of airplanes, as compared to sales of $593,000 just ten years before.

In December of last year the company received a Government contract for $20,016,099 worth of airplanes, a single order larger than total business done by the corporation during the first 12 years of its existence.

MANY RECORD FLIGHTS

Consolidated flying boats have made many extraordinary flights, but to company officials and to the U. S. Navy, they appear on the records as "routine." Among the more spectacular trips have been a number of transcontinental flights, the first of which was by Richard Archbold, from San Diego to New York in a flying boat, 2700 miles in 17 hours, 3 minutes. Archbold made two later transcontinental flights in Consolidated boats, both being from San Diego to Miami, Florida, 2300 miles non-stop. Other sensational overland flights were made by Commander Andrew Crinkley, who flew a four-engined Consolidated Patrol Boat from San Diego, via Salt Lake City, to Anacostia Naval Air Station, in 13 hours, then flew back to San Diego via Texas.

Many routine Naval flights deserve mention, including a formation flight of 48 boats to Pearl Harbor, Hawaii, 2553 miles in 25 hours; another formation flight of 15 boats to Pearl Harbor in the record time of 16 hours; flights totaling 19,000 miles over the Arctic regions, and a 24,130 mile flight in a twin-engined flying boat from New Guinea to San Diego, by way of Australia, the Indian Ocean, Africa, across the Atlantic, and overland to San Diego.

MILLIONS OF MILES

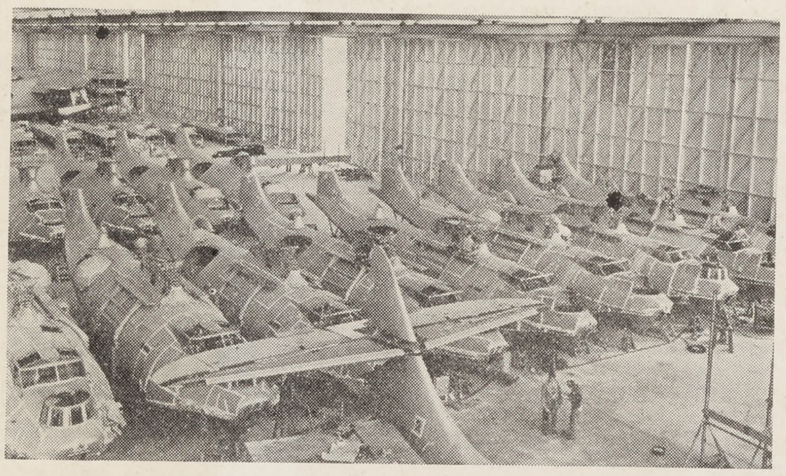
Consolidated flying boats can truthfully be called "the eyes of the Navy" as those now based and in use at various Atlantic and Pacific stations control 60,000,000 square miles of land and sea, an area equal to more than one-third the surface of the earth. These Naval Patrol boats have flight ranges of 4000 miles, more than sufficient for round-trip, nonstop, flights across the Atlantic. Twin-engined boats have wing spans of 104 feet and weigh 15 tons when fully loaded. Top speed is 199 miles per hour.

The latest Consolidated Naval flying boat, now in quantity production, is a four-engined ship, specifications of which have not been released by the U. S. Navy. A new commercial model recently tested at San Diego, but not yet in production, was the first airplane of any kind, land or sea, to be fitted with the new 18 cylinder, 2000 h. p. Wright Cyclone engines. This two-engine ship has a wing span of only 110 feet, but weighs 50,000 pounds loaded. The hull contains two complete decks with accommodations for 52 passengers for day operations, or sleeping accommodations for 28 persons. Speed is approximately 250 miles per hour.

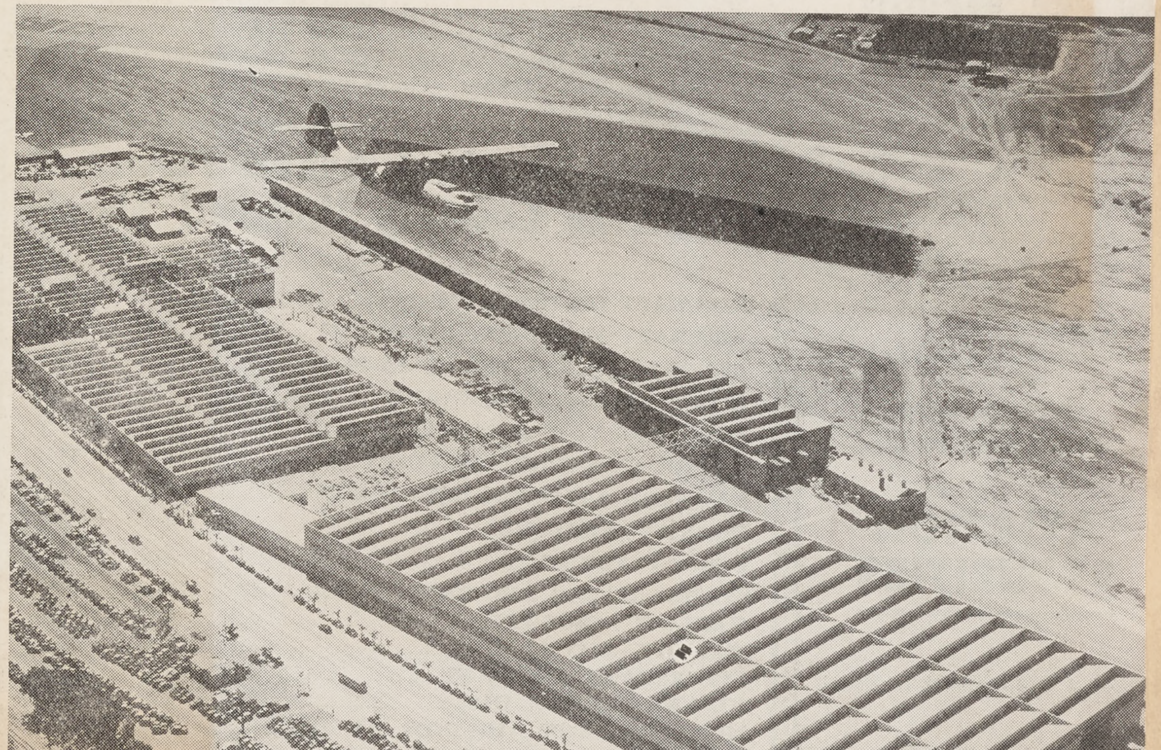
NEW BOMBER

A new U. S. Air Corps Bombardment airplane has recently been put into production, marking Consolidated's first entry into the four-engined bomber field. This model, known as the XB-24, has a wing span of about 125 feet, a gross weight of 40,000 pounds, and a speed of nearly 400 miles per hour with fuel for 300 miles and 8000 pounds of bombs.

Present Consolidated backlog exceeds $225,000,000, and more than 12,000 men are now employed. Major Fleet has announced that before present and expected contracts are completed, a total of 35,000 employees will be on the payroll.



Above is shown a corner of the Consolidated assembly floor with 15 PBY long range patrol boats nearing completion. In addition to these models, the company is building a large quantity of 4-engined bombers and other models of flying boats.



This is an air view picture of the Consolidated plant at San Diego where more than 225 million dollars' worth of naval and military airplanes are now under construction. The present plant shown above will shortly be doubled in size, and within 6 months, a total of 35,000 employees will be on the payroll.

THE SAN DIEGO UNION: WEDNESDAY MORNING, DEC. 4, 1940

British Financial Resources Topic Of Army, Navy, Defense Leaders

WASHINGTON, Dec. 3 (A.P.)—The whole question of British financial resources and ability to buy war materials in this country was reported authoritatively to have been the cause and chief topic of a meeting today of nine of the most important government officials.

According to this source, it was not a meeting to decide whether the United States should lend money to Great Britain, but more to take an accounting of the situation resulting from British contracts, now aggregating more than $2,500,000,000 and expected to rise to $4,000,000,000 in the next year. Another source, who seemed to have the same idea, said he understood all British purchases, present and prospective, were tabulated and analyzed.

CONTROVERSY RESULTS

It was, one indicated, the aftermath of the controversy stirred up by the recent statement of Lord Lothian, British ambassador, that Britain was running out of the means of buying American products and needed financial as well as material aid.

The reported nature of the meeting also seemed to fit the news that came out here Saturday that the British soon would send an official mission to this country to survey the financing problem. A possible explanation of today's gathering was that the United States was setting up a committee to join this British mission in the study—a study which is expected to develop vital information of the very nature for which a number of congressmen are demanding investigations.

ATTENDANCE SIGNIFICANT

The only certain thing about today's meeting was the attendance, which alone was significant because nearly every time a similar gathering of so many high officials has occurred in recent months, some important action in the "aid-to-Britain" policy has been announced very soon afterwards. Such meetings preceded the trade of navy destroyers for Atlantic bases, the announcement that Britain would be allowed to order 12,000 more warplanes, and the release of four-motored bombers to England.

"These people don't get together to talk about peanuts," is the way one conferee put it.

KNUDSEN ATTENDS

Attending were Henry Morgenthau jr., secretary of the treasury; Henry L. Stimson, secretary of war; Frank Knox, secretary of the navy; Jesse H. Jones, secretary of commerce and federal loan administrator; Sumner Welles, under-secretary of state; James V. Forrestal, under-secretary of the navy; Gen. George C. Marshall, chief of staff of the army; William S. Knudsen, production member of the national defense commission; Robert P. Patterson, assistant secretary of war, and Herbert Feis, economic adviser of the state department.

The Lothian controversy, it was learned, has created a great demand among officials, congressmen, manufacturers and bankers to know just what the British purchasing situation is now.

Manufacturers, particularly of planes, it was pointed out, want to know whether the millions of dollars they have spent to work on British orders will be repaid, or whether it is financially safe to accept more orders.

3000 Planes Received

NEW YORK, Dec. 3 (I.N.S.)—England has received directly or indirectly more than 3000 American military planes and is now getting between 75 and 90 percent of the output of major American plane and engine factories engaged in war and defense manufacture, it was learned from authoritative sources tonight.

The majority of the American planes already in England are trainers or suited for only limited war duties, because of the pre-war preoccupation of American factories with commercial plane construction.

EQUAL TO EUROPE CRAFT

Some of the new types now beginning to roll slowly from the assembly lines are reported to be equal to if not better than anything yet flown in the European battle skies.

Typical of these new planes are the Boeing B-17S, the Consolidated B-24S and the Martin B-26S, all giant bombers capable of high speed and with sufficient armament to defend themselves if intercepted even when unaccompanied by fighter escorts.

SEEKS MOSTLY BOMBERS

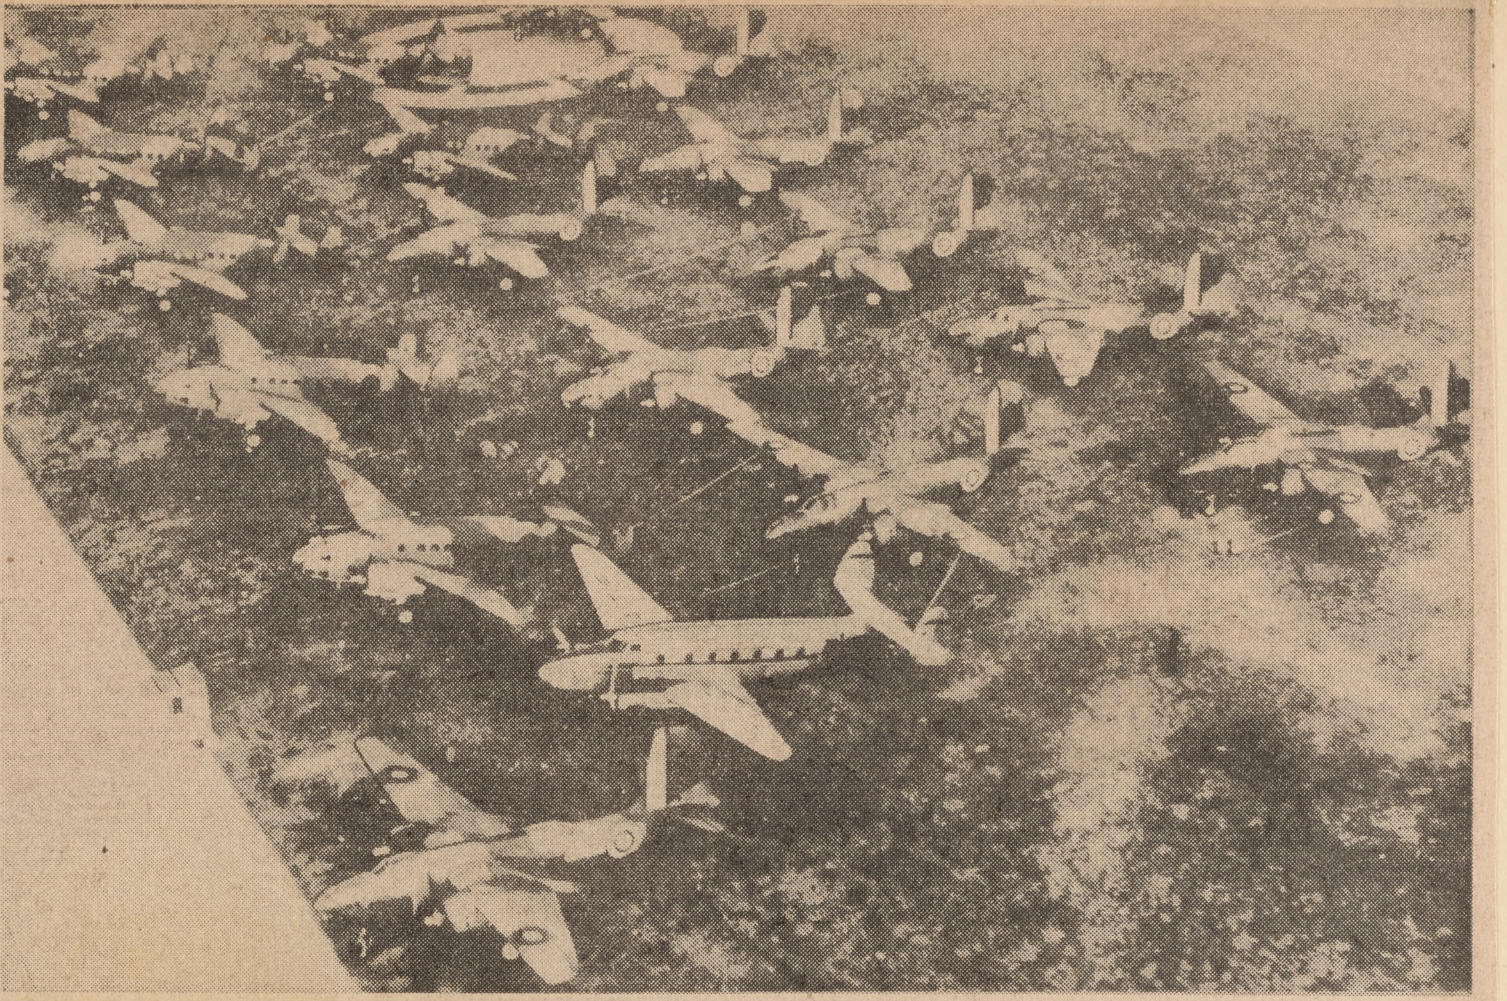
Officials in the aviation industry interpret the present trend to indicate that England will continue to place prime emphasis on her own Hurricanes and Spitfires for fighter planes, and to depend more and more on American factories for her long-range bombers.

Edgar N. Gott, vice president of the Consolidated Aircraft Corp. at San Diego, Calif., reported that work in that factory was proceeding "according to schedule." The schedule, as announced Nov. 20 by Gen. George Marshall, army chief of staff, was for delivery to England of three Consolidated B-24S, four-engined bombers comparable in size and purpose to the flying fortresses, in November, three in December, and 20 more by March 1.

26,000 Craft on Order

LONDON, Dec. 3 (I.N.S.)—Of 26,000 American warplanes ordered by the British, between 1500 and 2000 have reached the combat area and approximately another 1000 have been distributed to empire stations it was learned tonight.

CALIFORNIA WARBIRDS READY FOR SHIPMENT TO BRITAIN



Speed-up in production of U. S. warplanes for Britain brought this array of bombers to Floyd Bennett field, New York, yesterday. Planes were flown from California and will be dismantled for shipment. Single-tail planes are Douglas DB7A bombers; two-tail ships are Lockheed-Hudsons. Uncamouflaged plane in foreground is to go into commercial airline service in South America. (Associated Press wirephoto.)

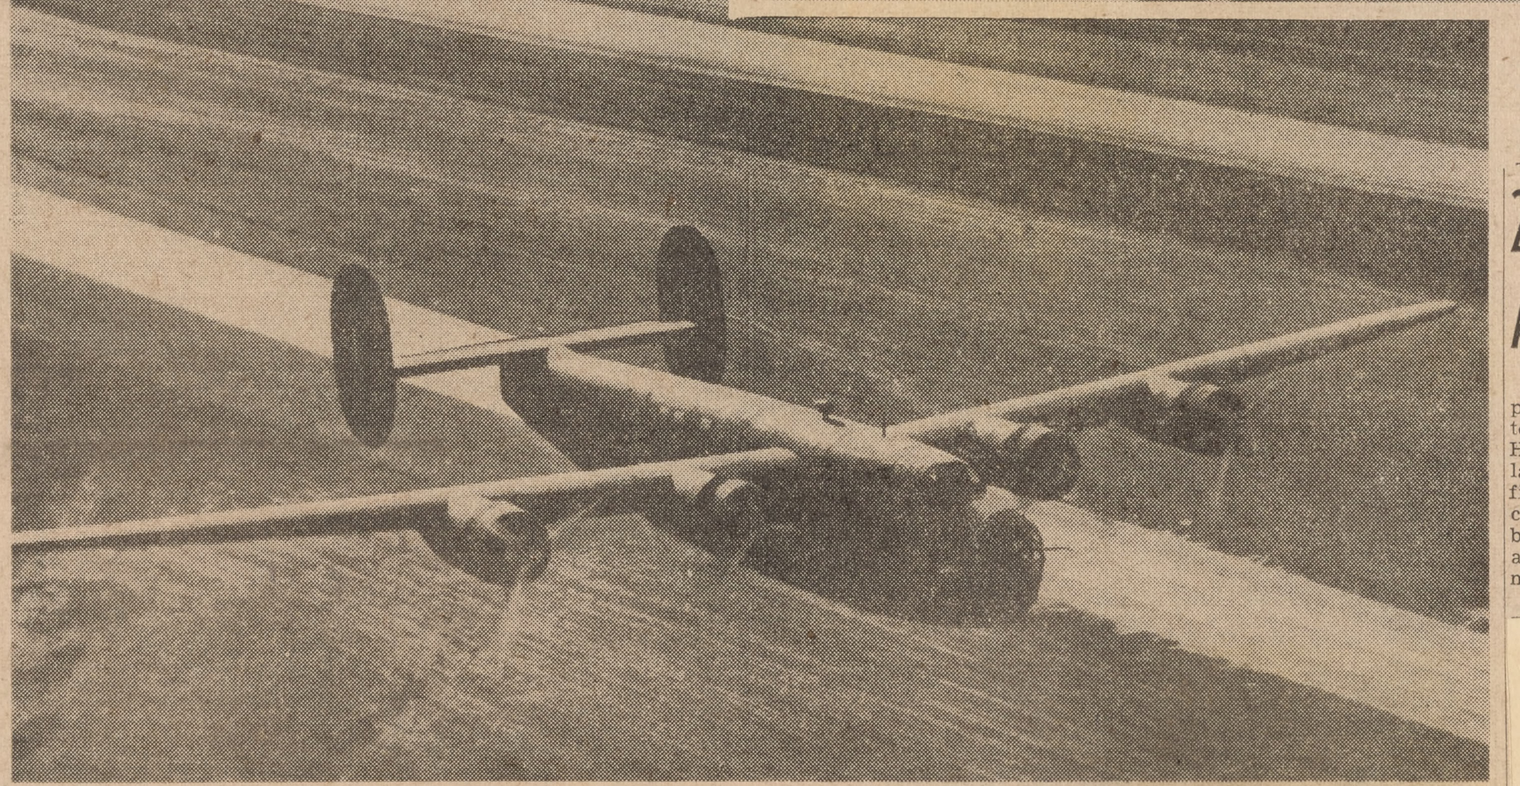
2ND CONSAIR BOMBER ARRIVES AT FT. WORTH ON HALIFAX HOP

Second of the Consolidated-built patrol bombers flown for delivery to the British Royal Air force at Halifax, Nova Scotia, arrived early last night at Ft. Worth, Tex., its first stop. It was refueled and anchored for the night. It left Lindbergh field at 5:10 a.m. yesterday and is expected to take off this morning for Port Washington, N. Y.

Douglas Kelley, San Diegan who assisted in ferrying the first bomber across the continent last week, was at the controls leaving San Diego. His co-pilot was Ed Greer, a veteran flier of Tampa, Fla.

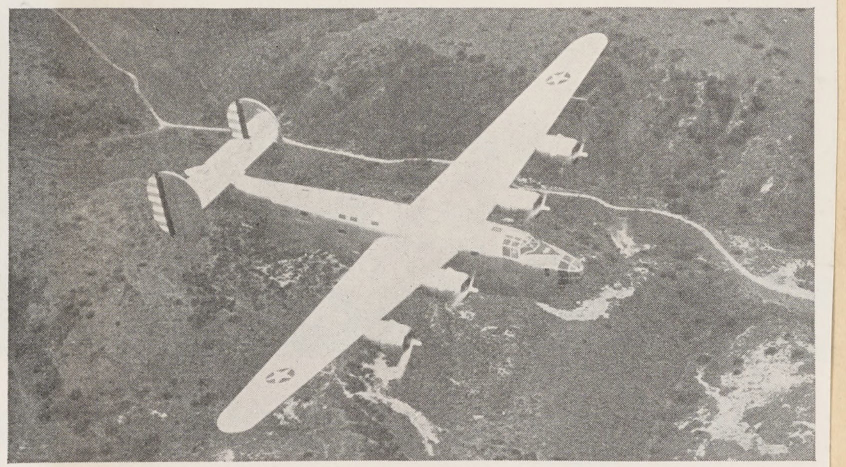
Lt. W. L. Cleveland, naval reserve airman, who was chief pilot of the first bomber flight, is reported en route here from Halifax to ferry the third plane across the continent.

Consolidated authorities said the R.A.F. bombers will be delivered at the rate of one every four days.



A Consolidated-built bomber for Britain makes a practice flight here as a preliminary to its overseas jaunt. It is one of the 26 B-24's released by the army to England recently. With its speed of more than 300 miles an hour and big fuel capacity it can carry a full load of bombs from England to almost any place in Europe and fly back again. Its speed and armament give protection against attack.

Consair's Bomber Released for Export



Above is one of the first flight pictures of the new Consolidated model 32 four-engined land bomber which is undergoing tests at San Diego, Cal. Designated by the Army as the XB-24, the plane marks Consolidated Aircraft Corp.'s re-entry into the landplane manufacturing field. The bomber has been released for export by the State Dept. and has been tagged the "Liberator."

Model 32 is a full cantilever, all-metal plane, powered by four Pratt & Whitney 14-cylinder twin-row aircooled engines rated at 1,200 hp. each. Propellers are Hamilton Standards, 12 feet in diameter. Fowler flaps extend inboard of the ailerons in the wing of high aspect ratio, with engine nacelles mounted flush with the upper surface of the center section.

Approximate gross weight of the plane is 40.000 lbs.; wing span, 110 ft.; length of fuselage, 64 ft.; over-all height, 19 feet. Tactical requirements are for a crew of from six to nine.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. All-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. Landing gear is of the tricycle type with single wheel forward which retracts into the fuselage. Main landing wheels retract into wing wells.

While performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 mph., a range of approximately 3,000 miles and a bomb carrying capacity of approximately four tons."

KUKULCAN 11/15/39

Formación de Aviones Bellanca, Corsarios y Consolidada, en el Campo Militar de Balbuena, el día del vuelo de un segundo Bellanca, 13 de octubre de 1939.

Wall St. Journal 12-6-40

Consolidated Aircraft Corp.

Additional details on delivery of 26 Consolidated Aircraft model 32 four-engined bombers for the British are made available here by company officials, who said that all deliveries can be made before March 1 next. The original announcement that the bombers would be released by the United States Army to the British was made from Washington two weeks ago.

These large bombers are similar to the Consolidated prototype model 32, first flown late in 1939, which marked the company's return to the landplane field. The original model was given a speed of over 300 miles an hour, a range of approximately 3,000 miles and bomb-carrying capacity of four tons.

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area, and returning without stop; or they can operate by shuttling between England and the British bases. Speed, defense and attack armament give them adequate protection from all angles, it is claimed.

PLAN 3000 NEW HOMES FOR MESA; CONSOLIDATED DOUBLING PLANT

Hillcrest Star-News 12-13-40

LOCAL FACTORY WILL EMPLOY 3,000 MEN WHEN BUILDINGS ARE FINISHED NEXT JUNE

From all sectors of San Diego's "prosperity front" news announcements came tumbling this week to heighten the constantly-growing pile of evidence that good times are here — and not only here but in a degree that even the most optimistic never dared dream as short a time as a year ago. Aircraft factories continued their dizzy pace of preparation to turn out the monsters of the sky for both war and peacetime uses, the list of national defense projects under way continued to swell, and retailers watched with satisfaction as sales showed sharp increases over the corresponding period of a year ago.

"Finest Plant" in World

San Diego was assured probably the most modern and efficient aircraft factory in existence this week when Consolidated Aircraft Corp. announced a seven million dollar construction program which will double its size and boost employment to a total of 30,000.

Eight new buildings will be erected along Pacific highway, and with the general contract already awarded to B. O. Larsen, ground is to be broken at an early date. The new structures are scheduled for completion next June.

Principal units will compose a huge parts plant, and a three-story drop hammer building which will house the largest battery of drop hammers and hydraulic presses on the Pacific Coast.

Consolidated, which now has a backlog of orders in excess of $325,000,000, including the building of bombers for the army, navy and Britain, has expanded its plant 1000 per cent since 1935.

The new plant has been designed to fit into the line production program of Consolidated flying boats and large land bombers, company officials said. Latest designs, especially engineered for modern aircraft manufacturing, have been employed.

Housing Project Huge

Government plans for a housing project on Kearney mesa across the valley from Hillcrest and Mission Hills contemplate construction of 2000 permanent dwellings, 1000 temporary dwellings and barracks to accommodate 750 unmarried men.

Occupants of the proposed buildings will be principally workers in local aircraft factories, it was learned.

The project has been a favorite topic of conversation and conjecture in this part of the city, as well it might, for the Hillcrest-Mission Hills business centers are nearer by about two miles to the housing project site than any other business section of the city, and a tremendous boost in local retail business is in sight when the construction is carried out.

The proposed temporary dwellings will probably be of the prefabricated type, so that at a later date they can be dismantled and moved as necessary, a city official reported.

The city has written the public building administration architect in Washington asking an opportunity of reviewing the projected construction plans. Since the development is within the city limits, the city is interested in plans for street design, lot size and arrangement, and gradients of streets.

City officials said they had no authoritative information on the project, but reported they understood unofficially that the government is negotiating for land owned by Dan Danciger on the north rim of Mission valley.

This bears out information which apepared exclusively in The Star-News two weeks ago that Danciger had gone to Washington in connection with this project.

It is believed on the basis of reports received here that the new community for defense housing centers on the intersection of Sixth ave. extension and Linda Vista rd., and that the whole community will cover an area about two miles in length and averaging one mile wide.

Within a week after the signing of the contract, power equipment is expected to be on the job to clear the land. Temporary houses for workers will be erected, followed by field offices and storage facilities.

S. D. GETS $17,536,963 FOR WAR PLANTS

Ridicules Fears of Rumored 'Let-Down'

Predicting a bright business future for San Diego, Philip Norton, defense housing expert, scrutinizes plans for the wide expansion of military home units here.

'TRADE BOOM SURE AFTER WAR; HOUSING NEEDED,' CITY TOLD

Residents of San Diego and other Pacific coast communities which are expanding rapidly because of defense activities need have no fear of the rumored "let-down" which many predict will follow the present emergency. This is the declaration of Philip Norton, special consultant for the defense housing coordinator for the western portion of the United States, who is in San Diego to confer with officials of local aircraft firms, bankers, business men and members of defense councils.

"With termination of the present emergency," he said, it is expected that China, victorious in her war with Japan, will open to the United States and the west coast in particular, one of the world's greatest markets, in her work of restoration.

"Heretofore our main business has been with Japan which in turn handled the trade of China. In the future, there is no reason why we cannot trade directly with the countries of the orient, eliminating the 'middle man' and at the same time obtain much of that trade which has been going to European nations.

Huge Stores in China

"China even now has huge stores of tung oil and other oils which are needed badly by this country and our exchange trading will be of no little magnitude."

Speaking of the local housing situation in regard to defense activities, Norton said: "One of the pressing needs in San Diego is a central registration office where householders in all parts of the city may register available rooms for rent in their homes.

"This does not apply only to rooming and lodging houses but to the so-called better homes. Renters and owners in all parts of the city should make available spare rooms to defense workers and their families as a practical and patriotic duty. The rapid influx of skilled and unskilled workers makes housing a problem and one which should be given immediate attention."

Norton stated that plans for such a registration bureau would be formulated here in the near future, probably by the local defense council, though no moves have been made yet in that direction.

"I have heard rumors that there will be up to 6000 or more housing units built by the government and this is not so," Norton said. "The government is building 3000 family units on Kearny mesa for civilian defense workers. There also will be 750 dormitory units for single men.

No Other Units Planned

"In addition the navy is building 1200 family units for naval personnel. These are being built near the Destroyer base and Naval Training station.

"Reports of other vast projects financed by the government for housing purposes are harmful in that they make private capital, on which the government is depending for a lot of new housing, fearful to invest. Also exaggerated reports of the number that will be brought here by defense industries are harmful. They tend, for one thing, to bring many more here than are needed."

The exaggerated reports on housing projects may have come, Norton said, by adding the number given in various surveys that have been made of local requirements. The surveys now are being coordinated to prevent such an erroneous impression from again being given.

"It seems that almost every one who has even a bicycle for transportation has made a housing survey," Norton commented smilingly.

Constructed To Sell

The housing consultant said he was recommending great care in construction of houses built by the government.

"I am urging that the future use of the houses be considered," he said. "After the present emergency the government will want to get out of the housing business and will no doubt try to sell the buildings as soon as possible. People who come to southern California and San Diego and buy houses expect them to have certain refinements. These must be put into the housing units if the government expects to sell them. A temporary barrack-type house will find no market. They'll have to be houses that people will want to own."

Charles F. Palmer, defense housing coordinator, may visit southern California and San Diego early next year to inspect progress of housing projects, Norton added.

CONSAIR WORKERS ADD THEIR BIT

Giving 45 Baskets; Christmas Fund Growing

It looked for awhile as if there wouldn't be enough baskets to go around. But . . .

Consolidated Aircraft sheet metal department workers had a benefit dance. They decided to devote the proceeds to the Christmas Basket Fund. So they're going to make up 45 baskets and deliver them personally to worthy families whose names will be provided by Al Fern, Basket Fund chairman.

A man phoned the city editor. He inquired carefully about all details of operation of the fund. "All right," he said, "I shall send in a check for $25. Please don't mention my name. Just call me 'Well Wisher.' "

The Speechmistress' club decided at its last meeting to do something to help make Christmas happier for someone. They took up a collection. There was $8 in dollars, quarters, dime and nickels. They turned it over to the Christmas Basket Fund.

Yes, more contributions of food and money can be used by the fund, sponsored annually by The Tribune-Sun and Fighting Bob post, American Legion, to provide Christmas dinners for men, women and children in want. There are many still in need. So you still can help by sending or bringing contributions to City Editor, The Tribune-Sun, Second ave. and Broadway, or letting him know if you would like offers of foodstuffs picked up at your home. Fighting Bob members will see that the baskets go to genuinely worthy families.

But the outlook for a happy Christmas for those who might otherwise be actually hungry is much better today. Here's the status of the fund:

Consair Sheet Metal Dept.	45 Baskets
Previously Contributed	$78.42
Well Wisher	25.00
Speechmistress club	8.00
Anonymous	2.00
W. L. B.	1.00

"We Three"	3.00
Total......	45 baskets plus $123.42

Union 12-19-40

U. S. to Finance $17,000,000 Consair Addition

Federal financing of $17,536,973.96 in an expansion program of Consolidated Aircraft Corp. was announced by the navy department at Washington yesterday.

Of this total $14,446,929.27 will be spent by the Defense Plant Corp., a Reconstruction Finance Corp. auxiliary, to finance Consair's big new parts factory near Old Town. This plant, now under construction, is approximately a mile and a half north of the company's Lindbergh field factory.

Another $3,090,044.99 will be spent by the navy for improvements at the Lindbergh field plant.

8 NEW UNITS PLANNED

Announcement of plans for the new parts factory was made recently, Edgar N. Gott, Consair vice president, reported.

Eight new units will be erected to house the parts unit, Gott said. Principal buildings will be three huge factory structures and a three-story drop-hammer building. Contract of $6,500,000 for construction of the plant has been awarded to B. O. Larsen, contractor.

EQUIPMENT INCLUDED

The rest of the Defense Plant Corp. money will be used in preparing the site, driving piles for the foundation, constructing approaches and equipping the new plant, which Gott said would be "a highly specialized production unit devoted to the manufacture of component parts and assemblies for wing and tail surface construction, with completely independent facilities for all operations requisite to their manufacture."

Plant to Double Bomber Capacity

New Cons. Aircraft Unit Due Next June

By the United Press.

SAN DIEGO, Cal., Dec. 9.—A $7,000,000 plant which will be erected here by the Consolidated Aircraft Corp. will virtually double the company's facilities to produce long range bombers, it was announced today.

The new plant "will be a highly specialized production unit devoted to manufacture of component parts and assemblies for wings and tail surface construction," a company announcement said.

The largest battery of drop hammers and hydraulic presses under one roof on the Pacific coast will be installed. The plant will be erected on a 52-acre site about a mile north of the present factory. There will be eight buildings, of a total roof area of 1,553,000 square feet.

By next June the new unit will be in operation, and Consolidated's personnel will be boosted from 14,000 to 30,000 to staff it.

Consolidated has a $323,000,000 backlog of orders for huge flying boats being built for the Navy and large bombers for the Army Air Corps and Great Britain.

---

8 Big Units In Separate Parts Factory

More than $17,000,000 will be spent for further expansion and improvement of the Consolidated Aircraft Corp. plant, under agreements announced today by the navy department, The Associated Press reports from Washington, D. C.

Of the total, $14,446,929.27 will be expended by the Defense Plant Corp., an RFC subsidiary, for constructing and equipping a huge parts factory along the east side of Pacific highway, 1½ miles north of the present plant. Both contracts total $17,536,963.

Navy to Spend $3,090,044

Another $3,090,044.69 will be spent by the navy department for improvements at the present factory, Edgar N. Gott, Consolidated vice president, revealed.

Eight new units will be erected to house the parts unit, Gott said. Principal buildings will be three huge factory structures and a three-story drop-hammer building. Contract of $6,500,000 for construction of the plant has been awarded to B. O. Larsen, contractor.

The structures will contain a covered manufacturing area of 1,553,000 square feet.

Equipment Included

The rest of the Defense Plant Corp. money will be used in preparing the site, driving piles for the foundation, constructing approaches and equipping the new plant, which Gott said would be "a highly specialized production unit devoted to the manufacture of component parts and assemblies for wing and tail surface construction, with completely independent facilities for all operations requisite to their manufacture."

Gott said the combined Consolidated payroll was expected to soar to 30,000 when the new division is placed in operation. The firm has a backlog of national defense orders and order for warplanes for Britain totaling in excess of $325,000,000.

Bomber Assembly Plant Sites Chosen

WASHINGTON, Dec. 21. (U.P.) The War Department today announced that Tulsa, Okla., has been chosen as a site for a heavy-bomber assembly plant to be operated by Consolidated Aircraft Corp., San Diego.

The plant is one of four which will assemble bomber parts to be manufactured by the automotive industry.

The department selected Omaha, Neb., as the site for a medium-bomber assembly plant to be operated by Glenn L. Martin Co., Baltimore, Md., and a similar establishment at Kansas City, Kan., to be operated by North American Aviation Corp., Inglewood, Cal.

Aircraft Industry Prepares

Consolidated Achieves "Line" Production On Giant Planes; Floor Space Increased

Aircraft manufacturers currently are engaged in the most spectacular program of expansion ever undertaken in the industrial history of this nation.

To obtain a first hand picture of this program—the progress, triumphs, and troubles—The Wall Street Journal's aviation editor, Gaston E. Marque, currently is making a survey of vital units in the industry. He is inspecting plants, interviewing top executives, not only of plane and engine manufacturers, but of leading supplies of parts, accessories and instruments.

His findings are being reported in a series of articles, of which the following is the sixth.

By Gaston E. Marque

SAN DIEGO, Calif.—This is the home of the giants of the air.

In its immense plant adjacent to Lindbergh Field on San Diego Bay, Consolidated Aircraft Corp. is turning out huge flying boats and landplanes weighing from 27,000 to 65,000 pounds and costing upward of $200,000 each.

Consolidated always has specialized in building large airplanes. The company claims the distinction of having built, since its inception in 1923, four times as many ships with a wing span of 100 feet or more as all other United States aircraft manufacturers combined.

A tour through its plant impresses on the visitor the fact that the company deals in great size. Huge mechanical and hydraulic presses, including one of 4,500 tons, large hydraulic drop hammers and hulls for the twin-engined PBY patrol bomber lined up 50 strong on the final assembly line, all convey the idea of great size.

And while the company is turning out only large airplanes it appears to have made about as much progress toward attaining line production as almost any other unit in the industry. The appearance of confusion in so many of the aircraft plants today, resulting from the constant rearrangement going on as new facilities are added in the course of preparing for production in larger volume than ever before, seems to be lacking in Consolidated's plant.

One reason for that probably is the fact that while most companies are just getting into production on entirely new models Consolidated is turning out an airplane, the PBY, which is much similar to that it has been manufacturing for several years. Furthermore, the climate in San Diego is such that the company can do a substantial part of its final assembly work outdoors the year around. Consequently when its ships reach the cumbersome stage they can be moved out to paved areas alongside the plant where big parts are fitted and the finishing touches put on the interior.

Consolidated has a further advantage in that its plant is relatively new, the first unit built only five years ago. As a result its original plant incorporated some of the more modern ideas in arrangement and was so designed as to allow orderly expansion.

When Consolidated transferred its activities to this city from Buffalo, N. Y., in 1935 it had about $6,000,000 of business on its books. It started operations with some 300 employes in a plant containing roundly 200,000 square feet of floor space. Today the company has an order backlog of approximately $320,000,000 and by February 1 next year expects to have roughly 1,500,000 square feet of covered floor area, plus a substantial paved but uncovered area suitable for final assembly work, and between 15,000 and 16,000 employes. This, however, will not complete Consolidated's expansion program.

The company has just announced a $7,000,000 addition which will approximately double its present floor area. So far Consolidated has financed its own expansion, having previously spent or committed itself to spend this year approximately $6,000,000 for enlargement of manufacturing facilities. The latest addition, however, it is understood will be financed by the Government and leased by the company.

The new addition, according to present plans, will be devoted to the manufacture of parts and minor assemblies with existing facilities turned almost entirely to final assembly work. This does not mean, however, that Consolidated is not planning to sub-contract some of its work. It is already doing considerable sub-contracting and plans to do more as it swings into increased production on its present orders.

Although Consolidated has greatly enlarged its plant this year and increased the number on its pay roll from about 3,200 on January 1, to almost 14,000 at present, its deliveries for 1940 probably will show relatively little improvement over last year when its shipments aggregated a little more than $3,600,000. This because, through most of the year, the company has been engaged principally in tooling up for production in increased volume and in turning out parts and sub-assemblies. Furthermore its deliveries have been held up somewhat by the failure of at least one sub-contractor to make deliveries on schedule and the inability to get engines in numbers required. As a result Consolidated today has an estimated $25,000,000 worth of parts and planes in various stages of production which should begin flowing off the final assembly line in steadily increasing numbers from now out.

On the basis of the present schedule deliveries from existing facilities, against contracts now on the books, should attain their peak around March or April. The latest addition should be completed by about June 1 and reach its peak employment of roughly 12,000 by November of next year.

Consolidated currently is working two ten-hour shifts five days a week. Like most other manufacturers it could undoubtedly enlarge its output by either working an additional day or adding another shift. This, however, has not proved feasible as yet as production of the airframe manufacturers naturally must be geared to that of their suppliers and sub-contractors, as well as that of the engine producers.

At this time Consolidated is in production on three models but actually is making deliveries in any quantity on only one type. It is manufacturing a twin-engined flying boat for the Navy and the British, a four-engined flying boat, the PB2Y, for the Navy, and a four-engined land bomber, the model 32 or B-24, for the Army and British. This bomber, the prototype of which was first flown in 1939, marks Consolidated's return to the landplane field. It is a high-wing ship, with a tri-cycle landing gear, which, according to available information, has a speed of over 300 miles per hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

Consolidated's $320,000,000 backlog which, incidentally, is equivalent to more than five times its aggregate deliveries for the past 17 years, includes about $80,000,000 of foreign business. Approximately $100,000,000 of the total was obtained on cost plus fixed fee contracts while the balance was taken on a fixed price basis.

No estimate of probable earnings results for 1940 can be made at this time because actual deliveries this month, which cannot be forecast accurately as yet, will have an important bearing on the final showing. Last year Consolidated earned $1,104,327, equal after preferred dividends, to $1.79 a share on the common. Indications are the excess profits tax will be quite burdensome to the company. Whether it will choose the average earnings or return on invested capital method for determining its excess profits tax exemption is not quite clear as yet as its credit under either bases would be approximately the same or roundly $850,000.

Union 12/1940

200 Children To Get Present From Shoe Fund

THE UNION SHOE FUND

Previously reported	$587.32
Consolidated Employes	70.00
Old Timer	5.75
Glass Cashbox	20.30
World War Veteran	5.00
Friend	7.00
W. H. M.	3.00
Satella J. Penman	10.00
Louise S. Wilson	10.00
Nattie B. Roe	5.00
Kate C. Hale	5.00
Mabel A. Vickers	5.00
Friend	1.00
Total	$734.37

The Union Shoe Fund's Christmas gift to 200 needy school children will be a pair of new shoes. The first 50 of the 200 will be fitted Saturday morning at the Universal Boot shop, 1154 Fifth ave., where all repairing of cast off shoes is done at cost.

After Consolidated Aircraft Corp. employes collected $70 yesterday, the Shoe Fund manager decided on 200 pairs as the Christmas quota.

MAY RAISE 'ANTE'

Another group of Consolidated workers intimated yesterday that they might "raise the ante of $70. All of which goes to show that the Christmas spirit often works wonders, especially when a child, cold and wet feet and sickness are involved.

"We are getting ready to fill a lot of Christmas baskets Saturday," said J. W. Kelly of Consolidated, "and we had heard about the great good the Shoe Fund is doing for the children. So we just dug down some more, and $70 was the result."

CAMPAIGN 2 WEEKS OLD

Can you picture 200 boys and girls being fitted out with new shoes, with Christmas just around the corner?

While yesterday's total was $734.37—amount donated since the Shoe Fund began this year's work two weeks ago—more than half of that sum already has been spent for new shoes. Last Saturday's quota was 100 pairs.

Yesterday when Mrs. Ellen Sweeney, secretary of the Catholic Welfare bureau, and Mrs. Elsa Lester, of the P.-T. A., were told of the decision to give 200 pairs of shoes before Christmas, both were overjoyed.

BETTER THAN MEDICINE

"To many a child a pair of warm shoes is worth more than a bottle of the best medicine or cough syrup," said Mrs. Sweeney.

If the Shoe Fund Yuletide spirit keeps up until Christmas like it did yesterday, there will be enough to pay the shoe bills and give several hundred boys and girls a happy Christmas with warm feet that they would not have had if the Shoe Fund had not come to their assistance.

Won't you please mail a check RIGHT NOW or send cash to the business office of The Union?

CONSAIR JOINS DEFENSE AGAINST COLD

J. W. KELLY G. V. HARRISON
. . . happy as they turned over $70 to Shoe Fund from Consolidated Aircraft Corp. workers.

Wall St. Journal - 12-9-40

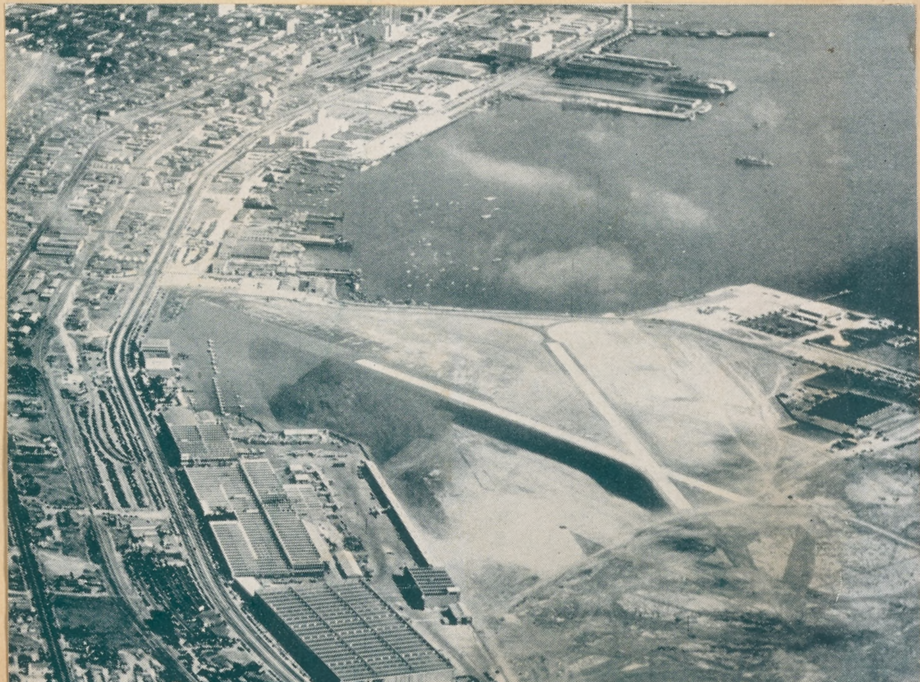
Consolidated Aircraft Plant To Be Expanded at San Diego

SAN DIEGO—Consolidated Aircraft Corp. has announced plans for additional expansion to round out its San Diego plant facilities, involving construction of a parts plant consisting of eight buildings at a cost of $7,000,000, which will practically double present manufacturing space under roof. The new plant, to be located a little more than a mile north of the present main unit at Lindbergh Field, will fit solidly into the line production program for Consolidated flying boats and large bombers, according to company officials.

The new parts plant will add 1,553,000 square feet of manufacturing space under roof, just about doubling the present roofed area including recent expansion which is nearing completion. With an accelerated construction program, the plant should be completed and in full operation by June 1, 1941, according to present plans, which should bring the company's employment roster to around 30,000.

This new plant will be a highly specialized production unit devoted to the manufacture of component parts and assemblies for wings and tail surfaces, with completely independent facilities for all operations needed for their manufacture.

The new factory site is 52 acres with an adjacent controlled area of 72 acres, part of which will be used for parking facilities. The equipment for the new plant has been ordered, and some of it is already coming to the company. To make immediate use of production equipment as delivered, many machines will be installed and operated in tents, then transferred to the new buildings as they are completed.



The News Meter 12/1940

The Consolidated Aircraft Corporation as it appeared when new units were dedicated last Labor Day. Additional buildings to be completed by January 15 will increase Consolidated's manufacturing area (over the original 1935) by more than 1,000 per cent!

Consair Assembly Plant at Tulsa, Army Plan; 'News' to S. D. Heads

WASHINGTON, Dec. 21 (U.P.)—The war department announced today that Tulsa, Okla., has been chosen as a site for a heavy bomber assembly plant to be operated by Consolidated Aircraft Corp., of San Diego.

Consolidated officials had no comment to offer on the fact that a "branch" factory would be operated in Tulsa. "Things come out so fast and frequently from the war department that news of that kind often is news to us," a Consolidated spokesman said.

Two representatives from Tulsa, W. G. Skelley and Russell Rhodes, visited the Consolidated plant and conferred with officials of the aircraft company this week.

The plant is one of four which will assemble bomber parts to be manufactured by the automotive industry.

The department selected Omaha, Neb., as the site for a medium bomber assembly plant to be operated by Glenn L. Martin Co., Baltimore, Md., and a similar establishment at Kansas City., Kan., to be operated by North American Aviation Corp., Inglewood.

The department did not disclose the sizes of the projected plants, explaining that final negotiations for construction and operation are not yet concluded.

Authoritatve sources said, however, the medium bomber plants would turn out about 100 planes monthly, while those making the larger craft would produce about 50 monthly. Cost of the plants probably will be about $7,000,000 to $10,000,000 each.

CONSAIR PAYS $5 YULE BONUS TO EACH EMPLOYE

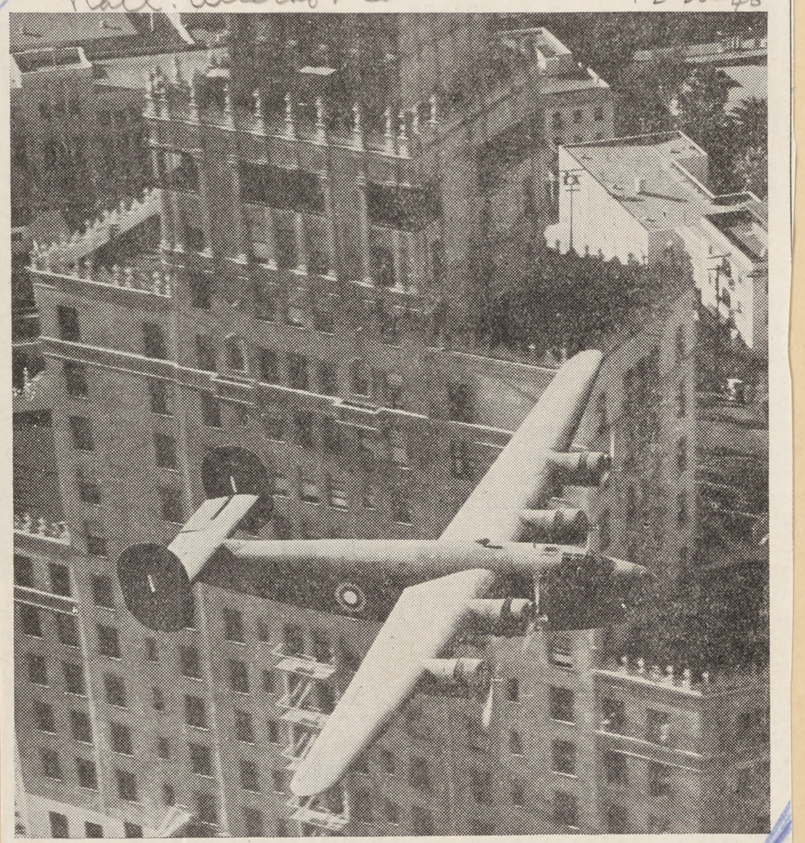
The problem of a turkey dinner with all the trimmings has been solved—at least for Consolidated Aircraft Corp. employes.

Maj. R. H. Fleet, Consolidated Aircraft president, yesterday announced that each person employed prior to Dec. 15 would receive a $5 Christmas check to cover expense of the holiday feast.

Which should be good news to poultry dealers as Consolidated's 14,000 employes will receive $70,000 in Christmas checks.

"We cannot allow the holiday season to pass without an expression of appreciation on the part of the company for the splendid cooperation it has received from employes throughout the year," said Maj. Fleet.

Natl. Aircraft Counsellor 12-20-40



The above picture shows one of the Consolidated Model 32 4-engine Bombers. A large quantity of these ships are destined for Great Britain as well as the U. S. Air Corps. The Consolidated company has recently broken ground for plant expansion which will double their present size.

NEW CONSOLIDATED PLANT TO COST SEVEN MILLION

Natl. Aircraft Counsellor 12-20-40

Consolidated Aircraft Corporation announces that ground will immediately be broken for the construction of a huge new Parts Plant at San Diego, which will virtually double Consolidated's present size. The new plant will fit solidly into the line production program on Consolidated flying boats and large land bombers.

The new huge Parts Plant will be located about 1 and 1/3 miles north of the Lindbergh Field site, and will add 1,553,000 square feet of covered manufacturing area, virtually doubling the tenfold expansion which is nearing completion at this time. With an accelerated construction program, the entire new Parts Plant is scheduled to be completed and in full operation by June, 1941. This plant is composed of a group of eight buildings, plus loading platform of 64,000 square feet. Cost is to run between $6,500,000 and $7,000,000. The factory site is 52 acres in size, with an adjacent area of 72 acres. Combined personnel to operate both plants will reach 35,000. New buildings will be similar in type to present Consolidated structures.

The equipment for the new plant has been ordered and is in the process of being delivered. To make immediate use of production equipment, many of the machines will be set up and operated under lean-to tents at the Lindbergh Field plant site, then transferred to the new buildings as quickly as they are ready for occupancy.

The largest battery of drop hammers and hydraulic presses under one roof on the Pacific Coast will be used in the new Drop Hammer Building, which will also house a complete pattern shop, foundry and die-storage departments.

3 Killed in Crash of S. D. Plane at Mexican Ranch

LORAN KNOWLES GRISWOLD
. . . well known here.

HERBERT LEROY MARTIN
. . . leaves widow.

L. E. SINCLAIR JR.
. . . pilot on ship.

Consair Workers Victims; Craft Burns on Field

A week-end aerial holiday ended in flaming death for two young San Diegans and a Calipatria resident when their plane crashed and burned at the Hamilton dude ranch in Lower California, 200 miles south of here.

The dead were Herbert Leroy Martin, 27, of 4062 Vermont st., Loran Knowles Griswold, 27, of 4386 Highland ave., and L. E. Sinclair jr., pilot, 28, of Calipatria.

TAKE-OFF DISASTROUS

Gerald Mokma, American vice consul at Tijuana and a witness of the accident, brought the first news of the crash when he returned to his office yesterday.

Mokma said the plane took off and while circling the field something fell off, apparently part of the engine or cowling. The plane spun in tail down and burst into flames.

The plane, a Cessna cabin model, cleared from Lindbergh field Saturday with the three young men aboard and Sinclair at the controls. His two passengers were employed at the Consolidated Aircraft Corp. here. Sinclair, son of a Calipatria rancher, was the owner of the plane.

TWO LEAVE WIDOWS

The San Diego victims were married. Griswold, a former Herbert Hoover High school football player, leaves his wife, Inez, his parents, Mr. and Mrs. H. L. Griswold, a sister, Mrs. Mary Killeson, all of this city, and his grandparents, Mr. and Mrs. C. M. Knowles of El Cajon.

Martin is survived by his wife, Helen and a 2-month-old daughter, both of this city, and a sister, Mrs. Don Geir, of Brawley. Martin, born in Hemet, lived in Brawley until March when he came here to work.

BODIES STILL IN SOUTH

The young men were in the experimental department at Consair.

Relatives sought to have the bodies of the victims brought back from Mexico by plane but weather conditions had halted flying operations. Mokma was expected to return to the scene of the accident today to assist in making arrangement for return of the victims.

AIRCRAFT STOCKS

By HARRY J. MOFFETT

DEFENSE ORDERS: Rumors of multi-million dollar orders for aircraft engines and parts have confused the minds of many persons as to what was actually taking place in the way of definite concrete orders. All veils drawn aside and eliminating repetition, it can be safely stated that more than $1,750,000 for defense has already been allotted the Pacific Coast, with by far the greater share of these expenditures going for aircraft and engines. During the past few months, actual orders amounting to more than one billion dollars have been given Boeing, Consolidated, Douglas, Lockheed, Vultee and Northrop alone. These orders, all for the United States Army and Navy, range from training to long range bombing planes. It is now estimated that total orders in Southern California for domestic and foreign account exceed one and one-half billion dollars. Most plants are operating, or are about to operate, on a 3-shifts per day basis and expansion programs will be completed early next year.

CONS. AIRCRAFT VOTES DIVIDEND

Will Pay $2 on Common, First in Two Years; Year's Net Between $1 and $2

LOS ANGELES — Resumption of common stock dividends by Consolidated Aircraft Corp., with a $2 payment, after a two-year interim is accompanied by unofficial estimates that the company in the last half of this year had a common share profit and for the full year will show between $1 and $2 a share depending on accounting policies.

The first half year was devoted largely to preparatory work for large scale production and it was only last August that quantity output was achieved. Since, production has increased steadily.

Deliveries in the first half were less than $500,000, indicating a substantial operating deficit for that period. Consolidated's backlog of $320,000,000 is largely for U. S. defensive needs and the British government. Inclusion of a substantial amount of British work, which carries a relatively higher profit margin obviously helps to offset the small profit return on U. S. orders.

Net $1.79 a Share in 1939

For all of 1939 Consolidated had sales of only $3,603,240, an abnormally low volume, and net profit was $1,104,327, or $1.79 on common. The substantial profit in relation to gross reflected the policy that profit on any contract was not taken into earnings until final completion of contract, although actual deliveries may have started in prior years. There is a good chance that this policy may be changed in computing this year's results.

Consolidated recently announced plans to construct a parts and assembly plant at San Diego. When complete with tools and machinery the plant probably will cost more than $10,000,000. This cost will be defrayed by the Government, but the plant will be operated by Consolidated on a ten-year lease basis with an option of purchase at the end of the period.

Line Production Achieved

Having completed another major phase of expansion last September, Consolidated is now in high gear production and output should continue to increase steadily. The company has achieved considerable success toward a production line for its four-engined bombers weighing 30 tons.

The $2 dividend on common declared yesterday is payable December 26 to stock of record December 20. The last previous payment was $1 in December, 1938.

Directors also declared the regular quarterly preferred dividend of 75 cents, payable December 31 to stock of record December 14.

Aircraft Plant Planning $14,000,000 Addition

Consolidated to Erect Eight Buildings on Coast

SAN DIEGO, Calif., Dec. 18 (AP).—Consolidated Aircraft Corporation officials said an agreement with the Defense Plant Corporation announced in Washington today involved a $14,000,000 plant addition project. Edgar N. Gott, vice-president, said eight new buildings would be constructed, virtually doubling the company's ten-fold expansion since 1935.

The new plant will be a highly specialized unit devoted to the manufacture of component parts and assemblies for wings and tail surface construction, with independent facilities for all operations requisite to their manufacture.

NEW CONSOLIDATED PLANT TO COST SEVEN MILLION

Natl. Aircraft Counsellor 12-20-40

Consolidated Aircraft Corporation announces that ground will immediately be broken for the construction of a huge new Parts Plant at San Diego, which will virtually double Consolidated's present size. The new plant will fit solidly into the line production program on Consolidated flying boats and large land bombers.

The new huge Parts Plant will be located about 1 and 1/3 miles north of the Lindbergh Field site, and will add 1,553,000 square feet of covered manufacturing area, virtually doubling the tenfold expansion which is nearing completion at this time. With an accelerated construction program, the entire new Parts Plant is scheduled to be completed and in full operation by June, 1941. This plant is composed of a group of eight buildings, plus loading platform of 64,000 square feet. Cost is to run between $6,500,000 and $7,000,000. The factory site is 52 acres in size, with an adjacent area of 72 acres. Combined personnel to operate both plants will reach 35,000. New buildings will be similar in type to present Consolidated structures.

The equipment for the new plant has been ordered and is in the process of being delivered. To make immediate use of production equipment, many of the machines will be set up and operated under lean-to tents at the Lindbergh Field plant site, then transferred to the new buildings as quickly as they are ready for occupancy.

The largest battery of drop hammers and hydraulic presses under one roof on the Pacific Coast will be used in the new Drop Hammer Building, which will also house a complete pattern shop, foundry and die-storage departments.

3 Killed in Crash of S. D. Plane at Mexican Ranch

LORAN KNOWLES GRISWOLD
. . . well known here.

HERBERT LEROY MARTIN
. . . leaves widow.

L. E. SINCLAIR JR.
. . . pilot on ship.

Consair Workers Victims; Craft Burns on Field

A week-end aerial holiday ended in flaming death for two young San Diegans and a Calipatria resident when their plane crashed and burned at the Hamilton dude ranch in Lower California, 200 miles south of here.

The dead were Herbert Leroy Martin, 27, of 4062 Vermont st., Loran Knowles Griswold, 27, of 4386 Highland ave., and L. E. Sinclair jr., pilot, 28, of Calipatria.

TAKE-OFF DISASTROUS

Gerald Mokma, American vice consul at Tijuana and a witness of the accident, brought the first news of the crash when he returned to his office yesterday.

Mokma said the plane took off and while circling the field something fell off, apparently part of the engine or cowling. The plane spun in tail down and burst into flames.

The plane, a Cessna cabin model, cleared from Lindbergh field Saturday with the three young men aboard and Sinclair at the controls. His two passengers were employed at the Consolidated Aircraft Corp. here. Sinclair, son of a Calipatria rancher, was the owner of the plane.

TWO LEAVE WIDOWS

The San Diego victims were married. Griswold, a former Herbert Hoover High school football player, leaves his wife, Inez, his parents, Mr. and Mrs. H. L. Griswold, a sister, Mrs. Mary Killeson, all of this city, and his grandparents, Mr. and Mrs. C. M. Knowles of El Cajon.

Martin is survived by his wife, Helen and a 2-month-old daughter, both of this city, and a sister, Mrs. Don Geir, of Brawley. Martin, born in Hemet, lived in Brawley until March when he came here to work.

BODIES STILL IN SOUTH

The young men were in the experimental department at Consair. Relatives sought to have the bodies of the victims brought back from Mexico by plane but weather conditions had halted flying operations. Mokma was expected to return to the scene of the accident today to assist in making arrangement for return of the victims.

Tulsa Chosen As Site for New Consair Plant

WASHINGTON, Dec. 21 (U.P.)—The war department announced today that Tulsa, Okla., has been chosen as a site for a heavy bomber assembly plant to be operated by Consolidated Aircraft Corp., of San Diego.

The plant is one of four which will assemble bomber parts to be manufactured by the automotive industry.

The department selected Omaha, Neb., as the site for a medium bomber assembly plant to be operated by Glenn L. Martin Co., Baltimore, Md., and a similar establishment at Kansas City., Kan., to be operated by North American Aviation Corp., Inglewood.

The department did not disclose the sizes of the projected plants, explaining that final negotiations for construction and operation are not yet concluded.

Authoritatve sources said, however, the medium bomber plants would turn out about 100 planes monthly, while those making the larger craft would produce about 50 monthly. Cost of the plants probably will be about $7,000,000 to $10,000,000 each.

No Consair Comment

Consolidated officials had no comment to offer on the fact that a "branch" factory would be operated in Tulsa.

"Things come out so fast and frequently from the war department that news of that kind often is news to us," a Consolidated spokesman said.

Two representatives from Tulsa, W. G. Skelley and Russall Rhodes, visited the Consolidated plant and conferred with officials of the aircraft company last week.

Natl. Aircraft Counsellor 12-20-40

AIRCRAFT STOCKS

By HARRY J. MOFFETT

DEFENSE ORDERS: Rumors of multi-million dollar orders for aircraft engines and parts have confused the minds of many persons as to what was actually taking place in the way of definite concrete orders. All veils drawn aside and eliminating repetition, it can be safely stated that more than $1,750,000 for defense has already been allotted the Pacific Coast, with by far the greater share of these expenditures going for aircraft and engines. During the past few months, actual orders amounting to more than one billion dollars have been given Boeing, Consolidated, Douglas, Lockheed, Vultee and Northrop alone. These orders, all for the United States Army and Navy, range from training to long range bombing planes. It is now estimated that total orders in Southern California for domestic and foreign account exceed one and one-half billion dollars. Most plants are operating, or are about to operate, on a 3-shifts per day basis and expansion programs will be completed early next year.

CONS. AIRCRAFT VOTES DIVIDEND

Will Pay $2 on Common, First in Two Years; Year's Net Between $1 and $2

LOS ANGELES — Resumption of common stock dividends by Consolidated Aircraft Corp., with a $2 payment, after a two-year interim is accompanied by unofficial estimates that the company in the last half of this year had a common share profit and for the full year will show between $1 and $2 a share depending on accounting policies.

The first half year was devoted largely to preparatory work for large scale production and it was only last August that quantity output was achieved. Since, production has increased steadily.

Deliveries in the first half were less than $500,000, indicating a substantial operating deficit for that period. Consolidated's backlog of $320,000,000 is largely for U. S. defensive needs and the British government. Inclusion of a substantial amount of British work, which carries a relatively higher profit margin obviously helps to offset the small profit return on U. S. orders.

Net $1.79 a Share in 1939

For all of 1939 Consolidated had sales of only $3,603,240, an abnormally low volume, and net profit was $1,104,327, or $1.79 on common. The substantial profit in relation to gross reflected the policy that profit on any contract was not taken into

Federal Reserve Board Chairman Marrine S. Eccles urges that Congress should fix sharpl increased bank reserve requirements in order t reduce excess reserves. This newspaper is hearty accord with the ends he has in vie It believes, however, that merely increasing r serve requirements would not solve the proble because it would not strike at the cause of th present unwieldy excess reserves. In effect, would be similar to attempting to cure th symptoms of a disease rather than the cause of the illness.

Aircraft Plant Planning $14,000,000 Addition

Consolidated to Erect Eight Buildings on Coast

SAN DIEGO, Calif., Dec. 18 (AP).—Consolidated Aircraft Corporation officials said an agreement with the Defense Plant Corporation announced in Washington today involved a $14,000,000 plant addition project. Edgar N. Gott, vice-president, said eight new buildings would be constructed, virtually doubling the company's ten-fold expansion since 1935.

The new plant will be a highly specialized unit devoted to the manufacture of component parts and assemblies for wings and tail surface construction, with independent facilities for all operations requisite to their manufacture.

hundred faces not about the rent being due, or the insurance or the car payment, but what to give to make someone happy!

Clerks smilingly eager to cooperate. They know the pocketbook isn't always tightly stuffed and that some consideration must be given to it. If the shopper obviously can't spend more than a dollar, well, they show her the nicest things they've got for a dollar!

Who said there wasn't any Santa? Pish and tush, my friends, as long as there a hundred million people wearing their energy down to zero and their pocketbooks almost there just to make someone smile with pleasure on the approaching morning, well, there is a Santa and that's that!

* * *

And what has San Diego got that Hollywood has not? A True Vowkeepers club. That's what. When they get married in San Diego, they do it for keeps. Or if they get married anywhere and come to San Diego just for the sunny weather why, they're sunk anyway if Forrest Warren hears about 'em. He'll sign them up for the club, which makes a specialty of honoring men and women who have loved enough to make a golden wedding anniversary something beside a mouthful of words.

And the smiles on the faces of those who belong! You'd think they'd met a president of something, or a king or two. But you won't get a chance to ask what the reason for the big smile is, they'll show you the button they're earned and tell you what it stands for; loyalty and faith and team-work for 50 years. And the city that is smart He'll remember you with gold and silver emotions.

* * *

Sitting in the Plaza in front of the U. S. Grant hotel just watching the busy crowd go by is a popular idea if the scores who do it daily are any proof. The gentleman on the left is a retired banker from Kansas. The lady across has reared a family and earned the rest and sunning, she's taking. Looking at her calm and tranquil face you'd never guess she wrestled with formulas and didies and spanked the consumers of both. The hands are heavily bejeweled and the eyes have it!

* * *

The white-haired lad with the cane hasn't been inoculated with the Christmas spirit yet. No smile there. But maybe someone has just tripped on that bandaged foot.

* * *

And there to the right, as we live and breathe are a pair of lovers. They know they're being watched, but they can see the kindly smile too. They know the whole world loves lovers!

Has there been a contest going on to see who could outdo Santa at his own game? Because a little bird just whispered the name of the lad who should take all cakes of honor. He is Maj. Fleet of Consolidated Aircraft Corp. Fourteen thousand employes will find a five-dollar bonus stuffed in the toes of their stocking as a Christmas remembrance. Seventy-thousand dollars worth of goodwill, all extended by one man ought to mean something very fine and big! It ought to mean you're a happy man, Major. From the clear skies above we seem to hear the old and familiar words: "'Tis more blessed to give than to receive."

There are also many new private structures. All these would be dangerously in the path of a flood such as we have had at more or less regular intervals in years past."

CITY UNABLE TO PAY

Pointing to the strained condition of the city's purse, the councilman made it clear that "it would be impossible for this community to raise $1,500,000 to supplement an appropriation by the federal government of $2,300,000 at this time."

In support of this he emphasized that municipal resources are "strained to the limit by the large increase in army, navy and marine corps personnel as well as the phenomenal increase in our aircraft factories with thousands of added workers now living in this area. Our police department is undermanned; our fire department is in the same position; we need to extend our water distribution system, our schools and all other like public facilities.

"I respectfully urge that you order another hearing on this very important matter, to be held in San Diego at the earliest possible date."

neer in the development of all-steel bodies, of cars with a low center of gravity, and of the hydraulic brakes which Jimmie Lynch, famous daredevil driver, has called the 'world's finest.'

"Many new features of the 1941 Dodge Luxury Liner give it claim to the title of America's Safety Car," Burger continued. "With the new Dodge safety wheel rims, tires cling to the rim even when flats occur at high speeds. From new and wider 'airplane vision' windshield the highway spreads out before the driver. Dodge rear windows are wider and deeper to give 47 percent more sternward vision. Door handles have to be lifted upward to spring the catch, it's impossible to open them accidentally. The Dodge safety signal speedometer keeps the driver ever mindful of the rate the car is traveling.

"However, we believe one of the most important safety features of the new Dodge Luxury Liner is fluid drive. There is likely to be a film of oil on streets and highways which makes them unusually slippery during the first rains. With the conventional method of driving there is often a sudden application of power which means a skid. The steady smooth power of Dodge fluid drive eliminates this wet weather driving hazard."

WYOMING PUBLISHER, WIFE VISIT S. D.; PREPARING BOOK

Mr. and Mrs. J. E. Hanway, of Casper, Wyo., are making their winter visit to San Diego. They are editors and owners of two daily newspapers in Casper—the Tribune and Herald.

For many years Hanway was a newspaper broker. He was engaged in buying and selling newspaper plants, which became a profitable business. In the days of newspaper contests, Hanway conducted one in Salt Lake City that brought returns of $60,000.

EDITED NEWSPAPER

Thirty-five years ago, when Walter and Floyd Whitcomb, of San Diego, lived in Horton, Kan., Hanway was editor of a weekly newspaper—the Commercial. It was there that Mrs. Hanway had her first newspaper experience—folding papers as they came from an old Campbell press.

The Hanways were married 50 years ago in Topeka, Kan., where, as a boy, he carried newspapers and "it just got in my blood."

WRITING BOOK

Because of the interesting life Hanway has had as a newspaper man, his family prevailed upon him to write a book—enough for distribution among relatives and close friends. During his vacation here and at other places on the Pacific coast, Hanway dictates to his secretary, Anne Casper, who has contributed a column of San Diego observations in today's Union.

Mr. and Mrs. Hanway received with The Union's compliments blue and gold buttons, making them members of the True Vow Keepers club.

Theological Student Here For Christmas

To spend Christmas with his mother, Mrs. Ina Dominy, Arthur Dominy, 19, who is studying for a commission as a navy chaplain at Wheaton college, Wheaton, Ill., arrived yesterday.

Young Dominy was graduated from San Diego High school in 1938. After completing a preliminary theological course at Wheaton, young Dominy will take a post-graduate course at the Philadelphia seminary. He then will apply for a commission in the navy chaplain corps.

Bodies of 3 Fliers Held at Ensenada Till Storm Permits Return to S. D.

Efforts are being made today to return to San Diego the bodies of three youths, two of them employes of the Consolidated Aircraft Corp. who were killed Sunday when their plane crashed in a take-off at Ensenada.

The three, badly burned, are being held at Ensenada awaiting removal here either by auto, boat or plane. Because of storm conditions, it is said, it is impossible to fly a large plane to the airport and road conditions are such that a large auto cannot make the trip today.

Gerald Mokma, American vice consul at Tijuana, who, on business at Ensenada Sunday, witnessed the crash, is seeking some means of bringing the bodies here.

The dead are Herbert Leroy Martin, 27, of 4062 Vermont st.; Loran Knowles Griswold, 27, of 4386 Highland ave., and L. E. Sinclair jr., of Calipatria, pilot of the plane.

Mokma stated that the plane had just taken off from the airport and the three headed for home after a day of hunting, when he saw some part of the plane fall into space. The craft then nosed up sharply, went into a tail spin and crashed from about a 400-foot altitude.

Mokma and others attempted to reach the plane, but as it burst into flames upon falling, numerous shotgun shells began exploding from the heat, holding rescuers at a distance.

The plane, a Cessna cabin model cleared from Lindbergh field Saturday with the necessary papers for the hunting trip to Ensenada. The trio stopped at Tijuana to show their papers then proceeded to Ensenada.

Both San Diego victims are survived by widows. Griswold, a former Herbert Hoover high school football player, is survived by his wife, Inez; his parents, Mr. and Mrs. H. L. Griswold, and his grandparents, Mr. and Mrs. C. M. Knowles, of El Cajon. Martin is survived by his wife, Helen, and a two-months-old daughter, both of this city, and a sister, Mrs. Don Geir, of Brawley.

Union 12-25-40

Storm Delays Return of Crash Victims' Bodies

Considerable delay may be experienced in bringing to the United States the bodies of three young aviators killed in a plane crash at the Hamilton ranch in Lower California, 200 miles south of here.

The victims were Herbert LeRoy Martin, 27, of 4062 Vermont st.; Loren Knowles Griswold, 27, of 4396 Highland ave., and L. E. Sinclair jr., of Calipatria.

The San Diegans were employed in the experimental department of Consolidated Aircraft Corp. and Sinclair, owner of the plane, was the son of a Calipatria rancher.

U. S. CONSUL RETURNS

Gerald A. Mokma, U. S. consul at Tijuana, was at Ensenada trying to speed the return of the bodies. Returning last night, he said that the district attorney had left Ensenada with a truck to bring out the bodies from the Hamilton ranch.

How long the trip would take, Mokma could not guess. He said rains have made the roads south of Ensenada difficult to travel.

Mokma said he had been unable to learn any new information as to cause of the accident. He said that soon after a take-off from the field at the Hamilton ranch, something fell from the plane in the vicinity of the engine and the machine went into a spin and crashed in flames.

WIRES TO ENSENADA OUT

Although local pilots had offered to fly to the Hamilton ranch and aid in bringing the bodies to San Diego, Consul Mokma said, however, the bodies would first have to be taken to Ensenada to make legal arrangements for transferring them across the border.

Due to the storm both telegraph and telephone wires were down between Tijuana and Ensenada, the consul said last night.

12-30-40 Union

Maj. Fleet Silent On Branch Plant

Maj. Reuben H. Fleet, Consolidated Aircraft Corp. president, said yesterday that he has received no word from Washington as to whether the proposed Consolidated branch plant will be built at Ft. Worth, Tex., or Tulsa, Okla.

"To be frank," Maj. Fleet said, "I get most of the news regarding Consolidated contracts and proposed plant expansion plans from reading The San Diego Union. And that news is accurate and authentic."

According to Washington reports, government plans to finance a Consolidated branch factory at either Ft. Worth or Tulsa have been held up temporarily, pending a dispute between the two cities over a site best suited for national defense purposes.

AIRCRAFT WORKERS GO LIMIT ON CHRISTMAS SUPPLIES

Employes of Consolidated Aircraft Corp. go the limit when they fill Christmas boxes for the needy. In addition to a ham and a supply of vegetables, 45 pounds of staples go into each box with a Christmas tree to each family listed. Busily engaged in filling the 150 boxes to be distributed are (left to right), L. E. Miller, F. H. Rose, J. W. Kelly and R. L. Clute.

Yule Baskets To Be Given by Consair Group

Consolidated Aircraft Corp. employes decided to go to Santa Claus' aid in supplying Christmas dinners to needy families in this area. So the Consair sheet metal department sponsored a Christmas charity ball at the Eagles hall and raised money to be expended in that cause.

Came the selection of a Christmas dinner menu.

BOUGHT STAPLES

"Why spend the allotment for each family on a turkey and trimmings that would last, at the most only a couple of days?" the Consair boys asked one another. So, they took the money and bought only "substantials."

Each of the 150 boxes to be distributed will contain a ham with plenty of celery, lettuce and apples. Each also will be overflowing with articles which may carry over for weeks. Sacks of flour, bags of potatoes and onions, jars of mayonnaise, glasses of jelly, packages of oatmeal and a variety of canned vegetables are closely packed into each container.

SWEETS SUPPLIED

And the younger members of each family are being remembered with a supply of candy and fruit.

"Gee, it's been lots of fun," said a husky metal worker as he almost staggered under the weight of a Christmas box he just had filled

American Aircraft Mechanic 12-19-40

Consair Employees Pay Increased Approximately $1,750,000

New Wage Agreement Being Negotiated by Machinists Union, No. 1125, A. F. of L. Being Completed to Satisfaction of Men and Company

At the regular Tuesday meeting held by Local 1125 the report of the Wage Review Board members was read by W. J. Chudleigh and the wage proposals negotiated with Consolidated affecting the men in the lower wage brackets and starting wage with increase every five weeks, was ratified by a vote of the union so large that it was almost unanimous. The wage rate agreed upon was virtually as reported in last week's Aircraft Mechanic, viz: 50 cents starting rate with an increase each 5 weeks until the rate at the end of six months employment will be 60c per hour. Theincrease effective immediately to apply to those that have been in the employ of Consolidated for six months or fraction thereof. Further increases to be based upon merit of individual employee. The present rule of 5c per hour bonus for the night shift to continue.

The wage review began in the Wing Department as a test and in reviewing the wages of some 2500 employees of this department, increases were granted in practically every case, the average increase being 6 to 7 cents per hour per man.

Increases in pay affecting more than 8000 employees will increase the payroll of Consolidated employees $977,626 annually; the cost of further planned increases to other employees approximate $774,770 or an increase for the present employees of approximately $1,652,396 annually.

On projected new employment during the next six months some $7,000,000 will be expended by the Consolidated.

The Wage Review will proceed as rapidly as possible by departments as scheduled.

---

tions.

Aircraft Mechanic

CONSOLIDATED

More than $17,000,000 will be spent for further expansion and improvement of the Consolidated Aircraft Corp. plant, under agreements announced today by the navy department.

Of the total, $14,446,929.27 will be expended by the Defense Plant Corp., an RFC subsidiary, for constructing and equipping a huge parts factory along the east side of Pacific highway, 1½ miles north of the present plant. Both contracts total $17,536,963.

Navy to Spend $3,090,044

Another $3,090,044.69 will be spent by the navy department for improvements at the present factory, Edgar N. Gott, Consolidated vice president, revealed.

The structures will contain a covered manufacturing area of 1,553,000 square feet.

Equipment Included

The rest of the Defense Plant Corp. money will be used in preparing the site, driving piles for the foundation, constructing approaches and equipping the new plant, which Gott said would be "a highly specialized production unit devoted to the manufacture of component parts and assemblies for wing and tail surface construction, with completely independent facilities for all operations requisite to their manufacture."

Gott said the combined Consolidated payroll was expected to soar to 30,000 when the new division is placed in operation. The firm has a backlog of national defense orders and order for warplanes for Britain totaling in excess of $325,000,000.

Trib. 12/27/40.

Ft. Worth Bids For Consair Factory

WASHINGTON, Dec. 27 (A.P.) — Last-minute pleas by advocates of other sites were said authoritatively today to have delayed the signing of contracts for a new assembly plant at Tulsa, Okla., for long-range army bombers.

The war department announced last week that Tulsa had been selected as the site for such a plant and that it would be operated by the Consolidated Aircraft Corp., of San Diego, Calif.

Officials said today that the contracts had not been signed but declined to state whether there had been an unexpected delay.

Ft. Worth Mentioned

The disclosure came after Sen. Sheppard (D-Tex) conferred with Under-Secretary Robert P. Patterson. Sheppard was said to have urged the claims of Fort Worth.

One of Four Plants

The plant under present plans is to be one of four for the manufacture of bombing planes from parts largely fabricated by the auto industry. Expected to cost from $8,000,000 to $10,000,000, it is to assemble four-motor bombers. Kansas City and Omaha have been chosen as sites for plants to assemble two-motor bombers.

An aid of Sen. Thomas (D-Okla) said the war department had held up signing of the Tulsa plant contract to permit filing of briefs by persons interested in locating the plant in Ft. Worth.

The senator's aid said a final decision on location of the plant would be made by the defense council. He said he was told by a war department official that signing of the contract with Consolidated would be delayed until after Jan. 1.

Trib-Sun 12-31-40

'Aircraft Major U. S. Industry; in Era Of Great Development,' Says Fleet

"The design and manufacture of aircraft now constitutes a major industry in this country, after many lean years of struggle," writes Maj. Reuben H. Fleet, president, Consolidated Aircraft Corp., in the firm's monthly publication, Consolidator. Forecasting a monthly payroll by the company of approximately $5,000,000 for an eventual total of more than 30,000 employes, Fleet's article continues, as follows:

"It is obvious that we are entering upon an era of great aircraft development. This company is maintaining its leadership in the industry and striving willingly to meet all demands upon it by our government.

"Great Efficiency"

"Airplanes have attained great efficiency in speed, range, weight-carrying capacity and safety. Cost of operation has been reduced until it now compares favorably for certain traffic with that of railroads.

"When one realizes that our airlines today are carrying less than

to our plant at Lindbergh field, we shall have reached our limit of expansion on this field and have completed our plans for enlargement when we built our first building in 1935.

"To fill orders on hand, we are now engaged in the construction of a parts plant with a total covered area approximating 1,550,000 square feet on Pacific blvd., about a half-mile from our home factory. When this new plant is completed and operating we shall have more than 30,000 employes, with a payroll of about $5,000,000 a month.

"Taxes Take 62 Percent"

"The regular federal and excess-profit taxes take approximately 62 percent of gross income; but as the two plants should annually produce $150,000,000 of airplanes and parts and we have not had to issue more stock to cover the cost of the added facilities, the net yield to our shareholders should be satisfactory.

"Apparently, until the temperament of mankind changes, world peace cannot be enjoyed in the absence of power capable of forcing and enforcing it. Such power is air power, augmented by naval power and by an army where occupation and policing of territory is necessary. Nothing within its range can stop aircraft; its range is now a continent or an ocean. Let us hope that when this war ends, possession of such aircraft, without its employment, will guarantee 'peace on earth, good will to men.'"

Germans Slay High In Raid on London

BERLIN, Dec. 31 (U.P.)—German bombers attacked London from a great height today, D.N.B., official news agency, reported. It said a German plane dive-bombed an arms factory, northeast of London, causing heavy damage with three direct hits. An entire section of a building was seen to collapse, it said.

Jan. 1, 'Neighbor Day,' Proclamation of Olson

LOS ANGELES, Dec. 31 (A.P.)—

Union 12-28-40

Army Delays Contract for New Consair Plant

WASHINGTON, Dec. 27 (A.P.)—Last-minute pleas by advocates of other sites were said authoritatively today to have delayed the signing of contracts for a new assembly plant at Tulsa, Okla., for long range army bombers.

The war department announced last week that Tulsa had been selected as the site for such a plant and that it would be operated by the Consolidated Aircraft Corp., of San Diego, Calif.

Officials said today that the contracts had not been signed but declined to state whether there had been an unexpected delay.

FT. WORTH SITE URGED

The disclosure came after Sen. Sheppard (D-Tex) conferred with Under-Secretary Robert P. Patterson. Sheppard was said to have urged the claims of Fort Worth.

The plant under present plans is to be one of four for the manufacture of bombing planes from parts largely fabricated by the auto industry. Expected to cost from $8,000,000 to $10,000,000, it is to assemble four-motor bombers. Kansas City and Omaha have been chosen as sites for plants to assemble two-motor bombers.

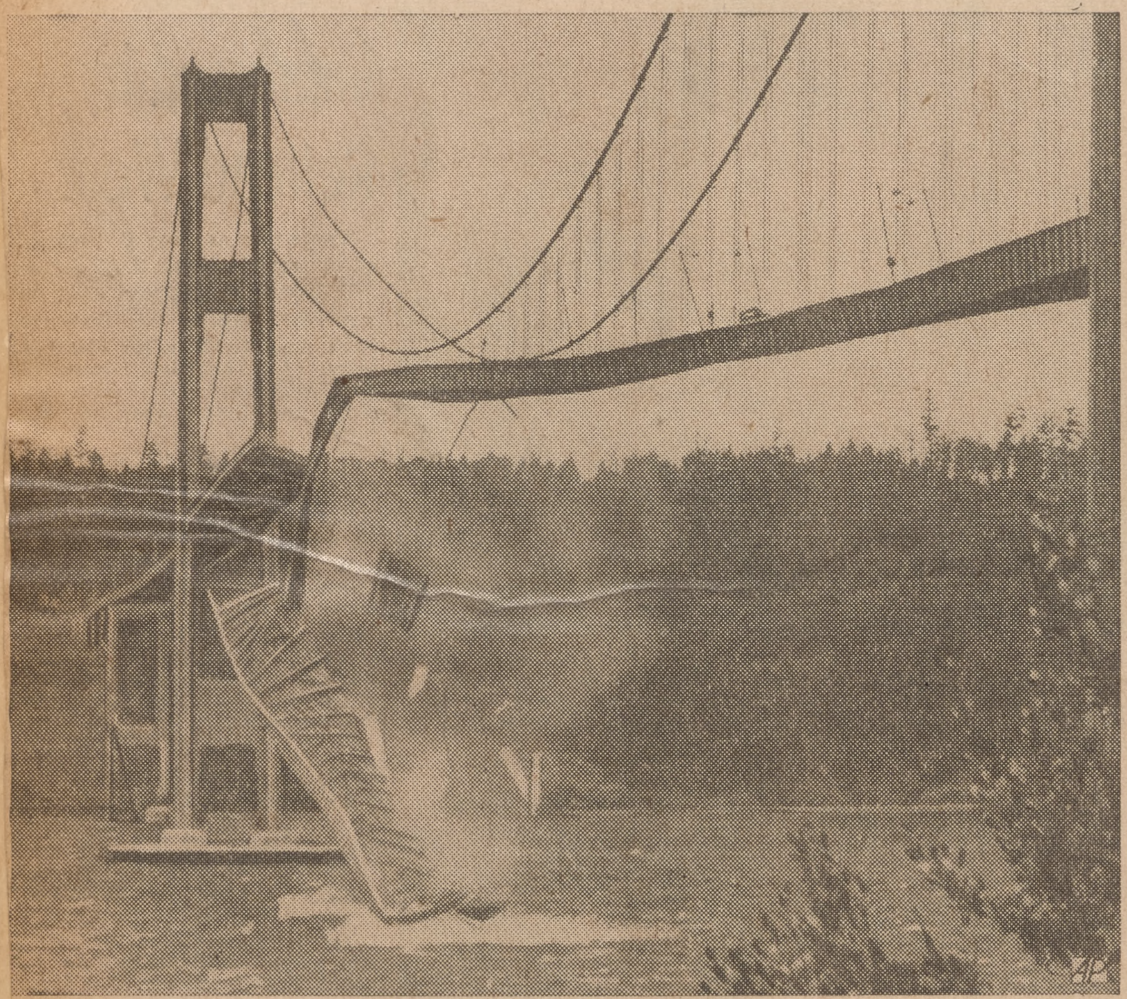
FINAL DECISION DUE

An aid of Sen. Thomas (D-Okla) said the war department had held up signing of the Tulsa plant contract to permit filing of briefs by persons interested in locating the plant in Ft. Worth.

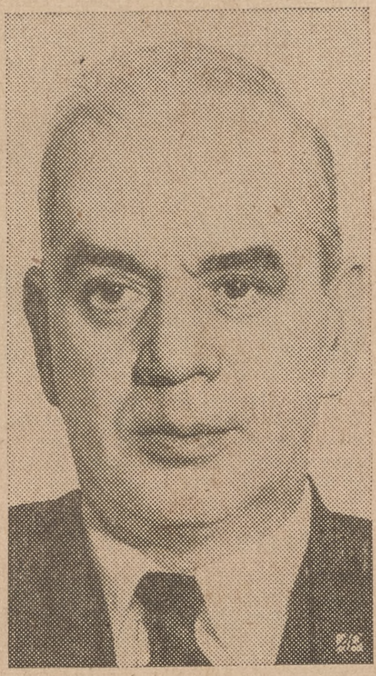
The senator's aid said a final decision on location of the plant would be made by the defense council. He said he was told by a war department official that signing of the contract with Consolidated would be delayed until after Jan. 1.

1940 AMERICA'S NEWS IN A WAR YEAR

An Associated Press Picture Review



'GALLOPING GERTIE' GOES Wind-blamed crackup of 2,800-foot center span of the new $6,400,000 Narrows bridge at Tacoma, Wash.—third longest single suspension in world—put an end Nov. 7 to the shimmying undulations that gave the bridge its nickname, "Galloping Gertie." Nature's fury in 1940 was also responsible for earthquakes: in Turkey (January); Peru (May); Rumania (November).



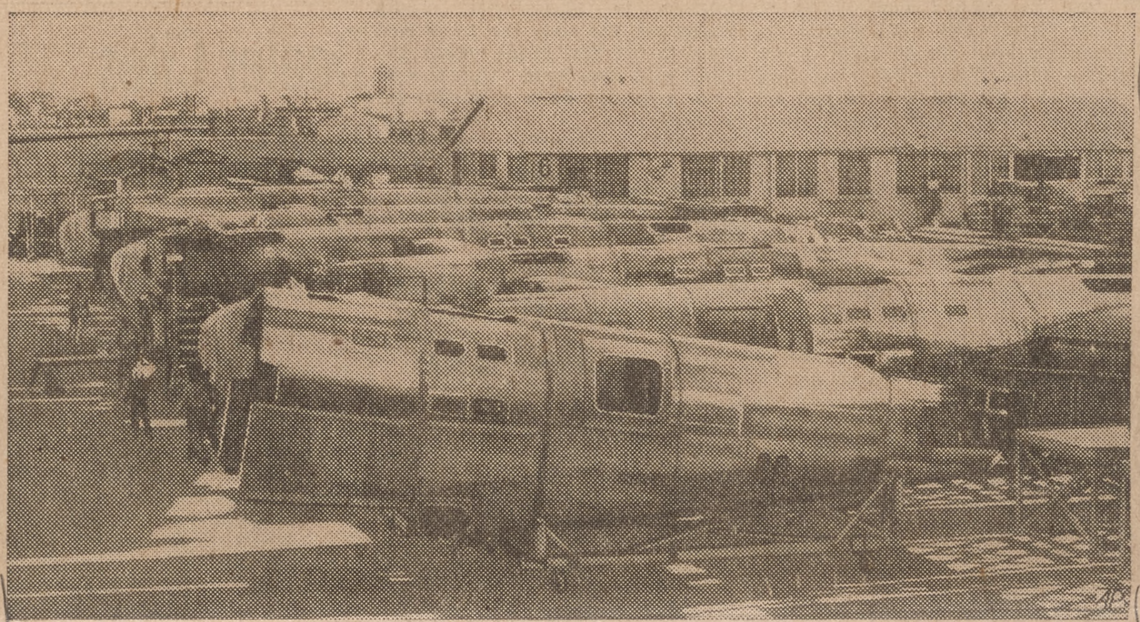
CHANGE Philip Murray (above) became CIO chieftain at Atlantic City convention where John L. Lewis on Nov. 18 formally resigned, sticking to a pre-election pledge that he'd quit if Franklin D. Roosevelt won.

'THIRD TERM' PRESIDENT Victor in a spirited election that broke even the Third Term precedent, President Roosevelt waved greetings from the White House Nov. 7, along with Mrs. Roosevelt (left), Vice President-Elect Henry Agard Wallace, Mrs. Wallace. F.D.R. accepted re-election as an endorsement of policies which in 1940 led to: Huge defense program, peacetime draft, trade of 50 over-age U.S. destroyers for British bases, western hemisphere defense collaboration with South and Central American republics, "all possible aid to the nations that still resist aggression."

THE WAX CASE Deprived by court action of a girl's wax-preserved corpse that he'd kept in his bedroom seven years while busy with life-restoring experiments, Karl van Cosel, 70, studies her death mask. Key West, Fla., commission found him sane, discharged him Oct. 10.

SAFE RETURN But for alert Cecil Wetzel and Ellis Woods, two lumbermen who stumbled onto the kidnaper and boy, there might not have been this reunion between Count and Countess Marc de Tristan and their son, Marc, 3, Sept. 22 at Hillsborough, Cal. Wilhelm Muhlenbroich, an alien, is serving a life sentence at San Quentin on kidnap charge. The little boy was held captive for 48 hours.

GOOD NEIGHBORS Uncle Sam's courtship of western hemisphere nations pushed ahead when Vice President-Elect Henry Agard Wallace traveled to Mexico City for Dec. 1 inaugural of Pres. Avila Camacho, and paused en route for this chat with a Mexican farmer. Also entered in neighborliness ledger is granting by U.S. of millions in credit to Argentina, Brazil, Chile, Peru, Ecuador.



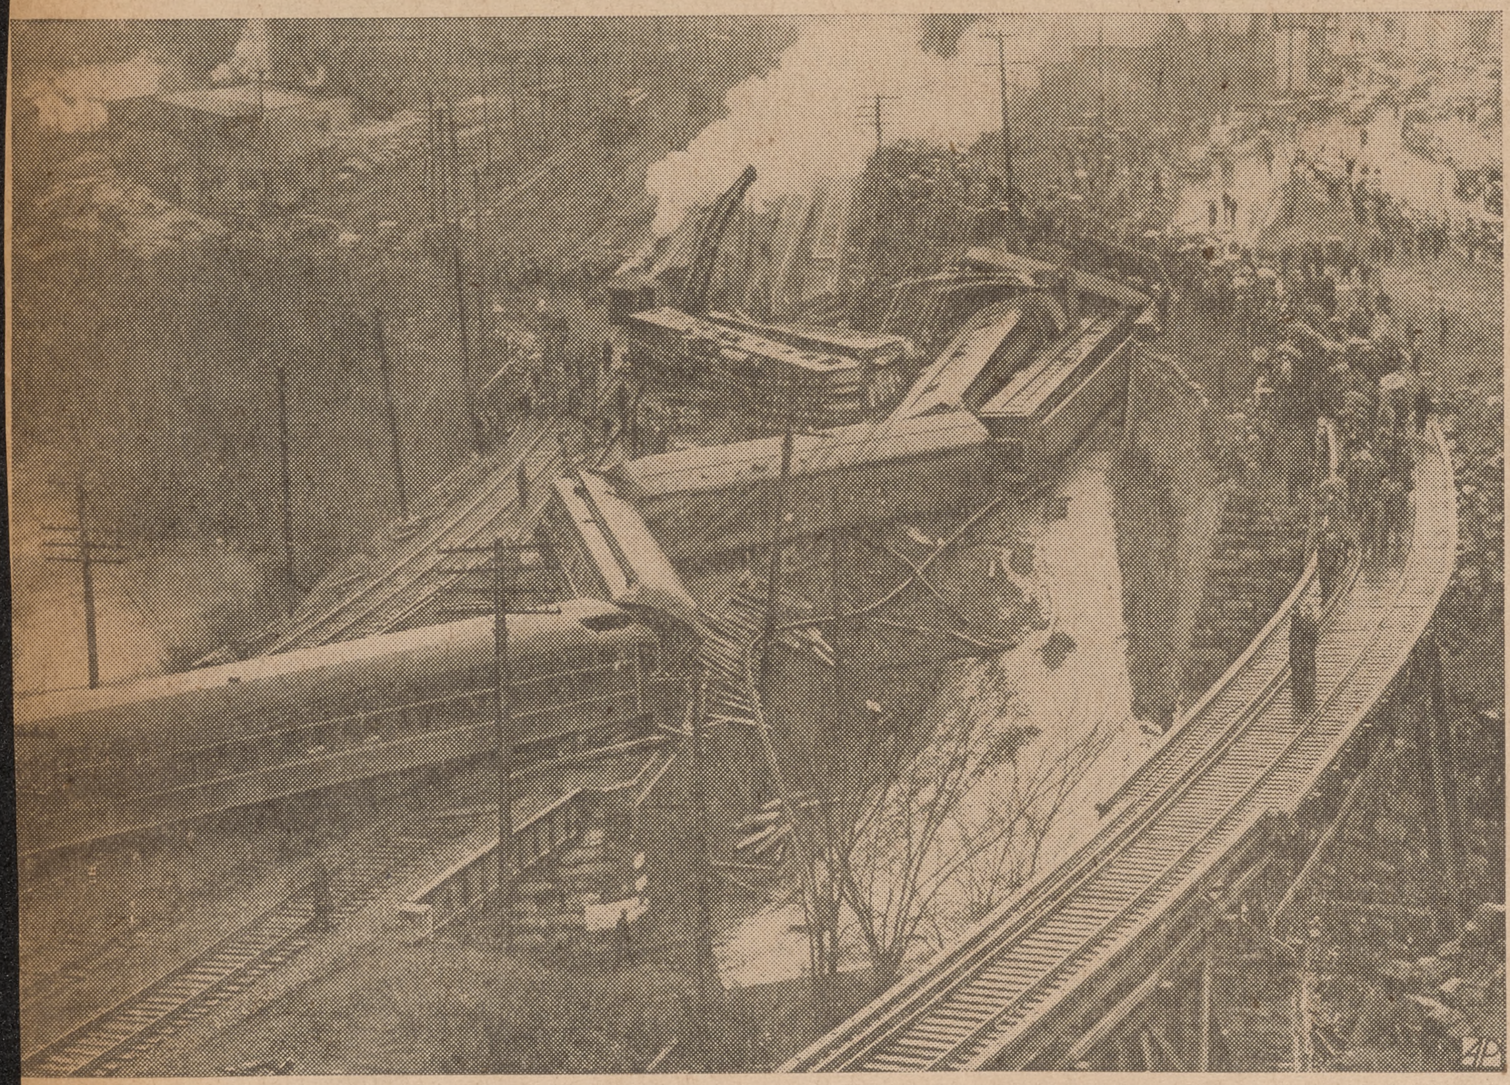
BOMBERS BY THE YARD Symbol of the faster tempo of U.S. production of planes and defense weapons are these four-motored, long-range bombers, so big they're assembled in yard at San Diego plant. Along with Sperry bombsight, planes like these were released to Britain in line with government's policy of giving aid.

HAVEN Foremost among war refugees who reached the Americas' hospitable shores was Crown Princess Juliana (above) of Th Netherlands. U.S. greeted thousands of refugee children an such celebrities as Paderewsk Former Empress Zita of Austria.

© Chicago Daily Times

CAMPAIGN TARGET From this brush with an egg-tossing Chicagoan Oct. 22 Wendell L. Willkie, Republican presidential candidate, emerged to carry on a fight that netted him some 22,000,000 votes in the country's bitterest political battle. The campaign even set a new high for vegetables thrown.

IT'S NO. 158 Eyes of 17,000,000 men who registered on Oct. 16 turned Oct. 29 to above drawing of first number in nation's first peacetime draft, in Washington. It was 158, drawn by blindfolded War Secretary Henry Stimson. Draftees are from 21 to 35, are being called according to drawing of serial numbers issued by local boards.



DEATH AT THE BEND Close to 30 persons were killed when a Chicago-bound express piled up at this bend near Little Falls, N. Y., April 19—the same month in which 212 Negro men and women burned to death in a flaming dance hall at Natchez, Miss. Heavy in death toll was the headon collision of a commuters' train and a freight July 31 at Cuyahoga Falls, Ohio, which killed about 40 persons. Sen. Ernest Lundeen of Minnesota was among 25 killed in Aug. 31 plane crash at Lovettsville, Va. Mine caveins at Bartley, W. Va., St. Clairsville, O., and in Pennsylvania cost the lives of several score miners.

GONE The death in January of Sen. William E. Borah (above), Idaho Republican, took a veteran legislator from Senate's ranks that before 1940 ended were to lose Sen. Ernest Lundeen, Minnesota; Sen. William Bankhead, Alabama; Sen. Key Pittman, Nevada.

SOLDIERS' LIFE FOR THEM Thousands of men shouldered arms as United States, bent on a bigger army, a two-ocean navy, an adequate air force, sent draftees and volunteers to army camps that mushroomed into being. The defense commission named by F.D.R. in May and including such leaders as William Knudsen, Sidney Hillman, Edward Stettinius, Jr., and Ralph Budd helped co-ordinate nation's defense efforts.

Trib-Sun 12-24-40

Bodies of 3 Fliers Held at Ensenada Till Storm Permits Return to S. D.

Efforts are being made today to return to San Diego the bodies of three youths, two of them employes of the Consolidated Aircraft Corp. who were killed Sunday when their plane crashed in a take-off at Ensenada.

The three, badly burned, are being held at Ensenada awaiting removal here either by auto, boat or plane. Because of storm conditions, it is said, it is impossible to fly a large plane to the airport and road conditions are such that a large auto cannot make the trip today.

Gerald Mokma, American vice consul at Tijuana, who, on business at Ensenada Sunday, witnessed the crash, is seeking some means of bringing the bodies here.

The dead are Herbert Leroy Martin, 27, of 4062 Vermont st.; Loran Knowles Griswold, 27, of 4386 Highland ave., and L. E. Sinclair jr., of Calipatria, pilot of the plane.

Mokma stated that the plane had just taken off from the airport and the three headed for home after a day of hunting, when he saw some part of the plane fall into space. The craft then nosed up sharply, went into a tail spin and crashed from about a 400-foot altitude.

Mokma and others attempted to reach the plane, but as it burst into flames upon falling, numerous shotgun shells began exploding from the heat, holding rescuers at a distance.

The plane, a Cessna cabin model cleared from Lindbergh field Saturday with the necessary papers for the hunting trip to Ensenada. The trio stopped at Tijuana to show their papers then proceeded to Ensenada.

Both San Diego victims are survived by widows. Griswold, a former Herbert Hoover high school football player, is survived by his wife, Inez; his parents, Mr. and Mrs. H. L. Griswold, and his grandparents, Mr. and Mrs. C. M. Knowles, of El Cajon. Martin is survived by his wife, Helen, and a two-months-old daughter, both of this city, and a sister, Mrs. Don Geir, of Brawley.

Union-12-25-40

Storm Delays Return of Crash Victims' Bodies

Considerable delay may be experienced in bringing to the United States the bodies of three young aviators killed in a plane crash at the Hamilton ranch in Lower California, 200 miles south of here.

The victims were Herbert LeRoy Martin, 27, of 4062 Vermont st.; Loren Knowles Griswold, 27, of 4396 Highland ave., and L. E. Sinclair jr., of Calipatria.

The San Diegans were employed in the experimental department of Consolidated Aircraft Corp. and Sinclair, owner of the plane, was the son of a Calipatria rancher.

U. S. CONSUL RETURNS

Gerald A. Mokma, U. S. consul at Tijuana, was at Ensenada trying to speed the return of the bodies. Returning last night, he said that the district attorney had left Ensenada with a truck to bring out the bodies from the Hamilton ranch.

How long the trip would take, Mokma could not guess. He said rains have made the roads south of Ensenada difficult to travel.

Mokma said he had been unable to learn any new information as to cause of the accident. He said that soon after a take-off from the field at the Hamilton ranch, something fell from the plane in the vicinity of the engine and the machine went into a spin and crashed in flames.

WIRES TO ENSENADA OUT

Although local pilots had offered to fly to the Hamilton ranch and aid in bringing the bodies to San Diego, Consul Mokma said, however, the bodies would first have to be taken to Ensenada to make legal arrangements for transferring them across the border.

Due to the storm both telegraph and telephone wires were down between Tijuana and Ensenada, the consul said last night.

12-30-40 Union

Maj. Fleet Silent On Branch Plant

Maj. Reuben H. Fleet, Consolidated Aircraft Corp. president, said yesterday that he has received no word from Washington as to whether the proposed Consolidated branch plant will be built at Ft. Worth, Tex., or Tulsa, Okla.

"To be frank," Maj. Fleet said, "I get most of the news regarding Consolidated contracts and proposed plant expansion plans from reading The San Diego Union. And that news is accurate and authentic."

According to Washington reports, government plans to finance a Consolidated branch factory at either Ft. Worth or Tulsa have been held up temporarily, pending a dispute between the two cities over a site best suited for national defense purposes.

AIRCRAFT WORKERS GO LIMIT ON CHRISTMAS SUPPLIES

Employes of Consolidated Aircraft Corp. go the limit when they fill Christmas boxes for the needy. In addition to a ham and a supply of vegetables, 45 pounds of staples go into each box with a Christmas tree to each family listed. Busily engaged in filling the 150 boxes to be distributed are (left to right), L. E. Miller, F. H. Rose, J. W. Kelly and R. L. Clute.

Yule Baskets To Be Given by Consair Group

Consolidated Aircraft Corp. employes decided to go to Santa Claus' aid in supplying Christmas dinners to needy families in this area. So the Consair sheet metal department sponsored a Christmas charity ball at the Eagles hall and raised money to be expended in that cause.

Came the selection of a Christmas dinner menu.

BOUGHT STAPLES

"Why spend the allotment for each family on a turkey and trimmings that would last, at the most only a couple of days?" the Consair boys asked one another. So, they took the money and bought only "substantials."

Each of the 150 boxes to be distributed will contain a ham with plenty of celery, lettuce and apples. Each also will be overflowing with articles which may carry over for weeks. Sacks of flour, bags of potatoes and onions, jars of mayonnaise, glasses of jelly, packages of oatmeal and a variety of canned vegetables are closely packed into each container.

SWEETS SUPPLIED

And the younger members of each family are being remembered with a supply of candy and fruit.

"Gee, it's been lots of fun," said a husky metal worker as he almost staggered under the weight of a Christmas box he just had filled

American Aircraft Mechanic 12-19-40

Consair Employees Pay Increased Approximately $1,750,000

New Wage Agreement Being Negotiated by Machinists Union, No. 1125, A. F. of L. Being Completed to Satisfaction of Men and Company

At the regular Tuesday meeting held by Local 1125 the report of the Wage Review Board members was read by W. J. Chudleigh and the wage proposals negotiated with Consolidated affecting the men in the lower wage brackets and starting wage with increase every five weeks, was ratified by a vote of the union so large that it was almost unanimous. The wage rate agreed upon was virtually as reported in last week's Aircraft Mechanic, viz: 50 cents starting rate with an increase each 5 weeks until the rate at the end of six months employment will be 60c per hour. Theincrease effective immediately to apply to those that have been in the employ of Consolidated for six months or fraction thereof. Further increases to be based upon merit of individual employee. The present rule of 5c per hour bonus for the night shift to continue.

The wage review began in the Wing Department as a test and in reviewing the wages of some 2500 employees of this department, increases were granted in practically every case, the average increase being 6 to 7 cents per hour per man.

Increases in pay affecting more than 8000 employees will increase the payroll of Consolidated employees $977,626 annually; the cost of further planned increases to other employees approximate $774,770 or an increase for the present employees of approximately $1,652,396 annually.

On projected new employment during the next six months some $7,000,000 will be expended by the Consolidated.

The Wage Review will proceed as rapidly as possible by departments as scheduled.

---

tions.

Aircraft Mechanic 12-19-40

CONSOLIDATED

More than $17,000,000 will be spent for further expansion and improvement of the Consolidated Aircraft Corp. plant, under agreements announced today by the navy department.

Of the total, $14,446,929.27 will be expended by the Defense Plant Corp., an RFC subsidiary, for constructing and equipping a huge parts factory along the east side of Pacific highway, 1½ miles north of the present plant. Both contracts total $17,536,963.

Navy to Spend $3,090,044

Another $3,090,044.69 will be spent by the navy department for improvements at the present factory, Edgar N. Gott, Consolidated vice president, revealed.

The structures will contain a covered manufacturing area of 1,553,000 square feet.

Equipment Included

The rest of the Defense Plant Corp. money will be used in preparing the site, driving piles for the foundation, constructing approaches and equipping the new plant, which Gott said would be "a highly specialized production unit devoted to the manufacture of component parts and assemblies for wing and tail surface construction, with completely independent facilities for all operations requisite to their manufacture."

Gott said the combined Consolidated payroll was expected to soar to 30,000 when the new division is placed in operation. The firm has a backlog of national defense orders and order for warplanes for Britain totaling in excess of $325,000,000.

Trib-Sun 12-31-40

'Aircraft Major U. S. Industry; in Era Of Great Development,' Says Fleet

"The design and manufacture of aircraft now constitutes a major industry in this country, after many lean years of struggle," writes Maj. Reuben H. Fleet, president, Consolidated Aircraft Corp., in the firm's monthly publication, Consolidator. Forecasting a monthly payroll by the company of approximately $5,000,000 for an eventual total of more than 30,000 employes, Fleet's article continues, as follows:

"It is obvious that we are entering upon an era of great aircraft development. This company is maintaining its leadership in the industry and striving willingly to meet all demands upon it by our government.

"Great Efficiency"

"Airplanes have attained great efficiency in speed, range, weight-carrying capacity and safety. Cost of operation has been reduced until it now compares favorably for certain traffic with that of railroads.

"When one realizes that our airlines today are carrying less than 9 percent of the Pullman traveling public, that in 1940 air mail revenue was less than 5 percent of postal revenue, air express totaled only $1,500,000, and little or no air freight has so far been carried, it will be readily appreciated that, with commercial and private flying steadily increasing, commercial aviation will utilize all the available aircraft manufacturing facilities in our country when military orders are reduced.

"Essential to Security"

"The greatest demand at the present time is for military aircraft. Adequate air power is essential to national security. Down through the ages history has demonstrated that a new weapon, once adopted, has been constantly improved and put to increasing use. Periodically, nations enter into limitation agreements on certain equipment, only to redouble the armament race when agreements expire or are scrapped.

"Here, at the Consolidated Aircraft factory, with a backlog of orders of more than $315,000,000, the volume of orders on hand and in sight assures our employes of work for several years.

"Expansion Limit Nearing"

"With the completion during the next few months of the additions to our plant at Lindbergh field, we shall have reached our limit of expansion on this field and have completed our plans for enlargement when we built our first building in 1935.

"To fill orders on hand, we are now engaged in the construction of a parts plant with a total covered area approximating 1,550,000 square feet on Pacific blvd., about a half-mile from our home factory. When this new plant is completed and operating we shall have more than 30,000 employes, with a payroll of about $5,000,000 a month.

"Taxes Take 62 Percent"

"The regular federal and excess-profit taxes take approximately 62 percent of gross income; but as the two plants should annually produce $150,000,000 of airplanes and parts and we have not had to issue more stock to cover the cost of the added facilities, the net yield to our shareholders should be satisfactory.

"Apparently, until the temperament of mankind changes, world peace cannot be enjoyed in the absence of power capable of forcing and enforcing it. Such power is air power, augmented by naval power and by an army where occupation and policing of territory is necessary. Nothing within its range can stop aircraft; its range is now a continent or an ocean. Let us hope that when this war ends, possession of such aircraft, without its employment, will guarantee 'peace on earth, good will to men.'"

Union 12-28-40

Army Delays Contract for New Consair Plant

WASHINGTON, Dec. 27 (A.P.)—Last-minute pleas by advocates of other sites were said authoritatively today to have delayed the signing of contracts for a new assembly plant at Tulsa, Okla., for long range army bombers.

The war department announced last week that Tulsa had been selected as the site for such a plant and that it would be operated by the Consolidated Aircraft Corp., of San Diego, Calif.

Officials said today that the contracts had not been signed but declined to state whether there had been an unexpected delay.

FT. WORTH SITE URGED

The disclosure came after Sen. Sheppard (D-Tex) conferred with Under-Secretary Robert P. Patterson. Sheppard was said to have urged the claims of Fort Worth.

The plant under present plans is to be one of four for the manufacture of bombing planes from parts largely fabricated by the auto industry. Expected to cost from $8,000,000 to $10,000,000, it is to assemble four-motor bombers. Kansas City and Omaha have been chosen as sites for plants to assemble two-motor bombers.

FINAL DECISION DUE

An aid of Sen. Thomas (D-Okla) said the war department had held up signing of the Tulsa plant contract to permit filing of briefs by persons interested in locating the plant in Ft. Worth.

The senator's aid said a final decision on location of the plant would be made by the defense council. He said he was told by a war department official that signing of the contract with Consolidated would be delayed until after Jan. 1.

Trib. 12/27/40.

Ft. Worth Bids For Consair Factory

WASHINGTON, Dec. 27 (A.P.) — Last-minute pleas by advocates of other sites were said authoritatively today to have delayed the signing of contracts for a new assembly plant at Tulsa, Okla., for long-range army bombers.

The war department announced last week that Tulsa had been selected as the site for such a plant and that it would be operated by the Consolidated Aircraft Corp., of San Diego, Calif.

Officials said today that the contracts had not been signed but declined to state whether there had been an unexpected delay.

Ft. Worth Mentioned

The disclosure came after Sen. Sheppard (D-Tex) conferred with Under-Secretary Robert P. Patterson. Sheppard was said to have urged the claims of Fort Worth.

One of Four Plants

The plant under present plans is to be one of four for the manufacture of bombing planes from parts largely fabricated by the auto industry. Expected to cost from $8,000,000 to $10,000,000, it is to assemble four-motor bombers. Kansas City and Omaha have been chosen as sites for plants to assemble two-motor bombers.

An aid of Sen. Thomas (D-Okla) said the war department had held up signing of the Tulsa plant contract to permit filing of briefs by persons interested in locating the plant in Ft. Worth.

The senator's aid said a final decision on location of the plant would be made by the defense council. He said he was told by a war department official that signing of the contract with Consolidated would be delayed until after Jan. 1.

The San Diego Union
SUNDAY MORNING, DEC. 29, 1940

Greater SAN DIEGO

staffs and clerical help, extension of the post exchange building, auditorium with swimming pool and a motor transport building.

ADDITION COMPLETED

Commissioned recently was the 410,000 seven story addition to the aval supply depot on the embarcadero.

Other storehouses are to built within a short time on the site now ccupied by the fresh fish markets etween E and F sts. on Harbor dr. These will be connected by an arcade with the navy pier at the foot f E st. which is to be lengthened o 1000 feet and widened to 250 feet t a cost of $3,000,000.

Other local outstanding naval developments of the last fiscal year vere a 1000-feet recommissioning pier and a 1200-foot quay wall at he destroyer base, six fuel oil tanks at the La Playa fuel depot; general storehouse at the Naval Air station and additions to the air station shops.

Admirals whose flagships are stationed at San Diego carry out extensive administrative duties along far-flung sectors of the national defense program.

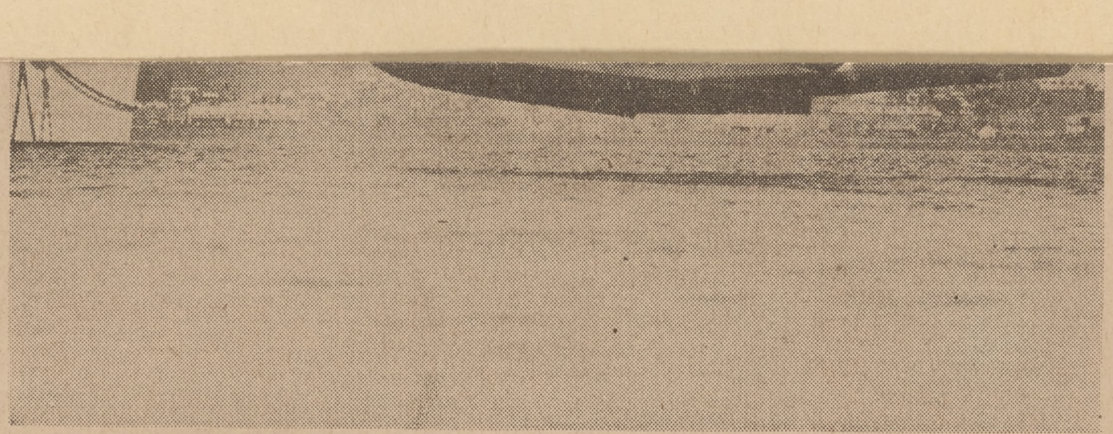
COMMANDS BATTLE PLANES

Vice Adm. William Halsey commands the high seas aircraft battle squadrons including all fighting, scouting and bombing planes operating from the carrier groups.

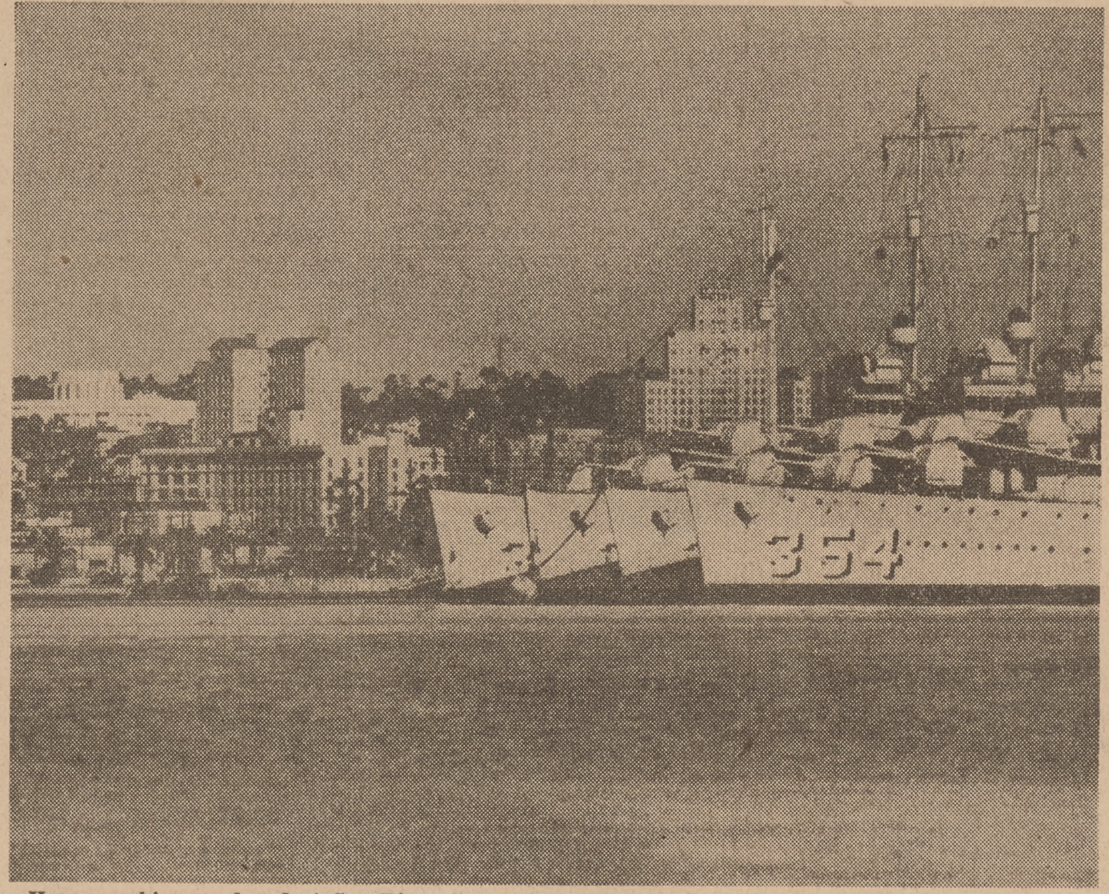
Rear Adm. Arthur Bristol has supervision of the vast network of fleet patrol wings, huge transoceanic bombers that operate over wide areas in the Pacific, Caribbean and Atlantic.

The submarine force commander has jurisdiction over the operations of sub-surface craft operating in he eastern Pacific, Panama and the Atlantic. Other flagships normally based here are those of the battle force destroyer commander; the commander of destroyer flotilla 1, and the commander of cruiser division 3.

Rear Adm. Charles A. Blakely is commandant of the 11th Naval district. His two-starred flag flies from atop the naval administration building at the foot of Broadway.



Known as the "Air Capital of the West," San Diego is the home of some of the nation's best military aviators. Huge navy planes streaking overhead are a common sight for San Diegans.



Huge warships are based at San Diego the year around and at times the harbor is literally packed with battlecraft of all kinds. From plane carriers to submarines, this is their home.

Agricultural Extension Service Established

The Agriculture Extension service is a local branch of the College of College of Agriculture of the University of California and the United States department of agriculture, and maintains a staff of agricultural specialists for San Diego county. The purpose of this organization is to provide information on all agricultural subjects. A city office is maintained at the chamber of commerce, where information and bulletins on the agriculture of the county may be obtained. This service is free to all.

San Diego Important Tuna-Packing Center

San Diego is America's most important tuna-packing center. Fifty-four percent of the tuna catch is canned in San Diego.

The tuna fleet based on San Diego comprises 68 vessels ranging in length from 50 feet to 150 feet, and carrying an average crew of 16 men. These boats are equipped with Diesel engines, refrigerating systems and other modern equipment.

They have a cruising radius of 2500 to 6000 miles, and capacities varying from 25 to 300 tons.

BUSINESS DISTRICT GROWS STEADILY

The business district of San Diego in the last 10 years has spread over an enlarged area, acquiring a more metropolitan atmosphere. Model business sections have also developed rapidly in the various outlying trade areas in the city.

The local stores, which compare favorably with those found in most of the large eastern centers of the country, serve more than 275,000 people living in San Diego's trading area.

Plane Firms Based At Lindbergh Field

Consolidated Aircraft Corp., the second largest airplane manufacturing organization in U. S. A., has its factory on Lindbergh field. The T. C. Ryan Aeronautical Co., and the Solar Aircraft Co., are now building planes and parts at Lindbergh field.

The U. S. Coast Guard has its largest base located on this field. Other important aircraft firms are now negotiating for sites on this airport.

$1,000,000 in barracks, mess halls and other facilities for the army's replacement center on the Torrey pines mesa, comprises a part of the national defense program at San Diego.

The replacement center will accommodate 7500 officers and men who will undergo training every six months. The replacement centers are establishments in which recruits will receive basic training in the branch of the service to which they are assigned after classification at the army's recruit reception centers.

NEW BARRACKS BUILT

At Ft. Rosecrans dozens of barracks will accommodate four new full battalions and a searchlight battery, comprising a total of 17 batteries.

At present the 19th Coast Artillery based at the fort is composed of three batteries to which are attached 400 officers and men under command of Col. Peter H. Ottoson. They man the 12-inch mortar batteries, the 155-millimeter guns and the three-inch anti-aircraft weapons which constitute the seacoast defenses of the port.

Powerful new guns have been assigned to the fort and they probably will be installed before many more months.

Army engineers also have surveyed the San Diego area for possible operation of 16-inch mobile guns to supplement the Ft. Rosecrans defenses.

DREDGING BIG AID

The huge $4,180,000 harbor dredging program has been of material help to the fort in providing additional space along the harbor front. The dredge Tualatin is now operating abeam Ballast Pt. depositing dredged material which will add 20 acres to the Ft. Rosecrans reservation. This acreage is to be used principally as a parade ground.

In addition to the new barracks, storehouses and other facilities essential to accommodate the rapidly expanding coast artillery forces here, the present small hospital is being expanded to house 100 bed patients.

ARMY LEASES LAND

The training center buildings are being constructed on land leased to the army by the city. The group of structures will extend over an area from the famed Torrey pine trees at the top of Torrey Pines grade along the ocean front to the old biological grade near the Scripps Institution of Oceanography at La Jolla.

The national emergency program also brought to San Diego for border patrol duty after an absence of nearly 20 years of a part of the famed 11th cavalry. These troops are now encamped near Morena. Another part of the 11th cavalry, assigned to guard the All-American canal, is encamped at Seeley in the Imperial valley.

Balboa park has many excellent bridle paths, available for riding the year round.

---

ego's climate have been compiled by the U. S. weather bureau and represent the average temperature that may be expected during these weeks:

---

of its market value, or $2500.

At the rate of $5.95 the taxes on this piece of property would be $148.75.

From these figures it will be seen that the total taxes on a home in San Diego are approximately 2.9 percent of the actual value of the property.

The following property is exempt from taxation under the California law:

1. Personal property of every householder in the amount of $100.
2. The property of Veterans to the amount of $1000, where all of the owner's property has an assessed value of less than $5000.

BOARD SETS RATE

The board of supervisors determines the county tax rate by comparing the need of the county as set forth in the budget with the property values as stated by the assessor and fixing a rate which

All persons having a gross incom of more than $5000 in the taxabl year are required to make return: A single person having a net in come of $1000 must file and marrie persons having a joint net incom of over $2500 must file a report.

The California state income ta was patterned after the federal in come tax and differs very littl from this tax, except for the fac that the rate is but ¼ of that c the federal rate and that Californi does not allow an earned incom exemption. In other words, you ma estimate your California incom tax by taking a federal form, de ducting the exemptions and multi plying by ¼ of the rate that th federal government requires. (Thi tax applies only to residents c California.)

Under the California law—notes debentures, shares of capital stock bonds, foreign mortgages, deeds c trust are no longer taxed as per sonal property.

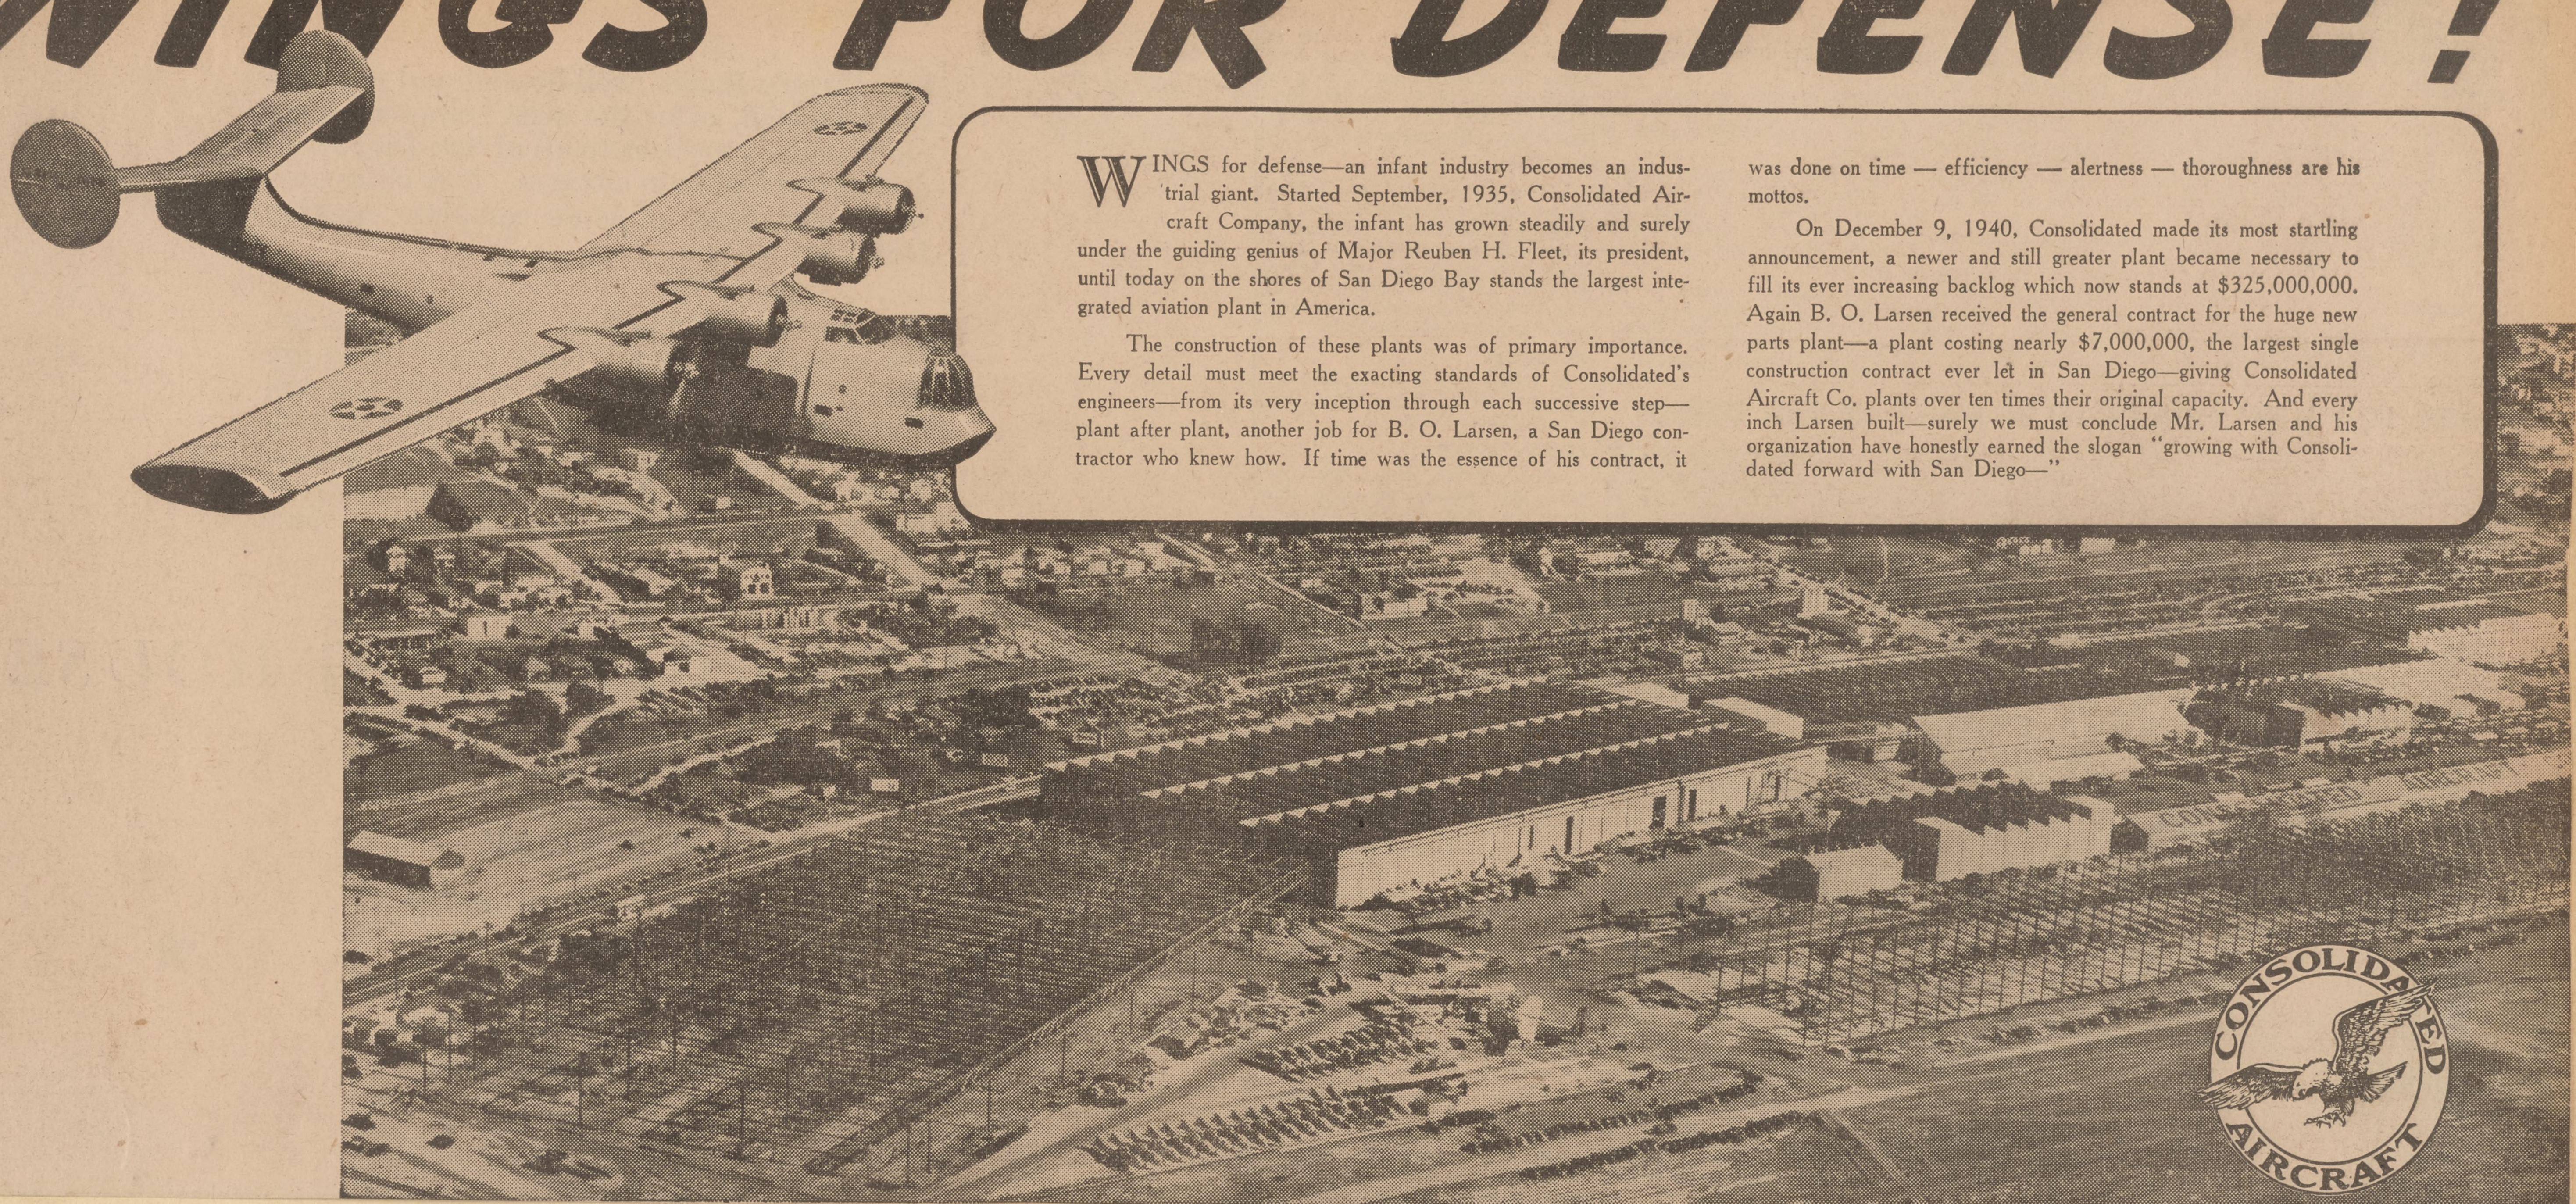
Union 12-21-40

WINGS FOR DEFENSE!



WINGS for defense—an infant industry becomes an industrial giant. Started September, 1935, Consolidated Aircraft Company, the infant has grown steadily and surely under the guiding genius of Major Reuben H. Fleet, its president, until today on the shores of San Diego Bay stands the largest integrated aviation plant in America.

The construction of these plants was of primary importance. Every detail must meet the exacting standards of Consolidated's engineers—from its very inception through each successive step—plant after plant, another job for B. O. Larsen, a San Diego contractor who knew how. If time was the essence of his contract, it was done on time — efficiency — alertness — thoroughness are his mottos.

On December 9, 1940, Consolidated made its most startling announcement, a newer and still greater plant became necessary to fill its ever increasing backlog which now stands at $325,000,000. Again B. O. Larsen received the general contract for the huge new parts plant—a plant costing nearly $7,000,000, the largest single construction contract ever let in San Diego—giving Consolidated Aircraft Co. plants over ten times their original capacity. And every inch Larsen built—surely we must conclude Mr. Larsen and his organization have honestly earned the slogan "growing with Consolidated forward with San Diego—"

Consair Employes Forming Social Club

12-28-40 Union

Formation of the Consolidated Employes' club, social organization for Consolidated Aircraft Corp. workers, is under way with a free dance scheduled tonight at club headquarters, 914 Seventh ave.

"A majority of aircraft employes are from out of town and for this reason a club was started," said Mack Tonkins, manager. "Dances are to be held frequently and sports facilities will be available to members and their families."

The club will be open daily from noon until 2 a.m.

Aviation News Features 1-1-41

"Achievements of 1940"

(Release Jan. 1)

From January 1, 1940, to January 1, 1941, 15 airplane factories in the East and on the West Coast accomplished the following:

THE EAST

Curtiss-Wright (including St. Louis division) increased floor space from 799,000 to 949,000 square feet; personnel from 4981 to 11,600.

Republic Aviation increased floor space from 200,000 to 230,000 square feet; personnel from 1350 to 2650.

Bell Aircraft increased floor space from 210,000 to 435,000 square feet; personnel from 1160 to 4300.

Vought-Sikorsky Aircraft increased floor space from 300,000 to 370,000 square feet; personnel from 1600 to 4500.

Glenn L. Martin increased floor space from 1,103,070 to 1,663,000 square feet; personnel from 13,000 to 17,500.

Brewster Aircraft increased floor space from 170,000 to 850,000 square feet; personnel from 960 to 6700.

Fairchild Aircraft increased floor space from 84,000 to 105,000 square feet; personnel from 485 to 1210.

THE WEST

Boeing Airplane Co. (including Stearman division) increased floor space from 921,000 to 1,636,000 square feet; personnel from 6500 to 10,000.

Consolidated Aircraft increased floor space from 961,500 to 1,700,000 square feet; personnel from 3200 to 14,000.

Douglas Aircraft increased floor space from 1,600,000 to 1,875,000 square feet; personnel from 14,100 to 19,200.

Lockheed Aircraft increased floor space from 668,000 square feet to 1,139,205 equare feet; personnel from 7400 to 17,400.

North American Aviation increased floor space from 600,000 to 1,012,680 square feet; personnel from 4800 to 8500.

Northrop Aircraft increased floor space from 13,000 to 516,000 square feet; personnel from 73 to 2600.

Ryan Aeronautical increased floor space from 80,000 to 160,000 square feet; personnel from 600 to 1500.

Vultee Aircraft increased floor space from 281,000 to 720,000 square feet; personnel from 848 to 5400.

Industry Backlog

Aviation December 1940

Unfilled orders of the aircraft industry now approximate $3,500,000,000, an increase of $385,000,000 in the past month consisting mainly of U.S. Navy orders. Only a year ago the industry was expanding its plant capacity to take care of a backlog which had crossed the $500,000,000 mark for the first time. Now that the U.S. Government's current aircraft purchasing program is nearly completed, plans already are being formulated in Washington for a new 20,000 military plane program to be presented to Congress early next year. Meanwhile Great Britain plans to order an additional 12,000 planes and the Dutch East Indies, among other nations, also are shopping around for more war planes. Contracts held by domestic plants come to a grand total of about 39,000 fighting craft; 25,000 for the American military and naval forces, and 14,000 for the British. The following table gives the latest approximate unfilled orders in dollar volume of 23 primary producers of planes or aircraft engines.

Allison (General Motors)	$100,000,000
Aviation Corp.	20,000,000
Beech	22,000,000
Bell	60,000,000
Boeing	203,000,000
Brewster	100,000,000
Cessna	11,000,000
Consolidated	300,000,000
Continental Motors	35,000,000
Curtiss-Wright	520,000,000
Douglas	400,000,000
Fairchild	15,000,000
Ford	122,000,000
Grumman	20,000,000
Lockheed	211,000,000
Martin	322,000,000
North American	225,000,000
Northrop	24,000,000
Packard	217,000,000
Republic	65,000,000
Ryan	12,000,000
United Aircraft	430,000,000
Vultee	95,000,000
	$3,529,000,000

Two Bombers to Take Off for Great Britain Today

Camouflaged Air Boats, at San Diego, Expected to Take New Route Because of Weather

SAN DIEGO, Dec. 30.—Two heavily camouflaged Consolidated PBY-type long-range patrol bomber seaplanes tentatively are scheduled to take off from San Diego Harbor about 6 a.m. tomorrow on a flight across the continent en-route to Great Britain.

Because of unfavorable weather conditions along the route taken several weeks ago by the first two air boats in a Royal Air Force order of several hundred bombers, the craft are expected to fly to Elizabeth City, N.J., and thence to Bermuda before attempting the long and hazardous trans-Atlantic crossing to England.

PREVIOUS ROUTE

The previous route was to Port Washington, Long Island, by way of Ft. Worth, Tex., and on to Halifax, N.S. Poor operating conditions during winter at Halifax have necessitated the use of Bermuda as an intermediate stop, it was learned. The planes will stop at Ft. Worth again on tomorrow's trip.

Elizabeth City, about 2400 airline miles from San Diego, is the site of the Coast Guard's newest and finest air station.

CRAFT FACE TEST

Bermuda is 725 miles beyond, and the flight to England, 3600 miles, will test almost to the limit the nonstop range of the bombers.

Pilots of the planes are expected to be Doug Kelley, veteran San Diego private aviator, and Rodney Jackson of New York.

Trib-Sun 12-31-40

Planes Leave S. D. On Hop to England

On the first leg of a flight to England, two San Diego-built Consolidated bombers left here at 6 a.m. today, according to report at Lindbergh field. The planes will stop en route to the east coast at Ft. Worth.

Pilots who took the planes from San Diego are Douglas Kelley and Roland Jackson. A few weeks ago the first planes of an order for England left here. The planes are camouflaged an olive green.

International News Service reported that the planes leaving today would go to England by way of Bermuda after stops at Fort Worth and Elizabeth, N. J. Decision to take off from Bermuda was due to reports of unfavorable weather over the north Atlantic.

Unverified rumors at noon were that two more planes might leave before nightfall, followed by one or two planes later in the week.

Consair Bombers To Take Off Today

Scheduled to take off at 6 a.m. today, two Consolidated built bombers of the PBY type will make the first leg of a trip to England. The planes will go to Ft. Worth, Tex., before proceeding to the east coast, where they will be taken across the Canadian border and delivered to the Royal Air force.

At the controls will be Doug Kelley, of San Diego, and Roland Jackson, of New York. The bombers are the third and fourth of a large order being constructed for Britain by the Consolidated Aircraft Corp.

about 11-21-40.

NEW YORK, Monday.

It is reported from San Diego, California, to-day, that work on an undisclosed number of bombers for the R.A.F. has reached an advanced stage at the Consolidated Aircraft Corporation's factory.

Known as B-24, this 20-ton four-engined machine is believed to be the most powerful long-range bomber in the United States, and incorporates many improvements on the so-called Flying Fortress type.

The same firm are making 600 twin-engine seaplane bombers for Britain.

Yesterday two twin-engine Douglas bombers, which are said to be better than anything of the kind yet sent to England, arrived in New York from California. It is understood that these form part of an order originally placed by the French purchasing commission.

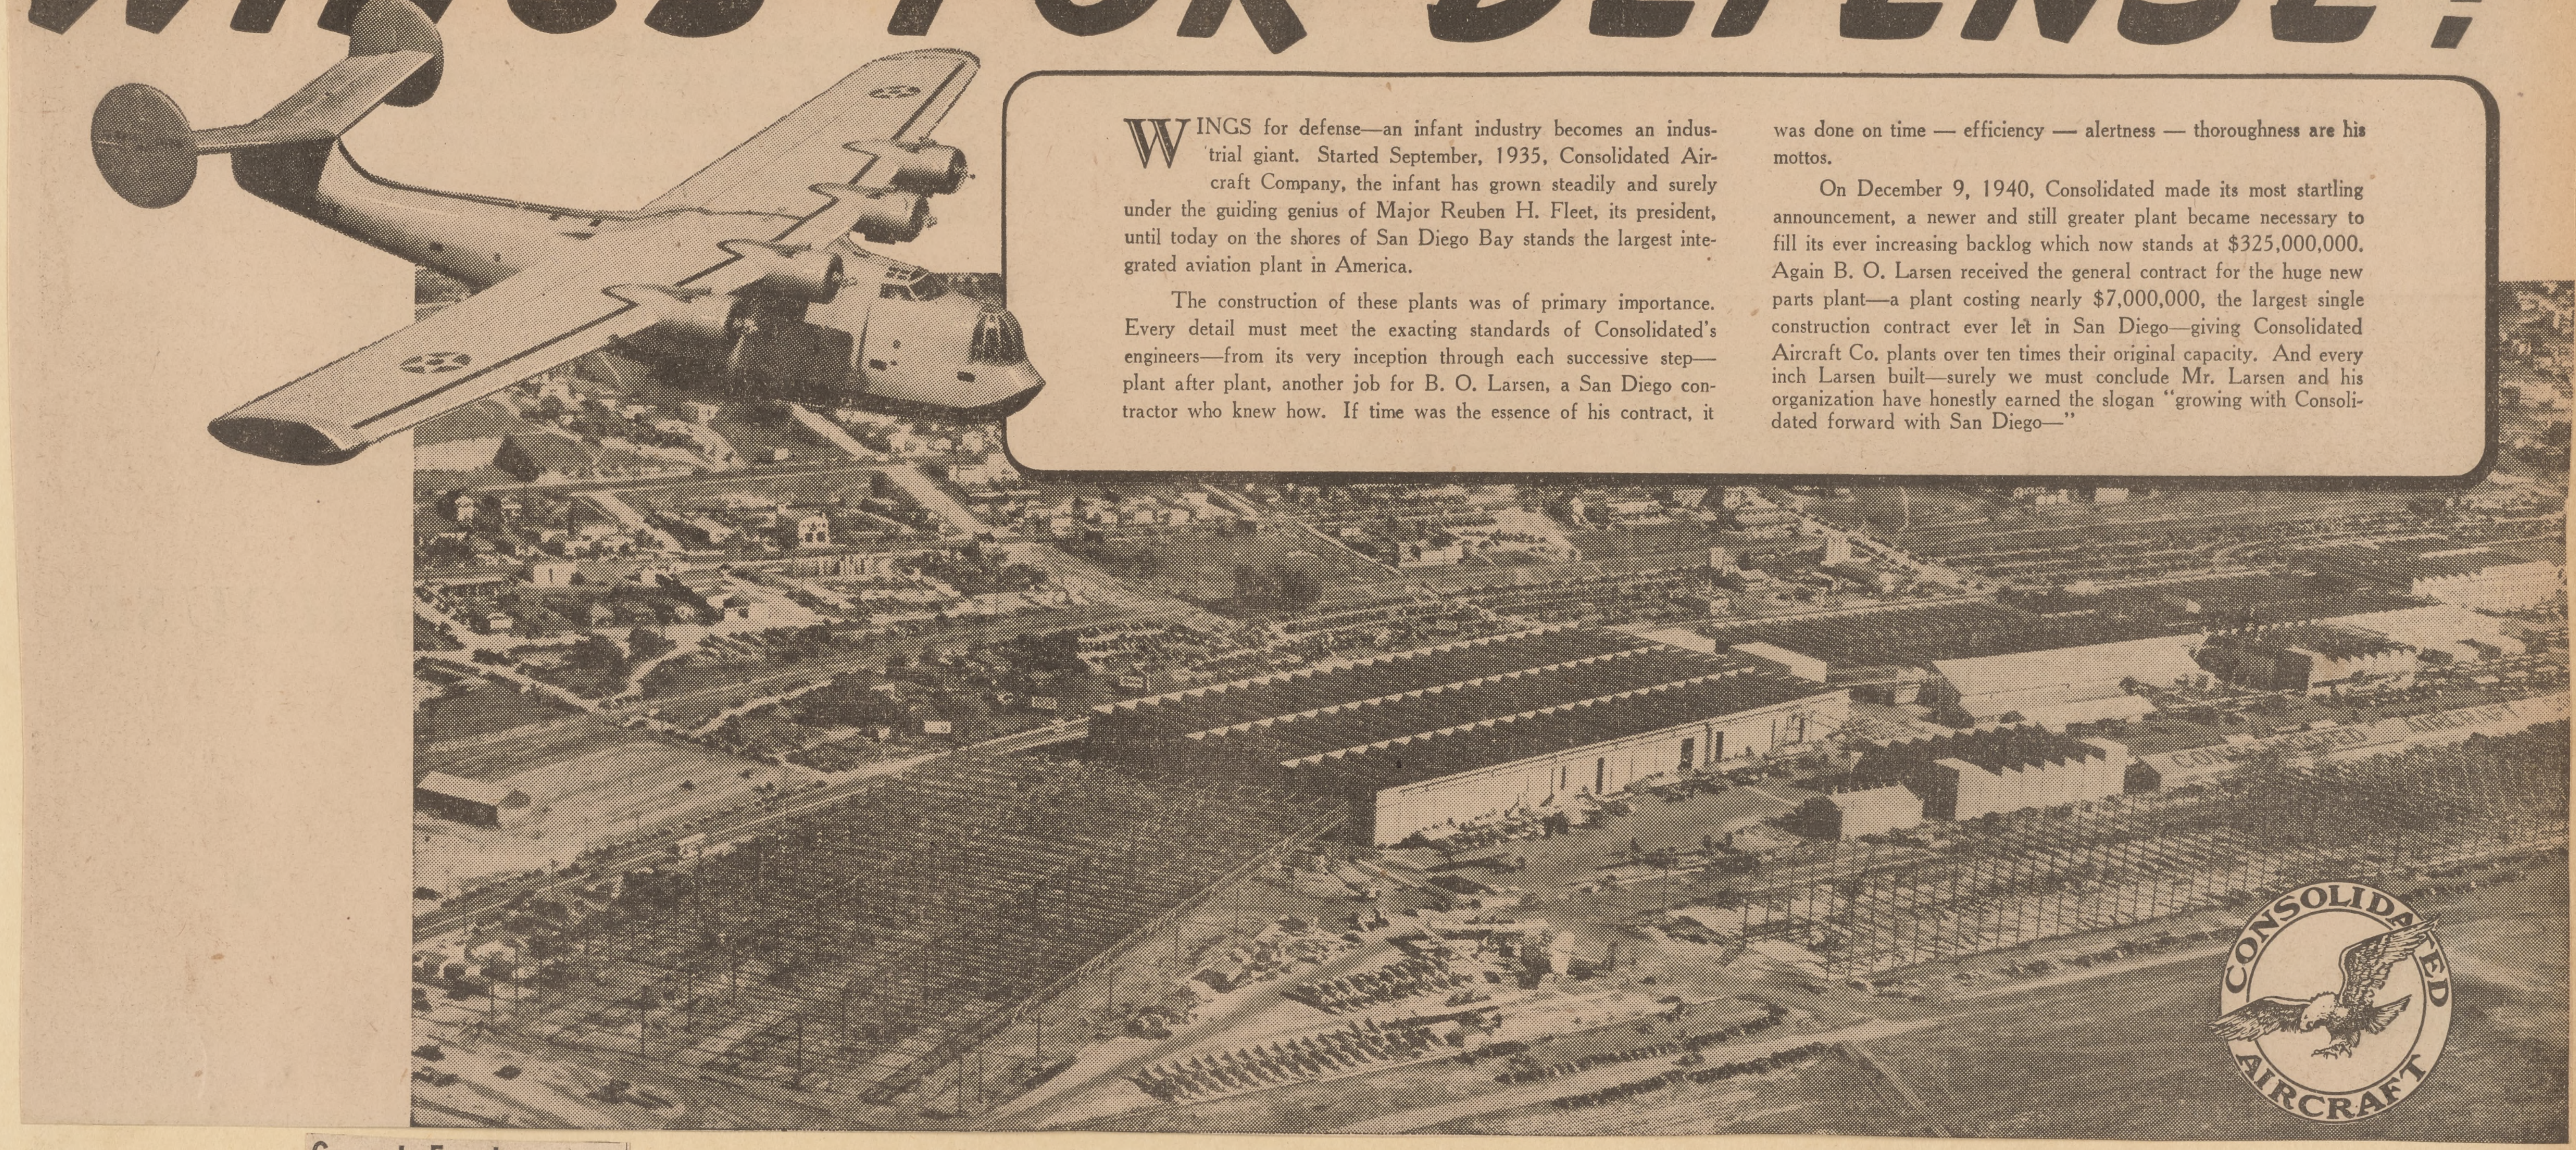
WINGS FOR DEFENSE!



WINGS for defense—an infant industry becomes an industrial giant. Started September, 1935, Consolidated Aircraft Company, the infant has grown steadily and surely under the guiding genius of Major Reuben H. Fleet, its president, until today on the shores of San Diego Bay stands the largest integrated aviation plant in America.

The construction of these plants was of primary importance. Every detail must meet the exacting standards of Consolidated's engineers—from its very inception through each successive step—plant after plant, another job for B. O. Larsen, a San Diego contractor who knew how. If time was the essence of his contract, it was done on time — efficiency — alertness — thoroughness are his mottos.

On December 9, 1940, Consolidated made its most startling announcement, a newer and still greater plant became necessary to fill its ever increasing backlog which now stands at $325,000,000. Again B. O. Larsen received the general contract for the huge new parts plant—a plant costing nearly $7,000,000, the largest single construction contract ever let in San Diego—giving Consolidated Aircraft Co. plants over ten times their original capacity. And every inch Larsen built—surely we must conclude Mr. Larsen and his organization have honestly earned the slogan "growing with Consolidated forward with San Diego—"

Consair Employes Forming Social Club

12-28-40 Union

Formation of the Consolidated Employes' club, social organization for Consolidated Aircraft Corp. workers, is under way with a free dance scheduled tonight at club headquarters, 914 Seventh ave.

"A majority of aircraft employes are from out of town and for this reason a club was started," said Mack Tonkins, manager. "Dances are to be held frequently and sports facilities will be available to members and their families."

The club will be open daily from noon until 2 a.m.

Aircraft Plants Have $340,000,000 Backlog

Factories Hum With Activity For U.S. Defense

By HOWARD MORIN

San Diego's three major aircraft manufacturing plants, with a total backlog of $340,000,000, are playing an important part in the national defense program.

Consolidated Aircraft Corp. has a backlog of $325,000,000 and is constructing bombers not only for the U. S. war and navy departments but also long range bombing aircraft for the British Royal Air force.

The Ryan Aeronautical Corp. is working night and day on $11,000,000 worth of military contracts. The Solar Aircraft Co., engaged chiefly in the manufacture of manifolds and other aircraft accessories, has a backlog of $4,000,000.

All three companies have been compelled to expand their production facilities by frequent enlargement of their factories at the municipal airport.

EMPLOYES INCREASE

In the early part of December the three aircraft concerns were employing a total of nearly 17,000 men and women. This number will be more than doubled by this spring when new additions to the plants will be in full operation.

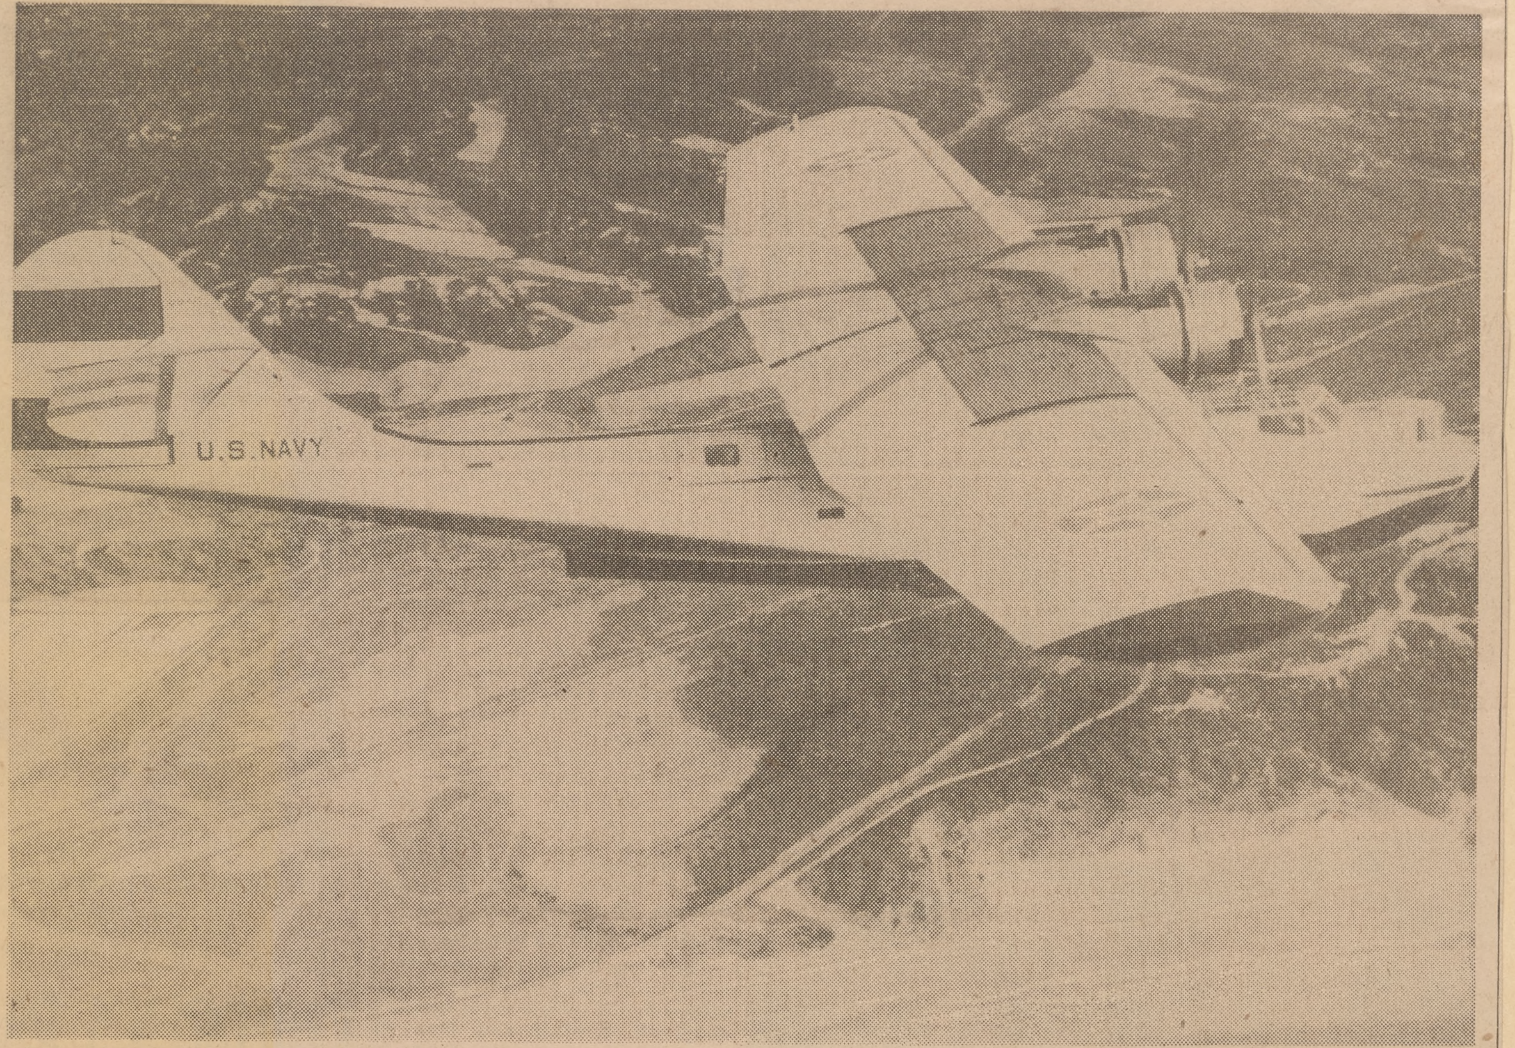
A $7,000,000 construction program which virtually will double the size of Consolidated is now under way. Eight new buildings are being erected along Pacific highway between Barnett ave. and Rosecrans st. Principal units will compose a huge parts plant, and a three-story drop hammer building which will house the largest battery of drop hammers and hydraulice presses on the Pacific coast.

The new buildings are situated on a factory site of 52 acres with 72 acres of adjacent parking area. Each of the three large units will be 400 by 750 feet. The smaller structures will include an office building, 750 by 50 feet; the drop hammer building 400 by 60 feet, a paint shop, a warehouse and a boiler plant.

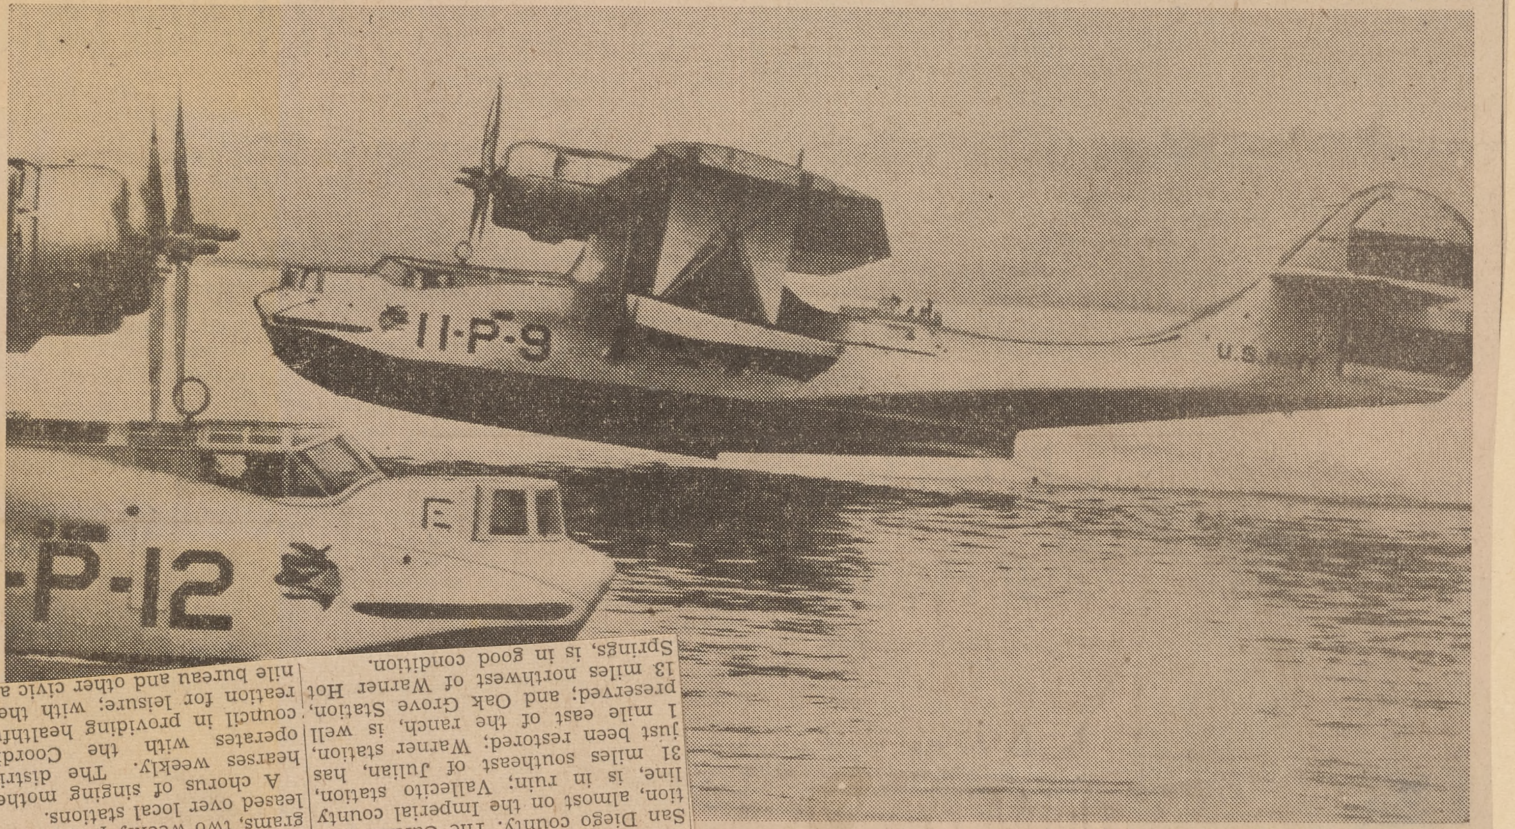
FLOOR AREA EXTENDED

The expansion program will increase the floor area of Consolidated to 1,630,02[illegible] square feet and the paved yard [illegible] to 1,100,141 square feet, a grand total of 2,730,167 square feet, an increase of 1000 percent of manufacturing area since 1935.

Although the Ryan company completed a new factory at Lindbergh field in June, 1939, additional government contracts made



Pictured is the famous Consolidated Model 28 twin-engined flying boat, the latest U. S. navy PBY-5, in flight. The PBYs have made Consolidated the largest manufacturer of flying boats in the world and have brought numerous records to the credit of local engineers.



in massed, non-stop flights over long distances from their San Diego base.

ticipates in many civic activities, such as providing for the sick, the needy and afflicted.

The membership of the auxiliaries attend to most of the hospital visitations and give their help to needy families, sewing clothes, making pajamas and night clothes for the Crippled Children's Home and other institutions such as the veterans' facilities and hospitals. It is estimated that more than $1200 was spent for cloth and thread alone in 1940 for this splendid work.

Four Stage Stations Established in County

From 1858 to 1861, stages operated over the southern route from San Francisco to Saint Louis. Four stations were established in eastern San Diego county. The Carizzo station, almost on the Imperial county line, is in ruin; Vallecito station, 31 miles southeast of Julian, has just been restored; Warner station, 1 mile east of the ranch, is well preserved; and Oak Grove Station, 13 miles northwest of Warner Hot Springs, is in good condition.

councils: El Trabajo, north end of county; Mt. Helix, east; Sweetwater, south; San Diego-elementary; and Sunset Secondary for high schools. Each association has representation at the annual state convention, which fixes state policies and elects officers.

As suggested in this year's district theme, "Our Homes, Our Schools, Our Children," this vigorous organization has a wide array of activities that engage the interests of its members.

The primary interest being instruction for parents, a strong program of discussion groups and meetings is maintained in cordial cooperation with the city schools; subject matter ranges from views of classroom procedure to family life problems. Citizenship and tolerance are emphasized. In addition to national and state radio programs, two weekly programs are released over local stations.

A chorus of singing mothers rehearses weekly. The district cooperates with the Coordinating council in providing healthful recreation for leisure; with the Juvenile bureau and other civic agencies

clude canned fish, confectionery and olives, onyx, marble, cement pipe, brick and tile, soaps, gas heaters, citrus products, macaroni and numerous other items.

Adobe Ranch Houses Still Standing Here

Several excellent examples of adobe ranch houses remain in San Diego county; many are off the main highways and difficult to reach. Agua Hedionda, known as the Kelly Ranch house, is three miles east of Carlsbad. Guajome, home of Cave J. Couts, three miles northwest of Vista. Osuna, homes of Juan Maria Osuna and Leandro Osuna, both homes at Rancho Santa Fe. Santa Margarita, one of the finest and best preserved adobes in California, is 10 miles northeast of Oceanside on the coast highway, or 7 miles southwest of fallbrook. The Sawday ranch house in the Valle de San Jose is just east of the junction of the Warner Hot Springs and San Felipe highways

An Open Letter

Messrs. Fleet and Associates,
Consolidated Aircraft Corp.
City
Gentlemen:

San Diego, Calif.
Dec. 23rd, 1940

I herewith present you with a challenge and a tribute. He who was the very embodiment of truth and the expression of the wisdom of all the ages, said: Render therefore unto Ceasar the things which are Caesar's and unto God the things that are God's.

You by your industrial initiative together with your power and wisdom to organize, have created in and for this city a great industrial enterprise, and for its populace a great opportunity, viz. the opportunity of Work and Progress. In the perpetuation of this great task as embraced in your program for the future we bid you Godspeed and wish you well. For what you have already accomplished and what you will yet achieve, we pay you tribute—for unto you, tribute is due.

Our challenge can best be expressed in the following lines which we have penned and which we now dedicate to you in this most crucial hour.

A. A. Perry,
Employee No. 795,
Consolidated Aircraft

AMERICA AWAKE

★

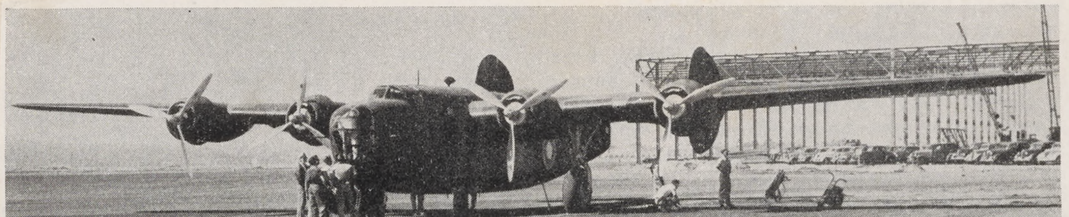
Production is the cry
Production is the need
This message oft repeated
We do well to heed.
Yes! Let us build armaments
And be sure we build them well
Not for aggression's purpose
Nor aught of recompense
But let us build them swiftly
For safety and defense.

Awake ye workers of America
Heed not the subtle power
Of discord and dissension
In this jeopardizing hour.
Today is yours in which to build
Great ships of sea and air
Therein lies supremacy
Here and everywhere.
Eventualities await
For them we must prepare
And to this end not hesitate
On land or sea or air.

Freedom's in the balance
Because of greed and hate
And if Totalitarians had their way
We'd be a vassal state
But this to them we will deny
On land and sea and sky.

Arouse ye builders of this craft
Before it is too late
Lest we like those across the seas
Suffer like terrible fate.
Our country's call we then will heed
Our energies we'll give
That Freedom's Cause, triumphantly
Forever then shall live.

Aviation — December, 1940



Wide World

A NEW FOUR-ENGINED BOMBER built by Consolidated Aircraft for Britain's Air Force. Large numbers of these planes are under construction at San Diego and will probably be flown across the Atlantic. The planes can carry four tons of bombs at 300 m.p.h. for 3,000 miles non-stop. Camouflage and RAF markings are already painted on as the bomber is prepared for test flight.

FAST BOMBERS FOR BRITAIN

NEW AMERICAN MACHINES

FROM OUR OWN CORRESPONDENT

NEW YORK, Nov. 18

?

The first two of an order for 70 or more Douglas bombers for Britain, superior to any hitherto sent abroad, arrived here on Saturday by air from California. They are similar in design to the D.B. 7-1 bombers now being bought by the United States Army—monoplanes with tricycle landing gears, powered with two 1,050 h.p. Pratt and Whitney engines, which give them a cruising speed of more than 280 miles an hour. In addition to bomb racks they have emplacements for three machine-guns.

It is said that the bombers were ordered originally for France, and were diverted to Britain after the surrender of France.

A report from San Diego says that the Consolidated Aircraft Corporation has nearly completed the first of a number of huge bombers for Britain, which are described as probably the most powerful long-range bombers in the world, superior even to the famous B-17 " flying fortresses." These B-24 aeroplanes are four-engined craft weighing 20 tons each. They have a cruising range of more than 3,000 miles, and a speed of more than 300 miles an hour, and can carry 8,000lb. of bombs.

(21st Nov.)

21/11/40

"Daily Telegraph"

LONDON, ENGLAND

U.S. SENDING NEW TYPE 'PLANE

BOMB SIGHT FOR BRITAIN

FROM OUR OWN CORRESPONDENT

WASHINGTON, Wednesday.

Gen. Marshall, United States Chief of Staff, announced to-day that 26 heavy four-engined bombers, equipped with the Sperry bomb-sight, had been released by the Priorities Board for despatch to Britain.

The bombers, which are being manufactured by the Consolidated Aircraft Co., are very similar in effectiveness to the famous Flying Fortresses, with a range of 3,000 miles. They are the first machines equipped with the Sperry bomb sight to be released to Britain. The United States is retaining for her own use the more modern Norden bomb sight.

Three of the new machines are due to be delivered this month and three in December, while 20 more are due to be delivered before March. Gen. Marshall pointed out that no comparable 'plane had ever been used in active operations, and the United States was anxious to see the results.

BRITISH EQUIPMENT

He also stated that Britain, in consideration of the release of the bombers, had agreed to supply to the United States sufficient engines to equip 41 Flying Fortresses.

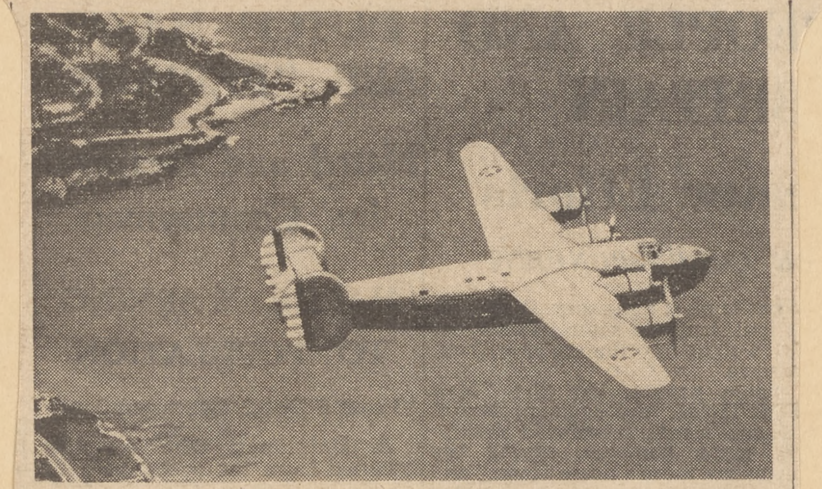
He disclosed that the United States Army has observers in British warplanes flying over Britain and the English Channel, but they had not flown over Germany.

The latest transaction means deliveries over and above the rough fifty-fifty rule announced recently. This rule, officials explain, was always intended to be a flexible standard.

American aircraft production is being speeded up as rapidly as possible with a view to reaching peak production by the Spring, when a British aerial offensive is anticipated. This speed up will be in the nature of an emergency spurt and may slow down deliveries some months after, but officials believe this is better than attempting a steadily rising flow which bears no relation to military requirements and strategy.

(LONDON – ENGLAND.)

THE SUNDAY TIMES, NOVEMBER 24, 1940



The new American bomber, B-24.

POWERFUL NEW BOMBERS FROM AMERICA

Greatest U.S. Contribution To Victory

By THE "SUNDAY TIMES" AIR CORRESPONDENT

News that America has released twenty-six Consolidated B-24 four-motor bombers for immediate delivery to the R.A.F. is most encouraging.

The Consolidated Model 32, designated the B-24 by the U.S. Army, is by far the best military aeroplane which the U.S.A. has yet produced and the first American aeroplane on which we can really bestow unreserved enthusiasm.

It is fast, it is well defended (British gun turrets can be installed) it can carry a big load of bombs, and it has a long range. It is superior to any bomber at present in service, though not to some of our new machines now flying. It is vastly better than the old Boeing B-17 "flying fortresses"—as indeed it should be for it is five years later in design.

Before France fell the Armée de l'Air had ordered 120 of these Consolidated bombers, but orders previously placed by the U.S. Army had to take precedence. Great Britain took over all the French orders, but the gesture by America will mean that deliveries can begin immediately. The first production model flew three weeks ago.

3,000-MILE RANGE

The B-24 is claimed to have a top speed of round about 330 m.p.h., a bomb load of 4,000 lb., and a maximum range of more than 3,000 miles. So, in fact, it could fly from New York to England by way of Berlin.

The best feature of the machine aerodynamically, which accounts for its high speed, is its wing, designed on a new principle. This "Davies" wing, which in plan is very long and narrow, resembling a paper knife, presents about one-third less resistance to the air than a conventional type. The making of such a long thin wing, constructionally stiff, is a triumph of engineering.

There has been some confusion between the Consolidated bomber and the Boeing bomber. Apart from the fact that they both have four motors, there is little similarity. Incidentally, the Boeing Company has copyrighted the name "Flying Fortress"—which is misleading anyway.

The sending of these Consolidated bombers for the R.A.F. to intensify the offensive is one of the greatest contributions America can make towards the winning of the war.

THE R.A.F.'s NEW COMMAND

CO-OPERATION WITH THE ARMY

The new Army Co-Operation Command of the R.A.F. comes into being on December 1. The decision to form this new Command successfully avoids the drawbacks of handing over a separate Air Arm to the Army, yet presents to it a specialised body of Air Power under an officer—Air Marshal Sir Arthur Barratt—who came from the Army and thoroughly understands Army problems as no purely Army officer understands the air.

The step satisfies all the requirements outlined in these notes some weeks ago, yet has few disadvantages.

Its great merit is its elasticity. So long as that is maintained the R.A.F. can fall into none of the troubles which the Luftwaffe dug for itself in its rigid training for and adherence to the dictates of the German Army.

Air strategy of necessity calls for an independent air force. There are times when the whole of the available fighter strength may be needed for defence of a single objective. There are times when the whole of the R.A.F. may have to be flung in to support of land forces.

The Army Co-operation Command forms thus a nucleus, which at times may serve as the hub of the operation of all the other Commands of the R.A.F., or it may form a small preserve from which the other Commands may draw machines for support in independent action as the situation needs.

As a strategic weapon the Army Co-Operation Command finds efficiency in its specialisation and strength in its elasticity.

November - December 1940

Consolidated

In its immense plant adjacent to Lindbergh Field on San Diego Bay, Consolidated Aircraft Corp. is turning out huge flying boats and landplanes weighing from 27,000 to 65,000 pounds and costing upward of $200,000 each.

Consolidated has always specialized in building large airplanes. The company claims the distinction of having built, since its inception in 1923, four times as many ships with a wing span of 100 feet or more as all other United States aircraft manufacturers combined.

Huge mechanical and hydraulic presses, including one of 4,500 tons, large hydraulic drop hammers and hulls for the twin-engined PBY patrol bomber lined up 50 strong on the final assembly line, all convey the idea of great size.

When Consolidated transferred its activities to San Diego from Buffalo, N. Y., in 1935 it had about $6,000,000 of business on its books. It started operations with some 300 employes in a plant containing roundly 200,000 square feet of floor space. Today the company has an order backlog exceeding $320,000,000 and by February 1 next year expects to have roughly 1,500,000 square feet of covered floor area, plus a substantial paved but uncovered area suitable for final assembly work, and between 15,000 and 16,000 employes. This, however, will not complete Consolidated's expansion program.

Consolidated has greatly enlarged its plant this year and increased the number on its payroll from about 3,200 on January 1, to almost 14,000 at present. Consolidated today has an estimated $25,000,000 worth of parts and planes in various stages of production which should begin flowing off the final assembly line in steadily increasing numbers from now out.

On the basis of the present schedule deliveries from existing facilities, against contracts now on the books, should attain their peak around March or April. The latest addition should be completed by about June 1 and reach its peak employment of roughly 12,000 by November of next year.

Consolidated currently is working two ten-hour shifts five days a week. Like most other manufacturers it could undoubtedly enlarge its output by either working an additional day or adding another shift. This, however, has not proved feasible as yet as production of the air-frame manufacturers naturally must be geared to that of their suppliers and sub-contractors, as well as that of the engine producers.

At this time Consolidated is in production on three models but actually is making deliveries in any quantity on only one type. It is manufacturing a twin-engined flying boat for the Navy and the British, a four-engined flying boat, the PB2Y, for the Navy, and a four-engined land bomber, the model 32 or B-24, for the Army and British. This bomber, the prototype of which was first flown in 1939, marks Consoldiated's return to the landplane field. It is a high-wing ship, with a tri-cycle landing gear, which, according to available information, has a speed of over 300 miles per hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

Parts Plant

The company has just announced a $7,000,000 addition which will approximately double its present floor area. So far Consolidated has financed its own expansion, having previously spent or committed itself to spend this year approximately $6,000,000 for enlargement of manufacturing facilities. The latest addition, however, it is understood will be financed by the Government and leased by the company.

The new addition, according to present plans, will be devoted to the manufacture of parts and minor assemblies with existing facilities turned almost entirely to final assembly work. This does not mean, however, that Consolidated is not planning to sub-contract some of its work. It is already doing considerable sub-contracting and plans to do more as it swings into increased production on its present orders.

THE SAN DIEGO UNION: SUNDAY MORNING, DEC. 29, 194

Aircraft Plants Have $340,000,000 Backlog

Factories Hum With Activity For U.S. Defense

By HOWARD MORIN

San Diego's three major aircraft manufacturing plants, with a total backlog of $340,000,000, are playing an important part in the national defense program.

Consolidated Aircraft Corp. has a backlog of $325,000,000 and is constructing bombers not only for the U. S. war and navy departments but also long range bombing aircraft for the British Royal Air force.

The Ryan Aeronautical Corp. is working night and day on $11,000,000 worth of military contracts. The Solar Aircraft Co., engaged chiefly in the manufacture of manifolds and other aircraft accessories, has a backlog of $4,000,000.

All three companies have been compelled to expand their production facilities by frequent enlargement of their factories at the municipal airport.

EMPLOYES INCREASE

In the early part of December the three aircraft concerns were employing a total of nearly 17,000 men and women. This number will be more than doubled by this spring when new additions to the plants will be in full operation.

A $7,000,000 construction program which virtually will double the size of Consolidated is now under way. Eight new buildings are being erected along Pacific highway between Barnett ave. and Rosecrans st. Principal units will compose a huge parts plant, and a three-story drop hammer building which will house the largest battery of drop hammers and hydraulice presses on the Pacific coast.

The new buildings are situated on a factory site of 52 acres with 72 acres of adjacent parking area. Each of the three large units will be 400 by 750 feet. The smaller structures will include an office building, 750 by 50 feet; the drop hammer building 400 by 60 feet, a paint shop, a warehouse and a boiler plant.

FLOOR AREA EXTENDED

The expansion program will increase the floor area of Consolidated to 1,630,02[illegible] square feet and the paved yard [illegible]a to 1,100,141 square feet, a grand total of 2,730,167 square feet, an increase of 1000 percent of manufacturing area since 1935.

Although the Ryan company completed a new factory at Lindbergh field in June, 1939, additional government contracts made it obligatory to build another addition in 19[illegible] which more than doubled the floor area of the original factory. Two wings are now being added to the company's administration building on Pacific highway to meet increasing needs of engineering and office space.

In August and September Ryan received from the Air corps two large orders for its new ST-3 primary training plane—orders totaling $7,425,000. These orders are sufficient to keep the plant running at a high capacity during the next 18 months.

NEW TRAINER BUILT

The new ST-3 trainer, incidentally, is the latest development of the long line of Ryan S-T trainers which were first built in 1934 and subsequently refined by engineering changes until today the S-T is widely considered to be the finest primary military training plane available.

Work currently in the process of construction also includes a million dollar order for Ryan S-T-M military training planes for export to a foreign government. Many of these trainers are to be equipped with sea floats, the first time that Ryan has offered its famous trainers for the training of naval pilots.

The company recently established an unusual record of test flying two new type trainers in a single day at San Diego's Lindbergh field. The Ryan factory now has 1500 employes on its payroll and an additional 1000 are expected to be hired within the next five or six months so that the Ryan planes called for under the national defense program may be delivered on schedule.

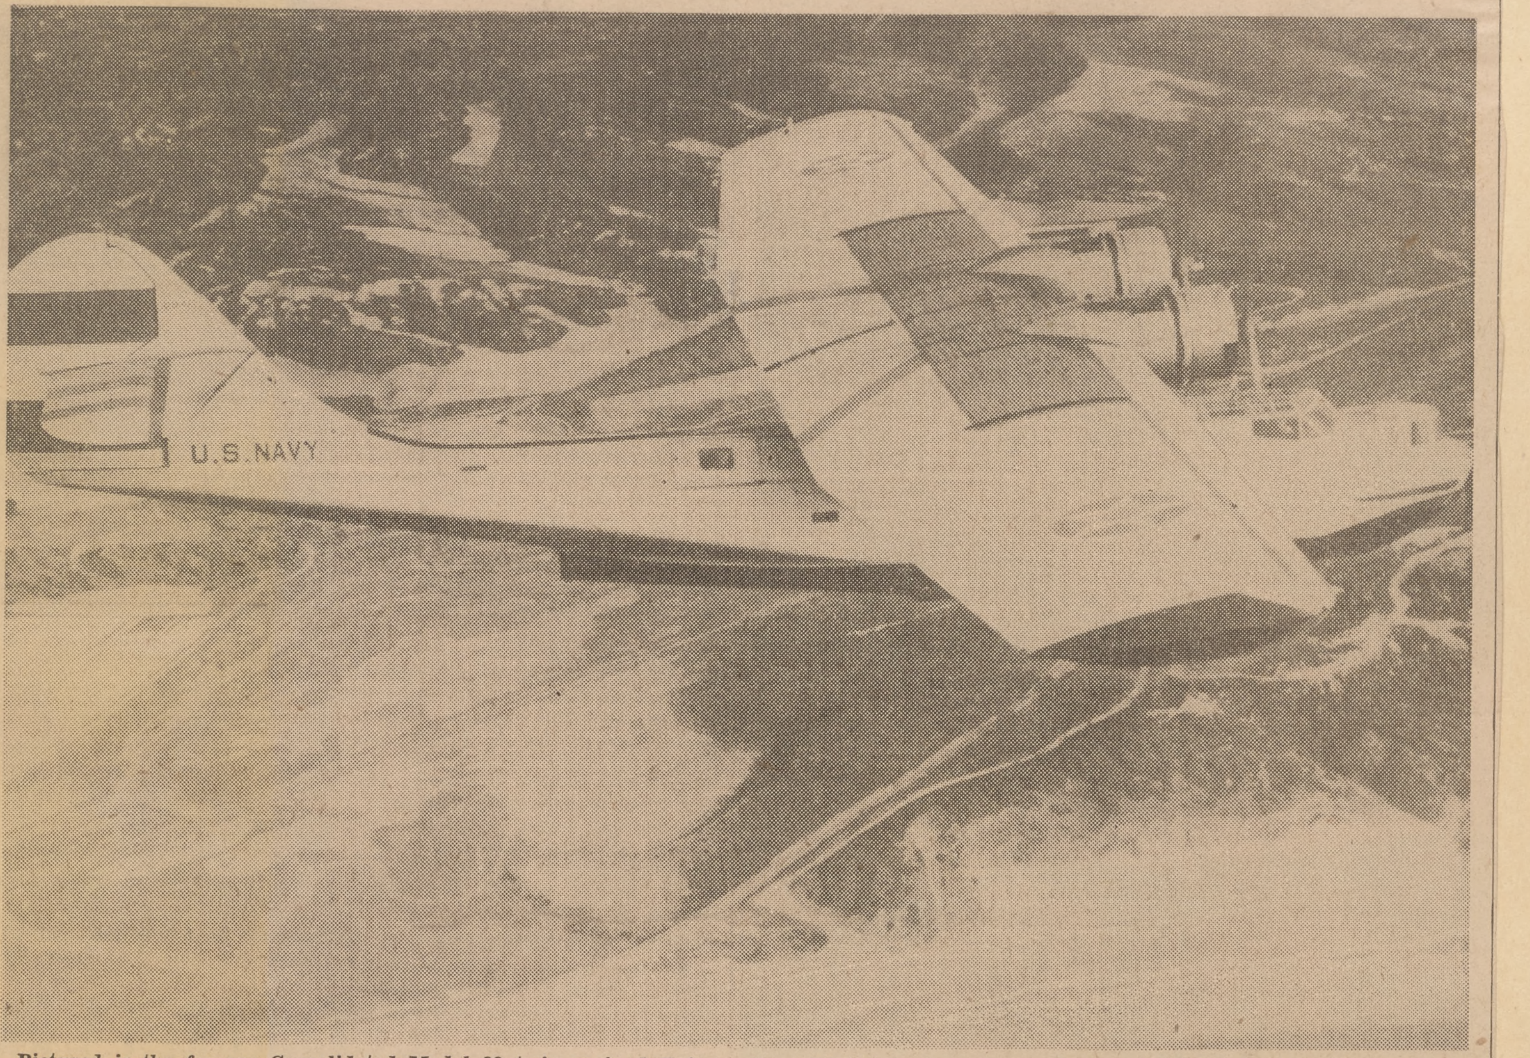
TO INCREASE OUTPUT

Current deliveries are being made at the rate of approximately two trainers per working day with the expectation that this rate will be greatly accelerated when the company finishes preparing tools necessary for the Air corps' type standardization mass production plan.

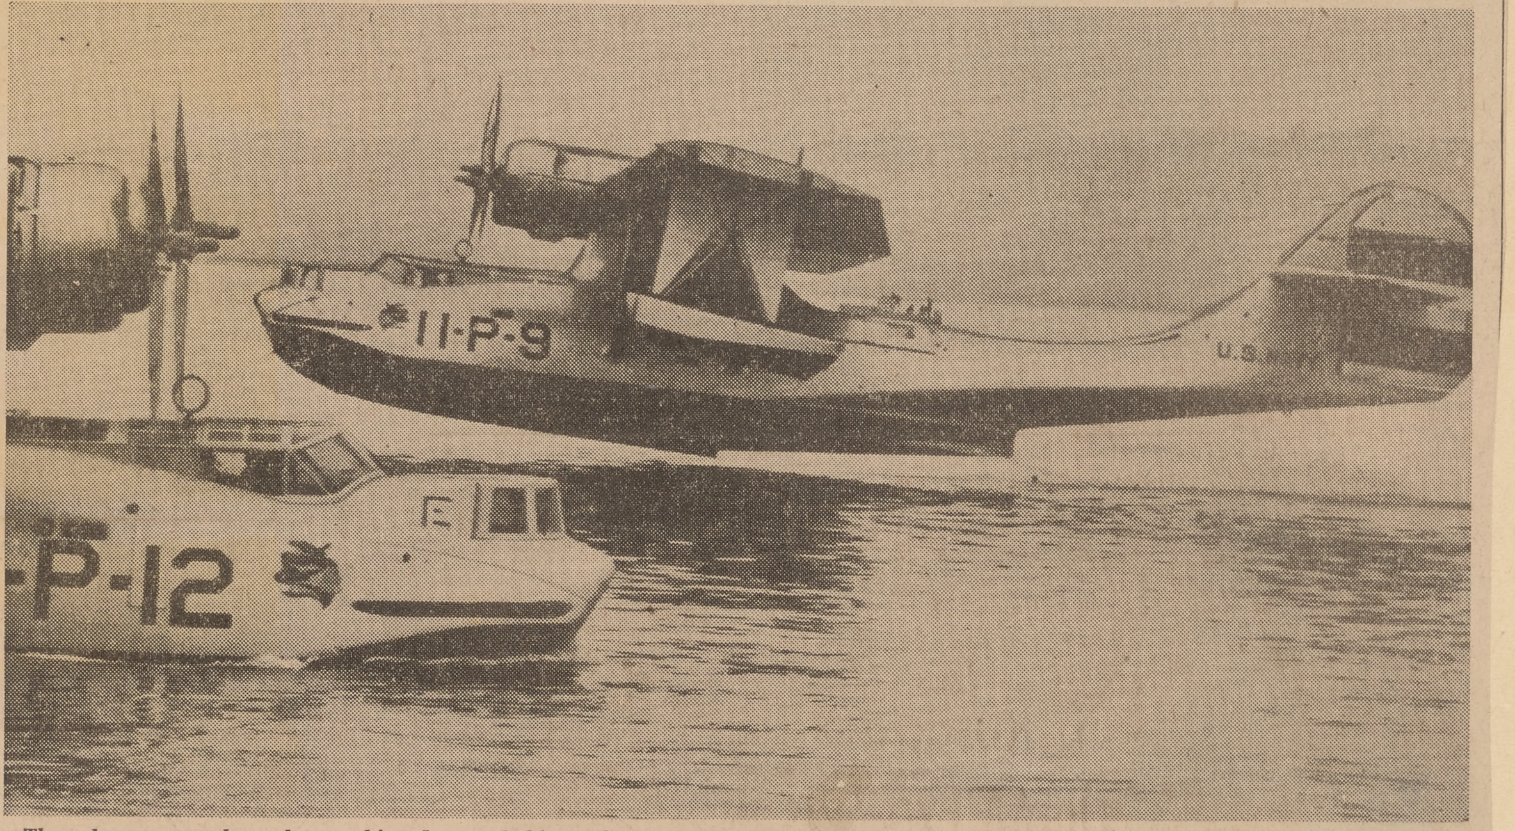
The Solar plant with a force of 650 workers has been trebled within the last year and additional ground has been obtained under lease from the harbor department for expanding the present facilities.

Local aircraft manufacturers are keenly alive to the fact there will be a slump at the end of the war but they are taking extraordinary precautions to avoid major lay-offs when this time comes. They are attuned primarily to the growing needs of American aviation, military, naval and commercial, and only in a limited way to foreign markets.

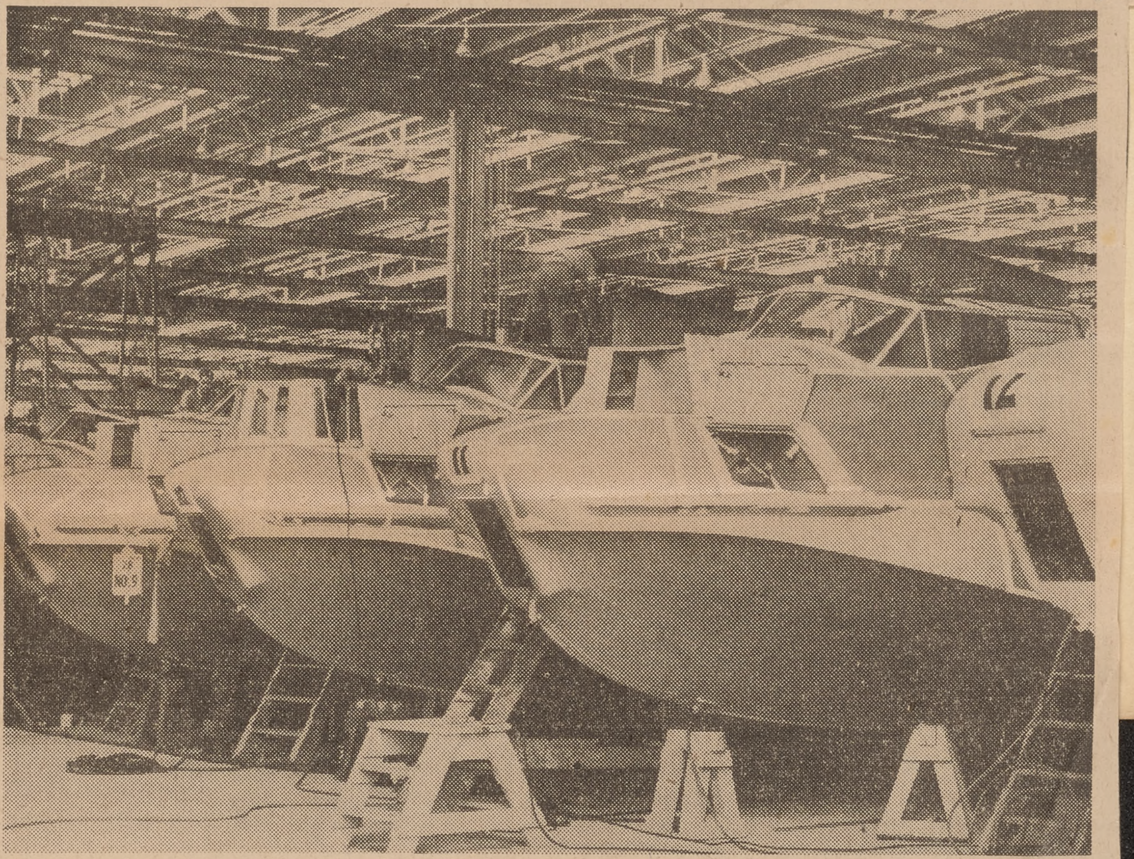
Because of this sound business policy and the steady expansion of the nation's air fleets, military and commercial, it is confidently expected the three San Diego aircraft plants will continue to operate with maximum personnel for many years.



Pictured is the famous Consolidated Model 28 twin-engined flying boat, the latest U. S. navy PBY-5, in flight. The PBYs have made Consolidated the largest manufacturer of flying boats in the world and have brought numerous records to the credit of local engineers.



These huge navy planes have achieved remarkable performance in massed, non-stop flights over long distances from their San Diego base.



Lineup of hulls for flying boats at Consair final assembly building. Heavy paper protects them during assembling operations. They soon will augment Uncle Sam's expanding air force.

An Open Letter

Messrs. Fleet and Associates,
Consolidated Aircraft Corp.
City
Gentlemen:

San Diego, Calif.
Dec. 23rd, 1940

I herewith present you with a challenge and a tribute. He who was the very embodiment of truth and the expression of the wisdom of all the ages, said: Render therefore unto Ceasar the things which are Caesar's and unto God the things that are God's.

You by your industrial initiative together with your power and wisdom to organize, have created in and for this city a great industrial enterprise, and for its populace a great opportunity, viz. the opportunity of Work and Progress. In the perpetuation of this great task as embraced in your program for the future we bid you Godspeed and wish you well. For what you have already accomplished and what you will yet achieve, we pay you tribute—for unto you, tribute is due.

Our challenge can best be expressed in the following lines which we have penned and which we now dedicate to you in this most crucial hour.

A. A. Perry,
Employee No. 795,
Consolidated Aircraft

AMERICA AWAKE

★

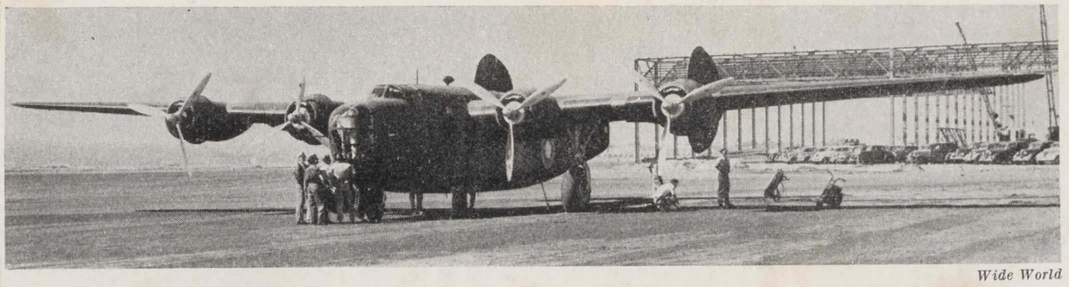
Production is the cry
Production is the need
This message oft repeated
We do well to heed.
Yes! Let us build armaments
And be sure we build them well
Not for aggression's purpose
Nor aught of recompense
But let us build them swiftly
For safety and defense.

Awake ye workers of America
Heed not the subtle power
Of discord and dissension
In this jeopardizing hour.
Today is yours in which to build
Great ships of sea and air
Therein lies supremacy
Here and everywhere.
Eventualities await
For them we must prepare
And to this end not hesitate
On land or sea or air.

Freedom's in the balance
Because of greed and hate
And if Totalitarians had their way
We'd be a vassal state
But this to them we will deny
On land and sea and sky.

Arouse ye builders of this craft
Before it is too late
Lest we like those across the seas
Suffer like terrible fate.
Our country's call we then will heed
Our energies we'll give
That Freedom's Cause, triumphantly
Forever then shall live.

Aviation – December, 1940



Wide World

A NEW FOUR-ENGINED BOMBER built by Consolidated Aircraft for Britain's Air Force. Large numbers of these planes are under construction at San Diego and will probably be flown across the Atlantic. The planes can carry four tons of bombs at 300 m.p.h. for 3,000 miles non-stop. Camouflage and RAF markings are already painted on as the bomber is prepared for test flight.

FAST BOMBERS FOR BRITAIN

NEW AMERICAN MACHINES

FROM OUR OWN CORRESPONDENT

NEW YORK, Nov. 18

The first two of an order for 70 or more Douglas bombers for Britain, superior to any hitherto sent abroad, arrived here on Saturday by air from California. They are similar in design to the D.B. 7-1 bombers now being bought by the United States Army—monoplanes with tricycle landing gears, powered with two 1,050 h.p. Pratt and Whitney engines, which give them a cruising speed of more than 280 miles an hour. In addition to bomb racks they have emplacements for three machine-guns.

It is said that the bombers were ordered originally for France, and were diverted to Britain after the surrender of France.

A report from San Diego says that the Consolidated Aircraft Corporation has nearly completed the first of a number of huge bombers for Britain, which are described as probably the most powerful long-range bombers in the world, superior even to the famous B-17 " flying fortresses." These B-24 aeroplanes are four-engined craft weighing 20 tons each. They have a cruising range of more than 3,000 miles, and a speed of more than 300 miles an hour, and can carry 8,000lb. of bombs.

(21st Nov.)

"Daily Telegraph"

LONDON, ENGLAND

U.S. SENDING NEW TYPE 'PLANE

BOMB SIGHT FOR BRITAIN

FROM OUR OWN CORRESPONDENT

WASHINGTON, Wednesday.

Gen. Marshall, United States Chief of Staff, announced to-day that 26 heavy four-engined bombers, equipped with the Sperry bomb-sight, had been released by the Priorities Board for despatch to Britain.

The bombers, which are being manufactured by the Consolidated Aircraft Co., are very similar in effectiveness to the famous Flying Fortresses, with a range of 3,000 miles. They are the first machines equipped with the Sperry bomb sight to be released to Britain. The United States is retaining for her own use the more modern Norden bomb sight.

Three of the new machines are due to be delivered this month and three in December, while 20 more are due to be delivered before March. Gen. Marshall pointed out that no comparable 'plane had ever been used in active operations, and the United States was anxious to see the results.

BRITISH EQUIPMENT

He also stated that Britain, in consideration of the release of the bombers, had agreed to supply to the United States sufficient engines to equip 41 Flying Fortresses.

He disclosed that the United States Army has observers in British warplanes flying over Britain and the English Channel, but they had not flown over Germany.

The latest transaction means deliveries over and above the rough fifty-fifty rule announced recently. This rule, officials explain, was always intended to be a flexible standard.

American aircraft production is being speeded up as rapidly as possible with a view to reaching peak production by the Spring, when a British aerial offensive is anticipated. This speed up will be in the nature of an emergency spurt and may slow down deliveries some months after, but officials believe this is better than attempting a steadily rising flow which bears no relation to military requirements and strategy.

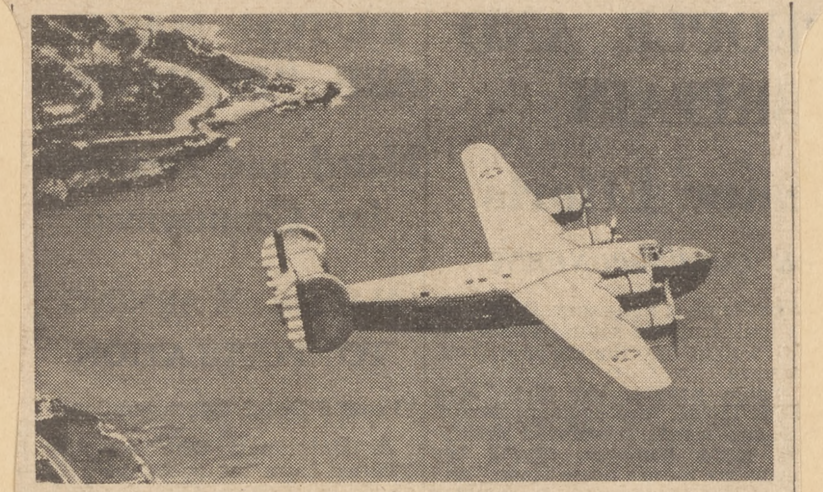
THE SUNDAY TIMES, NOVEMBER 24, 1940



The new American bomber, B-24.

POWERFUL NEW BOMBERS FROM AMERICA

Greatest U.S. Contribution To Victory

By THE "SUNDAY TIMES" AIR CORRESPONDENT

News that America has released twenty-six Consolidated B-24 four-motor bombers for immediate delivery to the R.A.F. is most encouraging.

The Consolidated Model 32, designated the B-24 by the U.S. Army, is by far the best military aeroplane which the U.S.A. has yet produced and the first American aeroplane on which we can really bestow unreserved enthusiasm.

It is fast, it is well defended (British gun turrets can be installed) it can carry a big load of bombs, and it has a long range. It is superior to any bomber at present in service, though not to some of our new machines now flying. It is vastly better than the old Boeing B-17 "flying fortresses" —as indeed it should be for it is five years later in design.

Before France fell the Armée de l'Air had ordered 120 of these Consolidated bombers, but orders previously placed by the U.S. Army had to take precedence. Great Britain took over all the French orders, but the gesture by America will mean that deliveries can begin immediately. The first production model flew three weeks ago.

3,000-MILE RANGE

The B-24 is claimed to have a top speed of round about 330 m.p.h., a bomb load of 4,000 lb., and a maximum range of more than 3,000 miles. So, in fact, it could fly from New York to England by way of Berlin.

The best feature of the machine aerodynamically, which accounts for its high speed, is its wing, designed on a new principle. This "Davies" wing, which in plan is very long and narrow, resembling a paper knife, presents about one-third less resistance to the air than a conventional type. The making of such a long thin wing, constructionally stiff, is a triumph of engineering.

There has been some confusion between the Consolidated bomber and the Boeing bomber. Apart from the fact that they both have four motors, there is little similarity. Incidentally, the Boeing Company has copyrighted the name "Flying Fortress"—which is misleading anyway.

The sending of these Consolidated bombers for the R.A.F. to intensify the offensive is one of the greatest contributions America can make towards the winning of the war.

THE R.A.F.'s NEW COMMAND

CO-OPERATION WITH THE ARMY

The new Army Co-Operation Command of the R.A.F. comes into being on December 1. The decision to form this new Command successfully avoids the drawbacks of handing over a separate Air Arm to the Army, yet presents to it a specialised body of Air Power under an officer—Air Marshal Sir Arthur Barratt—who came from the Army and thoroughly understands Army problems as no purely Army officer understands the air.

The step satisfies all the requirements outlined in these notes some weeks ago, yet has few disadvantages.

Its great merit is its elasticity. So long as that is maintained the R.A.F. can fall into none of the troubles which the Luftwaffe dug for itself in its rigid training for and adherence to the dictates of the German Army.

Air strategy of necessity calls for an independent air force. There are times when the whole of the available fighter strength may be needed for defence of a single objective. There are times when the whole of the R.A.F. may have to be flung in to support of land forces.

The Army Co-operation Command forms thus a nucleus, which at times may serve as the hub of the operation of all the other Commands of the R.A.F., or it may form a small preserve from which the other Commands may draw machines for support in independent action as the situation needs.

As a strategic weapon the Army Co-Operation Command finds efficiency in its specialisation and strength in its elasticity.

Industrial Los Angeles County

November - December 1940

Consolidated

In its immense plant adjacent to Lindbergh Field on San Diego Bay, Consolidated Aircraft Corp. is turning out huge flying boats and landplanes weighing from 27,000 to 65,000 pounds and costing upward of $200,000 each.

Consolidated has always specialized in building large airplanes. The company claims the distinction of having built, since its inception in 1923, four times as many ships with a wing span of 100 feet or more as all other United States aircraft manufacturers combined.

Huge mechanical and hydraulic presses, including one of 4,500 tons, large hydraulic drop hammers and hulls for the twin-engined PBY patrol bomber lined up 50 strong on the final assembly line, all convey the idea of great size.

When Consolidated transferred its activities to San Diego from Buffalo, N. Y., in 1935 it had about $6,000,000 of business on its books. It started operations with some 300 employes in a plant containing roundly 200,000 square feet of floor space. Today the company has an order backlog exceeding $320,000,000 and by February 1 next year expects to have roughly 1,500,000 square feet of covered floor area, plus a substantial paved but uncovered area suitable for final assembly work, and between 15,000 and 16,000 employes. This, however, will not complete Consolidated's expansion program.

Consolidated has greatly enlarged its plant this year and increased the number on its payroll from about 3,200 on January 1, to almost 14,000 at present. Consolidated today has an estimated $25,000,000 worth of parts and planes in various stages of production which should begin flowing off the final assembly line in steadily increasing numbers from now out.

On the basis of the present schedule deliveries from existing facilities, against contracts now on the books, should attain their peak around March or April. The latest addition should be completed by about June 1 and reach its peak employment of roughly 12,000 by November of next year.

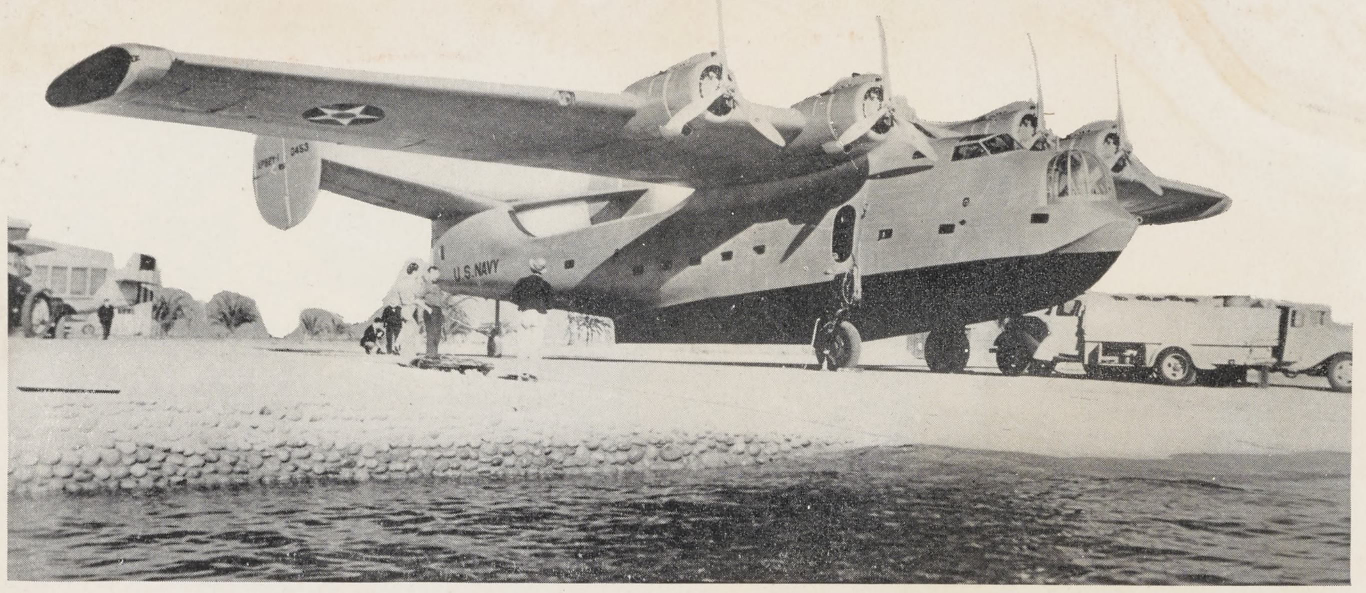
Consolidated currently is working two ten-hour shifts five days a week. Like most other manufacturers it could undoubtedly enlarge its output by either working an additional day or adding another shift. This, however, has not proved feasible as yet as production of the air-frame manufacturers naturally must be geared to that of their suppliers and sub-contractors, as well as that of the engine producers.

At this time Consolidated is in production on three models but actually is making deliveries in any quantity on only one type. It is manufacturing a twin-engined flying boat for the Navy and the British, a four-engined flying boat, the PB2Y, for the Navy, and a four-engined land bomber, the model 32 or B-24, for the Army and British. This bomber, the prototype of which was first flown in 1939, marks Consoldiated's return to the landplane field. It is a high-wing ship, with a tri-cycle landing gear, which, according to available information, has a speed of over 300 miles per hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

Parts Plant

The company has just announced a $7,000,000 addition which will approximately double its present floor area. So far Consolidated has financed its own expansion, having previously spent or committed itself to spend this year approximately $6,000,000 for enlargement of manufacturing facilities. The latest addition, however, it is understood will be financed by the Government and leased by the company.

The new addition, according to present plans, will be devoted to the manufacture of parts and minor assemblies with existing facilities turned almost entirely to final assembly work. This does not mean, however, that Consolidated is not planning to sub-contract some of its work. It is already doing considerable sub-contracting and plans to do more as it swings into increased production on its present orders.



CONSOLIDATED AIRCRAFT

Corporation, San Diego, is noted for development of flying boats, and recently turned out the world's largest amphibian plane. In addition to the four-engined bombers for the U.S. Navy (above) this company is also producing a bombardment plane for the United States Army Air Corps driven by four radial 1200 hp. engines. WILLIAM A. MALONEY, Consolidated plant engineer, here describes how the problems of heating southern California buildings differ from those in the east.

THE problem of supplying heat to an airplane factory in Southern California does not differ greatly from that of supplying heat to a manufacturing establishment of the same character in the Middle West or on the Atlantic Seaboard.

True, there is a considerable difference in design temperatures, but there is a corresponding, and offsetting, difference in the thermal conductivity characteristics of the construction materials used.

Along the northern Atlantic Seaboard and in the Middle Atlantic and Plains States, the common practice is to design for a differential of 0-70F or thereabouts, whereas, in California it is only necessary to design for a range of 35-70F. This difference in design temperatures does not necessarily indicate a large reduction in radiator surface requirements, for the reason that there is a considerable difference in the character of the available and employable building materials.

In the eastern section of the United States, the worst enemy of the heating engineer, when considering building materials, is the glass used in windows for the purpose of admitting daylight. For the balance of the building such materials as brick and concrete are used for basic walls and spandrels, and roofs are usually wood or concrete decks covered with felt and asphalt compound roofing.

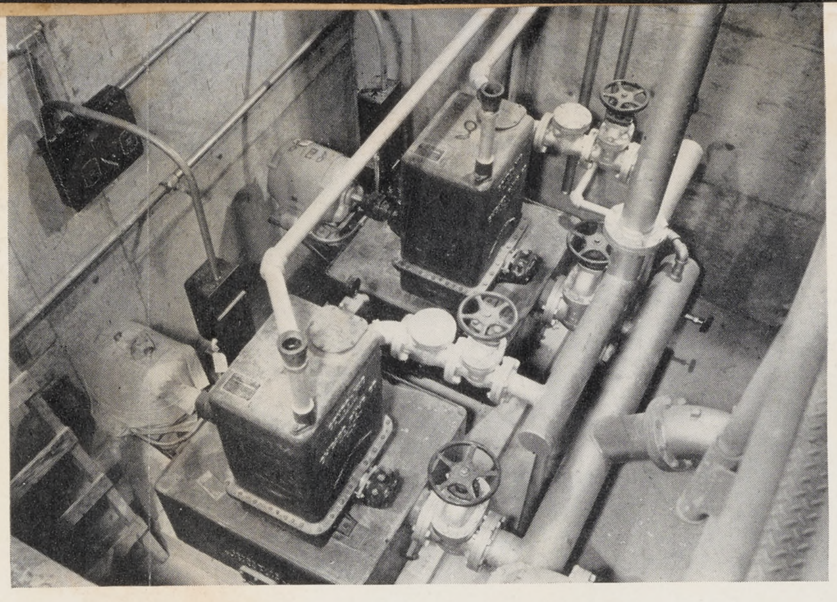
In sunny California, the available choice of materials changes considerably. The most popular and widely used material for wall and roof construction in industrial buildings is galvanized corrugated iron.

Although Southern California is looked upon by most of us as being a land possessed of a glorious sub-tropic climate, the fact still remains that the nights are quite cold, the temperature dropping to 35F or 40F after 8 p.m. in the winter months (November-April) and even in the summer months often going as low as 55F.

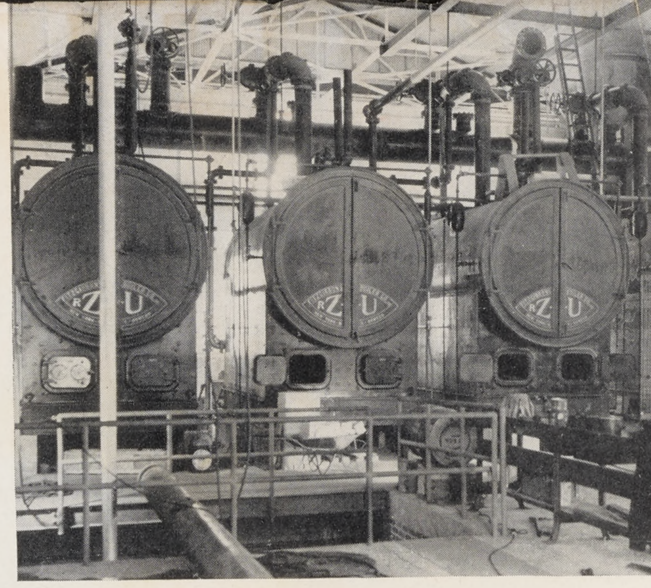
The outstanding characteristics of most aircraft manufacturing buildings are, first, the necessity for unobstructed clear height above the floor; second, the insistence on vast, unobstructed clear areas on the manufacturing and assembly floors. The first condition imposes on the designing engineer the necessity of keeping all supply and return lines above the bottom chord of the roof trusses, in order that the full height between the floor and the bottom chord line may be advantageously employed in handling large airplane fuselages and flying boat hulls. The second consideration compels the engineer to design carefully for uniform distribution and circulation of the warm air discharged from unit heaters in order to avoid the phenomenon of Cold 70. A third consideration, not previously mentioned, is the tendency to keep open the large hangar type doors which usually enclose two or three sides of modern aircraft manufacturing buildings. These doors must be kept open for the reason that "if we don't take a ship out Monday morning, we will surely take one out Wednesday afternoon."

In the 1939-40 expansion program at Consolidated there have been numerous additions to existing buildings, in which the boiler plant and piping systems were designed to allow for additions and expansions. Therefore, this discussion will not consider these additions, but will deal entirely with those separate new buildings served from a new, centrally-located boiler house.

The largest unit in the present program is the Final Assembly Building, measuring 360 ft. x 720 ft., containing with stockroom mezzanines, a total of 281,600 sq. ft. of usable floor area. In this building it was necessary to keep all heating and return mains, as well as other necessary services, above the bottom chord line of the roof trusses, in order not to interfere with the movement of travelling cranes required in the building. As the distance from the bottom chord to the floor was 36 ft., it was necessary to use high velocity, high output unit heaters located above the bottom chord line and discharging downward to the floor. The same considerations of clearance precluded the possibility of extending steam and return mains, and obtaining the required pitch, inside the building. It was, therefore, necessary to run these mains above the bottom chord line along the west exterior wall of the building, sufficiently high to permit the taking off of laterals in the various sawtooth bays, bringing the returned condensate back to the return main well above the bottom chord line.



A view in the boiler house just before completion showing the Chicago vacuum pumps and return header installation. Warren Webster valves and traps were used.



A view in the boiler house during the construction of the building showing the four Fitzgibbons boilers in process of installation.

The next largest building in point of volume, but not in area, is the Final Finish Building, to which finished airplanes, after engine and flying tests, are returned for final *touch-up* of exterior painting. This building is 120 ft. wide and 240 ft. long, with a clear height to bottom chord of truss of 36 ft., and is heated by a conventional fan system. Sufficient filtered, heated, outside air is introduced to the building to provide 7½ air changes per hour. For present operations, this volume of air is considered sufficient, but the fan rooms, of which there are two, both located above the bottom chord line, are designed and arranged to permit the addition of sufficient equipment to permit of providing 15 air changes per hour, should the building ever be converted to use for general spray painting operations. No provision for exhausting air is made at present, leakage through door cracks, steel sash mullions, and corrugated iron laps being deemed sufficient. The final plan (15 air changes per hour) includes provision for a water washed exhaust system to separate all pigment and solvents from the exhausted air.

The remaining major building, known as the *shed* is 30 ft. wide, 1000 ft. long, of lean-to construction, with an average height of 25 ft., and is heated by conventional, low discharge velocity unit heaters.

The total load in these three buildings is 158,500 sq. ft. E.D.R. and is supplied by a battery of four welded steel fire-tube boilers in a central boiler house, each of 42,500 sq. ft. capacity. These boilers are fired with radiant type burners, using 1200 B.t.u. natural gas, sufficient to develop 200% of rating at an overall efficiency of 77%. As the boiler house is located on the edge of Lindbergh Field, San Diego's airport, it was necessary to employ induced draft to keep the stack height below the safe gliding angle for entering airplanes. Gas and primary air supply are controlled by pressure operated valves and louvres, and the induced draft fans are controlled by stack temperature relays.

Temperature control in the manufacturing and assembly buildings is accomplished by means of local thermostats controlling the fan motors. In the Final Finish Building a pneumatically-operated by-pass damper system is used.

In the boiler plant, the supply and return headers, as well as the vacuum pump headers, are so arranged that the capacity can be quadrupled without changes to the piping system, and with but minor changes to the building structure and arrangement.

A view looking into the roof of the final assembly building showing one of the Buffalo Forge unit heaters. Herman Nelson DeLuxe unit heaters and Young Radiator concealed radiation were used.

Famous American Flying Boat for Sale

The famous United States Consolidated flying boat *"Guba"* was advertised for sale as a bargain in an American aviation magazine recently. This boat was much in the news last year, when it carried out a series of fine flights across British territories overseas. It accomplished a remarkable long-distance round trip that included crossings of the Atlantic and Pacific Oceans, the continents of Australia and Africa, and the first coast-to-coast crossing of the Indian Ocean from India to British East Africa. This achievement demonstrated some of the possibilities of modern long-range aircraft in linking up distant parts of the British Empire.

The *"Guba"* is said to have a range of 4,000 miles and a top speed of nearly 200 m.p.h. The extensive equipment aboard includes automatic pilot homing devices and direction-finding apparatus.

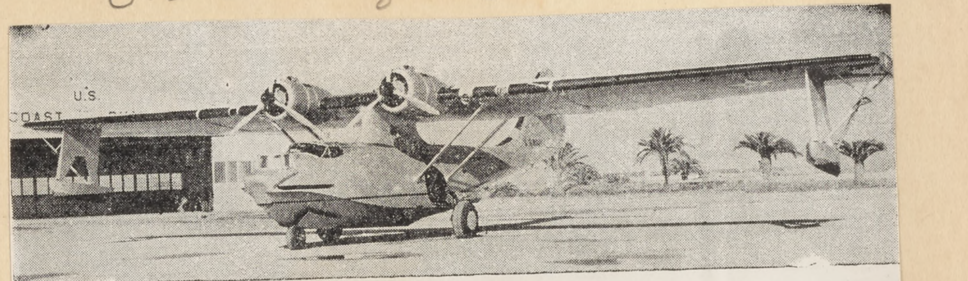
Consolidated Aircraft: $85,800,000 contract for Army bombers and $3,500,000 contract from Australia for flying boats. Backlog now approximately $221,000,000. Plant expansion costing more than $2,000,000 just completed and additional expansion plans expected to be announced soon.

U.S. Coast Guard Oct. 1940



LATEST IN AMPHIBIANS

This is the spectacular new amphibian being currently produced by the Consolidated Aircraft Corporation, San Diego, Calif., and known as Model 28-5A (designated by the Navy as XPBY-5A). This amphibian offers many aeronautical features which are the subject of careful study by Coast Guard aviation experts. Note the tricycle landing gear and the wing-tip pontoons which become extended parts of the wing when in flight.

On Page 10 of our September issue appeared the above picture. The descriptive lines accompanying pictures of the Consolidated Model 28-5A Amphibian and the GUBA flying boat were run together in a manner that confused some of the basic qualities of these two planes.

Consolidated Model 28-5A, pictured above, is a military-naval true amphibian. This plane is a product of the Consolidated Aircraft Corporation, San Diego, Calif.

The GUBA, as every aircraftsman knows, is Richard Archbold's private flying boat, most certainly not an amphibian.

We regret the error.

FULLSPEED AHEAD

In the Aircraft Industries

By MAJOR REUBEN H. FLEET

President, Consolidated Aircraft Corporation
Director, California State Chamber of Commerce

The eyes of the nation are on Southern California's aircraft factories. (Top) assembling bombers at Douglas plant in Santa Monica. (Center) Vultee "Vanguard" pursuit interceptor. (Bottom) Consolidated Aircraft four-engined land bomber

IN huge factories which spread across large tracts of land on the outskirts of Los Angeles and on San Diego's bay front, shrill electric drills and riveting hammers and ponderous hydraulic presses are blending into an industrial symphony significant to all California.

Creation of thousands of airplanes for America's defense is the order of the day. And California's aircraft factories, which produce more than 50 per cent of the planes built in the nation, have been assigned a major rôle in this vast program.

The aircraft manufacturers have adopted the principle of "defense first—profits afterwards." They have accepted patriotically the strict profit limitations of the Vinson-Trammel Act.

In a recent statement, the presidents of the leading Pacific Coast aircraft factories declared:

"In the present national defense emergency, aircraft manufacturers have offered, and continue to give, the government of the United States every resource and facility at their command.

"We are ready to build airplanes first and talk about profits afterward. To this end, the industry is making rapid progress.

"In this last 10 weeks members of the industry have actually purchased on their own responsibility more than $100,000,000 worth of materials for future use and have spent, or contracted obligations for, more than $50,000,000 in additional plant facilities, machinery, and equipment, and have added to their pay rolls 21,000 new employes.

"If additional time can be saved, some companies are prepared to build and finance emergency expansion themselves."

Many phases of California economy are being tremendously stimulated by this activity in the aircraft plants.

Labor, building construction industries, material and supply sources, parts makers, and many others—throughout California—are benefiting from the aircraft industry's situation of demand outracing supply.

Aircraft employment figures have risen phenomenally. Today they lead all other industries by a tremendous margin—an increase of 112 per cent over the same period last year, as against shipbuilding, the next closest industry, with a gain of 71 per cent.

Such figures spell good news not only for Southern California, where the factories are located, but for the entire State. For the industry is drawing skilled workers from all parts of California and is helping materially to ease the burden of relief rolls.

So important is this factor of locating trained workmen for aircraft construction that the State Department of Employment maintains a special aircraft placement bureau in the Los Angeles area. This bureau is in close contact with the plane factories and with employment offices throughout California, sending out the call for new employes whenever the occasion arises.

An example of what this means to the rest of the State is the fact that in the past year several hundred workers have been sent to the aircraft industry from the areas north of the Tehachapis.

Statistics change overnight in an industry expanding as rapidly as California's aircraft manufacturing industry. A recent survey shows that six major companies—Consolidated Aircraft Corp., San Diego; Douglas Aircraft Co., Santa Monica; Lockheed Aircraft Corp., Burbank (including Vega); North American Aviation, Inc., Inglewood; Northrop Aircraft, Inc., Hawthorne; and Vultee Aircraft, Inc., Downey—are employing approximately 50,000 men. In scores of other plane and parts plants, thousands more pairs of hands are working for air defense.

Currently, monthly pay rolls are running well over six million dollars, while the backlog of unfilled orders for the six companies has passed the half-billion-dollar mark.

By the time this article is published, all these figures will be much larger.

In anticipation of the tremendous task of fulfilling the needs of America's winged defense, the industry has embarked upon expansion programs costing millions of dollars, and adding millions of square feet of manufacturing space to existing facilities. In fact, within the next four months aircraft factories in the Los Angeles area alone will expand their working space by 52 per cent.

Some instances of this expansion:

Douglas Aircraft recently announced a $20,000,000 program, which includes construction of a huge new plant at Long Beach and extensive additions and improvements of the Santa Monica and El Segundo divisions.

Lockheed and its subsidiary, Vega Airplane Co., are in the midst of a $5,500,000 program which calls for 18 additional buildings with a floor area of 520,000 square feet for Lockheed and a new factory for Vega. (Architect's drawing of new Vega plant, page 17.)

Vultee's working space is being increased to 800,000 square feet through a program calling for expenditure of nearly $3,000,000.

North American's program contemplates expansion of its space to approximately 1,000,000 square feet before the end of 1940 and the company is negotiating for the erection of an additional plant at a new location.

Northrop, newest of the California companies, has been building rapidly to meet production orders.

And in San Diego, Consolidated is rushing to completion additions that will give it the largest integrated aircraft plant in the United States, with 2,529,100 square feet of covered and uncovered manufacturing space. Additional contiguous airport space is under option.

For space is at a premium in this bustling industry—from space in which to build airplanes to space in which to live and eat.

New communities are springing up all around the plants and contractors report they are unable to get homes up fast enough to house employes. Engineering departments cry for more space in the plants. More desk room is continually needed by the management. Even restaurants and lunchrooms are hard pressed to feed all the aircraft workers at mealtimes.

It is doubtful whether any industry in American history has ever passed through a more strenuous period of advancement. And all this intense, hectic activity of production and expansion is making itself felt from one end of the State to the other.

This is in the present. The picture of the future is even more important to California.

When President Roosevelt first called for the creation of a vast American air force, leaders of the aircraft industry promptly replied, "It won't be easy, but we can do it."

Such tremendous increases in production might have seemed impossible a few years ago. But the Government showed very clearly that it wasn't "just talking" when President Roosevelt anounced recently that 10,000 planes were actually under construction for the Army and Navy, and that aircraft production would approach an annual rate of 36,000 ships by 1942. And California factories will supply a major portion of this production.

The importance of the defense orders to a California industry that produces every type of plane known to modern warfare—long range, medium, patrol, attack and dive bombers, fighters and interceptors, troop transports, observation ships, and training planes—was tremendous.

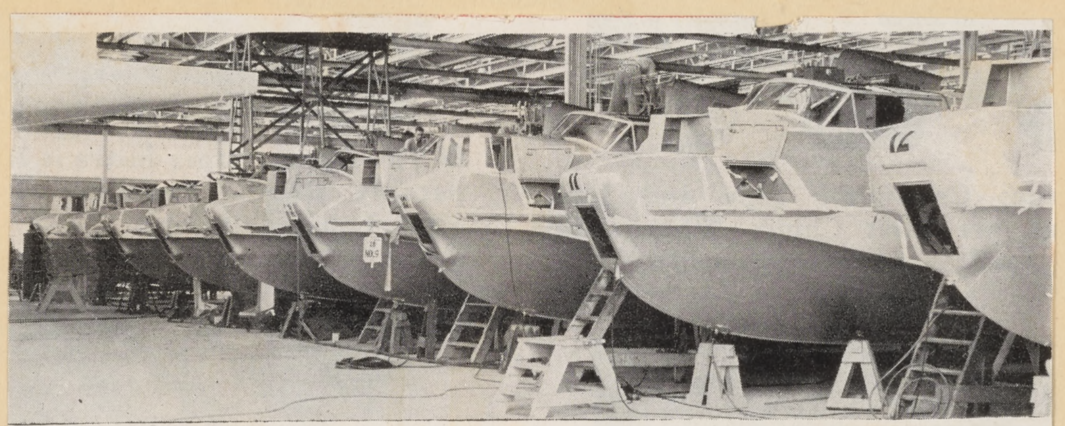
But both government and industry have been wise enough to look backward as well as forward, to avoid the evil of overexpansion as exemplified by World War I. Addressing a meeting of San Francisco business interests recently, Lieutenant-Colonel J. L. Stromme, industrial planning officer for the U. S. Army Air Corps, made the following significant remarks:

"In order that there can be no collapse due to overexpansion, no repetition of the days after 1918, when scores of aircraft factories became empty and lifeless, we are working toward the 'farming out' of machine shop work, and centering the activity of the actual aircraft factories in the assembly of planes.

"Thus we hope to utilize existing shop facilities where aircraft machine work, welding, and the like can be done, and place a sensible limitation on industry expansion."

Colonel Stromme's statement added emphasis to a situation in which many a Northern and Central California community had already seen some real opportunities. Led by San Francisco, a number of such communities are engaged in surveys to determine the potentialities their industries have to offer the aircraft industry in the matter of sub-contracting parts, accessories, and other materials susceptible to mass production.

How the aircraft industry's need for trained workers is being met is treated in an article beginning on page 14.



SNIPS--Oct. , 1940

Artists in Sheet Metal Working

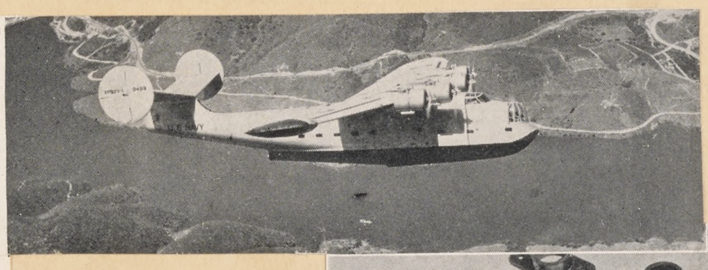
The illustration above is an official U. S. Navy photograph taken in the large Consolidated Aircraft Corporation plant at San Diego, California. These Navy flying boats, shown nearing completion, are something beautiful and graceful to behold. Careful designing, attention to thousands of important details and light weight materials utilized to their best advantage, are necessary to their production.

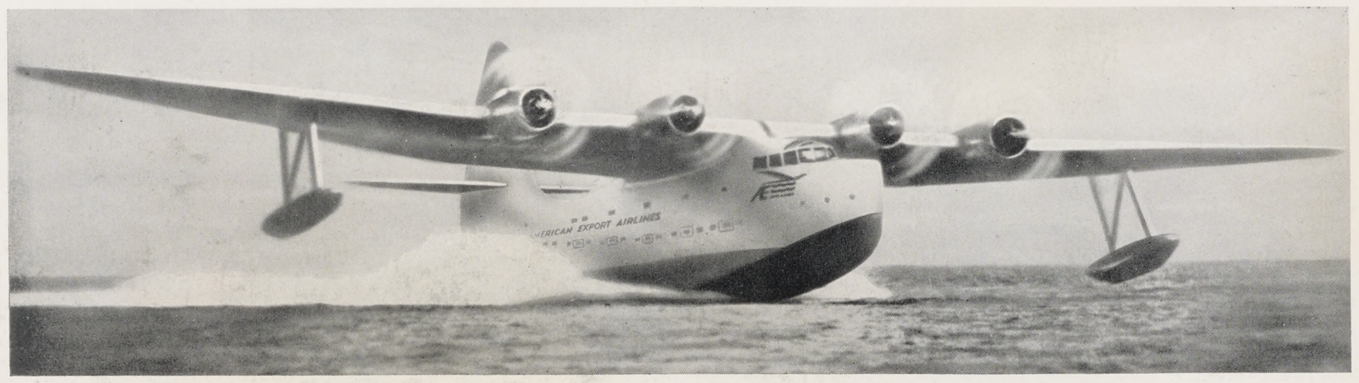
To gain this end, thousands of sheet metal parts must be ingeniously designed and accurately built to assure satisfactory assembly and operation. To the sheet metal department of the aircraft corporation is entrusted this job, equipped with the most modern of sheet metal working equipment. The men employed here are experts and artists in their craft and due credit can be given them for correctly and highly efficiently turning out the work required in modern aircraft manufacturing. They can be justly proud of their important part towards the completion of these magnificent flying craft.

New Bomber Tested

Bakelite Review Oct.,40

Consolidated Aircraft Corporation's 4-engine land bomber has a speed of 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of 4 tons. Years of skilled engineering effort have gone into this ship — every small part has been perfected in design and function to assure high standards of performance. Illustrated is a group of elevator and cab control bearings made of Bakelite phenolic material, molded by Remler Company, Ltd. This is a light duty bearing employed in the surface control mechanism. Bomb door track shoes are also molded of the same material as slides for the large bomb doors.





AMERICAN EXPORT AIRLINES' NEW FOUR-ENGINED FLYING BOAT

This is an Actual Photograph of the Navy Vought-Sikorsky Flying Boat with Exterior Changes to Show its Conversion into Commercial Use for the Carrying of Passengers, Mail and Express to Europe Next Year. Three of These Planes are Now Being Built by United Aircraft Corporation

American Export Airlines Soon Will Begin Flying the Atlantic

FINAL APPROVAL OF CERTIFICATES for a second American flag air service across the Atlantic, to be operated by the American Export Airlines, Inc., a subsidiary of American Export Lines, was announced by the Civil Aeronautics Board on July 15.

The decision stressed the Board's feeling that future importance to the United States of an air service across the North Atlantic justified a second, and necessarily competitive service. At present Pan American Airways, under the American flag, is solely in this field. At the time the present war started at least six foreign governments had received or applied for landing rights on this side of the Atlantic, and others, including British Imperial Overseas Airways, were launching service. The war has eliminated other services.

Pan American augmented its service recently to a third weekly frequency and announced its aim eventually to provide a daily service to and from Europe, six days a week.

American Export Airlines, however, bolstered its claims for consideration with detailed schedules for nonstop, fast service, using a late type of Navy patrol bomber, built by Consolidated and converted for passenger and cargo service.

One certificate, good until September 1, 1941, permits American Export to carry mail and express only between New York and Lisbon, Portugal, within 60 days. The other certificate calls for a new nonstop New York-Lisbon passenger service to begin next year, it was announced by J. E. Slater, executive vice president of the company. This certificate is to be effective as long as the conduct of operations to France, England and Ireland is rendered unlawful because of the Neutrality Act of 1939, and the Presidential proclamation issued thereunder, and for 60 days thereafter.

The mail-express service will be started with a Consolidated Model 28 PBY twin-engined monoplane which made three successful round-trip survey flights across the Atlantic last summer. Plans call for two round-trips monthly with Horta, the Azores, as an intermediate stop.

The nonstop passenger service, which also will carry mail and express, will be provided by three S-44 Vought-Sikorsky flying boats, the commercial version of the Navy's flying dreadnaughts, which are being built by the United Aircraft Corporation. The schedule calls for two round-trips a week.

AUTHORIZATION OF THE NEW SERVICES by the CAB with the approval of President Roosevelt, will result, Mr. Slater pointed out, in "important developments in trans-Atlantic air service," including:

> Increase in trans-Atlantic service between New York and Lisbon through the opening of a second line.
>
> Establishment of a nonstop service with consequent saving of time, made possible by the new type of flying boat with greater flying range and higher speed than the clipper ships now in operation.
>
> Eventual extension of the service to other European countries when restrictions imposed by the Neutrality Act are lifted
>
> Co-ordination of American Export Airlines flying boats with steamships of the American Export Lines, the parent company, in navigation and in sales and service facilities, thus making the first time that ship and plane services have been operated under unified management.
>
> Improvement in air service by creation of competition with Pan American Airways which now has a virtual monopoly in air service between the United States and Europe.
>
> Increase of the potential strength of the naval air service since the flying boats readily can be converted into bombing planes.

The company's original application, filed with the CAB May 9, 1939, and subsequently amended, sought certificates of public convenience and necessity authorizing it to establish routes between New York and Marseilles, via Biscarrosse, France, and between New York and Southampton, England, via Foynes, Irish Free State, as well as between New York and Lisbon.

It was the majority opinion of the Board that its approval of the steamship company's control of the air line was not necessary. The air line had applied for such approval in case it was necessary.

Commenting upon his company's plans, J. M. Eaton, vice president of American Export Airlines, said the company's personnel had been kept intact since completion of the survey flights last year. He said very little additional preparation would be necessary for the start of the PBY mail-express service. He pointed out also that the further flights of this ship will be useful in paving the way for the nonstop service with the Sikorsky planes.

American Aviation for August 1, 1940

American Export Airlines Granted New York-Lisbon Route by CAB

Unable to Find Pan Am's Trans-Atlantic Monopoly in Public Interest, Board Says; Temporary Operation With Consolidated Also Approved

Stating that it was unable to find that "the continued maintenance of an exclusive monopoly of trans-Atlantic American flag air transportation is in the public interest," the Civil Aeronautics Board on July 15 granted American Export Airlines permission to conduct scheduled operations between New York and Lisbon.

Climaxing a long, drawn-out fight between Export and Pan American Airways, intervener, the decision granted the former company two certificates: (1) a temporary permit to conduct mail-passenger-property service between New York, with Baltimore as a weather alternate, and Lisbon, with both Bermuda and Horta approved as stops in case of bad weather, and (2) a temporary permit to operate, until Sept. 1, 1941, mail-express service between New York, or Baltimore and Lisbon via the Azores, with Bermuda approved as a weather stop.

The Board dismissed without prejudice Export's applications for service to England, France and Italy, and dismissed for lack of jurisdiction the application for approval of the acquisition of control of the air carrier by American Export Lines Inc.

The mail-passenger-property certificate remains in effect as long as operations to England, France and Italy are unlawful under the Neutrality Act, and for 60 days thereafter. If Export makes application during the 60 days for removal of the time limitation, its temporary permit will remain in effect until the Board takes action on the application.

First Dissenting Opinion

CAB member Oswald Ryan agreed with Chairman Harllee Branch and member Grant Mason that the certificates should be issued, but dissented concerning the acquisition of control of the airline by the steamship company. Ryan, in the Board's first dissenting opinion, claimed that the CAB has jurisdiction over the matter.

In a lengthy discussion of "the need for competition in the trans-Atlantic service," the CAB said that although the service of Pan Am has not been inadequate, "we are unable to find that the continued maintenance of an exclusive monopoly of trans-Atlantic American flag air transportation is in the public interest, particularly since there is no such public control over the passenger or express rates to be charged or over the standards of service to be rendered as is customarily provided in the case of a publicly protected monopoly."

The question of entry of a second carrier into the trans-Atlantic picture "involves the entire underlying policy of the Civil Aeronautics Act of 1938," the decision said. Competition in air transportation is not mandatory, especially when considered in relation to any particular route or service, the CAB concluded. "Clearly, Congress has left to the discretion of the Board the determination of whether or not competition in a particular area is necessary to assure the sound development of an appropriate air transportation system," it said.

Competition Desirable

Competition, the Board continued, "invites comparisons as to equipment, costs, personnel, methods of operation, solicitation of traffic and the like, all of which tend to assure the development of an air transportation system properly adapted to the present and future needs of the foreign and domestic commerce of the U. S., of the postal service and of the national defense. Although it does not appear that the quality of service rendered by intervener is at present inadequate in any respect, the record indicates that benefits to the public, in the shape of improved service resulting from advances in the industry, would be accelerated by competition between U. S. air carriers on the north Atlantic route."

Pan Am had, at the Export hearing, contended that foreign carriers would soon be in a position to furnish stiff competition on the Atlantic. The CAB said, however, that "it is obvious . . . that competition by foreign air carriers will not have the same beneficial effect which competition by U. S. air carriers should have. The part which national loyalties may be expected to play in the routing of traffic must not be forgotten. Moreover, fundamental difference in background and technique between U. S. and foreign flag air carriers may tend to distinguish their respective services by essentially non-competitive basic characteristics, rather than by those differences of degree which stimulate progress through competition.

"The addition of new and improved equipment by foreign air carriers will, to be sure, result in the necessity of U. S. air carriers equaling or bettering such equipment if they desire to maintain their competitive position. However, unless and until the U. S. air carrier can match a given improvement in the service rendered by a foreign air carrier, U. S. air transportation will not have been advanced. On the other hand, any addition to service or improvement of equipment by a competing U. S. air carrier will be an immediate and direct advantage to the air transportation system of the U. S."

National defense also will be benefited by a second service, the CAB said. "It appears that competition by applicant would induce the use of different types of equipment and make use of the facilities of a greater number of our manufacturers, thereby affording the War and Navy departments valuable data concerning additional types of equipment. It would mean the training of additional American supervisory operations personnel and would provide an incentive to the development of new and different operating technique."

Since the outbreak of the war, Pan Am has been the only airline operating across the Atlantic, all European companies having suspended service, the decision noted, adding that "these factors render it all the more desirable to take advantage of this opportunity to entrench American air transportation more firmly in the North Atlantic field by means of a second American airline."

The CAB pointed out that the "saturation point of available air traffic on this route is not yet reached." It also quoted an Interstate Commerce Commission decision which stated that "Regulated monopoly is not a complete substitute for competition. The latter fosters research and experimentation and induces refinements in service which are not likely otherwise to be accomplished."

Cost Not Controlling

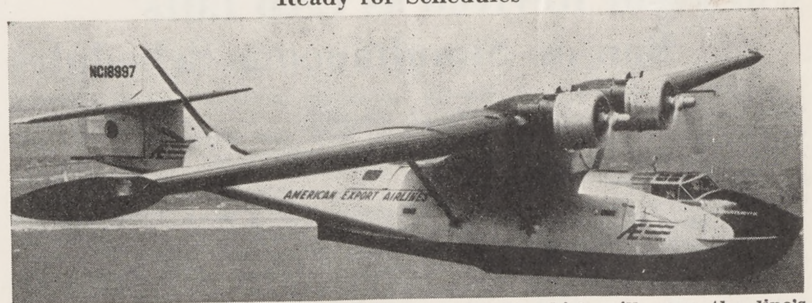
Pan Am had also contended that to approve Export rather than more Pan Am schedules would be a wasteful expenditure of government funds. "We are unable to agree that the advantage in cost to the government which the service proposed by intervener would have over that proposed by applicant can be accorded controlling significance on the issue of public convenience and necessity in this case," the CAB said.

Pan Am claimed that Export's 12-passenger four-engined Sikorsky S44's would not be satisfactory, but the CAB pointed out that both companies have access to U. S. aircraft markets, and added that neither company's equipment will be that in use 10 years from now. "It remains to be seen whether applicant's or intervener's equipment will find the greatest favor with the traveling public and which type, in general or in particular respects, will provide, technically speaking, the better operation," it said. It found Export fit, willing and able to perform the proposed service.

Concerning the mail-express service, which will be conducted with a Consolidated flying boat now owned by Export, the decision said that such service "is required by the public convenience and necessity not only because it will promote the development of applicant's complete passenger, mail and express service, but also because it will relieve intervener's trans-Atlantic service of some part of the extremely heavy mail loads which that service has had to bear in the past and which have resulted in intervener's inability to accommodate all of the passenger traffic offered . . . It should continue no longer than such time as applicant is in a position to inaugurate its complete passenger, mail and property service."

Since Export was not an air carrier when its stock control was acquired by the steamship company, section 408 of the Act does not apply, the CAB said. The steamship-airline relationship is not inconsistent with the public interest, and Export is fit, willing and able to operate either as an independent airline or in connection with the steamship company, the Board added.

Ready for Schedules



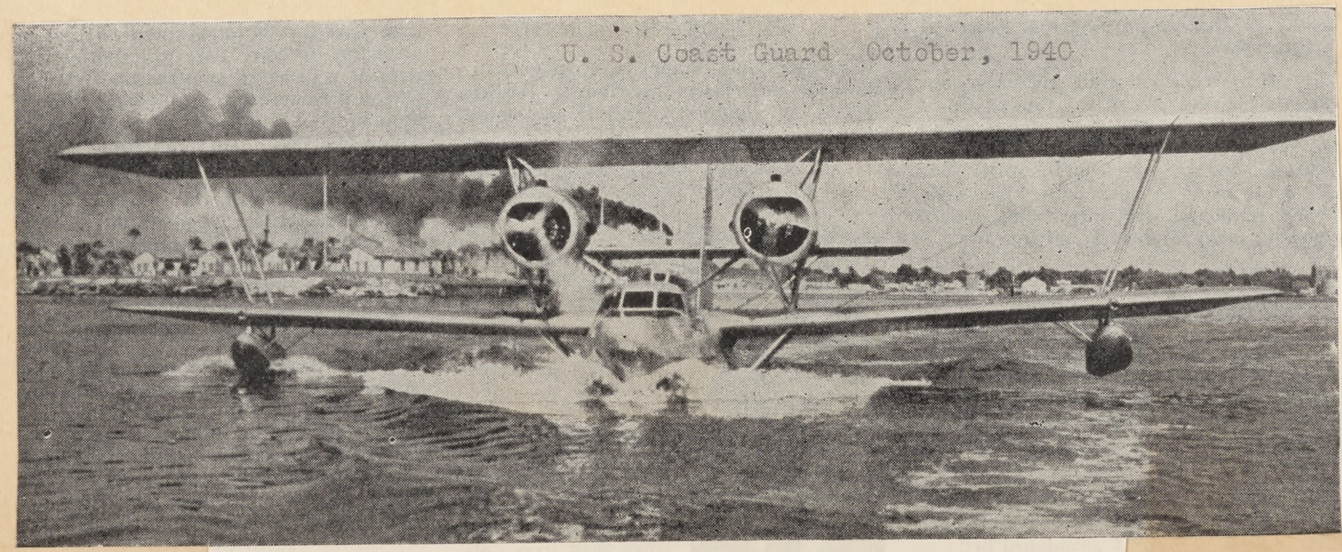
American Export Airlines' Consolidated model 28 which will open the line's New York-Lisbon route, carrying mail and express.

U.S. Coast Guard Oct. 1940

* * * * *

BIG CONSOLIDATED PLANE

The big Consolidated transport plane being built for the Coast Guard at the Consolidated plant (world's largest builders of Amphibians) in San Diego, Calif., is being constructed on Navy contract, and Navy inspectors, not C. G., comprise the board of inspectors. The radio equipment in the plane will, however, be a strictly Coast Guard job, with a C. G. radioman (Avery Brace, RM1c) serving as inspector. The Washington Whirlpool expects this big plane to be the forerunner of many Consolidated planes to be built for the Coast Guard in the not-distant future.



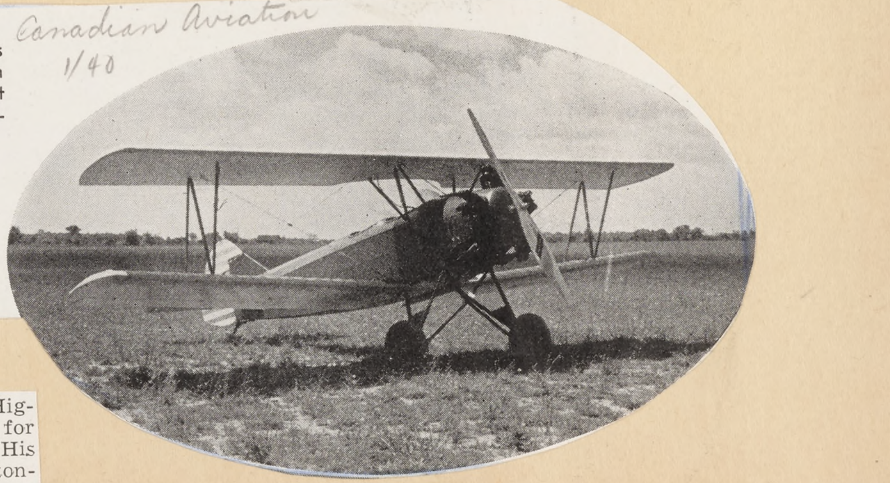
U. S. Coast Guard October, 1940

FOR SERVICE TO OUR COUNTRY HIGH IN THE SKIES

U. S. Coast Guard's PH-3, built by Hall Aluminum Aircraft Corporation, Bristol, Pennsylvania.

Canadian Aviation 1/40

RIGHT: More machines of this type have probably been built in Canada than any other type. It is the Fleet Trainer, manufactured by Fleet Aircraft Ltd., Fort Erie, Ont. With large numbers already in use in Canada, for both civil and military training, hundreds more will be used for elementary pilot training in the Commonwealth scheme.



During the past summer, Higgins has acted as test pilot for Fleet Aircraft Ltd., Fort Erie. His mechanic on the Leamington-Pelee route is James Sherratt.

U. S. Coast Guard

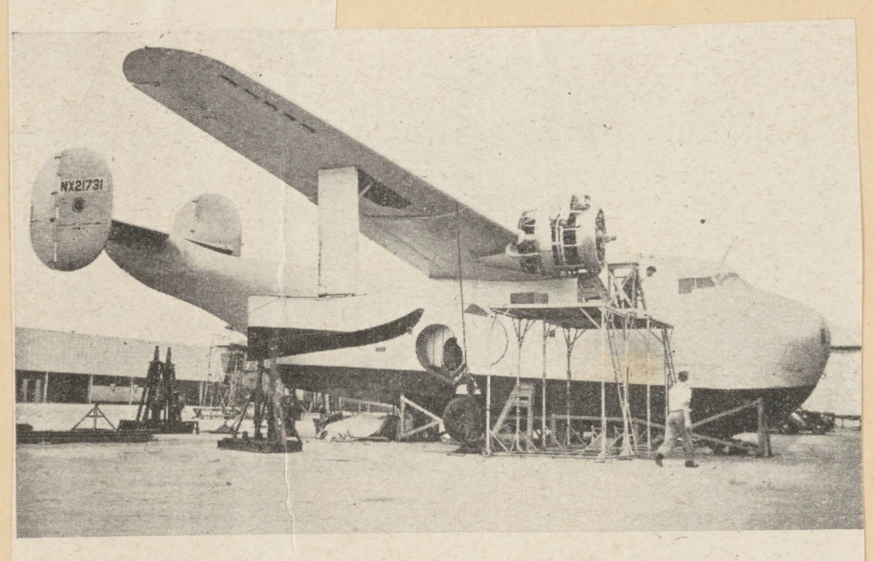
U. S. Navy Official Foto

WORLD GIRDLER

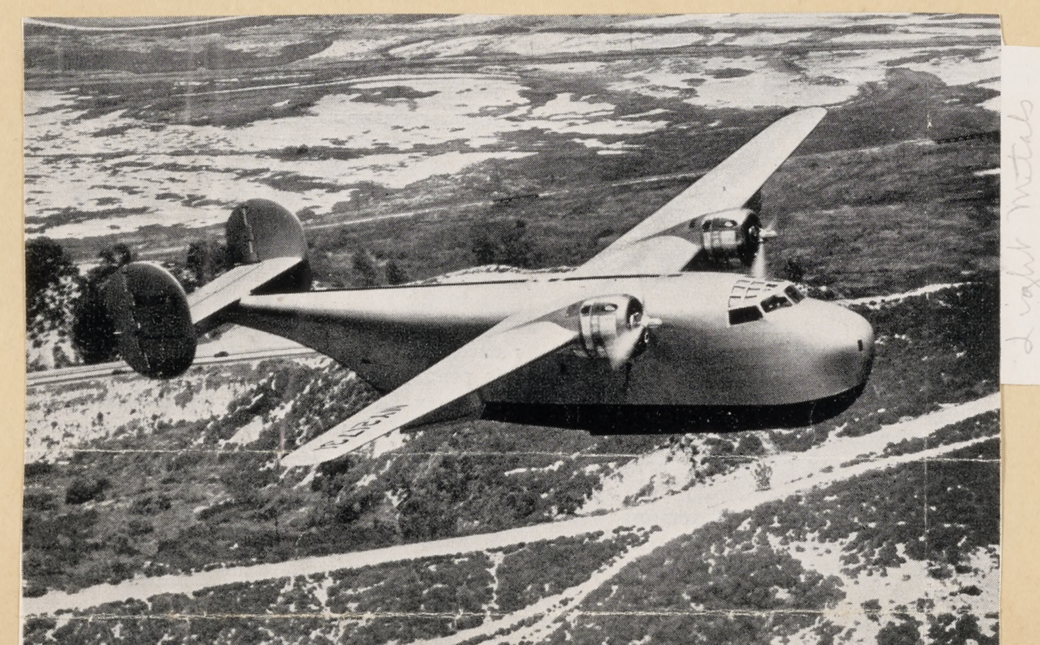
This is the famous GUBA flying boat (Consolidated Model 28) in which Explorer Richard Archbold flew completely around the world, crossing the continents of Africa, Australia, and America, crossing the Indian Ocean for the first time by airplane, making the first circumnavigation of the world at its greatest diameter, first seaplane flight around the world and longest non-stop over-water flight of a seaplane. The GUBA completed this epic voyage a year ago when it came to anchor at the Coast Guard Air Station, Brooklyn, N. Y. The GUBA (a flying boat, not an amphibian) is here shown over Boulder Dam. The forward hatch offers distinct structural possibilities for the handling of stretcher cases at sea. The wing-tip pontoons fold up and become extended parts of the wing when in flight. Tricycle landing gear.

8/8/40

FLIGHT



4,000 H.P. The Consolidated type 31 is powered by two of the new Wright two-row Duplex-Cyclone engines, and is probably the world's most powerful twin-engined flying boat. The "retractable tricycle undercarriage" is a beaching trolley. The struts of the outboard floats fold into the wing. The machine has accommodation for 52 passengers in the daytime and 28 at night.



Light Metals Sept, 1940

THE flying boat, Model 31, of the Consolidated Aircraft Corporation, San Diego, Cal., which was recently released for export to the Allies. It is one of the largest aircraft ever constructed and has carried out numerous trials with 52 passengers aboard. The hull, wings and tail surfaces are of aluminium-coated sheet and are internally reinforced. The cruising range is said to be from 8,000 to 10,000 miles, and the maximum speed in excess of 200 m.p.h. The craft is powered with two Wright Cyclone engines, developing 2,000 h.p. each. (See *Light Metals*, 1940/3/74.)

"Guba" Consolidated's PB-7 type recently crossed Eastern Canada on her delivery flight to England. From California to England gives one a clear idea of the range and power of the modern flying boat. The latest Consolidated boat, a four motor machine, appears to be one of the most efficient aeroplanes of its class in the field. It is capable of carrying 49,000 pounds of bombs and torpedoes. A range of 4,000 miles is available. Commercial Aviation 11/39

AIRCRAFT DEVELOPMENT

The Coast Guard has had considerable experience with airplanes during the past 15 years and out of this experience has come the belief that there has not yet been designed a satisfactory basic type of C. G. plane.

There is now reason to believe that Coast Guard aviators are paying much attention to recent developments at the Consolidated Aircraft Corporation, San Diego, Calif., where the Model 28-5A Amphibian (designated by the Navy as the XPBY-5A) represents the newest contribution to aeronautical progress. Basically the new Consolidated Amphibian is the Model 28 twin-engined flying boat, with full facilities for land operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all of which are fully retractable. The side wheels and supporting mechanism retracts into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance in planing is encountered.

Flight characteristics have been unaffected by the incorporation of the landing gear, and several handling advantages have become apparent. Flight testing with the gear in all positions, and in any combination with the retractable wing-tip floats, failed to disclose any adverse affects. The same stable flying characteristics of the PBY are maintained, and there was found no loss of speed with the landing gear in the retracted position.

The advantages of the landing gear, aside from greatly extending the scope of utility, are of special interest to all Coast Guard flyers. For rough water taxiing the extended gear serves as a sea anchor and greatly assists in control on rough open water, and in making an approach for mooring or ramp with an adverse wind. More engine power may be applied for short turns without undue acceleration. Turns on the water are achieved with far less skidding, and the danger of scraping the keel on the ramp is eliminated. There is no necessity for a beaching crew, as the ship can climb a ramp or beach under its own power, or descend in the same manner, completely controlled by the brakes. It may also operate from remote sand beaches without benefit of special ramps or facilities for handling.

The side wheels are above water when the ship rises on the step in making a take-off, and automatic means have been provided to eject all water in the closed bow wheel hatch before the plane is in the air. Thus the flying trim is unaffected.

In action the huge amphibian alights with a smooth absorption of its descending velocity, exhibiting no tendency to bounce or porpoise. When alighting on land, the ship's tendency in a side landing is to straighten out; and the brakes may be applied to the utmost without adverse effect. This technique simply increases the load on the nose wheel. No special procedure is needed for take-off or landing. The wheels may be locked, elevators pulled full back, and both engines given full take-off throttle without the possibility of the nose wheel rising from the ground. During one recent test, a landing was made in which a bump was struck on the instant of contact with the brakes on. The accelerator showed a very high reading, yet no trouble, either structural or in handling, was encountered. With the familiar Model 28 wing-tip floats extended, the drag is increased and the angle of glide is steepened.

Consolidated Dedicates New Plant

WITH APPROPRIATE CEREMONIES the large new buildings of Consolidated Aircraft Corporation at San Diego, Calif., were dedicated on Labor Day, September 2. High ranking officers in the Army, Navy and Marine Corps, Consolidated and other aviation leaders, employes and their immediate guests attended. A handsome souvenir booklet containing pictures of various types of Consolidated airplanes was distributed. Among the musical selections by the Consolidated Glee Club and Orchestra was a new song, "Wake up America," by Dorothy Fleet and Edward Borgens. Edgar N. Gott, vice president of the company, was master of ceremonies.

Rear Admiral Charles A. Blakley, U.S.N., Eleventh Naval District, delivered the dedicatory address. He said, in part:

> I hereby dedicate this new plant to work in national preparedness, to help maintain our rightful place as a mighty nation. And when this present emergency shall have passed, it may be dedicated in more glorious activity in supplying commerce with its products. I congratulate Major Fleet and his associates on this fine plant and bring the best wishes of the whole Navy. I declare this new addition and plant to be open.

Other addresses were given by Brig. Gen. Frank D. Lackland, Wing Commander, March Field; Maj. Gen. W. P. Upshur, Commanding Department of the Pacific, Fleet Marine Force and U. S. Marine Corps Base; Col. Peter H. Ottosen, Commanding Fort Rosecrans, and Maj. R. H. Fleet, president of Consolidated. Maj. Fleet said:

MAJ. REUBEN H. FLEET, PRESIDENT, CONSOLIDATED AIRCRAFT CORPORATION, DELIVERING ADDRESS AT DEDICATION OF NEW PLANT BUILDINGS

Major Fleet Expressed Himself Pointedly and With Characteristic Vigor as Being Opposed to the Bill Authorizing the Peacetime Commandeering of the Country's Industrial Plants. He Asserted that, Whereas His Company Had Planned to Announce Further Expansion, the Bill Had Caused it to Hesitate, Even While Striving to do all Possible as a Private Enterprise

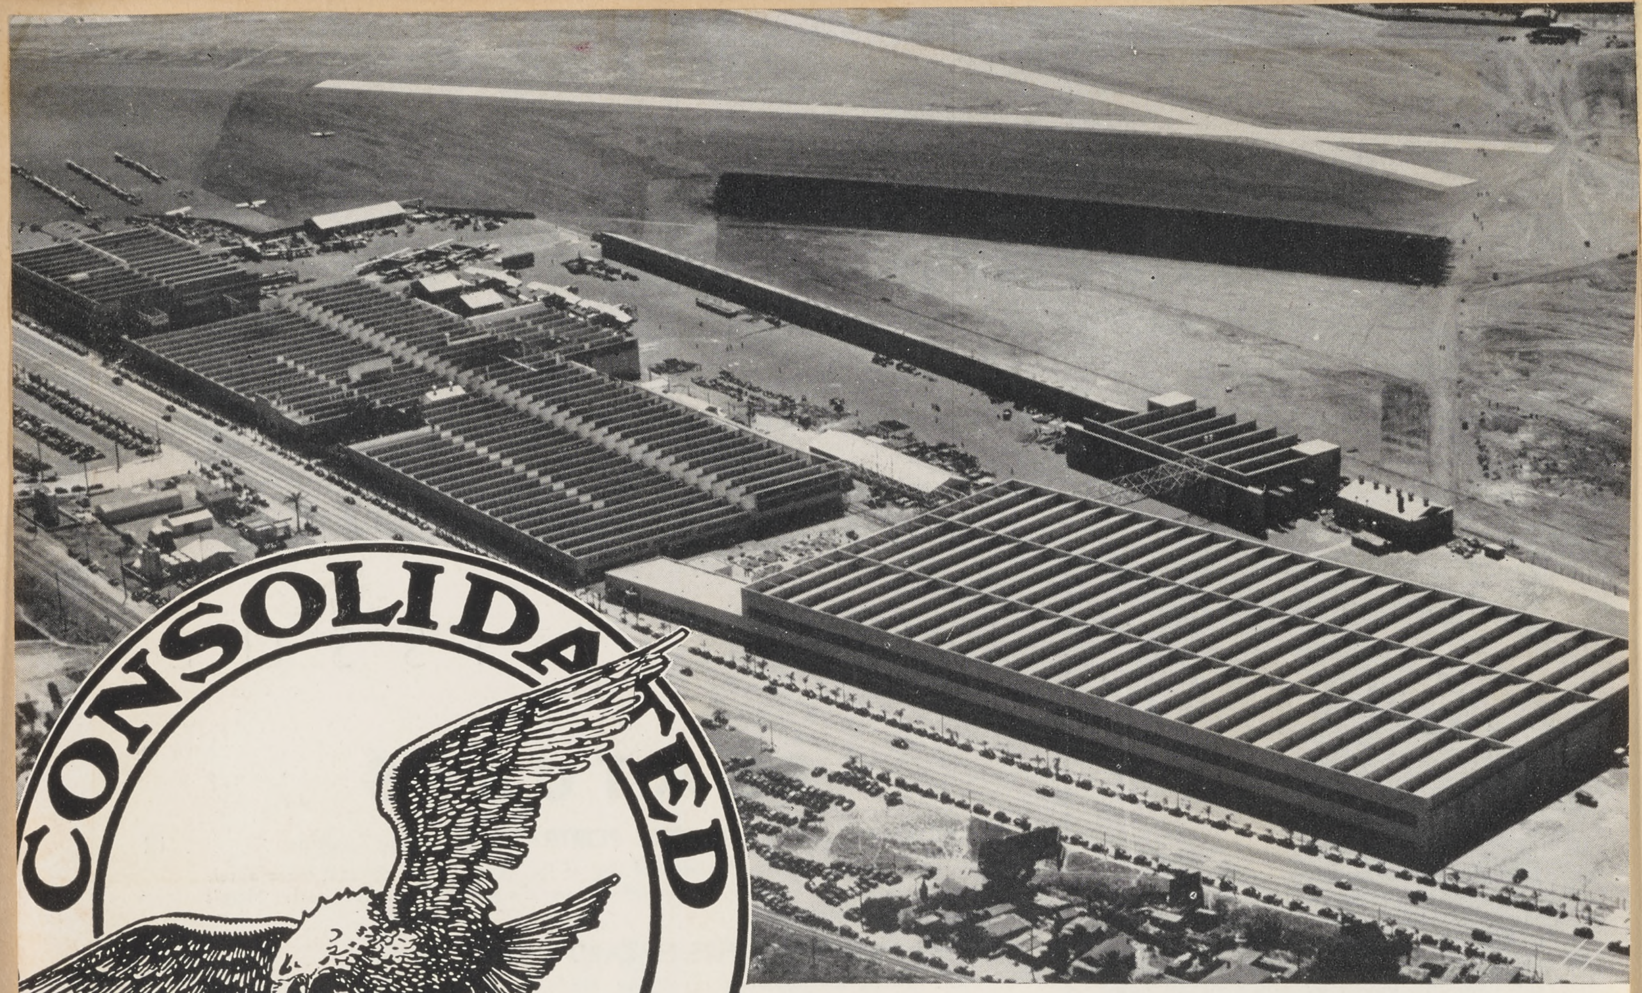
> Five years ago Consolidated Aircraft Corporation began work in San Diego, the city of our choice, with 300 workers and a plant of 200,000 sq. ft. Today, we have 9,600 men and 867,000 sq. ft. By Christmas, we shall have 15,000 men and 1,500,000 sq. ft. We came here with $6,000,000 of business—today, our backlog is $132,000,000. In this plant we have manufactured twice as many airplanes of over 100-foot wing span as have ever been made elsewhere in this country.
>
> We had planned announcement today of further extensive plant expansion, but the bill recently passed by the Senate authorizing peacetime commandeering of industrial plants which may fail in any respect to please a high official of our Government, makes us hesitate, much as we have been striving with all our might as a private enterprise to do our bit. Nationalization of her aircraft industry by France was so disastrous that that country's production fell down terribly, and even though she frantically resorted to foreign help at exorbitant expense, she collapsed as a nation and probably never will recover. We hope our Government will not make this mistake, which would be the beginning of labor regimentation, the emasculation of labor unions which our President has stated cannot strike against the Government, and the end in this country of free men and free enterprise.
>
> A year ago, Great Britain and France declared war on Germany. Since, Germany has conquered Poland, Norway, Finland, Holland, Denmark, Luxembourg, Belgium, and France and is now conducting a strong war of aggression against England. These results could not have been attained without superior airpower. Navies and armies are impotent without adequate airpower.
>
> Part of the new technique developed in this war has been instant concentration of air attack on landing fields. Herein we find the necessity for the possession of flying boats as they are not grounded by such tactics, because water cannot be destroyed by bombs.
>
> During the next few years our aviation industry will manufacture aircraft capable of protecting America from foreign attack and of carrying a war to the heart of any enemy fighting us. The airpower represented by these aircraft will enable America safely to enter into a world-peace pact, capable of enforcement because of the airpower thus created. Such airpower bows to no obstacle within its range—a continent or an ocean in a day. To preserve world peace, such power must exist; it does not police territory; it need not often be employed; its superiority at home should be sufficient to guarantee against aggression.
>
> And meanwhile aircraft will continue in peacetime to spread goodwill by enabling peoples to get together quickly and thus to know each other better. With each one realizing his individual responsibility, may those who toil here help to bring air supremacy, and therefore safety to our beloved country!

Consolidated Acquires Hall-Aluminum

HALL-ALUMINUM AIRCRAFT CORPORATION of Bristol, Pa., has been merged through purchase with Consolidated Aircraft Corporation, and some 32 key men as well as all material and equipment have been transferred to San Diego, Calif.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, is the son of Charles Ward Hall who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company. A. M. Hall was born in New York in 1899, and is a Mechanical Engineering graduate of Cornell University, 1924. He spent a year on the inspection side of the Navy's F4C-1 fighters, and was with the Union Carbide and Carbon Corp. as an engineer. From 1927 through 1936 he was vice-president of Hall Aluminum Aircraft Corp. and from 1936 to date, president.

Until its acquisition by Consolidated the company was engaged in the design and manufacture of aircraft, particularly flying boats.



CONSOLIDATED AIRCRAFT

AN INDUSTRY PORTRAIT

By

SELBY CALKINS

RACKS of shiny red, chromium trimmed bicyles and a fleet of little motor scooters equipped with diminutive sidecars, oddly enough, give the visitor to Consolidated Aircraft Corporation's San Diego factory his most vivid sense of the magnitude and scope of this giant of the aviation industry.

The visitor will hike miles (and "hike" is the word—not "stroll" or "walk" or any other term denoting a short or casual passage) through vast sheet metal departments, forests of jigs, broad assembly buildings and huge yards. He will see big flying boats under construction; PBY twin-engine patrol bombers with hulls like small yachts, four engine ships with bodies two stories high. He will see B-24 land bombers grow from sheets of metal and skeletons of ribs, frames and other stress members. He will see automatic machines making the plant's own millions of rivets, a wood shop bigger than the first Consolidated factory, even though there is no wood in the planes—except one single slab for the top of each map table, for thumb tacks!

Long factory vistas, huge buildings, outdoor assembly lines, steel work rising around actual manufacturing departments in production, raeing to roof against winter rains; these and a thousand like sights give him such conditioning to size that he loses his perspective.

That perspective, that realization of size and scope, is brought back with all the delicacy of a punch in the nose by the racks of bicycles and rows of motor scooters. Out of an office building comes an Air Corps inspector. He grabs a bicycle labeled "Army Only" and pedals briskly away. From another door emerges the employment manager, to ride off

On the adjoining page, the mammoth Consolidated Aircraft Corporation factory on Lindbergh Field, San Diego. This aerial view was made on September 6, three days after dedication of the newest unit in the company's expansion program, the $2,000,000 wing shown at the right of the photograph.

on a little "chug-chug." Mail boys, shop foremen, inspectors, Army and Navy representatives—everyone uses bikes or motor scooters to save indispensible minutes.

Seeing this, the visitor needs no statistics to impress him with the greatness of "Consair."

Consolidated Aircraft Corporation's history dates much farther back than May 23, 1923—its date of incorporation — for it may be truthfully said that the history of Consolidated is the life story of Major Reuben Hollis Fleet, its President. It is also the history of the aviation industry, of the first World War, of the first air mail service, the first Army and Navy training planes with steel tube fuselages, and the innumerable "firsts" in aviation's progress scored by Consolidated's flying boats.

Plain "Reub" Fleet, aged 30, when the United States entered the World War, he won the rating of Junior Military Aviator in the Army in 1917 at San Diego; became officer in charge of flying at Sacramento's Mather field; executive officer in charge of training in the office of the Chief of Air Corps; attended Gosport School of Advanced Flying for flying instructors in England; was officer-in-charge when the Army started air mail service between Washington and New York in May, 1918; became contracting officer for the Air Corps and business manager of McCook Field from January, 1919, to November, 1922.

The scene shifts to East Greenwich, Rhode Island, and the plant of the Gallaudet Manufacturing Company. While Major Fleet was at McCook Field, the Rhode Island company won a contract for remodeling of a number of DH's for the Army. Major Fleet resigned to become vice president and general manager of Gallaudet. Originally built as an airplane factory, the Gallaudet plant had descended to the lowly—but more profitable — work of making "feather boards" for the textile industry. (Feather boards are thin strips of wood around which bolts of cloth are wound.)

That remodeling job, in a factory of some 30,000 square feet of production space, proved the beginning of Consolidated as we know it today. In May, 1923, Major Fleet organized the Consolidated Aircraft Corporation, purchased the Dayton-Wright Company's engineering designs and used, under contract, the Gallaudet manufacturing facilities.

Operations were carried on here until 1924, when Major Fleet and his associates (many of them still Consair executives) were successful in an Army airplane competition and were awarded a contract for 50 two-place tandem trainers.

The contract brought the baby company smack against a problem still unsolved — a plant large enough to "handle the business on the books." There were also the problems of a good skilled labor supply, room for expansion, need for machine tools — all the same problems still fretting every aircraft manufacturer.

Consolidated solved its dilemma of 1924 by a nation-wide survey—and an "odd man wins" penny matching!

Present when the fateful decision was made were President Fleet, Plant Superintendent George Newman, and Col. V. E. Clark, Consolidated's chief engineer and inventor of the Clark Y and USA series of airfoils. Major Fleet favored Baltimore, as an industrial center; Col. Clark favored Dayton as a virtual Army headquarters; Newman boosted for Buffalo, where wartime Curtiss had trained a labor supply. Each thought his argument the best. Coins were produced and flipped into the air. The decision clattered to the desk top —Buffalo.

The city thus determined, ready to use manufacturing facilities were sought. One large plant was rejected for lack of headroom. The wartime Curtiss plant at 2050 Elmwood Ave., which had passed into the hands of the American Terminal Warehouse Corp., was finally selected.

Consolidated's first lease was signed on September 2, 1924 covering 28,351 square feet of manufacturing space. This document was the forerunner of a series of leases, supplemental agreements, leases to end all leases, supplemental agreements to them, etc., until the lease files presented an imposing—and confusing — array of documents. No less than 17 such transactions were carried out as Consolidated spread through the American Terminal Warehouse Corp. properties on Elmwood Ave., until finally the

Major Reuben Hollis Fleet, president of Consolidated, as he appears today. Major Fleet organized the company and still directs its

products coming from its shops. Following the same general outline which has brought us to this point, let us sketch the company today—first, its manufacturing facilities; second, its business:

Including an addition dedicated on September 2, 1940, the Consolidated Aircraft Company has a factory comprising 1,910,000 square feet of manufacturing space and 954,000 square feet of adjoining land for further expansion. Also early in September, Consolidated disclosed the purchase of the Hall Aluminum Aircraft Corp. of Bristol, Pennsylvania. Machinery and equipment of Hall Aluminum has been shipped to San Diego.

Consolidated's original San Diego factory encompassed 246,841 square feet of floor space, in which 262 employes worked for a payroll of approximately $10,000 per week. Today's huge plant employes 10,304 men (as of September 12, 1940 — additional men are being hired at the rate of 500 per week) with a weekly payroll of approximately $350,000, and in prospect of another $2,500,000 in plant expansion.

The company arrived in San Diego with a backlog of $6,000,000 in unfilled orders. Today the figure stands at approximately $220,000,000.

A detailed breakdown of the Consolidated backlog, one of the largest in the industry, is of course impossible because of defense restrictions. A recapitulation of recent orders and other data already published, however, will give the reader an insight into the strides taken by Consolidated.

In mid-August the company's backlog was approximately $130,700,000 including U. S. Navy orders for 200 PBY-5 twin engine patrol bombers and two PB2Y-2 four engine patrol bombers tabulated by the Navy as on order but undelivered; orders from the Navy, Great Britain and France (assumed by Great Britain) and a $14,800,000 order from the U. S. Army for 56 four engine B-24 four-engine heavy bombers.

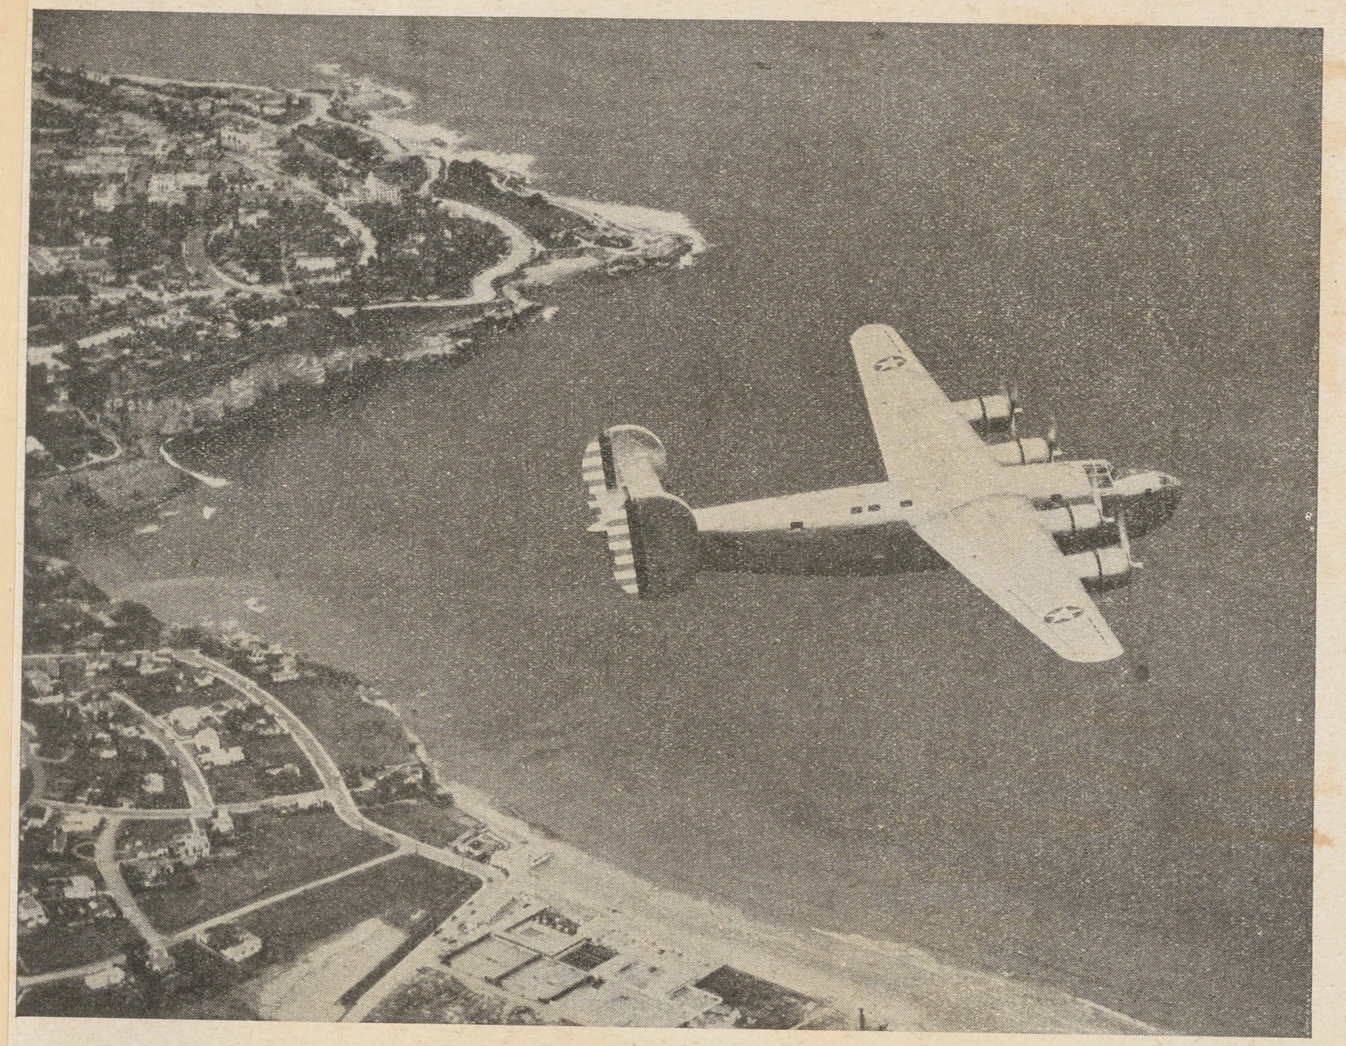
In rapid order came, on September 17, an order from Australia for 11 PBY twin-engine patrol bombers amounting to $3,500,000; and on September 20 an order from the U. S. Army for advanced versions of the B-24 in the amount of $85,800,000. The number of planes was not given in the published announcement, but a guess in the neighborhood of 300—based on the August 16 order for 56 planes at $14,800,000 — would not be far wrong.

A contract to remodel a few "Jennies"—and $220,000,000 in unfilled orders . . . thirty thousand square feet of rented space in a "feather board" plant—and two million square feet of 1940 factory . . . a handful of men designing and building a trainer in eight weeks—and 15,000 employes by Christmas . . . the flip of a copper coin sending a tiny concern to a Buffalo warehouse—and motor scooters to speed inter-office travel.

These are the lineaments of Consolidated's "Industry Portrait."

Some of the veteran officers being retired were largely responsible for the Navy's many successful mass flights of PBY patrol bombers (below) to Hawaii and Panama.

July 1940 Pop. Aviation



The U.S. Army Air Corps' latest big bomber, the Consolidated XB-24, in flight over San Diego, California. The aeroplane is liberally supplied with hatches and windows. Fixed wing-tip slots and two pitot heads may be noticed, and the airscrews are Hamilton Hydromatics.

CONSOLIDATED BOMBER XB-24

Davis Aerofoil Again Used : Patent Details

THE U.S. Army Air Corps' latest "bombardment" (long-range bomber) type, known to the Air Corps as the XB-24 and to its designers as Model 32, has a wing incorporating the new Davis aerofoil. Designed and built by the Consolidated Aircraft Corporation, the prototype made its initial flight early this year at Lindbergh Field, San Diego, California.

It is a four-engined high-wing bomber of all-metal construction. The wing is a full cantilever type of high aspect ratio with four tractor engine nacelles mounted flush to the upper surface. Fowler flaps extend from fuselage to ailerons. In the illustration five fixed slots will be noticed in each wingtip.

Power is provided by four Pratt & Whitney 18-cylinder twin-row radial air-cooled engines rated at 1,200 h.p. each. The airscrews are of the Hamilton Standard 3-bladed Hydromatic constant-speed type, 12ft. in diameter.

The gross weight of the aeroplane is 40,000 lb.; wing span, 110ft.; length of fuselage, 64ft.; and overall height, 19ft. Crew varies from 6 to 9 persons, depending upon the mission to be performed.

Control surfaces are fabric-covered and mass-balanced. A full cantilever horizontal tailplane has twin fins and rudders mounted at the tips. The all-metal stressed-skin fuselage is equipped with hatches and windows in the nose, tail, sides, top and bottom. The landing gear is of nose-wheel type with all three wheels retracting.

The makers claim a speed of over 300 m.p.h., a range of 3,000 miles, and a bomb carrying capacity of 4 tons.

The Davis aerofoil has come in for a certain amount of publicity and some extravagant stories have been written about it. But the fact that Consolidated, always in the forefront of American design, has seen fit to adopt it and use it on their outstanding twin-engined Model 31 flying boat and then on the later XB-24, shows that it is somewhat more efficient than a flat plate.

The Davis Aerofoil

This aerofoil is covered by U.S. Patent No. 1,942,688, dated January 9, 1934. Its inventor lodged the claim some years before this, in 1931. The following is a brief precis of the patent:—

For any given upper curve of an aerofoil there is but one most efficient lower complementary curve. The upper and lower curves of the profile each affect the fluid flow around the other and are interdependent.

The general object of the invention is to provide a formula for laying out the two profile lines so that they have a definite relationship for each given type of aerofoil.

(*Continued on page* 152.)

The co-ordinates for the upper or suction surface are determined by the two following equations:—

$$X_S = \sin\theta\,[0.6366198(A-B)+B] + \tan\theta\,[(1-0.6366198\,\theta)(1-A)]$$

$$Y_S = \cos\theta\,[0.6366198(A-B)+B] - A(1-0.6366198\,\theta)$$

A pair of similar equations defines the shape of the lower or pressure surface:—

$$X_P = \sin\theta\,[0.6366198(A-B)+B] + \tan\theta\,[(1-0.6366198\,\theta)(1-A)]$$

$$Y_P = \cos\theta\,[0.6366198(A-B)-B] - (A-2B)(1-0.6366198\,\theta)$$

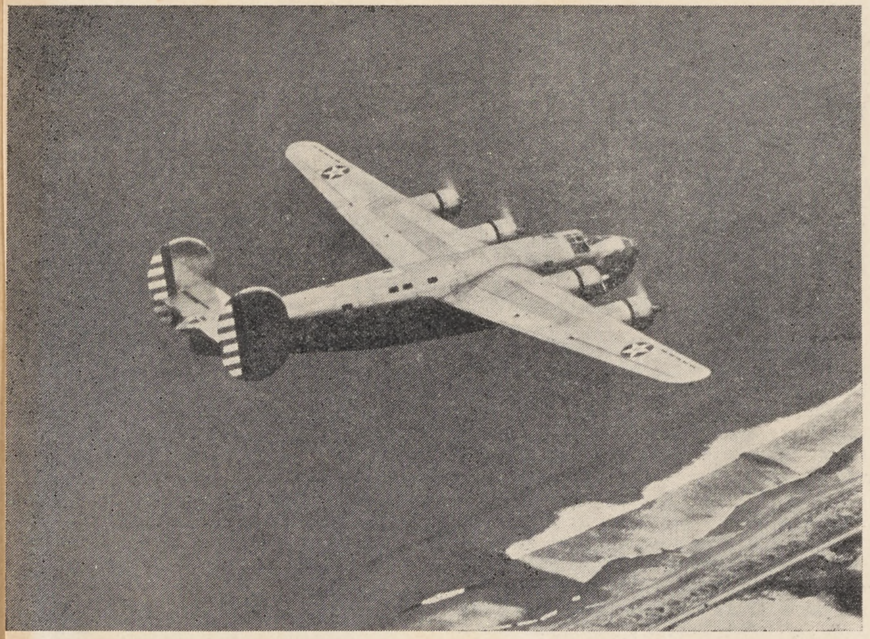
(In all four formulæs, θ varies from 0 to $\pi/2$ radians.)

The values of A and B are kept constant for any one aerofoil. A sufficient number of values of θ should be used in order that the points found will be numerous enough to determine fair curves. If the constants A and B are given regular increments, a series of aerofoils can be constructed which will vary gradually in their properties.

The equation was developed from formulæs based on the mechanical action of a rotor having rotation and translation through a fluid.

This combination of rotation and translation produces a lift, and the phenomenon, known as the "Magnus effect," has been well known to theoretical and practical aerodynamicists for many years. The Flettner rotor ship was built on this principle, and every time one puts top-spin on a tennis ball to pull it down quickly after crossing the net, the phenomenon is utilised, the lift in this case having a negative value. Back spin, of course, tends to keep the ball in the air.

The Davis section as used by Consolidated is thinner than current practice and the thin wing has always been attractive aerodynamically, due to reduction of profile drag. But how to obtain a light structure with shallow wing spars is the stress analyst's difficulty, and progress on this problem must precede any aerodynamic advances in reducing wing thickness. The Consolidated 31 appears to be a very good boat, but not all its excellence comes from the wing section, for the general progress in structures and in design generally has contributed much to its success.



CONSOLIDATED BOMBER UNDERGOES TESTS.

Shown above is one of the first flight pictures of the new Consolidated Model 32 four-engined land bomber undergoing tests at San Diego (California, U.S.A.).

Designated by the Army as the XB-24, the 'plane marks Consolidated Aircraft Corporation's re-entry into the land 'plane manufacturing field, breaking a virtual specialization which has brought Consolidated the distinction of being the world's largest manufacturer of flying boats.

The Model 32 is a full cantilever, all-metal 'plane, powered with four Pratt and Whitney 14-cylinder, twin-row radial, air-cooled engines rated at 1,200 h.p. each. The propellers are Hamilton Standards of the 3-bladed hydromatic constant-speed type, 12 feet in diameter. Fowler flaps extend inboard of the ailerons in the wing of high aspect ratio, with the engine nacelles mounted flush with the upper surface of the centre section.

The approximate gross weight of the airplane is 40,000 lbs.; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

While the performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3,000 miles, and a bomb-carrying capacity of approximately 4 tons."

Consolidated Aircraft Corporation, San Diego, California

Largest Aircraft Plant in America.

Consolidated Aircraft Corporation's present expansion programme, now being rushed to completion with full manufacturing facilities estimated as completed by August first, brings this plant into full alignment with the President's recently announced emergency defense programme for building a vastly expanded number of aircraft. **When completed, Consolidated Aircraft Corporation will have the largest integrated aircraft plant in America,** with 1,910,000 square feet of covered and uncovered manufacturing space and 954,440 square feet of contiguous airport land under option for further expansion if necessary. Ramp, airport and rail sidings are not included in these figures.

Founded in 1923, Consolidated has made a most rapid advance to its present position, unobtrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft. **Taking as an arbitrary measure of "bigness" the wing span of 100 feet or more, and including the airplane equivalent to spares furnished, Consolidated has constructed more than three times as many such airplanes as all other manufacturers combined. This includes those built during the World War period.** Since the company's advent in 1923, Consolidated has built approximately four times as many of such aircraft as all other U.S. manufacturers combined.

As early as 1934, six Consolidated P2Y-1 twin engined flying boats in the service of the U.S. Navy, flew the first successful massed flight from San Francisco to Hawaii, a distance of 2,414 miles, non-stop. Phenomenal success followed the current Model 28's, or U.S. Navy PBY's, the larger twin-engined flying boats. With these 'planes scarcely off the line the U.S. Navy began a series of "routine" delivery flights non-stop from San Diego to Hawaii, a distance of 2,553 miles, with the 'planes flying in groups of from 12 to 18 at a time. Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Another 88 in groups of from 12 to 48 at a time, have been flown non-stop from San Diego to Coco Solo, in the Canal Zone, a distance of 3,087 miles. Aboard these planes were some 1,200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

Consolidated engineers have followed the highly successful Model 28 design with the Model 29 a huge four-engined craft built for the U.S. Navy, and the Model 31, a twin-engined flying-boat boasting the first two radial air cooled engines of 2,000 horsepower each, ever to be installed in an airplane. Successfully tested, and known to exceed in range, speed and load carrying capacity its forerunners the Model 28's, the Model 31's performance figures are being carefully shielded because of their military potency, though a range of over 5,000 miles non-stop and speed of 250 m.p.h. are said to be conservative figures.

Re-entry of Consolidated into the land plane field is marked by the Model 32 four-engined land bomber known as the U.S. Army's XB-24, with an approximate gross weight of 40,000 pounds. Of this plane the United States Army Air Corps recently stated: "This airplane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3,000 miles and a bomb carrying capacity of approximately 4 tons."

Ind. L.A. County 11-12/40

Consolidated

In its immense plant adjacent to Lindbergh Field on San Diego Bay, Consolidated Aircraft Corp. is turning out huge flying boats and landplanes weighing from 27,000 to 65,000 pounds and costing upward of $200,000 each.

Consolidated has always specialized in building large airplanes. The company claims the distinction of having built, since its inception in 1923, four times as many ships with a wing span of 100 feet or more as all other United States aircraft manufacturers combined.

Huge mechanical and hydraulic presses, including one of 4,500 tons, large hydraulic drop hammers and hulls for the twin-engined PBY patrol bomber lined up 50 strong on the final assembly line, all convey the idea of great size.

When Consolidated transferred its activities to San Diego from Buffalo, N. Y., in 1935 it had about $6,000,000 of business on its books. It started operations with some 300 employes in a plant containing roundly 200,000 square feet of floor space. Today the company has an order backlog exceeding $320,000,000 and by February 1 next year expects to have roughly 1,500,000 square feet of covered floor area, plus a substantial paved but uncovered area suitable for final assembly work, and between 15,000 and 16,000 employes. This, however, will not complete Consolidated's expansion program.

Consolidated has greatly enlarged its plant this year and increased the number on its payroll from about 3,200 on January 1, to almost 14,000 at present. Consolidated today has an estimated $25,000,000 worth of parts and planes in various stages of production which should begin flowing off the final assembly line in steadily increasing numbers from now out.

On the basis of the present schedule deliveries from existing facilities, against contracts now on the books, should attain their peak around March or April. The latest addition should be completed by about June 1 and reach its peak employment of roughly 12,000 by November of next year.

Consolidated currently is working two ten-hour shifts five days a week. Like most other manufacturers it could undoubtedly enlarge its output by either working an additional day or adding another shift. This, however, has not proved feasible as yet as production of the air-frame manufacturers naturally must be geared to that of their suppliers and sub-contractors, as well as that of the engine producers.

At this time Consolidated is in production on three models but actually is making deliveries in any quantity on only one type. It is manufacturing a twin-engined flying boat for the Navy and the British, a four-engined flying boat, the PB2Y, for the Navy, and a four-engined land bomber, the model 32 or B-24, for the Army and British. This bomber, the prototype of which was first flown in 1939, marks Consoldiated's return to the landplane field. It is a high-wing ship, with a tri-cycle landing gear, which, according to available information, has a speed of over 300 miles per hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

Parts Plant

The company has just announced a $7,000,000 addition which will approximately double its present floor area. So far Consolidated has financed its own expansion, having previously spent or committed itself to spend this year approximately $6,000,000 for enlargement of manufacturing facilities. The latest addition, however, it is understood will be financed by the Government and leased by the company.

The new addition, according to present plans, will be devoted to the manufacture of parts and minor assemblies with existing facilities turned almost entirely to final assembly work. This does not mean, however, that Consolidated is not planning to sub-contract some of its work. It is already doing considerable sub-contracting and plans to do more as it swings into increased production on its present orders.

Popular Aviation - June 1940

Davis' airfoil is the keystone of the Air Corps' new Consolidated B-24 bomber.

First plane to use the Davis airfoil was the Consolidated Model 31 flying boat.

MYSTERY AIRFOIL

By

HAROLD KEEN

Uncle Sam may rule the skyways because of the work of a lone, scorned engineer. His new wing section astonished aviation authorities.

HE'S not listed in "Who's Who" and that's all right with David R. Davis, notwithstanding the fact he has solved an aviation riddle which defied the most brilliant aeronautical engineering minds since that incident at Kitty Hawk.

"I'm just a little fellow trying to get along," he comments, shunning a place in the Hall of Fame which ought to be reserved for "little fellows" who profoundly affect the study of aerodynamics, set the academicians back on their heels and show an incredulous world that what once had been considered the ultimate in combating flight's greatest enemy, air resistance, was hardly more than a modest approach to the problem.

That's by way of introducing David R. Davis, as modest a gifted individual as ever graced this earth. If posterity, despite the "Who's Who" oversight, remembers him only for the development of the Davis airfoil, a hard-won immortality will be his.

This is essentially the story of that airfoil and how it has jarred aeronautical engineering, but it cannot be disengaged from the story of the little-known man who conceived it. Davis, a bespectacled, mild-mannered gentleman who today occupies a small, easily accessible office on a quiet Hollywood street, recalls that he has always been a "nut on aviation."

Originally he set out to be a barrister, duly completing the law course at Vanderbilt University. But he soon discovered that law practice and law study registered totally different appeal and the bar held out no lure for him.

Aviation somehow gripped him from the start.

"I was one of that generation born with the urge to fly and build airplanes at this particular moment in world history," he comments.

Notice that the original Davis patent was filed in 1931, but not granted until 1934.

The handicap of defective eyesight possibly contributed in pointing Davis toward his destiny as one of the world's finest, self-taught practical aerodynamic experts. It has kept him close to the drafting board and out of the cockpit most of his life. He was refused enlistment in this nation's air forces during the World War and was cast in the humble role of infantry private. But the love for planes flamed with undimmed vigor through the years.

Early in the '20's Davis was in possession of funds looking for a place to roost. With Bill Henry, then an ambitious young journalist (now columnist for the Los Angeles *Times* following a period as correspondent with the Royal Air Force on the western front), induced Donald Douglas to come west early in the 1920's. The luster of Douglas' present-day fame has obscured his transition from status of employee to employer. He owes his start in manufacturing to David R. Davis and his continuance in this field to Bill Henry (see Popular Aviation, November, 1938).

David R. Davis

Douglas then was chief engineer for Glenn Martin, with whom he had moved east from the original Los Angeles plant. Both Henry and Davis knew him well, the former idolizing Douglas as the greatest engineer of his day.

The Davis-Douglas Aircraft Corporation was formed and the famed *Cloudster,* first Douglas transport, was built—with $30,000 of Davis' money. He also financed engineering of the first major Douglas military ship, the DT torpedo plane. But before the production order was received, Davis saw himself bucking against a stone wall. He went to Washington, observed at close quarters what seemed insurmountable difficulties in dealing with stubborn authorities. "I realized I wasn't big enough," he declared. And he severed his now historic connection with Donald Douglas. The Davis finances could go only so far.

Two persons made it possible for Douglas to continue. One was the rampaging Billy Mitchell, who shattered the monopolistic trend of Army and Navy aircraft orders and breathed new life into such struggling independents as Douglas. The other was hero-worshiping Bill Henry, who "sold" Douglas to his boss, Harry Chandler, publisher of the Los Angeles *Times.* Chandler and fellow financiers raised the necessary cash to keep Douglas in business and eventually his first large military order was received by the man who now heads the nation's most gigantic aircraft enterprise.

Thus ended David R. Davis' career as a financial "angel". He had turned over all the good will and assets of the Davis-Douglas Corporation to his friend, Don. Lock, stock and barrel the concern changed hands (Davis had been sole owner until then) without a penny involved. The money sunk into the experimental work on the DT was, however, ultimately repaid by the prospering Douglas.

In this unpromising manner began the most significant—and present—phase of Davis' career. He became a lone wolf engineer, operating much of the time only with his own unorthodox ideas for company. For a while, late in the 1920's, he was employed by the Bendix Aviation Corporation, where he developed the first variable-pitch propellers without mechanical control. He toyed with an automatically stable ship, abandoned the notion when it was found less practical than the controllable type.

He never lost his primary interest in wings. This plunged him into the vortex of a behind-the-scenes struggle—one in which he has been engaged since the Davis airfoil told the N. A. C. A. and most aeronautical engineers they may have been going up a detour in their search for the "perfect wing".

As long as man has been able to fly, he has been intensely concerned with the airplane wing. "In the old Curtiss days," Davis reminisced with a smile, "everybody had a secret wing section in his hip pocket. He guarded it with his life."

Davis was no exception. He always wondered what made the wing lift an airplane. What did a wing curve do? How did it function? And when he asked that question he came upon a conception as simple and yet as startlingly beyond man's thinking habits as Newton's discovery of the law of gravitation. A curve, he perceived, was not a dead geometric figure. *It was a living, mechanical, operating thing.* On the basis of this, he could not but depart from what now seemed an archaic process of obtaining the most efficient curve for an airplane wing — the so-called "cut and try" methods.

The oldest approach to this problem was by taking a wooden "blank" or board and sandpapering it down to different shapes, trying each in the wind tunnel until the best shaped wing was evolved. Truly hit or miss. An improvement on this technique was established by the National Advisory Committee for Aeronautics, which sought an airfoil system. This group's engineers developed a series of streamlines. These in turn were bent around different-shaped curves or "mean camber lines", thus creating a system of foils. In this general manner related series of foil shapes were developed, tested and the characteristics listed. By analyzing the "bent" streamlines, performance could be quite accurately foretold.

(*Continued on page* 64)

With airfoils stretching almost to infinity and millions spent in all parts of the world on their development, the engineers agreed that they had reached the acme of wing perfection—90 per cent efficiency, with the 10 per cent loss accounted for by skin friction. Meanwhile, working quietly with his revolutionary conception for more than a decade, David R. Davis threw overboard the time-honored approach to airfoils.

A curve, he saw, was the product of mechanical action—rotation at infinite speed. "A circle," he said, "is not an inert object. It is something going around—a radius arm (or lever arm) rotating about a center."

Having stumbled on this hypothesis, he discovered that the most efficient mechanical action to produce lift would result from the proper relation between the rotational speed of the radius arm and the translational velocity of the point about which the radius arm rotates.

Sounds pretty deep, doesn't it? Actually, it's quite simple. Two factors must be borne in mind when considering the Davis airfoil. One is rotation—*movement* of the radius arm around the center of a circle. The other is translation—*movement* of the center itself. You can reproduce part of a Davis airfoil—not *the* mystery Davis airfoil, of course—as follows:

Mark a dot on a sheet of paper, designating it as the center of a circle. Place the point of a pencil on that dot, then lay the pencil down to form a radius, or lever, arm. Now turn the pencil clockwise and, at the same time, move the point in a straight line to the left (thus indicating movement of the circle's center by the latter motion). The curve formed by the top of the pencil as result of this simultaneous action is fundamentally part of a Davis airfoil profile—the product of two *steady movements.*

Steadiness is important. "If you rotate a flywheel steadily it takes less effort to keep it moving," Davis explained. "If done jerkily, more horsepower will be required. The same is true of translation. The center of the circle must move at a steady rate. The combined steady actions will trace the top curve of an airfoil and a million of these (an abstract number) will form the wing's cover."

A wing surface is no more inert than a buzz-saw, Davies declares. It is a mechanical device whipping the tar out of the airstream, smashing all its resistance and converting it into work for the plane. That, stripped of elegant technical terms, is "lift." To illustrate this, Davis uses the golfer. The golf club rotates around the hand as a center. Both hand and club are moving—translation and rotation. If the swing is not smooth, the ball won't travel far. A weakling with a steady swing will send the ball farther than a muscular gent with jerky style.

An airfoil is the golf club in opposite action—seizing the ball as it would come to it in a reverse motion picture and killing its resistance. The more smoothly the wing does this with air, the faster the plane will travel with least effort. A wing in flight, to Davis at least, is nothing more than millions of lever arms grabbing and taking the punch out of air.

Where is the mystery in an airfoil so readily explained by its creator? Ah, that is the formula which expresses the most perfect relation between the rotational and translational speeds. With the seemingly endless possibilities involved no less than an Einstein, one would surmise, could arrive at this formula. But Davis calls it a natural conclusion reached once the old ideas of airfoil design are junked.

"I know little about mathematics," he says with a modesty so baffling because of its very sincerity—and in Hollywood, of all places.

The whole fabric of instruction in

Below is first flight photograph of Army's secret Consolidated XB-24 bomber. Engines are 1,200 h.p. each, gross weight 20 tons including 8,000 lbs. of bombs, speed 300.

Popular Aviation July 1940

aeronautical engineering schools was subjected to great stress by the Davis airfoil. Straight-laced engineers claimed that research already had gone as far as possible in this field—that a positive science had been achieved which would tolerate no modification, let alone complete annihilation.

When Davis placed his wing section in wind tunnels to outstrip performance characteristics of the super-airfoils developed by accepted methods, the cry of "black magic" was raised. There must be some trick to it, was the concensus of opinion. And, although the airfoil seemed destined to give America uncontested mastery in plane performance—because 90 per cent wing efficiency in one stroke has been increased to 100 per cent—Davis had to face the almost unbreakable prejudice born of the fear of entrenched engineers. Glenn Martin, for example, became highly interested but was dissuaded by his staff from adopting it. This, despite these facts on the Davis airfoil, as proved in wind tunnels in competition with the most widely used wing section:

1. It showed 25 per cent less profile drag at low speeds and 10 per cent less at high speeds.

2. It showed 20 parts of lift to one of drag, compared with 13 to 1.

But there must be a trick to it, they insisted. All except one of the nation's smartest engineers, another unsung, little-publicized gentleman named I. M. Laddon, chief engineer of Consolidated Aircraft Corporation, San Diego. It took imagination and courage, but when Laddon saw the Davis airfoil perform in the wind tunnel he was sold and proceeded to sell fellow officials.

The section was leased and used on Consolidated's Model 31, launched in May, 1939. With an extremely heavy hull, bomb and torpedo load to carry, this craft will fly in excess of 300 m.p.h. an amazing distance non-stop (reliably reported at 10,000 miles). It is almost as far ahead of its time as the Davis airfoil itself was in 1931, when the patent application was first made after several years' study. Military experts foresee this privately engineered ship as the future nucleus of an invincible U. S. Navy long-range air force.

Then came the sensational B-24, the four-motored bomber which has the Army Air Corps gushing in superlatives. The Davis airfoil again makes it possible, in large measure, for this 20-ton craft to hurtle through the air at better than 300 m.p.h.

Hard-shelled engineers began to crawl out of there ivory towers for a better look at this wing section they had snubbed. Other manufacturers, with Consolidated's example before them, have become quite interested. Whereas previously no amount of pleading could induce them to run their pet designs through wind tunnel tests in competition with Davis airfoil-equipped duplicates, they now are more than willing.

Two major plants (Davis will not reveal their identity, but they probably are Douglas and Boeing—Ed.)—have, since the Model 31 and B-24 began their trail-blazing, undertaken experimental designs around this airfoil. One of the concerns is building a huge landplane and the other a seaplane. Both are believed to be larger than any craft conceived yet and will have military *and* commercial utility, according to Davis.

The Davis section is of most practical value to large ships in which payload and long cruising range are major factors. By cutting down drag and improving lift, this wing section makes possible an increased gasoline or passenger and air express capacity. For instance, should the Davis airfoil be substituted for the conventional type on today's transports, a 15 to 20 per cent greater pay load might be possible, Davis estimated. He pointed out, however, that it would be impractical to switch wing sections on an established type, although it could be done in the same wing area. Fullest benefit can be obtained only when the rest of the plane is engineered with the airfoil in mind.

Davis has received inquiries from numerous foreign governments and he is conducting wind tunnel tests for their benefit, he revealed. In fact, negotiations with one particular country (reliably reported to be England.—Ed.), whose name he cannot disclose because of the international situation, have reached such an advanced stage that before this is published the Davis section may be putting new wings on European aircraft. England, France and Holland are known to be particularly intrigued with this wing section's possibilities. Davis is not dealng with any nation unfriendly to the United States and he infers that in this classification are those who have discarded the democratic idea.

There is irony in the fact that, whereas Martin might at one time have had access to the Davis airfoil, the avenue to it has been closed today. Martin is looked upon by Davis as in direct competition with Consolidated, to whom he owes a debt that can hardly be repaid in cash alone. The San Diego concern, after all, in a practical way showed the aviation world what Davis had been trying to demonstrate on paper and in the wind tunnel.

After the many years of battling, at thousands of dollars of personal expense, Davis is beginning to realize the monetary reward too few inventors enjoy. He receives, as royalty, one-half of one per cent of the plane's sales price, without engine. At this writing, the only actual production orders for a ship with a Davis airfoil are the Army contracts with Consolidated, totalling $11,365,000 for 46 B-24's. That amounts to approximately $245,000 per plane, or 1,200 a wing to swell Davis' exchequer. Not potatoes, exactly, but aggregating a sum to date that is not generous compensation for more than a decade's efforts.

Queries of light private plane manufacturers on the airfoil have been tabled by Davis to satisfy a quite obvious Army and Navy desire to confine its use, for the present, to secret military craft. He hopes some day to accommodate all concerns desiring his wing section rights. He is frank, however, in admitting that the Davis airfoil probably never will prove as attractive to small craft concerns as to those who specialize in sky juggernauts. "Maximum performance is not as essential in private planes," he explains.

The ideal characteristic of this new wing section is that aircraft performance is better at *every* flying attitude, whether climbing, landing or merely cruising. Not only are top speed, altitude attainment and long-range cruising greatly enhanced but the improved lift actually cuts down landing speed. Hence, the pilot of a plane with a Davis wing section need not fear "hot" landings, Davis maintains.

It is no more expensive to build a plane with the Davis airfoil than the NACA or any other type—provided all the engineering and construction is done, from the outset, with this curve an integral part of the plans. Wing areas of today's standard planes, if fitted with the Davis airfoil would, if anything, be reduced, Davis said, although this can be traceable to a modern tendency toward the heavily loaded wing for speed qualities. Both the Consolidated Model 31 and B-24 are quite heavily loaded per square foot and each plane is phenomenal for speed in its respective class.

The pioneering has been heart-breaking and would have caused a thinner-skinned man than Davis to give up before emerging from the jungle. But he hasn't finished shocking the aviation world. The wing has been his specialty to date and now he is turning his attention to the things that detract from its efficiency. The fuselage, tail and engines are nothing but "unfortunate" drag factors as far as Davis is concerned. And he has set about attacking this problem in a sensational pursuit interceptor, details of which we are not at liberty to disclose except to state it's the closest thing to a flying wing actually tested and proved for performance. The wind tunnel already has demonstrated it is 40 per cent more efficient than any other of that type.

Associated with Davis in development of this plane is W. J. Waterhouse, one of the nation's finest in practical structural work and an illustrious pioneer in his own right. He it was who supervised conversion of the wood construction in the Douglas DT to welded chromolybdenum tubing, a remarkable advance for its time. Affiliated with Glenn Curtiss at Hammondsport, N. Y., Waterhouse has been in aviation since its infant years.

Davis holds no malice for the overwhelming majority of engineers who greeted his airfoil with ridicule. His chief desire is to cooperate with NACA and military experts in practical application of his revolutionary conception. And as for taking the lion's share of credit, nobody need fear Davis for that. Of the only two plane types actually completed and using the Davis airfoil at this writing, he says:

"They were intelligent engineering jobs by Mr. Laddon and his staff. You must realize that my airfoil will show no performance if the rest of the plane isn't clean."

Aviation will have to learn from someone other than David R. Davis how much it owes him.

Bending Aluminum Aircraft Tubing

by Bert Freakley
Consolidated Aircraft Corp.

Manufacturing conditions in the aircraft industry make the tube bender's task much more difficult today than a few years ago, when a tube bent over a nail keg or one's knee might be satisfactory. Aluminum alloy tubes for oil and gas lines, for example, must be perfect in every respect, including the bends, before final inspection.

We have found that the use of a low-melting alloy as filler during bending not only results in perfect bends that are exactly reproducible at any future time, but also provides a means of checking for freedom from pinholes or other flaws in the material. The main purpose of the filler is simply to make the tube behave something like a solid bar and not flatten out at the point of bend, and for this non-metallic filler material (rosin or sand, for example) could be used. With sand or rosin, however, the filling process is tedious, inconvenient and sometimes unsafe, and the quality of the job is not always perfect.

Before bending, the tubes are visually inspected and cut to a length about 1-in. longer (for holding purposes) than that finally desired. Hardwood and rubber plugs, slightly tapered, are fitted snugly into one end of the tube and water at 160 deg. F. is poured in to bring the tube up to the same temperature as the molten filler alloy, which is next introduced. The filler in most common use is "Cerrobend" [50% Bi, 26.7 Pb, 13.3 Sn, 10 Cd, a designed-for-bending modification of Wood's metal produced by Cerro de Pasco Copper Corp., New York], which melts at 160 deg. F. The penetrative powers of the filler metal are such that some of it oozes through the close grain of the 1½-in. long plug.

At this stage, any pinholes, however small, will be revealed by the molten filler metal, which will come out through a hole finer than frog hair. If a defect has metal burnished in or over it, the Cerrobend will heave the metal out of the defect and expose the hole. If no defect was revealed, the filled tube is lowered slowly into cold water and left immersed while other tubes are being checked.

Now, suppose that *inside* this tube that has been left cooling there was a defect near the middle of the piece (the piece being 6-7 ft. long, 1 in. outside diam., of 0.049 in. 52 SO aluminum alloy) such that the wall thickness was actually only about 0.0005 in. The filler metal will raise a wart at that point as it solidifies during cooling, and will finally crack the tube open. A weak seam in the tubing will be split open in the same manner. This is because Cerrobend and similar alloys expand slightly on solidifying—enough to reveal any defects, but not to injure a sound tube.

Electrical conduit tubes, which do not have to be liquid tight, are bent with steel mandrels, no Cerrobend being used.

U. S. Air Services Jan 1940

Consolidated's Twenty-Million-Dollar Navy Contract—Notes

ONE OF THE LARGEST single orders for planes under the present national defense aviation expansion program was announced by the Navy Department on December 22, in the award of a $20,016,669.60 contract to the Consolidated Aircraft Corporation, of San Diego, Calif., for additional numbers of that company's Model 28, which is in use by the Navy as that Service's standard patrol bomber.

As noted elsewhere in this issue, the Navy now has an advanced amphibian version of this big plane at the Anacostia, D. C., Naval Air Station for service performance tests, but it is understood that the present order is for the standard Consolidated ship, such as this company has supplied the Navy for use as patrol bombers in current service.

There is every reason to believe the Navy is well satisfied with this particular model, based on performances of squadrons of these ships in mass flights to Hawaii and Panama. It will be recalled that more recently a squadron of Navy patrol bombers flew across the Pacific to the Philippine Islands, making two stops after leaving Hawaii. These, it is known, were Consolidated's basic Model 28, the famous PBY's.

The Navy confined announcement of its order to the bare fact of the award, as it no longer specifies number of ships, nor the type and number of engines.

⁂

THE AIR SERVICES

Consolidated Bomber Tested at San Diego

Now undergoing tests at San Diego, the new Consolidated Model 32 four-engined land bomber marks Consolidated's re-entry into the land plane manufacturing field.

The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 hp each. The propellers are Hamilton Standards of the 3-bladed Hydromatic constant speed type, 12 ft. in diameter. Fowler flaps extend inboard of the ailerons in the wing, with the engine nacelles mounted flush with the upper surface of the center section.

Approximate gross weight of the airplane is 40,000 lbs.; wing span, 110 ft.; length 64 ft.; and overall height, 19 ft. Tactical requirements are for a crew of from 6 to 9, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with a single retractable wheel forward. Main landing wheels retract into the wing wells.

While performance figures are not available, an official release indicates a speed of more than 300 mph, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons

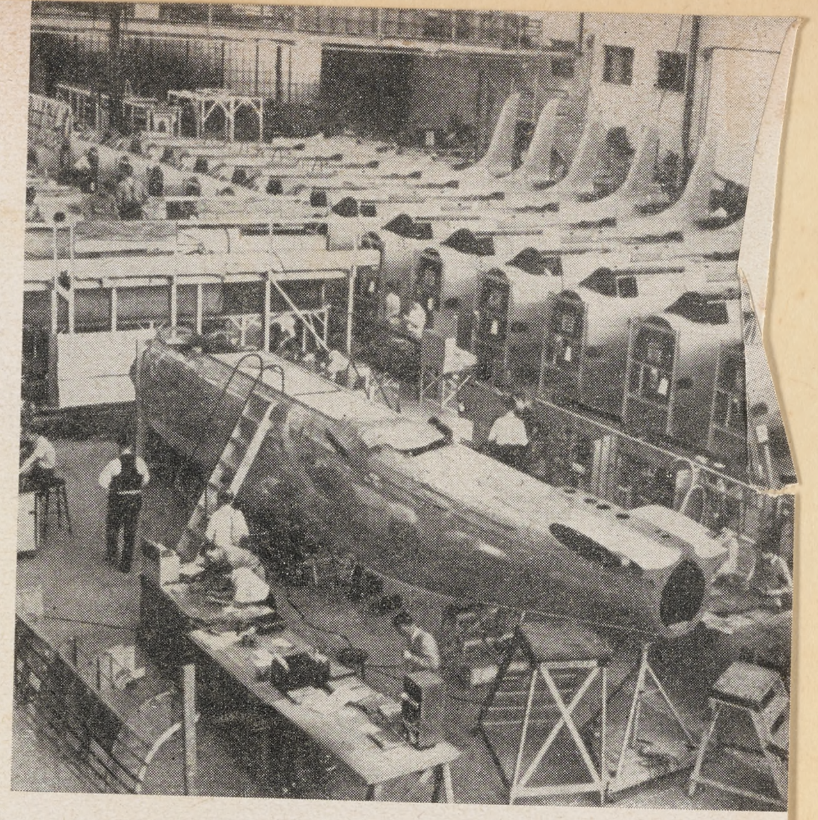
How America Is Helping Britain With Aircraft Supplies

★

By KEITH PALMER



BOMBERS FOR BRITAIN under construction at the Douglas factory in Santa Monica, California.

MR PALMER recently made the Melbourne-San Francisco and return journey with A.N.A., T.E.A.L., and Pan American. He described this 20,000 mile journey in the October edition.

Mr Palmer had several days on the West Coast of America, during which he visited the Douglas and Lockheed factories and met many leading aviation personalities. In this article he imparts a very encouraging picture of the invaluable war aid the U.S.A. is affording Britain.

LOCKHEED has supplied Britain with more service aeroplanes than any other American manufacturer. Douglas is at the moment building bombers for the Royal Air Force faster than any other company outside Britain, and because of the high repute of both companies any Australian visitor landed in the centre of the United States aircraft industry for only two days would have no doubt about choosing to see those two factories rather than any others.

It was very disappointing not to have time to get down to San Diego, less than an hour's flying away, to see the birthplace of the famous PBY's and of the new four-engined landplane bombers that seem likely, from all accounts, to earn as big a name as the flying boats. Also, I wanted to see North American, which is in Los Angeles area and which is credited with having got nearer to mass production than any other plane-maker in the world. But something had to be sacrificed, with time chasing as hard as it was, and because North American's main product was the *Harvard*, a type which Australians can see made — with modifications — in Australia, I saw Douglas and Lockheed.

They are the two biggest concerns in Los Angeles, he most important aircraft town on the Pacific Coast, where about three-quarters of the American industry is located.

Many Australians ask why the industry should ave picked on this town with such unanimity. here are several answers.

In the first place the weather is ideal. The warmth of the winter makes it unnecessary to provide any heating for the factories, which can also be of much lighter construction than buildings in the Eastern States because they never have to carry a snow load. The climate is also an asset in getting the goods away from the factory. Test-flying is possible every day of the year, and although at first one doesn't consider that very important, it is easy to see what a week's fog or snow would do to clutter up the works when aeroplanes are being built at the rate of several a day.

Secondly, Douglas has been established there for many years, and that in itself attracted other manufacturers because it meant that there was a supply of skilled labor to be drawn on as a nucleus for a new production force.

This effect is cumulative, because as the industry grows the city becomes more and more desirable for newcomers, both because of the labor supply and the natural growing-up of accessory and material supply.

For this reason, no manufacturer is anxious to comply with the desire of the Government that new factories should be considerably inland, on the other side of the mountain ranges from any potential attacker in the Pacific. This would raise costs and would introduce great difficulties of labor supply; and against it the industry uses the argument that the main need for defence is a large number of aeroplanes, which can best be produced by expansion on present sites.

Enormous Backlog

AT present, plant increases of 70 per cent. are actually in hand, to enable the Pacific Coast section of the industry to bite into its backlog of approximately £A170,000,000, a figure that is growing almost daily with new British orders and that will soar prodigiously when the United States Government finally places orders to carry out its vast rearmament programme. Early in August, none of the new United States programme had reached the contract stage, and apart from routine deliveries, fairly small, the bigger factories were free to concentrate on their job for the R.A.F.

To give an idea of the terrific activity on the coast, I have summarised here the position of the

(Over)

---

superbly finished as the DC2 and DC3, and, given the chance, would do as much flying. Some of the executives to whom we talked wondered if the policy that sets such a standard was correct, pointing to the thousands of man-hours that are going into producing perfection when something less than perfection would do.

But none of them wants to lower the standard, and none could suggest exactly where the line should be drawn, once something less than the best was decided on. Certainly the time, labor and money spent on perfecting the construction of an aeroplane that may have a life of only a few hours, and equipping it in a way that may often be completely unnecessary, could be spent in producing more aeroplanes, but that is simply sacrificing efficiency of the unit for sheer mass.

Early in August it was generally believed in the United States that the Germans had begun to do this. It was widely stated, and apparently on good authority, that many German machines had no blind flying instruments. The story was that only formation leaders had full equipment, and that in instrument-flying conditions the rest simply formated closely on him. But what happens if the fully-equipped machine is shot down, and the others have to pass through cloud to get home, no one could explain.

Production Short-Cuts

ACTUALLY, in the United States, as, we believe, in the British industry, standards are rising, with consequent increases in cost and, even more important in war time, in man-hours per machine. However, to some extent this latter factor is being overcome by production short-cuts, made possible by the large orders of today. Even without improved production methods, the rate goes up on large orders as the labor force learns its job on the type under construction.

One advance in production methods I noticed was in the Douglas factory, where the DB7 fuselages, instead of being built up on one jig, as is still done with transports, are built in several sections — two halves, like a cigar split down the middle, nose and tail.

A great deal of installation work, including control cables, etc., seemed to be done while the two halves of the fuselage were still separate, giving the men plenty of room and natural light to work in. At a given stage in the production line the two halves meet, and later take on the nose and tail.

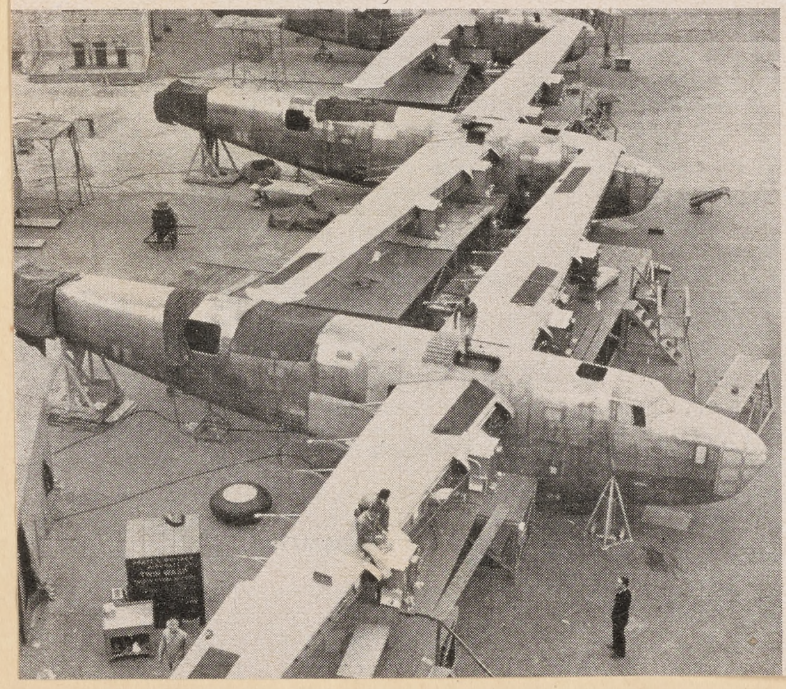
THE NORTH AMERICAN FACTORY which is generally considered to be the nearest approach to the mass production methods of the motor industry. Here, the Harvard, an advance trainer, is the chief type in production.

The final assembly section of the factory, where this was going on, was an immense place. Dozens of DB7's in all stages were on the floor, working steadily towards the vast main doors whence they are wheeled out for test flights. In such a building one loses all sense of normal size; everything is huge, and all departments are true to scale. After walking for miles through a factory it is no surprise to come on a drawing office where literally hundreds of men are at work, and after a time one takes things pretty much for granted. Only now, in retrospect, do I realise how huge that main assembly department was by thinking of the number of DC3's that were going through, and how comparatively little space they occupied; or of what a comparatively small thing, in another part of the factory, one of the main jigs (from memory, the centre-section) of the new DC4 seemed.

Our guide through the Douglas factory was Major V. E. Bertrandias, well known to many people in Australian aviation who met him when he brought the first DC2 and later the first DC3 to this country. As vice-president, and O.C. exports, he is now one of the busiest men in the plant. With purchasing missions from Britain and from Allies, such as Norway, which are fighting on from British soil, in Los Angeles, he was particularly busy when Jack Percival and I were in California, but he met us at the airport, spent a long evening talking about the aviation situation, introducted us to other men in the industry, including Captain Eddie Rickenbacker, America's leading ace of the Great War and now head of Eastern Airlines, and next day gave up his morning to showing us the factory. It was he, also, who introduced us to Donald Douglas, who gave us more than half an hour of his time.

At Lockheed we had no such previous contacts, so it must have been American hospitality, combined with letters of introduction from Mr D. H. Dureau, that induced executives to spend an afternoon entertaining us.

The American newspaper men who came out here on the *Clipper's* Press flight claimed that they had never met more hospitality than in Australia. We could return the compliment by saying that we had never been better treated than in Los Angeles. After Lockheed had provided me with an office and a typewriter for an hour, made special arrangements to send a long cable for me, and provided us with a fine collection of assorted aviation reading — not all about Lockheed —



THE NEW CONSOLIDATED four-engined bomber which has recently been released for export to Britain. A speed of over 300 m.p.h., a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons is claimed.

Aviation Angles

12/19/40

By Dr. Nathaniel F. Silsbee

Beaver College Comptroller, Formerly U. S. Air Service Aircraft Production, and Member Aviation Writers Association.

LONG-RANGE AIR DEFENSE

Last spring when President Roosevelt called for an Air Defense objective of 50,000 airplanes and a productive capacity of 50,000 planes a year, an extremely important problem arose as to the most effective types of aircraft for the defense of the western hemisphere. Major-General H. A. Arnold, then Chief of the Army Air Corps and recently promoted to the General Staff to more effectively represent air power at headquarters, maintained that the only effective method of defense was to employ long-range bombing planes capable of intercepting and disabling enemy fleets up to 1,000 miles from shore, preventing them from ever becoming a menace to America's populous and heavily industrialized seaboard centres on the Atlantic ocean, and more recently, the Pacific, with its heavy proportion of vital military aircraft productions plants.

JOINT ARMY-NAVY BOARD

Early in the summer the joint Army-Navy Board for Western Hemisphere Defense made plans calling for at least 600 four-engined land-based Army bombers in addition to the long-range patrol-bombers used by the Navy. Experinced flying officers of the G.H.Q. Air Force not only felt that this number was wholly inadequate for such an extensive job, but were also fearful that large numbers of the wrong types of planes would be included in our rearmament program, particularly thousands of pursuit planes and short range bombers. These are necessary in European air warfare, and a certain number of them here also, but it was emphasized that for our peculiar problems long-range bombers with terrific hitting power was a prime essential.

EVERYBODY SATISFIED

It is now understood that largely through the persistent advocacy of Major-General Frank M. Andrews of the General Staff and former Chief of the Army Air Corps this point of view has prevailed and some 1,100 long-range bombers are on order and are being turned out as rapidly as possible. The two main types are the famous Boeing B-17 and the new Consolidated B-24. The Navy have also stepped up their orders for their huge patrol-bombers of the PBY (Consolidated) and PBM (Martin) types. In this article we shall take a look at the two Army ships and next week review the main items of interest in connection with the Navy patrol-bombers.

NEW FLYING FORTRESSES

Late in October the new Boeing B-17C four-motored bomber was put through exhaustive flight tests at Wright Field, Dayton, by Army Air Corps experts. This is the fifth model of the "flying fortress," and the tests being satisfactory, production and delivery to our Air Corps and to Great Britain is being speeded up. As a matter of fact practically all of the present output is being released for Britain, and these ships, with their 4,000 mile range, 300 mile speed, altitude above 40,000 feet, huge bomb load, and new tail turret for machine guns, should be of the utmost value to the Royal Air Force, the main lack of which has been long-range bombing planes capable of reaching military objectives in the eastern parts of "greater Germany" and Italy. Lessons learned from the present war are being incorporated in the still newer B-17D, which will be in production by spring, while the experimental work on the B-17E, a further improvement, is well under way. The B-17D, by the way, will be well adapted for high altitude work in that its cabins are to be supercharged in the same way as the Boeing "Stratoliner," so successfully used by TWA in its transcontinental flights, and by Pan-American in its new speed-up service to South America. We still have the feeling, however, that until these huge bombers can be more successfully defended themselves, without the aid of a swarm of fast convoy fighting planes, the name "flying fortress" is somewhat misleading. Each successive model is being stepped-up in this matter, however, and it may be of interest to note that the gigantic Douglas bomber, the B-19, with a range of 7,000 miles, is wholly independent as regards defensive fire-power. In all, some 650 of the B-17C, B-17D, and B-17E types have been ordered.

CONSOLIDATED BOMBER

Re-written

Owing to the fact of the Boeing jobs having been developed in 1937 it is natural that more of these should be ordered than a new experimental type. However, the Consolidated B-24 appears to be a splendid ship and 450 have been contracted for. Great Britain has also placed a sizeable order, and it will be recalled that recently our Air Corps allowed the British to take priority on the first 20 B-24's to come off the line, which will not only help the R. A. F. in their offensive effort, but enable us to gain valuable experience for later developments of the B-24 based on actual performance in the war. Exact performance figures tre not available for release, but the following summary will give an idea of what the new ship will do: Powered by 4 Pratt & Whitney Twin Wasp 1,100 h. p. engines it has a speed in excess of 325 m.p.h., a range of over 3,000 miles, a ceiling of about 36,000 feet and a bomb load that will spell plenty of trouble for an enemy objective. From an aerodynamic point of view it may be of interest to point out that it has twin-rudders (like the Lockheed planes) and employs the new Davis airfoil for wing, which gives greater lift, decreased resistance and allows a higher wing-loading with equal safety—all of which adds up to SPEED! The B-24 also follows the new trend in military and commercial planes (a revival of pre-World War days) in using the tricycle landing gear, making for easier take-offs and landings.

The mere possession of these two long-range bombers serves due notice to all-comers that Uncle Sam means to keep enemy aircraft and fleets where they belong!

Southern Engineer - March 1940

Today's Design—Tomorrow's Plane

By

ROBERT W. AUSTIN, Jr.

THE Europeans are becoming more startled every day at the progress of the American designers and builders of transports. At least, that was the condition before the present war started. Now they are thinking of the bombing plane instead of the transport. This is all the more reason why the United States should continue to develop and build the best aircraft in the world. Although there is not a great demand for passenger service on the Trans-Atlantic route at the present time, it would be very profitable to continue development of the transports, because of the decreased foreign competition.

100 passengers, 300 m.p.h.

It is a little difficult for us to realize the rapidity of advancements now being made in oceanic transportation. Pan American Airways has decided that the present day transport will not withstand the demands to be made of it in the near future. With this in mind, P.A.A. has made the following challenge to eight of aviation's largest airplane manufacturers: an airplane to be designed with accommodations for at least 100 passengers including staterooms, a dining room, a lounge, and dressing rooms. In addition, there must be accommodations for sixteen crew members. The plane must carry complete facilities for storing and preparing food. It should have a payload capacity of 25,000 pounds and be able to fly 5,000 miles in still air at a top speed of 300 miles per hour under this loading. These specifications were sent to the eight firms in the form of an invitation to bid for a contract. The four companies accepting the invitation were Boeing, Sikorsky, Douglas, and Consolidated. During the first four months after the invitations were issued, these companies compiled thousands of sketches and performance charts for Pan American officials. Accompanying this article is an artist's conception of three of the flying ships being considered. Notice first that there are no radical changes in the streamlining of these ships, because the present-day streamlining has reached such high efficiency that it will probably remain as it is for years to come.

design

The Consolidated ship is the only one in the group with four engines and three passenger decks. The others have six engines and only two passenger decks. All four ships are capable of carrying 100 passengers. They all contain passageways leading to the engines, so that they may be repaired during flight. They also contain a bar, a lounge, a dining room, passenger cabins, dressing rooms, and a galley. All of these ships are designed to fly much higher than life sustaining atmosphere and pressure exist. It will, therefore, be necessary for them to have constant pressure cabins with special ventilating systems that will artificially enrich the air with oxygen.

The Douglas, although we do not have a sketch of it, is possibly the unique ship of the group. It has the same passenger capacity as the other designs, but instead of being a flying boat, it is a land plane. Evidently, the Douglas engineers believe that their airplane will remain an airplane. Possibly they have started a revolutionary idea. The ship is capable of remaining in flight on three of its six engines while the other three are being repaired during the flight. This cuts down to a minimum the possibility of having to make a forced landing on the water. If for any reason it should have to land on the water, the cabin is so tightly sealed that the plane would remain afloat for several days. The only draw-back is, that it could never take-off from the water once it landed.

Contrary to general belief, the larger transports do not require much more space for landing than the small ones. For that reason, there are many fields that could accommodate it such as the newly constructed North Beach Airport

Seats are converted to berths. Luxurious quarters are provided.

Today's Design—Tomorrow's Plane

(Continued from page seven)

engine now used. No matter what type of engine is used, the plane must have at least 10,000 horsepower.

The propeller efficiency is a problem that has never been solved completely. A propeller that will absorb all of the horsepower of the engine is still a rarity. As the tip of the propeller approaches 750 miles per hour, which is the approximate speed of sound, it begins to lose its pulling power. The problem for the engineer is to gear the propeller so that the tip speed remains below 750 miles per hour and still absorb all of the power delivered to it.

A material that is light in weight, very strong, and unaffected by salt corrosion, is the material for the hull construction. Duralumin will corrode. Stainless steel is strong, but it is very heavy and hard to work. The desired material might be produced by alloying these two alloys, but that can be determined only through experiment.

The expense of these ships is also an engineering problem. Naturally, the companies will be as economical as possible, but they will never sacrifice quality for economy in an airplane. Each of these ships will cost over $5,000,000 for the first one, with each additional plane costing about $1,500,000.

12 hour trip

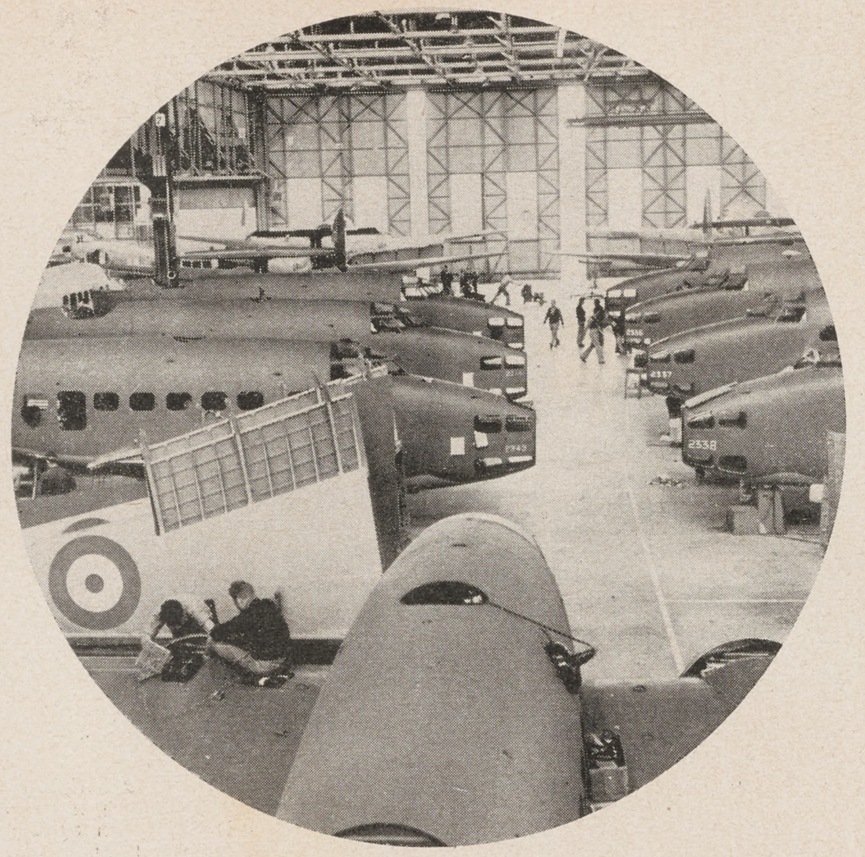
First of all, you will have paid about $450 for the trans-Atlantic round-trip, which will probably take a lot of the thrill out of your experience. But since you have already paid for it you might as well get the most out of it. When you get tired of your stateroom you may go to the gameroom and play pingpong. But this soon becomes boring so you go into the lounge and read, or start a conversation with someone to whom the hostess has introduced you. After your little chat, it will probably be time for one of the two meals that you will be served during each crossing. The food will consist of frozen vegetables and fruit, and one meat, possibly chops or roast. After the meal you will probably visit the bar and then retire to your room for eight hours sleep, as this flight is being made at night. There will be practically no bumping because of the high altitude flying, and the noise will be at a minimum because of the tightly sealed cabin. When you arise in the morning you will find a shower in the dressing room with hot and cold running water. After breakfast you will probably be over Ireland and therefore have something to look at other than a wide expanse of water or a cloud bank. Probably the most confusing thing about the flight will be the time element. Before leaving New York, you were told to advance your watch 25 minutes each hour, and before you leave London you will be told to set your watch back 25 minutes each hour.

The eastward crossing will require but about 12 hours, whereas the westward crossing will require about 13 or 14 hours because the plane will have to buck the prevailing Easterly winds in returning.

And there you have tomorrow's trans-Atlantic plane that is today's design.

Specifications of the *Consolidated* 100-passenger flying boat:

Gross Weight	168,000 lbs.
Wing Span	194 feet
Wing Area	3,450 sq. ft.
Overall height	31 feet
Overall length	102½ feet
Fuel Capacity	8,450 gals.
Payload	25,000 lbs.
High speed at 20,000 feet Altitude	276 MPH
Range at 20,000 feet Altitude (still air)	5,000 miles
Stalling speed at sea level (½ fuel, flaps down, power on)	78 MPH
Service ceiling	30,000 feet
Time to climb to 20,000 feet	34 min.
Rate of climb at sea level	680 ft./min.
B.H.P./R.P.M. S.L. to 25,000 feet (Turbo Supercharged)	2150/2600



the total it can be said that Lockheed is expected to be producing between 200 and 300 planes a month by the end of this year. It can be assumed from the number of employees that the Douglas output will be still higher. Consolidated will

LOCKHEED HUDSON BOMBERS are now coming along at approximately 70 a month. They have given an excellent account of themselves in active service with the R.A.F. Coastal Comcand. The R.A.A.F. have 149 on order, of which approximately 100 have been delivered in Australia.

be producing fewer aircraft because its units are so mucl bigger. Boeing production c DB7's can be guessed at minimum of two or three a da Vultee — which is likely t get a British order for it *Vanguard* fighter — and North rop, reported to be negotiatin to build Bell *Airacudas* unde sub-contract, will be producin relatively small numbers. Nort American has apparent reached the stage at which can turn out advanced trainers as fast as anyo wants them.

main factories, as given by a number of authoritative sources:—

DOUGLAS. — 19,000 employees; 140,000,000 dollar backlog; June production 8,000,000 dollars; main military production DB7 and A20 bombers for Britain.

LOCKHEED. — 12,000 employees; including 2000 in Vega, a subsidiary company; 169,000,000 dollar backlog; main production Hudsons for Britain, with Hudson successor just starting; 4,000,000 dollars expansion under way.

CONSOLIDATED. — 6650 employees; 71,000,000 dollar backlog; main production long range flying boats and bombers for R.A.F.; now doubling facilities.

BOEING. — 7600 employees; 50,000,000 dollar backlog; main production Douglas DB7s under sub-contract for Britain: 377,000 sq. ft. of factory space being added, and facilities more than doubled since last December.

NORTH AMERICAN.—6000 employees; 85,000,000 dollar backlog; been manufacturing 175 planes a month, mainly advanced trainers for Britain.

VULTEE. — 3500 employees; 14,750,000 dollar backlog.

NORTHROP. — 700 employees; 2,500,000 dollar backlog.

This all adds up to a handsome total of production, but you cannot appreciate it fully without taking into account the rapidity of the growth. Douglas, long the mammoth of the industry, had only 6700 employees as recently as 1938. Lockheed had 2400 employees two years ago, when the first British order was received; by next March it and Vega will have a combined labor force of 25,000. North American, Consolidated, Boeing, Vultee and the recently-formed Northrop company could all show still more astonishing growth.

It is extremely difficult to calculate production rates, even if it were advisable, but as a pointer to

Add to these the capacity of the Eastern firr — Curtiss-Wright, which sold hundreds of fighte to France, United Aircraft, Glenn Martin, nc working on a big British order, and such firr as Brewster, Grumman (whose deck fighters a now being used off aerodromes by the R.A.F.) ar Republic (ex-Seversky), and you can see how ir portant the United States is as a supplier.

Engine Bottleneck Diminishing

AT present, the engine bottle-neck remains, b with the new plants built by Allied finar coming into operation it is steadily widening, a even such a conservative authority as Don Douglas, who has consistently deprecated extra gant estimates of the industry's capacity, can its ultimate removal.

There is, however, no immediate prospect getting a considerable supply of liquid-coo engines. Everyone realises that *Merlins* cannot turned out in a few weeks, and when we were America arrangements to build them there had been completed. It is fortunate that the Alliso being built by a concern with the finance, organi tion and production experience of General Mot which can probably boost output faster than a one else could, now that this engine is regar as a finished job.

In any case, although they mean much, numb are not everything, as Donald Douglas emphasi He said that all private reports from Europe agr on the high quality of the American aircraft s plied, and the superiority of their performa over the German, and on the equal superiority the British pilots. Quality, with a reasonable ba ing of quantity, would be the determining fa in the air war, he considered.

This quality in the aircraft is obvious. *Hudson* is too well known here to need comm The Douglas DB7's that we saw in all stages ar

---

superbly finished as the DC2 and DC3, and, given the chance, would do as much flying. Some of the executives to whom we talked wondered if the policy that sets such a standard was correct, pointing to the thousands of man-hours that are going into producing perfection when something less than perfection would do.

But none of them wants to lower the standard, and none could suggest exactly where the line should be drawn, once something less than the best was decided on. Certainly the time, labor and money spent on perfecting the construction of an aeroplane that may have a life of only a few hours, and equipping it in a way that may often be completely unnecessary, could be spent in producing more aeroplanes, but that is simply sacrificing efficiency of the unit for sheer mass.

Early in August it was generally believed in the United States that the Germans had begun to do this. It was widely stated, and apparently on good authority, that many German machines had no blind flying instruments. The story was that only formation leaders had full equipment, and that in instrument-flying conditions the rest simply formated closely on him. But what happens if the fully-equipped machine is shot down, and the others have to pass through cloud to get home, no one could explain.

Production Short-Cuts

ACTUALLY, in the United States, as, we believe, in the British industry, standards are rising, with consequent increases in cost and, even more important in war time, in man-hours per machine. However, to some extent this latter factor is being overcome by production short-cuts, made possible by the large orders of today. Even without improved production methods, the rate goes up on large orders as the labor force learns its job on the type under construction.

One advance in production methods I noticed was in the Douglas factory, where the DB7 fuselages, instead of being built up on one jig, as is still done with transports, are built in several sections — two halves, like a cigar split down the middle, nose and tail.

A great deal of installation work, including control cables, etc., seemed to be done while the two halves of the fuselage were still separate, giving the men plenty of room and natural light to work in. At a given stage in the production line the two halves meet, and later take on the nose and tail.

The final assembly section of the factory, where this was going on, was an immense place. Dozens of DB7's in all stages were on the floor, working steadily towards the vast main doors whence they are wheeled out for test flights. In such a building one loses all sense of normal size; everything is huge, and all departments are true to scale. After walking for miles through a factory it is no surprise to come on a drawing office where literally hundreds of men are at work, and after a time one takes things pretty much for granted. Only now, in retrospect, do I realise how huge that main assembly department was by thinking of the number of DC3's that were going through, and how comparatively little space they occupied; or of what a comparatively small thing, in another part of the factory, one of the main jigs (from memory, the centre-section) of the new DC4 seemed.

Our guide through the Douglas factory was Major V. E. Bertrandias, well known to many people in Australian aviation who met him when he brought the first DC2 and later the first DC3 to this country. As vice-president, and O.C. exports, he is now one of the busiest men in the plant. With purchasing missions from Britain and from Allies, such as Norway, which are fighting on from British soil, in Los Angeles, he was particularly busy when Jack Percival and I were in California, but he met us at the airport, spent a long evening talking about the aviation situation, introducted us to other men in the industry, including Captain Eddie Rickenbacker, America's leading ace of the Great War and now head of Eastern Airlines, and next day gave up his morning to showing us the factory. It was he, also, who introduced us to Donald Douglas, who gave us more than half an hour of his time.

At Lockheed we had no such previous contacts, so it must have been American hospitality, combined with letters of introduction from Mr D. H. Dureau, that induced executives to spend an afternoon entertaining us.

The American newspaper men who came out here on the *Clipper's* Press flight claimed that they had never met more hospitality than in Australia. We could return the compliment by saying that we had never been better treated than in Los Angeles. After Lockheed had provided me with an office and a typewriter for an hour, made special arrangements to send a long cable for me, and provided us with a fine collection of assorted aviation reading — not all about Lockheed —

THE NORTH AMERICAN FACTORY which is generally considered to be the nearest approach to the mass production methods of the motor industry. Here, the Harvard, an advance trainer, is the chief type in production.

THE NEW CONSOLIDATED four-engined bomber which has recently been released for export to Britain. A speed of over 300 m.p.h., a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons is claimed.

LONG-RANGE AIR DEFENSE

Last spring when President Roosevelt called for an Air Defense objective of 50,000 airplanes and a productive capacity of 50,000 planes a year, an extremely important problem arose as to the most effective types of aircraft for the defense of the western hemisphere. Major-General H. A. Arnold, then Chief of the Army Air Corps and recently promoted to the General Staff to more effectively represent air power at headquarters, maintained that the only effective method of defense was to employ long-range bombing planes capable of intercepting and disabling enemy fleets up to 1,000 miles from shore, preventing them from ever becoming a menace to America's populous and heavily industrialized seaboard centres on the Atlantic ocean, and more recently, the Pacific, with its heavy proportion of vital military aircraft productions plants.

JOINT ARMY-NAVY BOARD

Early in the summer the joint Army-Navy Board for Western Hemisphere Defense made plans calling for at least 600 four-engined land-based Army bombers in addition to the long-range patrol-bombers used by the Navy. Experinced flying officers of the G.H.Q. Air Force not only felt that this number was wholly inadequate for such an extensive job, but were also fearful that large numbers of the wrong types of planes would be included in our rearmament program, particularly thousands of pursuit planes and short range bombers. These are necessary in European air warfare, and a certain number of them here also, but it was emphasized that for our peculiar problems long-range bombers with terrific hitting power was a prime essential.

EVERYBODY SATISFIED

It is now understood that largely through the persistent advocacy of Major-General Frank M. Andrews of the General Staff and former Chief of the Army Air Corps this point of view has prevailed and some 1,100 long-range bombers are on order and are being turned out as rapidly as possible. The two main types are the famous Boeing B-17 and the new Consolidated B-24. The Navy have also stepped up their orders for their huge patrol-bombers of the PBY (Consolidated) and PBM (Martin) types. In this article we shall take a look at the two Army ships and next week review the main items of interest in connection with the Navy patrol-bombers.

NEW FLYING FORTRESSES

Late in October the new Boeing B-17C four-motored bomber was put through exhaustive flight tests at Wright Field, Dayton, by Army Air Corps experts. This is the fifth model of the "flying fortress," and the tests being satisfactory, production and delivery to our Air Corps and to Great Britain is being speeded up. As a matter of fact practically all of the present output is being released for Britain, and these ships, with their 4,000 mile range, 300 mile speed, altitude above 40,000 feet, huge bomb load, and new tail turret for machine guns, should be of the utmost value to the Royal Air Force, the main lack of which has been long-range bombing planes capable of reaching military objectives in the eastern parts of "greater Germany" and Italy. Lessons learned from the present war are being incorporated in the still newer B-17D, which will be in production by spring, while the experimental work on the B-17E, a further improvement, is well under way. The B-17D, by the way, will be well adapted for high altitude work in that its cabins are to be supercharged in the same way as the Boeing "Stratoliner," so successfully used by TWA in its transcontinental flights, and by Pan-American in its new speed-up service to South America. We still have the feeling, however, that until these huge bombers can be more successfully defended themselves, without the aid of a swarm of fast convoy fighting planes, the name "flying fortress" is somewhat misleading. Each successive model is being stepped-up in this matter, however, and it may be of interest to note that the gigantic Douglas bomber, the B-19, with a range of 7,000 miles, is wholly independent as regards defensive fire-power. In all, some 650 of the B-17C, B-17D, and B-17E types have been ordered.

CONSOLIDATED BOMBER

Re-written

Owing to the fact of the Boeing jobs having been developed in 1937 it is natural that more of these should be ordered than a new experimental type. However, the Consolidated B-24 appears to be a splendid ship and 450 have been contracted for. ~~Great Britain has also placed a sizeable~~ order, and ~~it will be recalled~~ that recently our Air Corps allowed the British to take priority on the first 20 B-24's to come off the line, which will not only help the R. A. F. in their offensive effort, but enable us to gain valuable experience for later developments of the B-24 based on actual performance in the war. Exact performance figures tre not available for release, but the following summary will give an idea of what the new ship will do: Powered by 4 Pratt & Whitney Twin Wasp 1,100 h. p. engines it has a speed in excess of 325 m.p.h., a range of over 3,000 miles, a ceiling of about 36,000 feet and a bomb load that will spell plenty of trouble for an enemy objective. From an aerodynamic point of view it may be of interest to point out that it has twin-rudders (like the Lockheed planes) and employs the new Davis airfoil for wing, which gives greater lift, decreased resistance and allows a higher wing-loading with equal safety—all of which adds up to SPEED! The B-24 also follows the new trend in military and commercial planes (a revival of pre-World War days) in using the tricycle landing gear, making for easier take-offs and landings.

The mere possession of these two long-range bombers serves due notice to all-comers that Uncle Sam means to keep enemy aircraft and fleets where they belong!

Southern Engineer - March 1940

Today's Design—Tomorrow's Plane

By

ROBERT W. AUSTIN, Jr.

THE Europeans are becoming more startled every day at the progress of the American designers and builders of transports. At least, that was the condition before the present war started. Now they are thinking of the bombing plane instead of the transport. This is all the more reason why the United States should continue to develop and build the best aircraft in the world. Although there is not a great demand for passenger service on the Trans-Atlantic route at the present time, it would be very profitable to continue development of the transports, because of the decreased foreign competition.

100 passengers, 300 m.p.h.

It is a little difficult for us to realize the rapidity of advancements now being made in oceanic transportation. Pan American Airways has decided that the present day transport will not withstand the demands to be made of it in the near future. With this in mind, P.A.A. has made the following challenge to eight of aviation's largest airplane manufacturers: an airplane to be designed with accommodations for at least 100 passengers including staterooms, a dining room, a lounge, and dressing rooms. In addition, there must be accommodations for sixteen crew members. The plane must carry complete facilities for storing and preparing food. It should have a payload capacity of 25,000 pounds and be able to fly 5,000 miles in still air at a top speed of 300 miles per hour under this loading. These specifications were sent to the eight firms in the form of an invitation to bid for a contract. The four companies accepting the invitation were Boeing, Sikorsky, Douglas, and Consolidated. During the first four months after the invitations were issued, these companies compiled thousands of sketches and performance charts for Pan American officials. Accompanying this article is an artist's conception of three of the flying ships being considered. Notice first that there are no radical changes in the streamlining of these ships, because the present-day streamlining has reached such high efficiency that it will probably remain as it is for years to come.

design

The Consolidated ship is the only one in the group with four engines and three passenger decks. The others have six engines and only two passenger decks. All four ships are capable of carrying 100 passengers. They all contain passageways leading to the engines, so that they may be repaired during flight. They also contain a bar, a lounge, a dining room, passenger cabins, dressing rooms, and a galley. All of these ships are designed to fly much higher than life sustaining atmosphere and pressure exist. It will, therefore, he necessary for them to have constant pressure cabins with special ventilating systems that will artificially enrich the air with oxygen.

The Douglas, although we do not have a sketch of it, is possibly the unique ship of the group. It has the same passenger capacity as the other designs, but instead of being a flying boat, it is a land plane. Evidently, the Douglas engineers believe that their airplane will remain an airplane. Possibly they have started a revolutionary idea. The ship is capable of remaining in flight on three of its six engines while the other three are being repaired during the flight. This cuts down to a minimum the possibility of having to make a forced landing on the water. If for any reason it should have to land on the water, the cabin is so tightly sealed that the plane would remain afloat for several days. The only draw-back is, that it could never take-off from the water once it landed.

Contrary to general belief, the larger transports do not require much more space for landing than the small ones. For that reason, there are many fields that could accommodate it such as the newly constructed North Beach Airport

Seats are converted to berths. Luxurious quarters are provided.

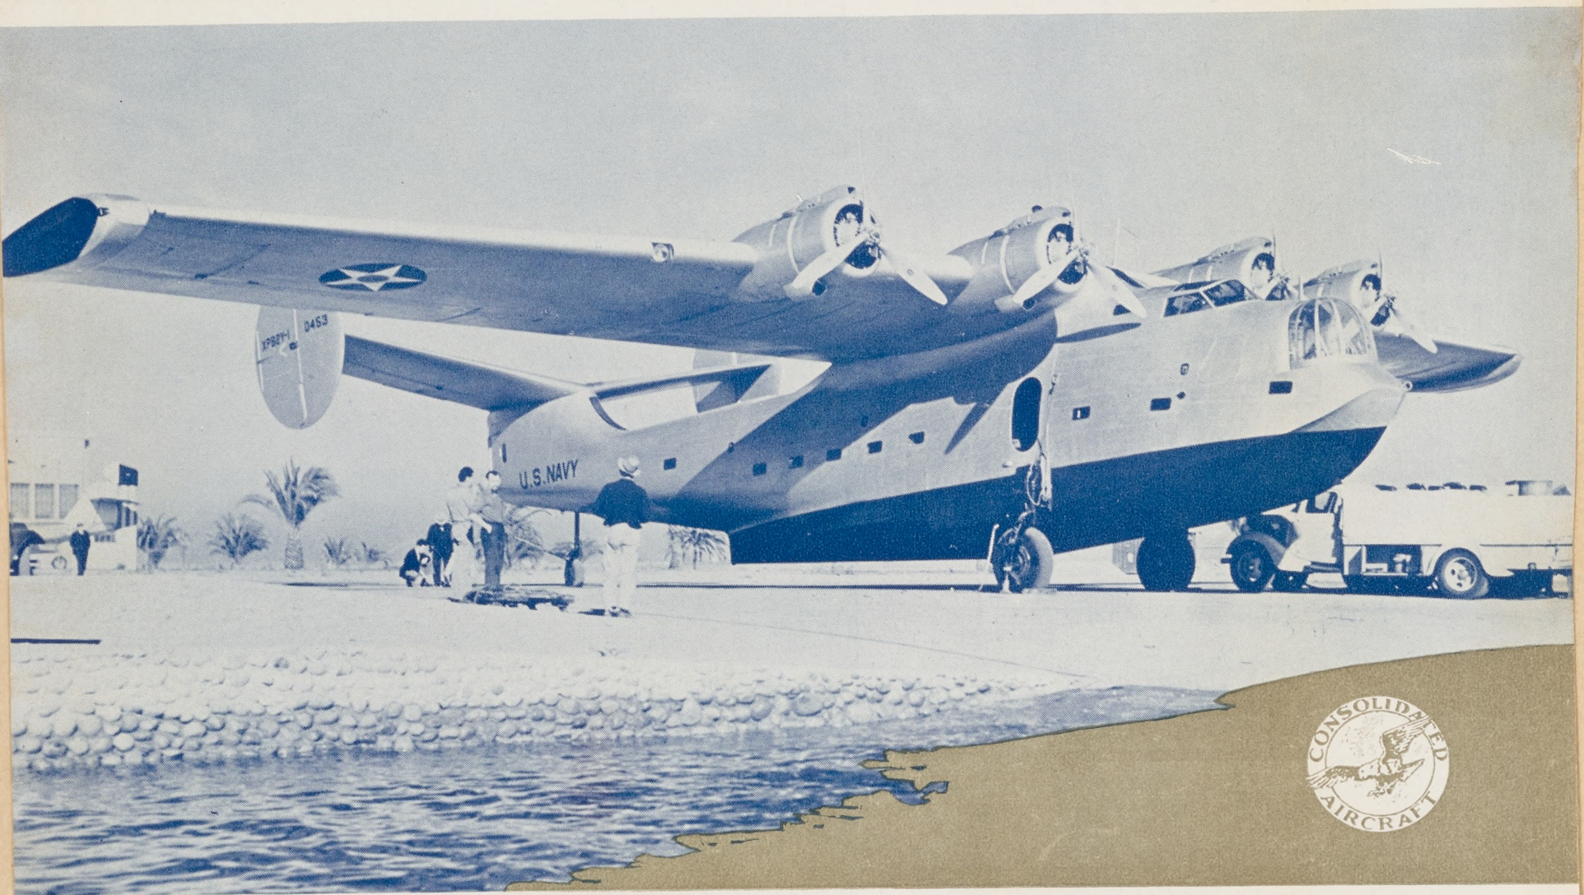
Consolidated—Biggest Builder of Flying Boats

By CHARLES O. HERB



THE Consolidated Aircraft Corporation, San Diego, Calif., is famous for its pioneer work in the development of long-range flying boats. Recently it produced the world's largest amphibian. Mighty planes of the United States Navy—four-engined bombers—as well as the Navy's fleet of more than 200 twin-engined patrol bombers (PBY) have also been built by Consolidated. In the commercial field, the concern made a noteworthy contribution to aviation by the construction, in 1939, of a fast, long-range flying boat capable of carrying fifty-two passengers, which is propelled by two Wright engines of 2000 H.P. each.

The latest Consolidated development is a bombardment airplane for the United States Army Air Corps, which is driven by four radial air-cooled engines of 1200 H.P. each that give it a speed of over 300 miles an hour. Thus large land planes have been added to the line of flying boats made by the concern, and it is now engaged on important contracts for supplying military planes to the British and French air forces.

Vast changes have occurred in aircraft building during the seventeen years that have passed since the founding of this concern. The airplanes of those days, constructed in large part of wood and fabric, have now been superseded by planes in which the only wood is the top of the navigator's table. This is made of wood solely to permit the use of thumb-tacks for holding down maps. The fabric covering on modern planes is now confined almost entirely to the movable control surfaces.

Five years ago, the concern moved from its Buffalo, N. Y., plant to San Diego, where buildings had been erected and equipped to provide advanced manufacturing facilities. With the completion of current factory expansion, Consolidated will have 1,910,000 square feet of covered and uncovered manufacturing space. Yard areas paved with asphaltic concrete can be used virtually the entire year for final assembly operations, because of the mild climate. The hulls are assembled indoors in a department, the final assembly line of which is seen in the illustration on page 189. Typical manufacturing operations in this aircraft-building plant, especially in the machine shop, are described here.

In Fig. 1 is shown a Cincinnati centerless grinding machine being employed for the external finishing of chromium-molybdenum tubes for the beaching gear for the flying boats. These tubes are 3 1/2 inches outside diameter by 18 inches long. They must be of the required diameter, round, and straight within close limits. The same machine is used for grinding a large variety of other work, including bronze bushings 3 1/2 inches outside diameter by 3 inches long, and parts of smaller diameter.

The application of a Murchey threading machine for cutting threads of 7/16 inch diameter, fourteen per inch, American Standard coarse thread series, to a length of 5 1/2 inches, is illustrated in Fig. 2. The work-piece is a special aluminum-alloy stud, 6 inches in length. One end is held between jaws on the carriage, and the part is threaded as the carriage advances the other end through the chasers of the die-head on the headstock. The movement of the carriage is controlled by a lead-screw. This machine has a capacity for cutting, on a production basis, threads from 1/4 inch to 1 1/2 inches in diameter to the Class 3 fit demanded for aircraft parts.

Another threading operation which consists of cutting a No. 10 thread, thirty-two per inch, American Standard fine series, on a chromium-molybdenum-steel bolt is shown in Fig. 3. This operation is performed on a machine built by the Eastern Machine Screw Corporation. The bolt head is of rectangular shape, about 3/4 inch wide by 1 inch long, and of the same thickness as the bolt diameter. The bolt shank extends for a length of 3/4 inch. The rectangular head is held in the slotted end of a bar mounted in the tailstock chuck, the fit between the walls of the slot and the work being tight enough to grip the piece solidly. Threads from No. 4 up to 1/2 inch are cut on this machine.

Sheets of aluminum alloy are scarfed along the edges to the required taper by the Cincinnati milling machine illustrated in Fig. 4, which is equipped with a work-holding fixture that can be tilted to various degrees by merely adjusting the convex bottom surface of the fixture table backward or forward along the concave top of the fixture base. The machine is fitted with a special cutter-head of combined welded and cast construction. The cutter is 4 1/2 inches in diameter by 12 inches long, and is made with teeth of an extremely steep helix, having a generous amount of front rake and clearance. With this design, thin shearing cuts are taken

"BIG BOATS"

COMMANDER A. M. PRIDE

Bureau of Aeronautics

● In the early days of naval aviation there were F-boats, H-boats and "Big Boats." F-boats were little frail flying boats with Curtiss OX engines; H-boats were larger, had a Liberty engine and were the ultimate vehicles for most of our World War crop of Naval Aviators. But for the favored and the skillful, there were the two-engined "Big Boats"—H-12's with the long flat-bottomed tails; the handy H-16's with their multiplicity of cables and struts, and their counterparts, the F5L's. Only a few H-12's were built, but a great many H-16's and F5L's went into service both here and abroad and for several years after the War they comprised the principal equipment of the scouting air squadrons attached to the Fleet.

As today, the "Big Boats" went with the Fleet into its problem areas and back to the home ports between major problems. The 60-hour periods between overhauls of the Libertys were no help in keeping up with the battleships and many were the engines which had to be changed while planes were secured to the fan-tail of a mine-sweep or beached on a sheltered strand. Even so, the cruises went ahead, year after year, and by the time most of the Libertys had been used up and every hard landing was smashing in the bottom of a hull which had dried out in too-long storage, it was realized that something had to be done to carry on the work of the large seaplane after the last F5L had done its service.

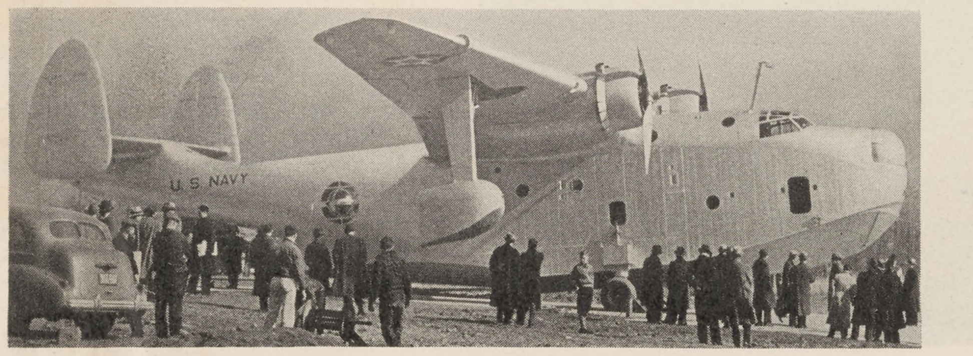
COMDR. A. M. PRIDE: Enrolled in Naval Reserve from civilian life (1917). Aviation Assignments—England and France (1918); Chatham Air Station and Carlstrom Field, Arcadia (1919-'20); USS Arizona, Hampton Roads Air Station, Mitchell Field (1920-'21); USS Langley (1921-'24); postgraduate instruction in aeronautical engineering at Naval Academy and MIT (1924-'25); USS Saratoga and Lexington (1926-'29); Hampton Roads Naval Air Station (1929-'32); VF Squadron 3-B aboard USS Langley (1932-'34); In charge Flight Test Section, Anacostia Naval Air Station (1932-'36); Bureau of Aeronautics (1936-'37); Air Officer, USS Wright (1937-'38); Staff, Patrol Wing One (1938-'39); Aeronautical Board, Bureau of Aeronautics (June 1939 to date).

New construction involved features of metal structures and radial air-cooled engines, but the old angular hull lines and sponsons were retained. Wings of the new boats advanced from the multiple bay trusses, used thicker and more efficient sections and improved the cleanliness of the whole plane. The absence of the "Dutch landscape" effect provided on the top of the hulls by an assortment of windmills to drive various accessories was not regretted.

From the metal counterparts of H-16's and F5L's, the type passed through the biplane stages common to other types of the period, but with little improvement, except such as might be incident to improved power plants. Then came the Hall PH-1 with no gasoline in the hull, no sponsons and a pay-load to gross weight ratio which made its predecessors out-of-date. This product appeared at about the time Martin and Consolidated planes were making it look as though the biplane, as a patrol plane type, would soon be gone. It was not long before the Consolidated PY Series were edging into the picture to the exclusion of everything else. This family abandoned the lower wings, used cantilever wings and retracting wing-tip floats, and brought refinements exemplified by the various versions of the PBY.

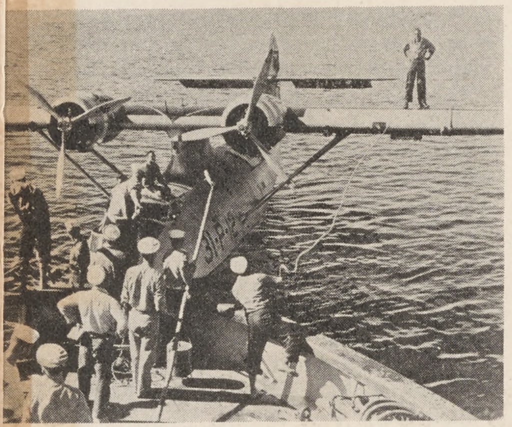
The "B" (for "bomber") was included with the "P" and the "Y" while the first of the current models was undergoing trials and it became apparent that this craft could do some effective bombing if such were required. Successive production schedules have placed in service the PBY-1, -2, -3 and -4, and the XPBY-5

The Martin XPBM-1 patrol bomber, a twin-engined, gull wing monoplane



Aero Digest

Fueling the flying boats from a fuel truck, and from a tender (below)



proficient culinary experts. Each plane has a two-burner electric stove and each plane crew seems to include at least one enthusiast who delights in operating it.

When landings have to be made, the difficulties are of seamanship rather than airmanship. Taxying into the wind is easy if the chop does not drench the windshield, obscure vision and give the pilots a shower. Taxying across the wind is something else again, and if the cross-wind is strong it frequently requires fully throttling one motor, while the other is wide open.

If a buoy is to be made, one of the crew has to "take it" from the nose of the boat with a boat hook. He takes a turn with a light line as soon as he can, snubbing the buoy up close to the plane and then secures the riding pendant and "preventer." Despite much ingenuity, the perfect mooring arrangement for flying boats has not yet been devised and the wire cable and fittings with which the planes are equipped are paralleled with slack lines to prevent the plane from drifting down on its leeward neighbor if the riding pendant fails.

When the planes have been secured at their buoys, with covers on the cockpit enclosures and engines, and the watch stationed on board, the boat from the tender takes the crew to the ship.

Take-off Technique

Take-off technique in "big-boats" has changed with the years and with increased horsepower and improved hull lines. Thanks to extensive model basin experiments, and take-off trim investigations by the NACA, as well as plenty of experimenting by the service test and squadron pilots, it has been well established that the modern "big boats" do best when they have their control adjustments set at a predetermined point according to the position of the center of gravity and are then "flown" out of the water, with no violent "rocking." It used to be that a sharp "pull-back" was the customary maneuver to "unstick," but this seems to defeat its purpose as often as it helps. While judicious "pull-back" can still make a doubtful take-off certain, a similar movement at the wrong moment can ruin the chances of getting off.

Landing technique hasn't changed much except for a greater emphasis on "power-on" landings. The idea is to get down to the low speed while maintaining the plane in its best attitude for striking the water. "Power-on" is the safest way to land on a glassy surface, through a fog, or at night and much practice to perfect the technique is required of each pilot ordered to flying boats.

Handling flying boats in the air presents nothing peculiar which is not experienced in other types of similar size.

Communications, internal and external, are necessarily elaborate due to separation of stations through the plane and because of development of the flying-boat's potentialities as a source of information to other fleet units. Interphones serve for internal communications and headphones are worn habitually by all hands on watch.

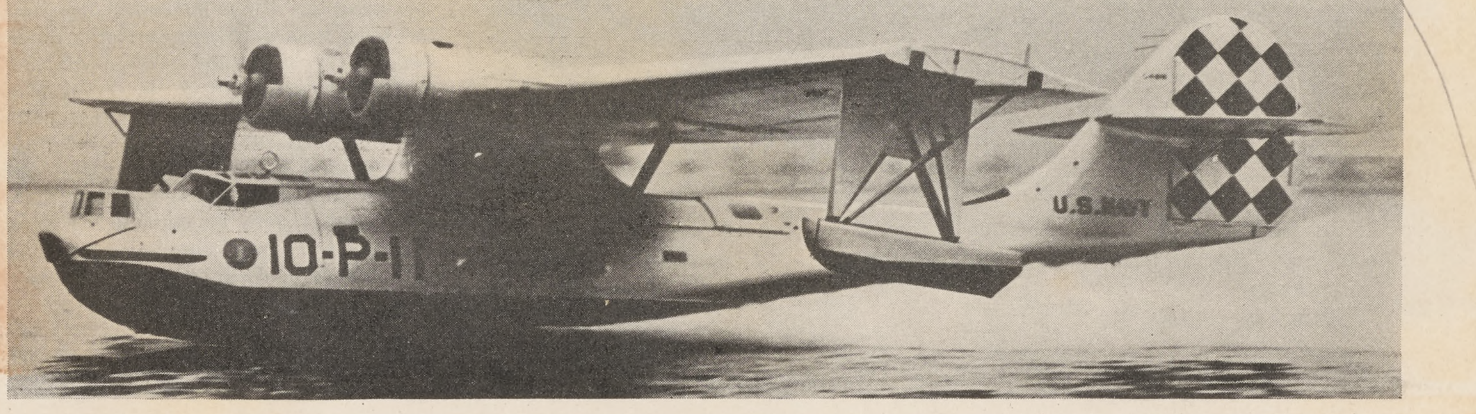
As the plane is seldom operating independently, at least two, and sometimes more, external communications channels must be maintained. This calls for an elaboration of radio equipment found in no other service type. In common with surface vessel practice, distress frequencies are guarded, as are weather and military frequencies. In addition, radio-bearings must be obtained whenever available or required by the pilot or navigator.

As suggested previously, it is customary to turn over straight-away piloting to the automatic pilot and relieve the human pilots of as much of that work as possible. This plan has a real military value in that it enables the pilots to observe more of the ocean and air above it than if they had to give almost exclusive attention to steering the course, and flying the plane. And when it is considered that the most important reason for having "big-boats" is to have something to take pairs of eyes to where they can scan vast areas of the sea and the spaces above the sea, it is realized that these eyes must have little else to do.

It is difficult to predict where the increasing demands on the "big boat" will lead design. The tendency in "big boat" characteristics is toward 4-engined planes or toward increased performance in twin-engined types using the higher powered engines now coming into the picture. Consolidated has received a Navy contract for some of the 4-engined type. More endurance, and better living accommodations, with increased military loads, point to increasing sizes, but operational difficulties react against increasing size and weight. A large plane over a given area of the sea is not, necessarily, any more effective as an observation post than is a smaller plane. Furthermore, if the small plane

(Continued on page 164)

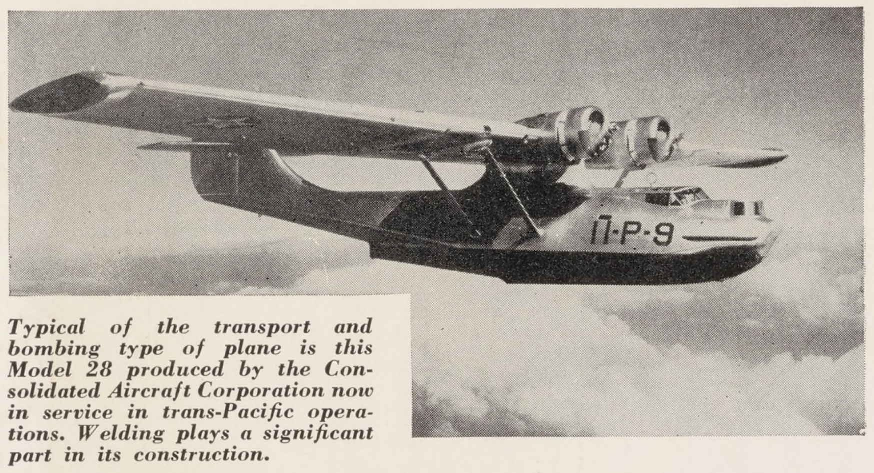
Consolidated PBY-1 patrol bomber "on the step" during its take-off run



can get there as quickly, and remain as long, it may be at an advantage in that the facilities which made it and maintain it and can make and maintain more units. However, the 250 or more PBY's now in service will be used for some time, and "big boat" operation will be the same, fundamentally, as it was with the H-16's—primarily scouting, and when opportunity dictates, bombing.

The large plane is more effective than its smaller counterpart if it carries more bombs to the same point, but, again, it is a more prominent and, frequently, less maneuverable target, and more small units might furnish a better set-up. New designs seem to indicate larger units, though, and the only safe prediction seems to be that, at least, "big boats" will remain "big" in the eyes of the pilots of other naval types, and that they are here to stay.

Welding Problems in Aviation



Typical of the transport and bombing type of plane is this Model 28 produced by the Consolidated Aircraft Corporation now in service in trans-Pacific operations. Welding plays a significant part in its construction.

ALL welding fixtures are made oversize and allowances are made for the shrinkage to be expected. Sometimes the design of the work itself brings about a condition in which both the expansion and contraction, plus the shrinkage, bring about trouble with the welding operation and results. There must be allowance for expansion, contraction and shrinkage, or some part of the weld will suffer.

A simple and excellent example of this is shown in Fig. 1. Here it was desired to run a tube through a boxlike structure of considerable stiffness (with the flanges, as well as the area of the bottom, contributing to this stiffness) and to weld around the point of passage of the tube through the box. Due to the stiffness of the box around the weld, the expansion forces the metal in the area surrounding the weld to be compressed. The outer areas remain cool and resist this expansion with their full strength. In the areas between, which are progressively cooler toward the outside, the force of expansion acts upon the metal in what amounts to cold working. Here the crystal structure of the metal is crushed and compacted together. Then, as the immediate area of the weld cools, it contracts more than it expanded, pulling with great strength upon the very structure it has just compressed, also pulling forward and back around the weld. Being restricted in contraction as it was in expansion, and with no allowance for the added shrinkage possible, all it can

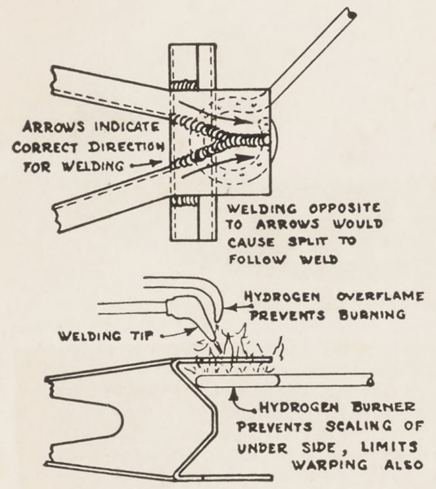
(over)

is necessary after the normalizing. To avoid much of this the welders tack weld re-enforcing pieces which are cut loose after the heat treatment.



ARROWS INDICATE CORRECT DIRECTION FOR WELDING
WELDING OPPOSITE TO ARROWS WOULD CAUSE SPLIT TO FOLLOW WELD
HYDROGEN OVERFLAME PREVENTS BURNING
WELDING TIP
HYDROGEN BURNER PREVENTS SCALING OF UNDER SIDE, LIMITS WARPING ALSO

FIG. 2

Another phase of welding in which normalizing plays a large part is in the welding of large or complex assemblies in which it is desired to hold the work to close finish dimensions for subsequent machining. If the entire assembly is welded up immediately as a single unit, the strains set up and the interaction of them during the normalizing may easily warp the structure all out of shape. To avoid this the assembly is broken down into sub-assemblies in which the welding becomes more or less self-contained. Then these subassemblies are normalized after welding to remove the strains. Allowances are made in welding to allow for fitting the subassemblies together and they are straightened in themselves if found out of alignment. Then in the final assembly of the sub-assemblies into the one whole structure, only simple strains can be set up, rather than the danger of compounded strains and the likelihood of the structure being warped beyond recovery is averted. Fig. 3 indicates two simple shrinkage or warping effects which can be compounded into a lot of trouble in an intricate structure.

(Continued on page 96)

Hydrogen Protection

While most of the welding is done with the oxygen-acetylene flame, hydrogen is likewise brought into play with great benefit. Hydrogen is used for the welding of aluminium because it smothers the area surrounding the area of the weld with hydrogen to the exclusion of oxygen and prevents the aluminium from oxidizing. Two oxidized aluminium surfaces will not weld well even with the application of liberal amounts of flux. Hydrogen too, can be called to good turn simultaneously as a pre-heater and to prevent the formation of scale on thin steel pieces. While it actually heats of course, it seems to have the property of cooling, or at least of spreading the heat from a weld so that distortion is not so apt to occur. A simple hydrogen burner of copper tubing shaped to fit the work and used on the back side of a thin steel sheet being welded, largely prevents the formation of scale. See Fig. 2.

FIG. 3

A hydrogen burner placed above the oxy-acetylene torch and directing a flow of hydrogen down on the weld area helps also on the top side of the weld. Complex welds with sheet as thin as .035 can be accomplished by an airplane welder with comparative ease through the application of this principle.

If the welding could be made to take place over the entire line of the weld at one time, it is probable that many of the problems associated with welding would be eliminated. But, since it is necessary for the welding to progress along as a concentrated cone of heat from one end of the weld to the other, difficulties are multiplied. The direction of the progress of the weld has much to do with its successful completion. One direction will work perfectly, the reverse will split the work.

Welding in the trough of an acute angle is difficult, because the weld puddle should be in the very bottom and this is where the most heat should be concentrated but actually the hot flame cone is always closer to the adjacent walls. The result is that the bottom of the weld is apt to be not fully molten, the sides burned or melted away.

Welding in a confined area such as a pocket or inside a tube is another condition or predicament hard for the welder to cope with to the full extent of his skill. Here the torch tip becomes excessively heated. Water-cooled welding torch tips have been rigged up with gratifying results.

THE MYSTERY AEROFOIL

An American Invention

I HAVE before me as I write an article entitled " Mystery Airfoil "; it is the story of the Davis aerofoil and its inventor, David R. Davis.

All readers of *Flight* will readily recall the phenomenal Consolidated 31 flying-boat with its Davis wing and, more recently, the B-24 4-engined bomber of the same make. Until I read the story of the Davis foil I did not fully appreciate the fact that it was destined to go down in history as one of the epic inventions of our time with the most far-reaching effect on the design of aircraft.

Here, indeed, is an enthralling and inspiring story: " A curve, he perceived, was not a dead geometric figure. IT WAS A LIVING, MECHANICAL, OPERATING THING. On the basis of this, he could not but depart from what now seemed an archaic process of obtaining the most efficient curve for an airplane wing—the so-called ' cut and try ' methods." Again, " A curve, he saw, was the product of mechanical action—rotation at infinite speed. ' A circle,' he said, ' is not an inert object. It is something going around—a radius arm (or lever arm) rotating about a centre.'

" Having stumbled on this hypothesis, he discovered that the most efficient mechanical action to produce lift would result from the proper relation between the rotational speed of the radius arm and the translational velocity of the point about which the radius arm rotates.

" Two factors must be borne in mind . . . one is rotation—MOVEMENT of the radius arm around the centre of a circle. The other is translation—movement of the centre itself.

" Mark a dot on a piece of paper, designating it as the centre of a circle. Place the point of a pencil on that dot, then lay the pencil down to form a radius, or lever arm. Now turn the pencil clockwise and, at the same time, move the point in a straight line to the left (thus indicating movement of the circle's centre by the latter motion). The curve formed by the top of the pencil as result of this simultaneous action is fundamentally part of a Davis airfoil profile—the product of two *steady movements*.

" Steadiness is important. ' If you rotate a flywheel steadily it takes less effort to keep it moving,' Davis explains. ' If done jerkily more H.P. will be required. The same is true of translation. The centre of the circle must move at a steady rate. The combined steady actions will trace the top curve of an airfoil, and a million of these (an abstract number) will form the wing's cover.'

" A wing surface is no more inert than a buzz-saw, Davis declares. It is a mechanical device whipping the tar out of the airstream, smashing all its resistance and converting it into work for the 'plane. That, stripped of elegant technical terms, is ' lift.' To illustrate this, Davis uses the golfer. The golf club rotates around the hand as a centre. Both hand and club are moving—translation and rotation. If the swing is not smooth the ball won't travel far. A weakling with a steady swing will send the ball farther than a muscular gent. with jerky style.

" An airfoil is the golf club in opposite action—seizing the ball as it would come to it in a reverse motion picture and killing its resistance. The more smoothly the wing does this with air the faster the 'plane will travel with least effort. A wing in flight, to Davis at least, is nothing more than millions of lever arms grabbing and taking the punch out of the air.

" Where is the mystery in an airfoil so readily explained by its creator? Ah, that is the formula which expresses the most perfect relationship between the rotational and translation speeds. With the seemingly endless possibilities involved no less than an Einstein, one would surmise, could arrive at this formula. But Davis calls it a natural conclusion reached once the old ideas of airfoil design are junked."

The article goes on to tell of the innumerable and possibly inevitable difficulties Davis encountered in trying to get people interested, how the N.A.C.A. were flabbergasted when they observed for themselves the amazing efficiency of the Davis foil when compared with the super-foils they had evolved.

In discussing foreign interest in the Davis wing, the following is relevant: " . . . negotiations with one particular country (reliably reported to be ENGLAND.—ED.), whose name he cannot disclose, because of the international situation, have reached such an advanced stage that before this is published the Davis section may be putting new wings on European aircraft."

Apparently, Davis is not enamoured by the Dictators, or anybody who has discarded the democratic ideal.

Whether or no we are already building 'planes with this new aerofoil, I thought that I would bring this article to the notice of *Flight* readers.

JOHN W. MORRISON.

London, N.W.3.

AIRCRAFT CONSOLIDATION

All physical assets, as well as the name and good will of the Hall-Aluminum Aircraft Corporation, of Bristol, Pa., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall-Aluminum Corporation is now a part of Consolidated Aircraft Corporation, San Diego, Calif.

Some 32 key men of the eastern airplane plant have joined the new organization, and all patent rights, material and equipment of the former company have been acquired through the purchase.

Hall-Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall-Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, president and sole stockholder, had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall applied for and was granted numerous basic patents relating to this field.

Along with the airplanes built, there were developed a complete line of draw bench shapes and other parts of strong aluminum alloys which were perfected and continuously produced and sold since 1923 to various airplane manufacturers.

In 1927 Hall-Aluminum Corporation was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company, until its acquisition by Consolidated Aircraft Corporation, has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Clinging rather tenaciously to the naval side of aviation construction, Hall-Aluminum Aircraft has produced principally seaplanes and flying boats, pioneering in many phases of the work and particularly in all-metal construction. In 1920 metal wings were constructed for HS-3 flying boats. In 1924 there were built in conjunction with the Curtiss Aeroplane and Motor Company, two U. S. Navy F4C-1 fighter airplanes . . . the first all-metal aircraft used by the U. S. Navy. Other airplanes built included the C-333, XFH-1, XPH-1, PH-1s, PH-2s, PH-3s, and XP2H-1, a four-engine long range patrol or bomber boat with four liquid cooled engines. In 1933 it made the longest non-stop flight up to that time by the Navy, from Norfolk, Va., to Coco Solo in the Canal Zone.

The Company also made the twin float monoplane torpedo bomber, the XPTBH-2. Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U. S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, now merged with Consolidated Aircraft Corporation, is the son of Charles Ward Hall, who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company.

Among those also joining Consolidated from the roster of executives of Hall-Aluminum Aircraft Corporation are: Charles F. Pape, who was vice-president, treasurer and director; Henry S. Deichert, factory superintendent, and John H. Smith and John Sangster, general foremen.

U. S. COAST GUARD November 1940

The Airlog October, 1940.

FLYING-FORTRESSES AND NAVAL PATROL-BOMBERS.

To Be Sold To England.

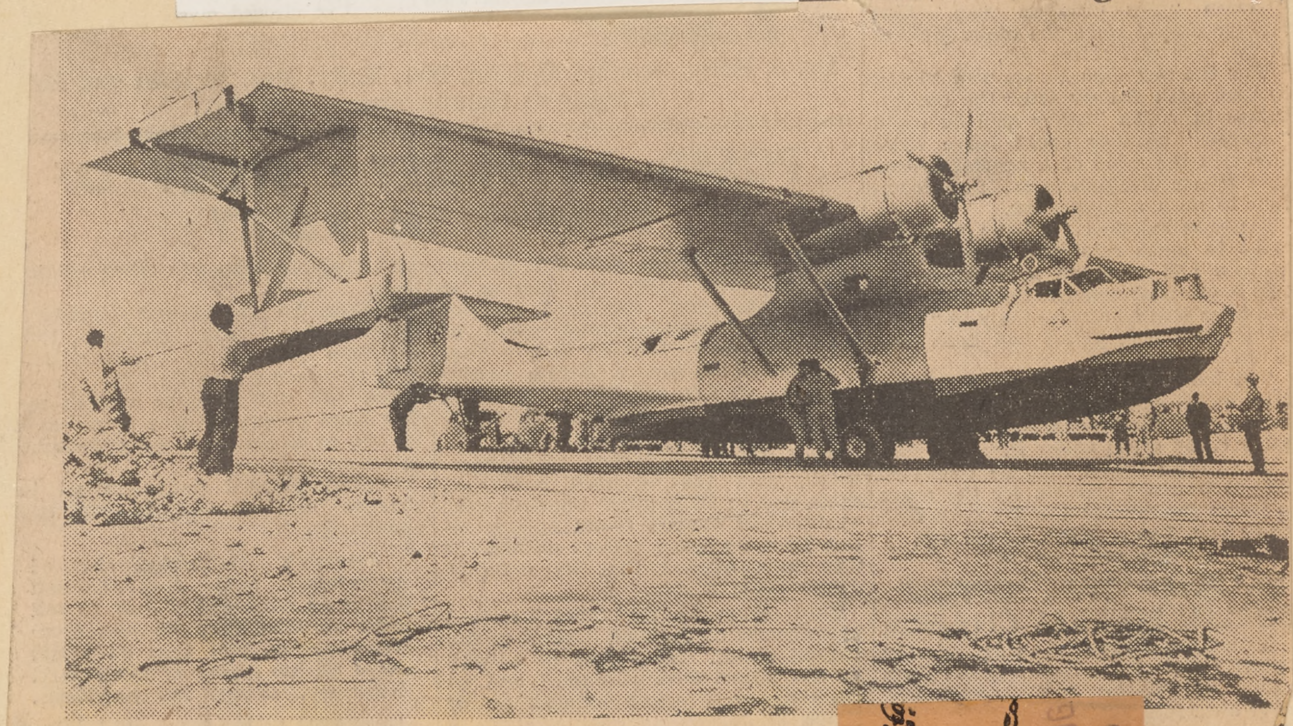
It is reported from America that, under a trade-in arrangement whereby the U.S. Government shall sell back to the manufacturers, in part-payment for other craft, a considerable number of Army and Navy bombers — Boeing four-engined "Flying Fortresses" and Consolidated twin-engined PBY flying-boats — the manufacturers, under Government permit, shall, in turn, put them in virtual brand-new order and sell them to England.

An initial shipment of twenty-five of each is declared imminent.

Heavily armed, with five machine-gun positions in "blisters" above, on the sides and below, as well as mounting forward-firing guns and being able to carry heavy bomb loads great distances at fairly high speeds, the Boeing "Flying Fortresses" would be difficult customers for ordinary fighting craft to come up against. They could operate over extreme ranges and attack enemy plants much further afield than those now being bombed from England by the Royal Air Force.

Similarly, the PBY's., with extreme range of about 4,000 miles as reconnaissance craft and able to carry a substantial bomb load for little short of that distance, should prove most useful adjuncts in both northern and Mediterranean areas.

Flying-boat "Ferry" between U.S. and England



Mr. Richard Archbold, the former explorer, has announced in New York that he has sold his flying-boat, Guba, which he has used on scientific expeditions in Africa and New Guinea, to the British Government for transporting aluminium from the United States to England. The Guba will make trips twice a week. The American airman, Clyde Pangborn will head the crew.

THE PATROL PLANE AND THE FUTURE

By LIEUTENANT COMMANDER A. B. VOSSELLER, *U. S. Navy*

THE ENVIABLE reputation of American Naval Aviation, so richly deserved after years of efficient operations, is probably based principally upon public interest in the rather spectacular phases of carrier aviation. Operating airplanes from a ship's deck far at sea in the face of many difficulties, and the precision with which such operations have been carried on year after year, have an appeal to the lay mind which is quite understandable, and a value which is readily apparent to even the most confirmed landsman. While the flying boat type, extensively used during World War I, was instrumental in focusing naval interest upon the potentialities of aviation as an arm of the fleet, during the decade beginning in 1920 development of this type languished to a certain extent while primary attention was concentrated upon the perfection of carrier operations. The fact that the American Navy is the only one having any sizable and effective air component which can accompany the Fleet is eloquent testimony to the efficiency with which these developments have been carried on.

With no attempt or intent to disparage the accomplishments of carrier aviation, it is nevertheless surprising to find that many experts, real and merely self-styled, have consistently overlooked the accomplishments and possibilities of the patrol plane. Perhaps this is understandable since the Navy itself has made no attempt to publicize the accomplishments of the patrol wing. For example, mass flights of patrol planes to Honolulu, Panama, Alaska, and even to the Philippine Islands, have been consistently described by the Navy Department as merely routine. Routine though they have been, they have nevertheless had more than their share of drama, and further, great promise of future accomplishment.

All naval officers are familiar with the sight of patrol planes, singly or in large groups, winging their way through fair weather and foul, over and around the Fleet. Because the big planes look large and deliberate, there is, perhaps, a tendency to regard them as lumbering and slow and, on the whole, rather ineffective. What is not appreciated is the fact that they not only can and do operate at tremendous distances from their bases and tenders through all sorts of weather, but also that they can, and undoubtedly will, deliver a tremendous offensive blow should our country ever become involved in war.

Much has been written in recent months on the subject of bombing, including the bombing of battleships. Discussion of this latter subject seems to have suffered a decline recently, perhaps because the verdict may be so near. The question of whether bombers can sink battleships is, of itself, of little importance, but the incontrovertible fact that ships can be bombed and unquestionably damaged must be considered by those charged with the responsibility for the national defense. The factor in a discussion of bombing types that interests us most, as naval officers, is not that we ourselves may be bombed, but rather *what type of plane is best for use against an enemy.*

Dismissing, momentarily, our carrier-based bombers, which are admirably suited for their task and are easily the peer of any in existence elsewhere in the world, let us consider the patrol plane and its place in any naval war in which the United States might become involved. It has long

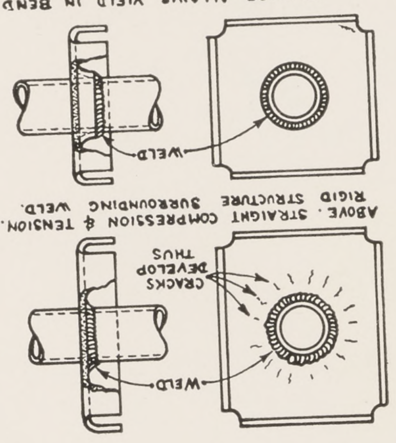
4,000 H.P. The Consolidated type 31 is powered by two of the new Wright two-row Duplex-Cyclone engines, and is probably the world's most powerful twin-engined flying boat. The "retractable tricycle undercarriage" is a beaching trolley. The struts of the outboard floats fold into the wing. The machine has accommodation for 52 passengers in the daytime and 28 at night.

do is to pull until something lets go. The area around the weld will develop cracks as indicated.

The solution is shown in the lower sketch of Fig. 1. The hole of passage for the tube was made considerably undersize and flanged with a generous radius inwardly. Then the welding was done along the flange edge. Thus constructed, the flange radius allows bending to take place in the flange both in expansion and contraction and allows absorption of the shrinkage easily. Actually, as at first designed, the chances were much against even the most skilled welder being able to complete the job satisfactorily. When changed to the flange solution, however, far less skillful welders experienced no trouble at all. Allowances for expansion, contraction and shrinkage must be designed in such cases in the work itself.



WELD
CRACKS DEVELOP THUS
ABOVE. STRAIGHT COMPRESSION & TENSION. RIGID STRUCTURE SURROUNDING WELD.
WELD
FLANGE ALLOWS YIELD IN BEND ADJACENT TO WELD, MODIFYING BOTH COMPRESSION FROM HEAT OF WELD AND TENSION FROM SHRINKAGE & COOLING.

FIG. 1

In a variation of the same princi-

run inside another with a very close fit between them. On the outer tube a fitting was welded. On cooling a crack was apt to be found in the outer tube at any place on its circumference adjacent to the welding. The explanation being that in welding, the outer tube was heated first and expanded away from the inner tube. As the welding progressed the inner tube became as hot as the outer tube and brought the clearance in this dually expanded condition back to the original close fit. On cooling, however, the welded area of the outer tube tried to take up its expansion through contraction and, in addition, the weld shrinkage. The inner tube had little or no shrinkage since the weld did not penetrate this deep and, further, it could not contract as rapidly as the exposed outer tube. The net result being that the outer tube tried to shrink and contract but was prevented from doing so and simply split.

Normalizing

The above are cases in which the nature of the work itself caused the trouble to be immediately recognized as much above the limits of the metal. But even under ordinary circumstances the welding, being confined to a small area at a time that progresses from one end of the weld to the other, sets up strains in the welded piece and this is the reason for normalizing. The welded up structure with its strains is soaked in heat until it is uniformly relaxed and the strains ease out of the stressed areas. Unless precautions are taken in this normalizing, long or weighted pieces are apt to sag in the normalizing furnace and undesirable straightening

---

Hydrogen Protection

While most of the welding is done with the oxygen-acetylene flame, hydrogen is likewise brought into play with great benefit. Hydrogen is used for the welding of aluminium because it smothers the area surrounding the area of the weld with hydrogen to the exclusion of oxygen and prevents the aluminium from oxidizing. Two oxidized aluminium surfaces will not weld well even with the application of liberal amounts of flux. Clinging rather tenaciously to the naval side of aviation construction, Hall-Aluminum Aircraft has produced principally seaplanes and flying boats, pioneering in many phases of the work and particularly in all-metal construction. In 1920 metal wings were constructed for HS-3 flying boats. In 1924 there were built in conjunction with the Curtiss Aeroplane and Motor Company, two U. S. Navy F4C-1 fighter airplanes . . . the first all-metal aircraft used by the U. S. Navy. Other airplanes built included the C-333, XFH-1, XPH-1, PH-1s, PH-2s, PH-3s, and XP2H-1, a four-engine long range patrol or bomber boat with four liquid cooled engines. In 1933 it made the longest non-stop flight up to that time by the Navy, from Norfolk, Va., to Coco Solo in the Canal Zone.

The Company also made the twin float monoplane torpedo bomber, the XPTBH-2. Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U. S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, now merged with Consolidated Aircraft Corporation, is the son of Charles Ward Hall, who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company.

Among those also joining Consolidated from the roster of executives of Hall-Aluminum Aircraft Corporation are: Charles F. Pape, who was vice-president, treasurer and director; Henry S. Deichert, factory superintendent, and John H. Smith and John Sangster, general foremen.

U. S. COAST GUARD November 1940

The Air Log October, 1940.

FLYING-FORTRESSES AND NAVAL PATROL-BOMBERS.
To Be Sold To England.

It is reported from America that, under a trade-in arrangement whereby the U.S. Government shall sell back to the manufacturers, in part-payment for other craft, a considerable number of Army and Navy bombers — Boeing four-engined "Flying Fortresses" and Consolidated twin-engined PBY flying-boats — the manufacturers, under Government permit, shall, in turn, put them in virtual brand-new order and sell them to England.

An initial shipment of twenty-five of each is declared imminent.

Heavily armed, with five machine-gun positions in "blisters" above, on the sides and below, as well as mounting forward-firing guns and being able to carry heavy bomb loads great distances at fairly high speeds, the Boeing "Flying Fortresses" would be difficult customers for ordinary fighting craft to come up against. They could operate over extreme ranges and attack enemy plants much further afield than those now being bombed from England by the Royal Air Force.

Similarly, the PBY's., with extreme range of about 4,000 miles as reconnaissance craft and able to carry a substantial bomb load for little short of that distance, should prove most useful adjuncts in both northern and Mediterranean areas.

HYDROGEN BURNER PREVENTS SCALING OF UNDER SIDE, LIMITS WARPING ALSO

FIG. 2

Another phase of welding in which normalizing plays a large part is in the welding of large or complex assemblies in which it is desired to hold the work to close finish dimensions for subsequent machining. If the entire assembly is welded up immediately as a single unit, the strains set up and the interaction of them during the normalizing may easily warp the structure all out of shape. To avoid this the assembly is broken down into sub-assemblies in which the welding becomes more or less self-contained. Then these subassemblies are normalized after welding to remove the strains. Allowances are made in welding to allow for fitting the subassemblies together and they are straightened in themselves if found out of alignment. Then in the final assembly of the sub-assemblies into the one whole structure, only simple strains can be set up, rather than the danger of compounded strains and the likelihood of the structure being warped beyond recovery is averted. Fig. 3 indicates two simple shrinkage or warping effects which can be compounded into a lot of trouble in an intricate structure.

THE MYSTERY AEROFOIL
An American Invention

I HAVE before me as I write an article entitled "Mystery Airfoil"; it is the story of the Davis aerofoil and its inventor, David R. Davis.

All readers of *Flight* will readily recall the phenomenal Consolidated 31 flying-boat with its Davis wing and, more recently, the B-24 4-engined bomber of the same make. Until I read the story of the Davis foil I did not fully appreciate the fact that it was destined to go down in history as one of the epic inventions of our time with the most far-reaching effect on the design of aircraft.

Here, indeed, is an enthralling and inspiring story: "A curve, he perceived, was not a dead geometric figure. IT WAS A LIVING, MECHANICAL, OPERATING THING. On the basis of this, he could not but depart from what now seemed an archaic process of obtaining the most efficient curve for an airplane wing—the so-called 'cut and try' methods." Again, "A curve, he saw, was the product of mechanical action—rotation at infinite speed. 'A circle,' he said, 'is not an inert object. It is something going around—a radius arm (or lever arm) rotating about a centre.'

"Having stumbled on this hypothesis, he discovered that the most efficient mechanical action to produce lift would result from the proper relation between the rotational speed of the radius arm and the translational velocity of the point about which the radius arm rotates.

"Two factors must be borne in mind . . . one is rotation—MOVEMENT of the radius arm around the centre of a circle. The other is translation—movement of the centre itself.

"Mark a dot on a piece of paper, designating it as the centre of a circle. Place the point of a pencil on that dot, then lay the pencil down to form a radius, or lever arm. Now turn the pencil clockwise and, at the same time, move the point in a straight line to the left (thus indicating movement of the circle's centre by the latter motion). The curve formed by the top of the pencil as result of this simultaneous action is fundamentally part of a Davis airfoil profile—the product of two *steady movements*.

"Steadiness is important. 'If you rotate a flywheel steadily it takes less effort to keep it moving,' Davis explains. 'If done jerkily more H.P. will be required. The same is true of translation. The centre of the circle must move at a steady rate. The combined steady actions will trace the top curve of an airfoil, and a million of these (an abstract number) will form the wing's cover.'

"A wing surface is no more inert than a buzz-saw, Davis declares. It is a mechanical device whipping the tar out of the airstream, smashing all its resistance and converting it into work for the 'plane. That, stripped of elegant technical terms, is 'lift.' To illustrate this, Davis uses the golfer. The golf club rotates around the hand as a centre. Both hand and club are moving—translation and rotation. If the swing is not smooth the ball won't travel far. A weakling with a steady swing will send the ball farther than a muscular gent. with jerky style.

"An airfoil is the golf club in opposite action—seizing the ball as it would come to it in a reverse motion picture and killing its resistance. The more smoothly the wing does this with air the faster the 'plane will travel with least effort. A wing in flight, to Davis at least, is nothing more than millions of lever arms grabbing and taking the punch out of the air.

"Where is the mystery in an airfoil so readily explained by its creator? Ah, that is the formula which expresses the most perfect relationship between the rotational and translation speeds. With the seemingly endless possibilities involved no less than an Einstein, one would surmise, could arrive at this formula. But Davis calls it a natural conclusion reached once the old ideas of airfoil design are junked."

The article goes on to tell of the innumerable and possibly inevitable difficulties Davis encountered in trying to get people interested, how the N.A.C.A. were flabbergasted when they observed for themselves the amazing efficiency of the Davis foil when compared with the super-foils they had evolved.

In discussing foreign interest in the Davis wing, the following is relevant: ". . . negotiations with one particular country (reliably reported to be ENGLAND.—Ed.), whose name he cannot disclose, because of the international situation, have reached such an advanced stage that before this is published the Davis section may be putting new wings on European aircraft."

Apparently, Davis is not enamoured by the Dictators, or anybody who has discarded the democratic ideal.

Whether or no we are already building 'planes with this new aerofoil, I thought that I would bring this article to the notice of *Flight* readers.

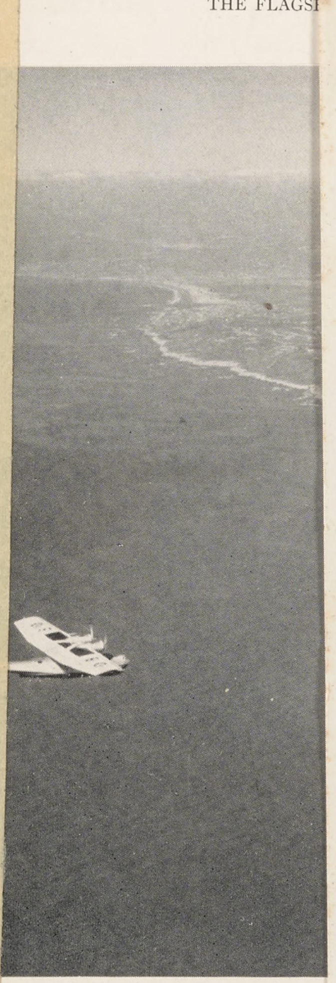
THE FLAGS



Consolidated Aircraft Corporation

THE NAVY'S LAND-BASED AIR POWER CAPABLE OF LONG-RANGE SCOUTING AND BOMBING OPERATIONS

The recent acquisition of Atlantic bases will enable the patrol plane to guard every approach to our vital areas.

been recognized that the patrol plane, because of its great range, and ability to stay in the air for long periods, is a superb scout. Information is the first need of any commander, and hence the primary duty of the patrol plane is, as the name suggests, scouting or patrolling. Supply of vital information is such an important duty that, in the writer's opinion, successful discharge of this function has tended to obscure the patrol plane's value as a bomber.

What are the characteristics of the patrol plane which make it so well suited for its tasks? What are the characteristics of the airplane which cause public imagination to seize upon it so readily as the ideal instrument of war? The suggestion is ventured that these are the ease and speed with which an airplane can reach an objective and, under certain circumstances, the relative invulnerability it possesses while delivering a destructive and nerve-shattering blow to its target. In considering any instrument of war, the layman is handicapped by a lack of intimate knowledge of the engineering *principals* which go into the design of the weapon. This is particularly true of the airplane, because the engineering which goes into its design is so very intimately interwoven with the characteristics desired in the finished product. Certainly no instrument of war is more carefully and perfectly engineered for its intended purpose! It is believed that this fact underlies a great many misconceptions concerning the airplane, and particularly the patrol plane. The mere fact that a large airplane can sustain itself in the air is still a source of some astonishment to many; is it surprising, therefore, that some amateur strategists reach incorrect conclusions when they evaluate desirable strategic or tactical considerations without regard to the engineering possibilities of the airplane? On the contrary such errors are quite natural, and it is with hope of clearing up some of these misconceptions that this article is written.

Without reference to their order of relative importance, the main characteristics of any airplane are:

(*a*) Its top and cruising speeds
(*b*) Its landing speed
(*c*) Its range
(*d*) Its endurance in the air
(*e*) Its load-carrying capacity
(*f*) Its size
(*g*) Its cost

Other features which are of particular importance for military or naval use are the facility with which the airplane can be handled, both in the air and on the ground, and the defensive or offensive characteristics which can be provided.

It is not proposed to go into the above characteristics in great detail, but merely to outline a few of the underlying relationships and their connection with certain aspects of usefulness which the finished airplane should possess. The question of speed is one of the most difficult and important ones which we should consider. It is, in a way, unfortunate that speed has become so highly emphasized, because it has given rise, in some cases, to entirely erroneous impressions of the value and utility of various types of aircraft. Press reports from abroad early in the war frequently described the success of French pilots in American built Curtiss Hawks against faster Messerschmidt 109's. In the single-seater type, where admittedly speed is a primary requisite, it must be conceded that speed alone is not sufficient.

The bomber must depend primarily upon altitude and surprise to get home his attacks successfully. Speed will always be most welcome as a means of cutting down losses from enemy fighters and reducing the time under anti-aircraft fire should the effort at surprise fail. However, since bombers can never hope to have as much speed as the fighters, they can never hope to elude the fighters by this means. In any event, far at sea, which is where we want to do any bombing of the enemy, the bombers have only carrier-based

fighters to face, and it is unlikely that their number will be comparable to that which would be expected in an attack on a strongly defended shore base. Losses must be expected, but should the bombers be fortunate enough to hit their first objective, the enemy carriers, they can then expect to operate almost without opposition.

This principle of neutralizing and preventing operations from the enemy's air bases is one which the German Air Force has followed with great success in the present war. Dunkerque was an exception. R.A.F. fighters were able to operate from their bases in England and the German Air Force was consequently unable to prevent the evacuation of hundreds of thousands of troops. This particular operation, in which the high performance German bombers were prevented by R.A.F. fighter interference from stopping the evacuation, proves that high speed alone for the bomber is not sufficient to permit operations in the face of determined fighter opposition.

In any consideration of bombing aircraft, greater attention should be paid to the bomb-carrying capacity and the range of the airplane than to the speed alone. Recognizing that the bomber is essentially a load-carrying aircraft, aeronautical authorities agree that sufficient power cannot be included to make the bomber superior or even equal in speed to a fighter or specially designed interceptor.

Common misconception has the speed of an airplane directly related to its load-carrying capacity. While the two are related, the relationship is neither simple nor direct. What connection there is derives principally from the fact that the load-carrying airplane is generally designed with a larger wing area, and, in addition, frequently employs an airfoil section in which lifting capacity rather than low drag is emphasized. Likewise, in order to enclose its load, the load-carrying airplane has a large hull or fuselage, which increases frontal resistance as well as parasite drag. Both factors are prejudicial to high speed. From this the reader may deduce that the flying boat falls in the classification of the heavy load-carrying airplane. This is true, although the patrol plane's greater size comes automatically from its dependence upon a boat hull for landing and taking off. This greater size automatically results in a greater volumetric capacity for the large flying boat, but, quite unexpectedly, a further advantage results in a reduction of the necessary structural weight. This is because the hull of the boat not only serves to enclose the crew but also serves as a landing and taking-off medium. The landplane, on the other hand, must carry landing gear which is only so much dead weight when it is in the air.

The Lilienthal Memorial Lecture, in 1938, was delivered by Mr. Igor I. Sikorsky upon the subject of "The Large Flying Boat." In the course of his paper he analyzed the problem of long-range air transport very fully, comparing the large landplane with the flying boat from both the theoretical and practical standpoints. Mr. Sikorsky is recognized as one of the world's foremost designers of aircraft and the fact that he was invited to Berlin to deliver the Memorial Lecture at the annual meeting of the Lilienthal Society indicates the authority with which he speaks. The following extracts are quoted from his lecture: (The italics have been added.)

"These and other conditions are responsible for the fact that medium or small size flying boats are in general less efficient than corresponding types of landplanes, the advantages of the landplanes being particularly pronounced in small ships. *However, in the very large machines, the conditions become different.* In view of the importance of this question, it appears desirable at this time to make a brief study of the influence of size on the relative efficiency of landplanes and flying boats.

"In medium sizes, between ten and

4,000 H.P. The Consolidated type 31 is powered by two of the new Wright two-row Duplex-Cyclone engines, and is probably the world's most powerful twin-engined flying boat. The "retractable tricycle undercarriage" is a beaching trolley. The struts of the outboard floats fold into the wing. The machine has accommodation for 52 passengers in the daytime and 28 at night.

Welding Problems in Aviation

Typical of the transport and bombing type of plane is this Model 28 produced by the Consolidated Aircraft Corporation now in service in trans-Pacific operations. Welding plays a significant part in its construction.

ALL welding fixtures are made oversize and allowances are made for the shrinkage to be expected. Sometimes the design of the work itself brings about a condition in which both the expansion and contraction, plus the shrinkage, bring about trouble with the welding operation and results. There must be allowance for expansion, contraction and shrinkage, or some part of the weld will suffer.

A simple and excellent example of this is shown in Fig. 1. Here it was desired to run a tube through a boxlike structure of considerable stiffness (with the flanges, as well as the area of the bottom, contributing to this stiffness) and to weld around the point of passage of the tube through the box. Due to the stiffness of the box around the weld, the expansion forces the metal in the area surrounding the weld to be compressed. The outer areas remain cool and resist this expansion with their full strength. In the areas between, which are progressively cooler toward the outside, the force of expansion acts upon the metal in what amounts to cold working. Here the crystal structure of the metal is crushed and compacted together. Then, as the immediate area of the weld cools, it contracts more than it expanded, pulling with great strength upon the very structure it has just compressed, also pulling forward and back around the weld. Being restricted in contraction as it was in expansion, and with no allowance for the added shrinkage possible, all it can

Hydrogen Protection

While most of the welding is done with the oxygen-acetylene flame, hydrogen is likewise brought into play with great benefit. Hydrogen is used for the welding of aluminium because it smothers the area surrounding the area of the weld with hydrogen to the exclusion of oxygen and prevents the aluminium from oxidizing. Two oxidized aluminium surfaces will not weld well even with the application of liberal amounts of flux. Hydrogen too, can be called to good turn simultaneously as a pre-heater and to prevent the formation of scale on thin steel pieces. While it actually heats of course, it seems to have the property of cooling, or at least of spreading the heat from a weld so that distortion is not so apt to occur. A simple hydrogen burner of copper tubing shaped to fit the work and used on the back side of a thin steel sheet being welded, largely prevents the formation of scale. See Fig. 2.

TOUCHING HERE
GAP
RIGID STRUCTURE
BENT
WELDS

FIG. 3

A hydrogen burner placed above the oxy-acetylene torch and directing a flow of hydrogen down on the weld area helps also on the top side of the weld. Complex welds with sheet as thin as .035 can be accomplished by an airplane welder with comparative ease through the application of this principle.

If the welding could be made to take place over the entire line of the weld at one time, it is probable that many of the problems associated with welding would be eliminated. But, since it is necessary for the welding to progress along as a concentrated cone of heat from one end of the weld to the other, difficulties are multiplied. The direction of the progress of the weld has much to do with its successful completion. One direction will work perfectly, the reverse will split the work.

Welding in the trough of an acute angle is difficult, because the weld puddle should be in the very bottom and this is where the most heat should be concentrated but actually the hot flame cone is always closer to the adjacent walls. The result is that the bottom of the weld is apt to be not fully molten, the sides burned or melted away.

Welding in a confined area such as a pocket or inside a tube is another condition or predicament hard for the welder to cope with to the full extent of his skill. Here the torch tip becomes excessively heated. Water-cooled welding torch tips have been rigged up with gratifying results.

THE MYSTERY AEROFOIL

An American Invention

I HAVE before me as I write an article entitled "Mystery Airfoil"; it is the story of the Davis aerofoil and its inventor, David R. Davis.

All readers of *Flight* will readily recall the phenomenal Consolidated 31 flying-boat with its Davis wing and, more recently, the B-24 4-engined bomber of the same make. Until I read the story of the Davis foil I did not fully appreciate the fact that it was destined to go down in history as one of the epic inventions of our time with the most far-reaching effect on the design of aircraft.

Here, indeed, is an enthralling and inspiring story: "A curve, he perceived, was not a dead geometric figure. IT WAS A LIVING, MECHANICAL, OPERATING THING. On the basis of this, he could not but depart from what now seemed an archaic process of obtaining the most efficient curve for an airplane wing—the so-called 'cut and try' methods." Again, "A curve, he saw, was the product of mechanical action—rotation at infinite speed. 'A circle,' he said, 'is not an inert object. It is something going around—a radius arm (or lever arm) rotating about a centre.'

"Having stumbled on this hypothesis, he discovered that the most efficient mechanical action to produce lift would result from the proper relation between the rotational speed of the radius arm and the translational velocity of the point about which the radius arm rotates.

"Two factors must be borne in mind . . . one is rotation—MOVEMENT of the radius arm around the centre of a circle. The other is translation—movement of the centre itself.

"Mark a dot on a piece of paper, designating it as the centre of a circle. Place the point of a pencil on that dot, then lay the pencil down to form a radius, or lever arm. Now turn the pencil clockwise and, at the same time, move the point in a straight line to the left (thus indicating movement of the circle's centre by the latter motion). The curve formed by the top of the pencil as result of this simultaneous action is fundamentally part of a Davis airfoil profile—the product of two *steady movements*.

"Steadiness is important. 'If you rotate a flywheel steadily it takes less effort to keep it moving,' Davis explains. 'If done jerkily more H.P. will be required. The same is true of translation. The centre of the circle must move at a steady rate. The combined steady actions will trace the top curve of an airfoil, and a million of these (an abstract number) will form the wing's cover.'

"A wing surface is no more inert than a buzz-saw, Davis declares. It is a mechanical device whipping the tar out of the airstream, smashing all its resistance and converting it into work for the 'plane. That, stripped of elegant technical terms, is 'lift.' To illustrate this, Davis uses the golfer. The golf club rotates around the hand as a centre. Both hand and club are moving—translation and rotation. If the swing is not smooth the ball won't travel far. A weakling with a steady swing will send the ball farther than a muscular gent. with jerky style.

"An airfoil is the golf club in opposite action—seizing the ball as it would come to it in a reverse motion picture and killing its resistance. The more smoothly the wing does this with air the faster the 'plane will travel with least effort. A wing in flight, to Davis at least, is nothing more than millions of lever arms grabbing and taking the punch out of the air.

"Where is the mystery in an airfoil so readily explained by its creator? Ah, that is the formula which expresses the most perfect relationship between the rotational and translation speeds. With the seemingly endless possibilities involved no less than an Einstein, one would surmise, could arrive at this formula. But Davis calls it a natural conclusion reached once the old ideas of airfoil design are junked."

The article goes on to tell of the innumerable and possibly inevitable difficulties Davis encountered in trying to get people interested, how the N.A.C.A. were flabbergasted when they observed for themselves the amazing efficiency of the Davis foil when compared with the super-foils they had evolved.

In discussing foreign interest in the Davis wing, the following is relevant: ". . . negotiations with one particular country (reliably reported to be ENGLAND.—ED.), whose name he cannot disclose, because of the international situation, have reached such an advanced stage that before this is published the Davis section may be putting new wings on European aircraft."

Apparently, Davis is not enamoured by the Dictators, or anybody who has discarded the democratic ideal.

Whether or no we are already building 'planes with this new aerofoil, I thought that I would bring this article to the notice of *Flight* readers.

JOHN W. MORRISON.

London, N.W.3.

AIRCRAFT CONSOLIDATION

All physical assets, as well as the name and good will of the Hall-Aluminum Aircraft Corporation, of Bristol, Pa., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall-Aluminum Corporation is now a part of Consolidated Aircraft Corporation, San Diego, Calif.

Some 32 key men of the eastern airplane plant have joined the new organization, and all patent rights, material and equipment of the former company have been acquired through the purchase.

Hall-Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall-Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, president and sole stockholder, had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall applied for and was granted numerous basic patents relating to this field.

Along with the airplanes built, there were developed a complete line of draw bench shapes and other parts of strong aluminum alloys which were perfected and continuously produced and sold since 1923 to various airplane manufacturers.

In 1927 Hall-Aluminum Corporation was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company, until its acquisition by Consolidated Aircraft Corporation, has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Clinging rather tenaciously to the naval side of aviation construction, Hall-Aluminum Aircraft has produced principally seaplanes and flying boats, pioneering in many phases of the work and particularly in all-metal construction. In 1920 metal wings were constructed for HS-3 flying boats. In 1924 there were built in conjunction with the Curtiss Aeroplane and Motor Company, two U. S. Navy F4C-1 fighter airplanes . . . the first all-metal aircraft used by the U. S. Navy. Other airplanes built included the C-333, XFH-1, XPH-1, PH-1s, PH-2s, PH-3s, and XP2H-1, a four-engine long range patrol or bomber boat with four liquid cooled engines. In 1933 it made the longest non-stop flight up to that time by the Navy, from Norfolk, Va., to Coco Solo in the Canal Zone.

The Company also made the twin float monoplane torpedo bomber, the XPTBH-2. Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U. S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, now merged with Consolidated Aircraft Corporation, is the son of Charles Ward Hall, who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company.

Among those also joining Consolidated from the roster of executives of Hall-Aluminum Aircraft Corporation are: Charles F. Pape, who was vice-president, treasurer and director; Henry S. Deichert, factory superintendent, and John H. Smith and John Sangster, general foremen.

U. S. COAST GUARD November 1940

The Airlog October, 1940.

FLYING-FORTRESSES AND NAVAL PATROL-BOMBERS.

To Be Sold To England.

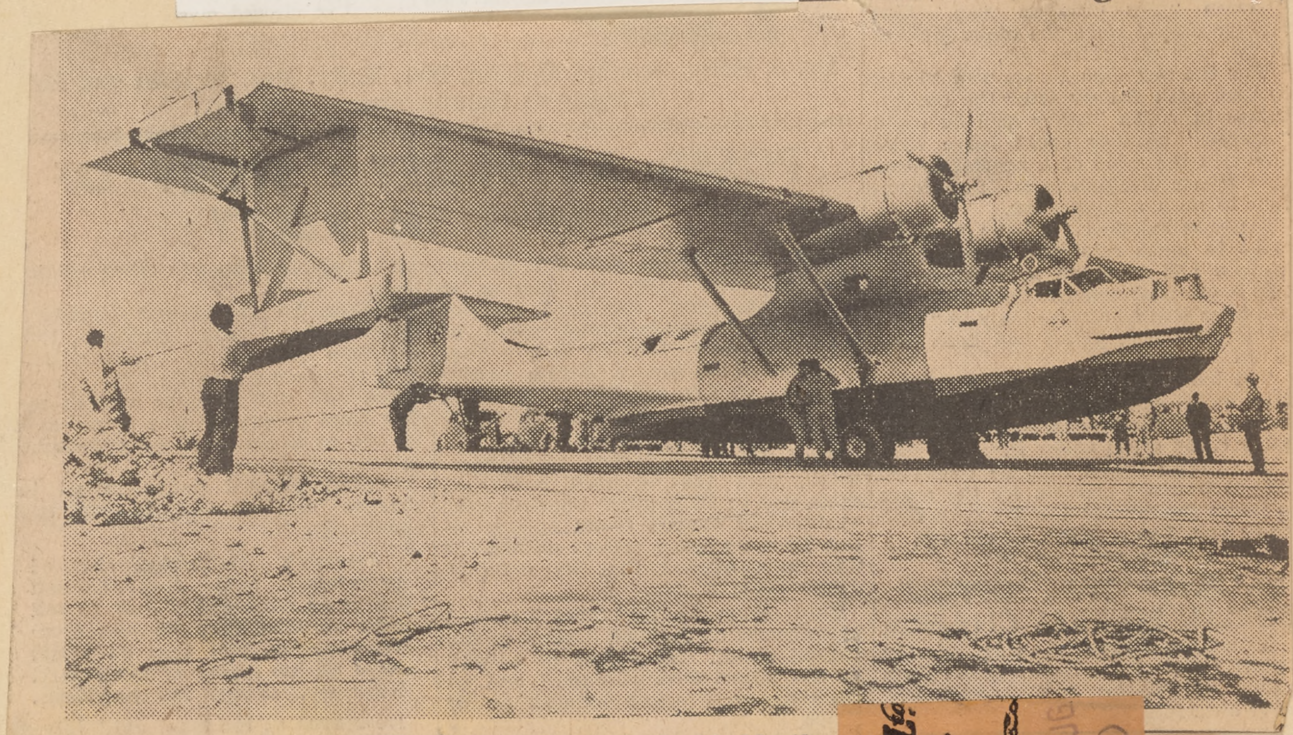
It is reported from America that, under a trade-in arrangement whereby the U.S. Government shall sell back to the manufacturers, in part-payment for other craft, a considerable number of Army and Navy bombers — Boeing four-engined "Flying Fortresses" and Consolidated twin-engined PBY flying-boats — the manufacturers, under Government permit, shall, in turn, put them in virtual brand-new order and sell them to England.

An initial shipment of twenty-five of each is declared imminent.

Heavily armed, with five machine-gun positions in "blisters" above, on the sides and below, as well as mounting forward-firing guns and being able to carry heavy bomb loads great distances at fairly high speeds, the Boeing "Flying Fortresses" would be difficult customers for ordinary fighting craft to come up against. They could operate over extreme ranges and attack enemy plants much further afield than those now being bombed from England by the Royal Air Force.

Similarly, the PBY's., with extreme range of about 4,000 miles as reconnaissance craft and able to carry a substantial bomb load for little short of that distance, should prove most useful adjuncts in both northern and Mediterranean areas.

Flying-boat "Ferry" between U.S. and England



Mr. Richard Archbold, the former explorer, has announced in New York that he has sold his flying-boat, Guba, which he has used on scientific expeditions in Africa and New Guinea, to the British Government for transporting aluminium from the United States to England. The Guba will make trips twice a week. The American airman, Clyde Pangborn will head the crew.

twenty tons, a well-designed flying boat would normally have a somewhat smaller structural weight. In large sizes the flying boat becomes the substantially lighter one of the two.

"As the size increases, the structural weight of the flying boat hull, with side floats, decreases in per cent of the gross weight. The weight of the landplane fuselage may decrease slightly, or it may remain the same according to the design. The weight of the landing gear tends to increase substantially. This can be understood from the fact that the structural weight of the wheels increases faster than the carrying capacity. Furthermore, the height of the aircraft above the ground becomes greater which calls for an increase in the structural weight of the supporting members on top of the increase in proportion to loads carried. Finally, heavy concentrated loads, huge doors to permit retracting the landing gear, etc., also call for an unproportionately heavier structural weight.

"Investigations of large ships disclose that under similar conditions of pay load, accommodations on board, power plant, gross weight, etc., the landplane would have a structural weight of at least 5 to 6 tons more in the class of 100-ton aircraft.

"Table 4 represents performances that may be expected from a flying boat and two landplanes of similar power and useful load. Column 1 gives the performance of the 100-ton flying boat; column 2 represents a landplane with the same wing area and the same gross weight. In view of the greater structural weight and in spite of lesser parasite drag, this ship will have a substantially smaller range with the same pay load, or would have to *carry about 40 per cent less pay load for the same range.* Column 3 represents data of another landplane of generally similar type but with the wing area increased so as to permit carrying the same useful load as in the case of the flying boat and maintaining the same wing loading. The larger wing is assumed to have the same aspect ratio. *It may be noticed that this plane will have performance characteristics generally inferior to the flying boat.*

"These figures are based on a study completed by our organization and are believed to represent fairly well the characteristics of a 100-ton, long-range transport flying boat which can be produced on the basis of our present-day engineering. As for the landplane, the writer considers that the structural weight may be even greater than has been assumed. Furthermore, the wing loading was assumed to be equal in all cases. Actually, it is believed that in view of practically unlimited take-off and landing spaces the flying boat can, under similar conditions, stand a heavier wing loading than the landplanes, in which case its lead in performance will be further increased.

"For the landplane the conditions are not the same. The structural weight of the landing gear would require a greater percentage from the total as the weight increases. *Furthermore, the size of the airports*

would create limitations in the size and wing loading of the aircraft. This and other considerations point to the conclusion that the largest landplanes will remain substantially below the size and weight of flying boats.

"The results of the study of relative efficiency of sea and landplanes of different sizes may now be briefly summarized as follows: *In small sizes the landplane is more efficient. In intermediate sizes the two types become comparable* with the landplane having a greater operating speed, while the flying boat, a better useful lifting capacity, because of small structural weight. *In larger sizes* of about 100 ton or more, *the flying boat becomes superior in nearly every respect,* as it has been shown above. While other assumptions with respect to range, useful volume allowance, etc., may alter the figures, yet the conclusions and trends as expressed above are believed to be generally correct.

"A résumé of the analysis brings us to the following conclusion:

"The service in general strongly suggests a large aircraft in preference to a series of small ones. This is dictated by the necessity for large, competent flying crews and extensive radio and navigation equipment that are necessarily independent of the size of the ship and cargo carried. It is further necessitated by the ample room needed. *In larger sizes the flying boat appears to be definitely superior with respect to its general efficiency and all-around performance characteristics.* Besides offering greater actual safety and a better feeling of security for long over-water flights, the ship offers better protection from forced landing because its lighter weight will insure superior performance and higher ceiling with part of the power units out of commission. It further offers advantages in safety and service by the fact that it has at its disposal thousands of square kilometers of inland water in case of bad weather near its destination, as compared with the few airports of hardly a couple of square kilometers for the landplane. *In view of all this, the author believes that the huge flying boat will represent the more efficient and practical type of transport aircraft for future intercontinental travel.*"

The bombing plane is essentially a long-range gun, its principal utility being its range; its weakness, the fact that it must return to its base to reload. The natural effort is, therefore, to increase the *range* so that the enemy may be destroyed long before he threatens our coast, to increase the *bomb load* to increase the hitting power, and lastly, to increase the *speed* to assist in evading enemy interference and to hasten the return in case further attacks are necessary. The first two of the desirable objectives enumerated above force us to a large airplane, and since the large seaplane, as has been pointed out, is superior to the large landplane in all three of the fundamental respects, the reasons for its preference are clear.

So much for the flight characteristics of the airplane itself. Even though the suitability of the patrol plane for its primary mission of scouting and its secondary one of bombing be granted, the picture is not complete without considering the logistic problem. It is in operating flexibility and the comparative ease with which the logistic problem may be handled that the patrol plane is without a peer. Naval officers are acutely aware of the vital necessity for proper fleet bases, supply depots, and an adequate train. All aircraft need comparable facilities, although the patrol plane is as nearly independent of fixed bases as any type of craft can be. While patrol planes must have base facilities, the fact is not well recognized that since these planes operate from the surface of the water, they need not in war time be restricted to large prepared fields, hangars, or supply depots. They can be, and are, effectively and efficiently operated from movable tenders and are thus relieved of the neces-

4,000 H.P. The Consolidated type 31 is powered by two of the new Wright two-row Duplex-Cyclone engines, and is probably the world's most powerful twin-engined flying boat. The "retractable tricycle undercarriage" is a beaching trolley. The struts of the outboard floats fold into the wing. The machine has accommodation for 52 passengers in the daytime and 28 at night.

Welding Problems in Aviation

Typical of the transport and bombing type of plane is this Model 28 produced by the Consolidated Aircraft Corporation now in service in trans-Pacific operations. Welding plays a significant part in its construction.

ALL welding fixtures are made oversize and allowances are made for the shrinkage to be expected. Sometimes the design of the work itself brings about a condition in which both the expansion and contraction, plus the shrinkage, bring about trouble with the welding operation and results. There must be allowance for expansion, contraction and shrinkage, or some part of the weld will suffer.

A simple and excellent example of this is shown in Fig. 1. Here it was desired to run a tube through a boxlike structure of considerable stiffness (with the flanges, as well as the area of the bottom, contributing to this stiffness) and to weld around the point of passage of the tube through the box. Due to the stiffness of the box around the weld, the expansion forces the metal in the area surrounding the weld to be compressed. The outer areas remain cool and resist this expansion with their full strength. In the areas between, which are progressively cooler toward the outside, the force of expansion acts upon the metal in what amounts to cold working. Here the crystal structure of the metal is crushed and compacted together. Then, as the immediate area of the weld cools, it contracts more than it expanded, pulling with great strength upon the very structure it has just compressed, also pulling forward and back around the weld. Being restricted in contraction as it was in expansion, and with no allowance for the added shrinkage possible, all it can

FIG. 2

Another phase of welding in which normalizing plays a large part is in the welding of large or complex assemblies in which it is desired to hold the work to close finish dimensions for subsequent machining. If the entire assembly is welded up immediately as a single unit, the strains set up and the interaction of them during the normalizing may easily warp the structure all out of shape. To avoid this the assembly is broken down into sub-assemblies in which the welding becomes more or less self-contained. Then these subassemblies are normalized after welding to remove the strains. Allowances are made in welding to allow for fitting the subassemblies together and they are straightened in themselves if found out of alignment. Then in the final assembly of the sub-assemblies into the one whole structure, only simple strains can be set up, rather than the danger of compounded strains and the likelihood of the structure being warped beyond recovery is averted. Fig. 3 indicates two simple shrinkage or warping effects which can be compounded into a lot of trouble in an intricate structure.

(Continued on page 96)

Hydrogen Protection

While most of the welding is done with the oxygen-acetylene flame, hydrogen is likewise brought into play with great benefit. Hydrogen is used for the welding of aluminium because it smothers the area surrounding the area of the weld with hydrogen to the exclusion of oxygen and prevents the aluminium from oxidizing. Two oxidized aluminium surfaces will not weld well even with the application of liberal amounts of flux. Hydrogen too, can be called to good turn simultaneously as a pre-heater and to prevent the formation of scale on thin steel pieces. While it actually heats of course, it seems to have the property of cooling, or at least of spreading the heat from a weld so that distortion is not so apt to occur. A simple hydrogen burner of copper tubing shaped to fit the work and used on the back side of a thin steel sheet being welded, largely prevents the formation of scale. See Fig. 2.

FIG. 3

A hydrogen burner placed above the oxy-acetylene torch and directing a flow of hydrogen down on the weld area helps also on the top side of the weld. Complex welds with sheet as thin as .035 can be accomplished by an airplane welder with comparative ease through the application of this principle.

If the welding could be made to take place over the entire line of the weld at one time, it is probable that many of the problems associated with welding would be eliminated. But, since it is necessary for the welding to progress along as a concentrated cone of heat from one end of the weld to the other, difficulties are multiplied. The direction of the progress of the weld has much to do with its successful completion. One direction will work perfectly, the reverse will split the work.

Welding in the trough of an acute angle is difficult, because the weld puddle should be in the very bottom and this is where the most heat should be concentrated but actually the hot flame cone is always closer to the adjacent walls. The result is that the bottom of the weld is apt to be not fully molten, the sides burned or melted away.

Welding in a confined area such as a pocket or inside a tube is another condition or predicament hard for the welder to cope with to the full extent of his skill. Here the torch tip becomes excessively heated. Water-cooled welding torch tips have been rigged up with gratifying results.

Flight 7/18/40

THE MYSTERY AEROFOIL

An American Invention

I HAVE before me as I write an article entitled "Mystery Airfoil"; it is the story of the Davis aerofoil and its inventor, David R. Davis.

All readers of *Flight* will readily recall the phenomenal Consolidated 31 flying-boat with its Davis wing and, more recently, the B-24 4-engined bomber of the same make. Until I read the story of the Davis foil I did not fully appreciate the fact that it was destined to go down in history as one of the epic inventions of our time with the most far-reaching effect on the design of aircraft.

Here, indeed, is an enthralling and inspiring story: "A curve, he perceived, was not a dead geometric figure. IT WAS A LIVING, MECHANICAL, OPERATING THING. On the basis of this, he could not but depart from what now seemed an archaic process of obtaining the most efficient curve for an airplane wing—the so-called 'cut and try' methods." Again, "A curve, he saw, was the product of mechanical action—rotation at infinite speed. 'A circle,' he said, 'is not an inert object. It is something going around—a radius arm (or lever arm) rotating about a centre.'

"Having stumbled on this hypothesis, he discovered that the most efficient mechanical action to produce lift would result from the proper relation between the rotational speed of the radius arm and the translational velocity of the point about which the radius arm rotates.

"Two factors must be borne in mind . . . one is rotation—MOVEMENT of the radius arm around the centre of a circle. The other is translation—movement of the centre itself.

"Mark a dot on a piece of paper, designating it as the centre of a circle. Place the point of a pencil on that dot, then lay the pencil down to form a radius, or lever arm. Now turn the pencil clockwise and, at the same time, move the point in a straight line to the left (thus indicating movement of the circle's centre by the latter motion). The curve formed by the top of the pencil as result of this simultaneous action is fundamentally part of a Davis airfoil profile—the product of two *steady movements.*

"Steadiness is important. 'If you rotate a flywheel steadily it takes less effort to keep it moving,' Davis explains. 'If done jerkily more H.P. will be required. The same is true of translation. The centre of the circle must move at a steady rate. The combined steady actions will trace the top curve of an airfoil, and a million of these (an abstract number) will form the wing's cover.'

"A wing surface is no more inert than a buzz-saw, Davis declares. It is a mechanical device whipping the tar out of the airstream, smashing all its resistance and converting it into work for the 'plane. That, stripped of elegant technical terms, is 'lift.' To illustrate this, Davis uses the golfer. The golf club rotates around the hand as a centre. Both hand and club are moving—translation and rotation. If the swing is not smooth the ball won't travel far. A weakling with a steady swing will send the ball farther than a muscular gent. with jerky style.

"An airfoil is the golf club in opposite action—seizing the ball as it would come to it in a reverse motion picture and killing its resistance. The more smoothly the wing does this with air the faster the 'plane will travel with least effort. A wing in flight, to Davis at least, is nothing more than millions of lever arms grabbing and taking the punch out of the air.

"Where is the mystery in an airfoil so readily explained by its creator? Ah, that is the formula which expresses the most perfect relationship between the rotational and translation speeds. With the seemingly endless possibilities involved no less than an Einstein, one would surmise, could arrive at this formula. But Davis calls it a natural conclusion reached once the old ideas of airfoil design are junked."

The article goes on to tell of the innumerable and possibly inevitable difficulties Davis encountered in trying to get people interested, how the N.A.C.A. were flabbergasted when they observed for themselves the amazing efficiency of the Davis foil when compared with the super-foils they had evolved.

In discussing foreign interest in the Davis wing, the following is relevant: ". . . negotiations with one particular country (reliably reported to be ENGLAND.—ED.), whose name he cannot disclose, because of the international situation, have reached such an advanced stage that before this is published the Davis section may be putting new wings on European aircraft."

Apparently, Davis is not enamoured by the Dictators, or anybody who has discarded the democratic ideal.

Whether or no we are already building 'planes with this new aerofoil, I thought that I would bring this article to the notice of *Flight* readers. JOHN W. MORRISON.

London, N.W.3.

AIRCRAFT CONSOLIDATION

All physical assets, as well as the name and good will of the Hall-Aluminum Aircraft Corporation, of Bristol, Pa., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall-Aluminum Corporation is now a part of Consolidated Aircraft Corporation, San Diego, Calif.

Some 32 key men of the eastern airplane plant have joined the new organization, and all patent rights, material and equipment of the former company have been acquired through the purchase.

Hall-Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall-Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, president and sole stockholder, had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall applied for and was granted numerous basic patents relating to this field.

Along with the airplanes built, there were developed a complete line of draw bench shapes and other parts of strong aluminum alloys which were perfected and continuously produced and sold since 1923 to various airplane manufacturers.

In 1927 Hall-Aluminum Corporation was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company, until its acquisition by Consolidated Aircraft Corporation, has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Clinging rather tenaciously to the naval side of aviation construction, Hall-Aluminum Aircraft has produced principally seaplanes and flying boats, pioneering in many phases of the work and particularly in all-metal construction. In 1920 metal wings were constructed for HS-3 flying boats. In 1924 there were built in conjunction with the Curtiss Aeroplane and Motor Company, two U. S. Navy F4C-1 fighter airplanes . . . the first all-metal aircraft used by the U. S. Navy. Other airplanes built included the C-333, XFH-1, XPH-1, PH-1s, PH-2s, PH-3s, and XP2H-1, a four-engine long range patrol or bomber boat with four liquid cooled engines. In 1933 it made the longest non-stop flight up to that time by the Navy, from Norfolk, Va., to Coco Solo in the Canal Zone.

The Company also made the twin float monoplane torpedo bomber, the XPTBH-2. Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U. S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, now merged with Consolidated Aircraft Corporation, is the son of Charles Ward Hall, who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company.

Among those also joining Consolidated from the roster of executives of Hall-Aluminum Aircraft Corporation are: Charles F. Pape, who was vice-president, treasurer and director; Henry S. Deichert, factory superintendent, and John H. Smith and John Sangster, general foremen.

U. S. COAST GUARD November 1940

The Air Log October, 1940.

FLYING-FORTRESSES AND NAVAL PATROL-BOMBERS.
To Be Sold To England.

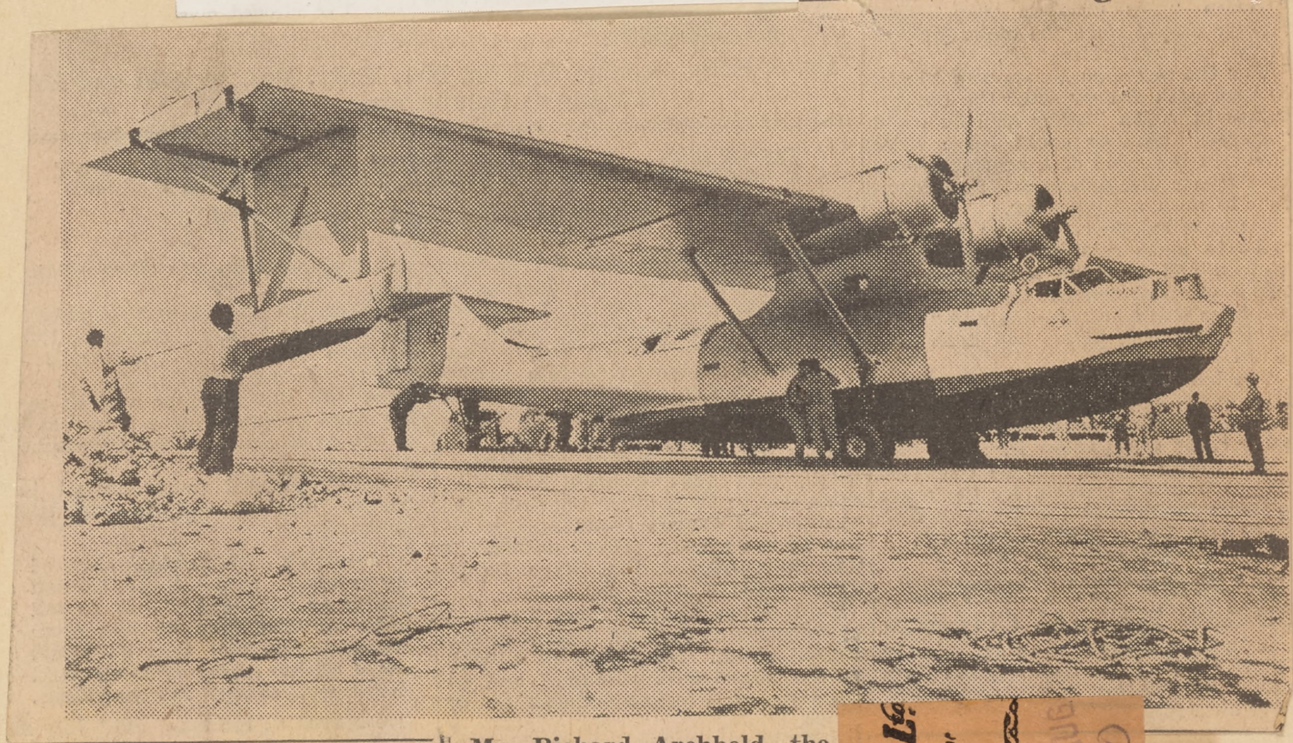
It is reported from America that, under a trade-in arrangement whereby the U.S. Government shall sell back to the manufacturers, in part-payment for other craft, a considerable number of Army and Navy bombers — Boeing four-engined "Flying Fortresses" and Consolidated twin-engined PBY flying-boats — the manufacturers, under Government permit, shall, in turn, put them in virtual brand-new order and sell them to England.

An initial shipment of twenty-five of each is declared imminent.

Heavily armed, with five machine-gun positions in "blisters" above, on the sides and below, as well as mounting forward-firing guns and being able to carry heavy bomb loads great distances at fairly high speeds, the Boeing "Flying Fortresses" would be difficult customers for ordinary fighting craft to come up against. They could operate over extreme ranges and attack enemy plants much further afield than those now being bombed from England by the Royal Air Force.

Similarly, the PBY's., with extreme range of about 4,000 miles as reconnaissance craft and able to carry a substantial bomb load for little short of that distance, should prove most useful adjuncts in both northern and Mediterranean areas.

Flying-boat "Ferry" between U.S. and England



Mr. Richard Archbold, the former explorer, has announced in New York that he has sold his flying-boat, Guba, which he has used on scientific expeditions in Africa and New Guinea, to the British Government for transporting aluminium from the United States to England. The Guba will make trips twice a week. The American airman, Clyde Pangborn will head the crew.

THE FLA

sity of returning always to a certain fixed locality. The importance of this in a war in which air bases, and particularly their landing areas, are vulnerable to bombing attacks is readily apparent.

Until recently the United States Navy has been woefully short of aircraft tenders. This deficiency is now rapidly being corrected and, once the process is complete, the resulting increase in flexibility and efficiency of operations should be truly surprising. Ships can carry surprisingly large amounts of supplies and personnel, and in an emergency tankers, freighters, and passenger vessels are available for this service in profusion. Thus in war time the patrol plane will be able to go wherever ships can go. It is this release from fixed ground facilities that gains for the patrol plane its great advantage. Any small harbor, cove, little-used fishing port, island, river, or coral atoll can be made suitable for patrol plane operations if there is good holding ground for the anchors and sufficient room for planes to taxi to and from their take-off area. Such facilities are improved if conditions permit tenders and supply vessels to enter, but this is not an absolute necessity, since such bases as those enumerated can be prepared at any time by caching ashore sufficient stocks of fuel and bombs to provide for contemplated operations.

Some regard the patrol plane solely as a scouting airplane. While it is true that the patrol plane, because of its range and endurance, is superbly fitted to act as the long-range scout or air cruiser, it also represents one of the few successful dual-purpose types afloat, either in the air or in the water. Consider the suitability of the patrol plane as a bomber as well as a long-range scout. This dual suitability automatically arises from its great weight-carrying capacity, range, and ability to reach high ceilings which are results of its inherent characteristics as well as its speed advantage over the large landplane.

Several other fortunate circumstances result automatically from the necessary features of patrol plane design. The first of these is the greater protective gun power inherent in patrol planes, their size and shape making it easy to provide gun stations in adequate number and to equip these with guns of larger caliber. An important corollary is that additional space makes the guns easier to serve, further augmenting the value of the defensive armament provided. Another consideration is that gun mounts, particularly the larger power-operated mounts, fair in better in the nose, tail, and tunnel gun positions, with less drag penalty upon their use in a patrol plane design than in a smaller airplane.

The foregoing applies to the newest patrol planes only. Improvements are being made in the present models of the PBY series now in wide service use and those in manufacture will be delivered with much improved defensive armament. Enemy fighters required to attack any of the Navy's new patrol planes will find them extremely formidable antagonists, with no blind angles whatever and with a concentration of fire in the areas most subject to attack. Patrol planes in formation should be immune to attack except by vastly superior numbers of enemy fighters.

A second element inherent in patrol plane design (size) permits installation of excellent personnel accommodations. The accommodations, even in our new patrol planes, are neither luxurious nor commodious, yet comfortable bunks are provided, a certain amount of room is available in which to move around and shake out the kinks, and there are limited galley facilities. These accommodations are sufficient to maintain the crew at a high degree of personal efficiency, particularly in war time, and provide the added advantage that the crews will be able to live aboard their airplanes for limited periods.

The psychological, as well as the practi-

THE MYSTERY AEROFOIL

An American Invention

I HAVE before me as I write an article entitled "Mystery Airfoil"; it is the story of the Davis aerofoil and its inventor, David R. Davis.

All readers of *Flight* will readily recall the phenomenal Consolidated 31 flying-boat with its Davis wing and, more recently, the B-24 4-engined bomber of the same make. Until I read the story of the Davis foil I did not fully appreciate the fact that it was destined to go down in history as one of the epic inventions of our time with the most far-reaching effect on the design of aircraft.

Here, indeed, is an enthralling and inspiring story: "A curve, he perceived, was not a dead geometric figure. IT WAS A LIVING, MECHANICAL, OPERATING THING. On the basis of this, he could not but depart from what now seemed an archaic process of obtaining the most efficient curve for an airplane wing—the so-called 'cut and try' methods." Again, "A curve, he saw, was the product of mechanical action—rotation at infinite speed. 'A circle,' he said, 'is not an inert object. It is something going around—a radius arm (or lever arm) rotating about a centre.'

"Having stumbled on this hypothesis, he discovered that the most efficient mechanical action to produce lift would result from the proper relation between the rotational speed of the radius arm and the translational velocity of the point about which the radius arm rotates.

"Two factors must be borne in mind . . . one is rotation—MOVEMENT of the radius arm around the centre of a circle. The other is translation—movement of the centre itself.

"Mark a dot on a piece of paper, designating it as the centre of a circle. Place the point of a pencil on that dot, then lay the pencil down to form a radius, or lever arm. Now turn the pencil clockwise and, at the same time, move the point in a straight line to the left (thus indicating movement of the circle's centre by the latter motion). The curve formed by the top of the pencil as result of this simultaneous action is fundamentally part of a Davis airfoil profile—the product of two *steady movements*.

"Steadiness is important. 'If you rotate a flywheel steadily it takes less effort to keep it moving,' Davis explains. 'If done jerkily more H.P. will be required. The same is true of translation. The centre of the circle must move at a steady rate. The combined steady actions will trace the top curve of an airfoil, and a million of these (an abstract number) will form the wing's cover.'

"A wing surface is no more inert than a buzz-saw, Davis declares. It is a mechanical device whipping the tar out of the airstream, smashing all its resistance and converting it into work for the 'plane. That, stripped of elegant technical terms, is 'lift.' To illustrate this, Davis uses the golfer. The golf club rotates around the hand as a centre. Both hand and club are moving—translation and rotation. If the swing is not smooth the ball won't travel far. A weakling with a steady swing will send the ball farther than a muscular gent. with jerky style.

"An airfoil is the golf club in opposite action—seizing the ball as it would come to it in a reverse motion picture and killing its resistance. The more smoothly the wing does this with air the faster the 'plane will travel with least effort. A wing in flight, to Davis at least, is nothing more than millions of lever arms grabbing and taking the punch out of the air.

"Where is the mystery in an airfoil so readily explained by its creator? Ah, that is the formula which expresses the most perfect relationship between the rotational and translation speeds. With the seemingly endless possibilities involved no less than an Einstein, one would surmise, could arrive at this formula. But Davis calls it a natural conclusion reached once the old ideas of airfoil design are junked."

The article goes on to tell of the innumerable and possibly inevitable difficulties Davis encountered in trying to get people interested, how the N.A.C.A. were flabbergasted when they observed for themselves the amazing efficiency of the Davis foil when compared with the super-foils they had evolved.

In discussing foreign interest in the Davis wing, the following is relevant: ". . . negotiations with one particular country (reliably reported to be ENGLAND.—ED.), whose name he cannot disclose, because of the international situation, have reached such an advanced stage that before this is published the Davis section may be putting new wings on European aircraft."

Apparently, Davis is not enamoured by the Dictators, or anybody who has discarded the democratic ideal.

Whether or no we are already building 'planes with this new aerofoil, I thought that I would bring this article to the notice of *Flight* readers. JOHN W. MORRISON.

London, N.W.3.

AIRCRAFT CONSOLIDATION

All physical assets, as well as the name and good will of the Hall-Aluminum Aircraft Corporation, of Bristol, Pa., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall-Aluminum Corporation is now a part of Consolidated Aircraft Corporation, San Diego, Calif.

Some 32 key men of the eastern airplane plant have joined the new organization, and all patent rights, material and equipment of the former company have been acquired through the purchase.

Hall-Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall-Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, president and sole stockholder, had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall applied for and was granted numerous basic patents relating to this field.

Along with the airplanes built, there were developed a complete line of draw bench shapes and other parts of strong aluminum alloys which were perfected and continuously produced and sold since 1923 to various airplane manufacturers.

In 1927 Hall-Aluminum Corporation was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company, until its acquisition by Consolidated Aircraft Corporation, has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Clinging rather tenaciously to the naval side of aviation construction, Hall-Aluminum Aircraft has produced principally seaplanes and flying boats, pioneering in many phases of the work and particularly in all-metal construction. In 1920 metal wings were constructed for HS-3 flying boats. In 1924 there were built in conjunction with the Curtiss Aeroplane and Motor Company, two U. S. Navy F4C-1 fighter airplanes . . . the first all-metal aircraft used by the U. S. Navy. Other airplanes built included the C-333, XFH-1, XPH-1, PH-1s, PH-2s, PH-3s, and XP2H-1, a four-engine long range patrol or bomber boat with four liquid cooled engines. In 1933 it made the longest non-stop flight up to that time by the Navy, from Norfolk, Va., to Coco Solo in the Canal Zone.

The Company also made the twin float monoplane torpedo bomber, the XPTBH-2. Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U. S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, now merged with Consolidated Aircraft Corporation, is the son of Charles Ward Hall, who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company.

Among those also joining Consolidated from the roster of executives of Hall-Aluminum Aircraft Corporation are: Charles F. Pape, who was vice-president, treasurer and director; Henry S. Deichert, factory superintendent, and John H. Smith and John Sangster, general foremen.

U. S. COAST GUARD November 1940

The Air Log October, 1940.

FLYING-FORTRESSES AND NAVAL PATROL-BOMBERS.

To Be Sold To England.

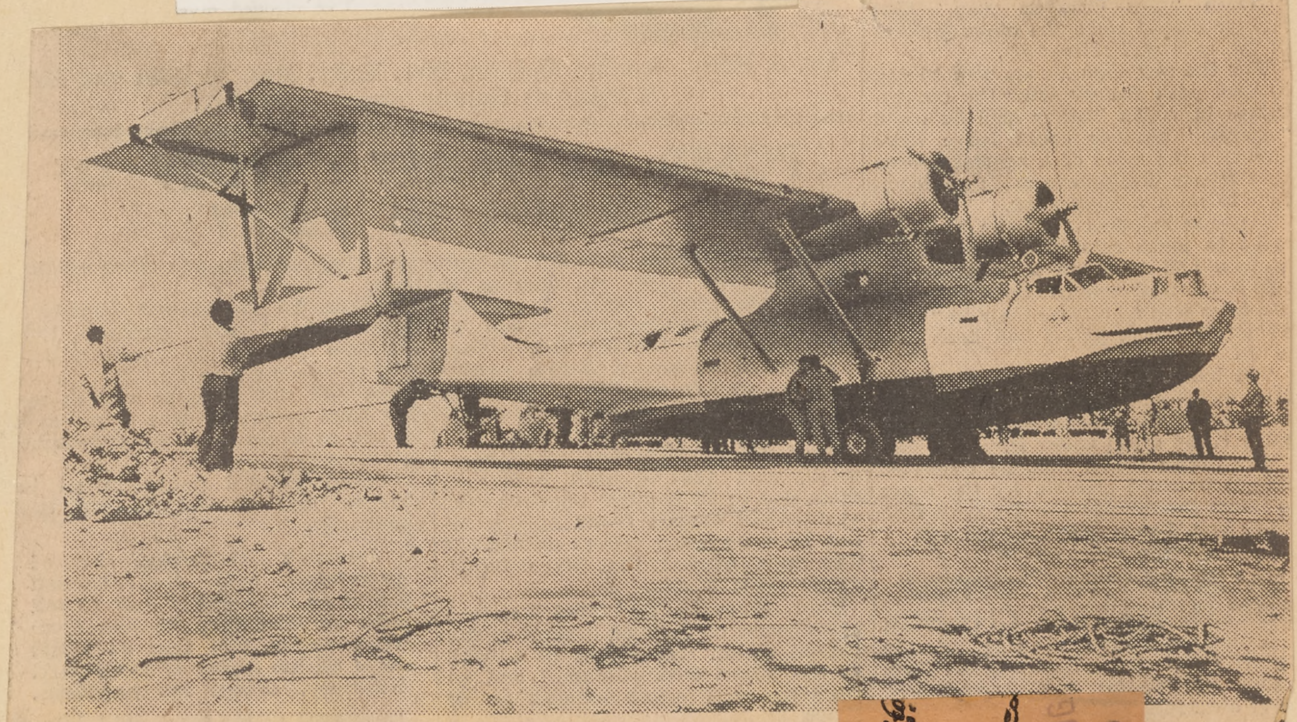
It is reported from America that, under a trade-in arrangement whereby the U.S. Government shall sell back to the manufacturers, in part-payment for other craft, a considerable number of Army and Navy bombers — Boeing four-engined "Flying Fortresses" and Consolidated twin-engined PBY flying-boats — the manufacturers, under Government permit, shall, in turn, put them in virtual brand-new order and sell them to England.

An initial shipment of twenty-five of each is declared imminent.

Heavily armed, with five machine-gun positions in "blisters" above, on the sides and below, as well as mounting forward-firing guns and being able to carry heavy bomb loads great distances at fairly high speeds, the Boeing "Flying Fortresses" would be difficult customers for ordinary fighting craft to come up against. They could operate over extreme ranges and attack enemy plants much further afield than those now being bombed from England by the Royal Air Force.

Similarly, the PBY's., with extreme range of about 4,000 miles as reconnaissance craft and able to carry a substantial bomb load for little short of that distance, should prove most useful adjuncts in both northern and Mediterranean areas.

Flying-boat "Ferry" between U.S. and England



Mr. Richard Archbold, the former explorer, has announced in New York that he has sold his flying-boat, Guba, which he has used on scientific expeditions in Africa and New Guinea, to the British Government for transporting aluminium from the United States to England. The Guba will make trips twice a week. The American airman, Clyde Pangborn will head the crew.

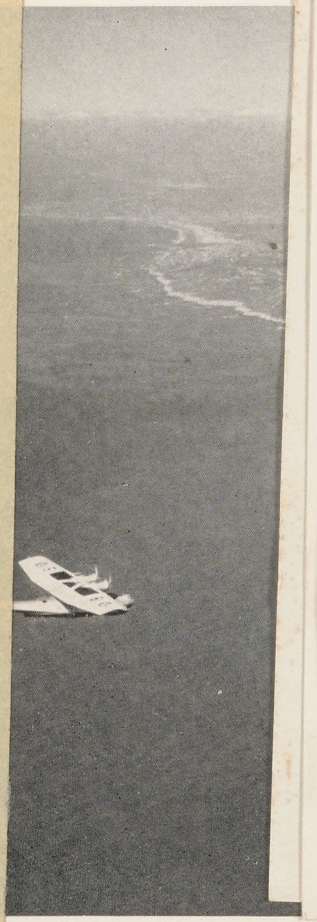
THE FLA



Consolidated Aircraft Corporation

THE NAVY'S LAND-BASED AIR POWER CAPABLE OF LONG-RANGE SCOUTING AND BOMBING OPERATIONS

The recent acquisition of Atlantic bases will enable the patrol plane to guard every approach to our vital areas.

cal, advantages of flying over water in a seaplane rather than in a landplane are perfectly apparent. A patrol plane shot down in the immediate theater of action has some chance of effecting repairs and taking off again, or at least of having the crew rescued by some friendly ship; whereas a landplane down at sea under these circumstances will be washed off the books 99 times out of a hundred, whether the forced landing is the result of enemy action or accident. It is an interesting and commonly overlooked fact that whereas the landplane without flotation commonly suffers fatal damage in a landing at sea, the same is not true with respect to the seaplane forced down upon the land. The flying boat would probably suffer less damage than a large landplane from an emergency landing ashore, because the landplane's wheels are of little value, except on prepared fields, and if a "wheels up" landing is made, the landplane fuselage is not as well equipped to take the shock as is the seaplane hull. In this connection the *accompanying chart* shows the astonishing number of water landing places, suitable for use by large seaplanes, scattered over almost the entire United States. The existence of these landing places has been well recognized for some time and accounts for the large number of "big boats" which have flown directly across the United States.

Besides the *Guba* which made several crossings, the XPB2Y-1 flew across nonstop in an elapsed time of 13 hours for the President's inspection in 1939, then turned around and went back the same way. An export version of the PBY type for the Royal Air Force was flown across the continent by Consolidated Aircraft incident to its delivery, as was American Exports' survey airplane. The airplane for the R.A.F. landed at Buffalo to rest the crew and to refuel before proceeding to Botwood, Newfoundland, for the Atlantic crossing. There have also been several unheralded flights of patrol planes across the southern part of the United States from San Diego to the Gulf of Mexico.

The exploits of the *Guba*, Mr. Richard Archbold's commercial version of a standard Navy PBY converted for use as a unit of the American Museum of Natural History expedition to New Guinea, were reported rather extensively in the aeronautical magazines at the time. Its cruise has, however, never been generally recognized as the magnificent achievement it was. This cruise was so prophetic of what has here been said of the adaptability and flexibility of large flying boat operations that it is considered worth while to retell the story briefly.

Mr. Archbold's first *Guba* was flown cross-country to New York for the installation of certain special radio equipment and, while there, was purchased by the Soviet Government. With Sir Hubert Wilkins in command the plane engaged in the arctic search for Levanevsky, the Russian explorer lost there with his crew.

A similar plane was immediately purchased by Mr. Archbold and in preparatory training flights the plane was flown cross-country to New York once and to Miami twice.

On June 10, 1938, the new *Guba* completed its 3-lap flight to New Guinea, the stops en route being at Hawaii and Wake Island, and the 7,178-mile flight was completed without incident in 51 hours and 5 minutes.

The principal need for an airplane on this expedition (to the interior of New Guinea to collect zoological data pertaining to birds, mammals, and plants) was in transferring supplies and personnel inland to the otherwise almost inaccessible scene of the exploration.

Approximately 150 flights were made from Hollandia (the base of the expedition) on the north coast of New Guinea to Lake Habbema and the Eidenberg River. Lake Habbema is approximately 300 miles inland and at an altitude of 12,000

feet, and the fact that the *Guba* repeatedly landed and took off at this altitude is a real tribute to the airplane and pilots. During one 10-day period 110 men and 60,000 pounds of supplies were transported by air. Some idea of how this must have expedited matters for the explorers can be gained from the fact that this trip is reported to take 3 months on foot through the jungle!

It is obvious that just an airplane would not have been enough. It had to be a seaplane in order to use the only possible take-off and landing areas in the midst of the jungle, the lakes and rivers provided by nature.

The expedition ended in May, 1939, and shortly thereafter, having been commissioned by the Australian Government to make a survey flight across the Indian Ocean, the *Guba* started out on its homeward-bound trip, around the world! The route was to Australia; thence across the Indian Ocean to Mombasa, Kenya Colony on the African East Coast; thence across Africa to Dakar, Senegal, in French Africa; and from there nonstop to St. Thomas, Virgin Islands. The plane then went to New York for a stop at the World's Fair [illegible] finally returned to San Diego, com[illegible] 24,130 miles of flying from New Guinea.

Interesting as a more complete account of the feats of the *Guba* would undoubtedly be, the above facts speak for themselves. The *Guba* was in all essential respects a standard Navy PBY. The obvious conclusion is that the patrol planes now in the fleet can go practically anywhere and can perform their mission when they get there.

It is hoped that the facts and figures herein presented will serve to inform those not in close touch with aviation progress of the capabilities and possibilities inherent in large patrol planes. Developments are of course continuing, and the new patrol planes are expected to be superior to the PBY type which has set up such remarkable records of performance and still constitutes the bulk of our patrol plane strength.

The trend is unquestionably toward larger aircraft as well as larger surface ships and, as the author has attempted to show, this trend is fundamentally correct, for it is the direction in which lies greater performance and greater military capabilities and is not simply an endeavor to build airplanes "bigger and better." The questions of cost and handling technique can, it is believed, safely be left to the future, for if larger planes are needed we shall have to have them whatever they cost. If their size makes them difficult to handle we can count upon American ingenuity and resourcefulness to develop the necessary methods.

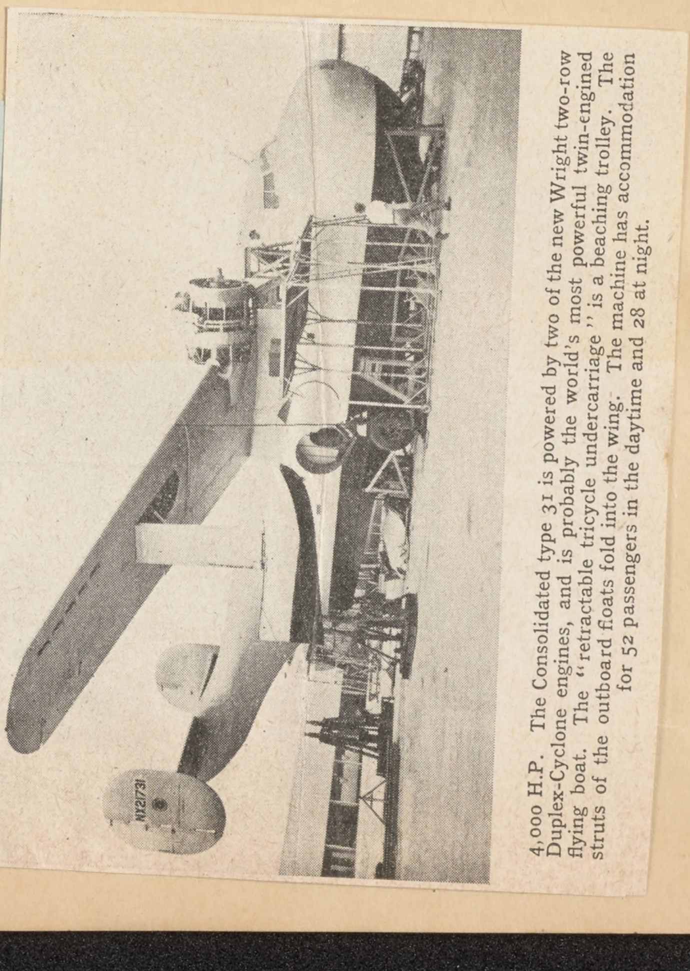
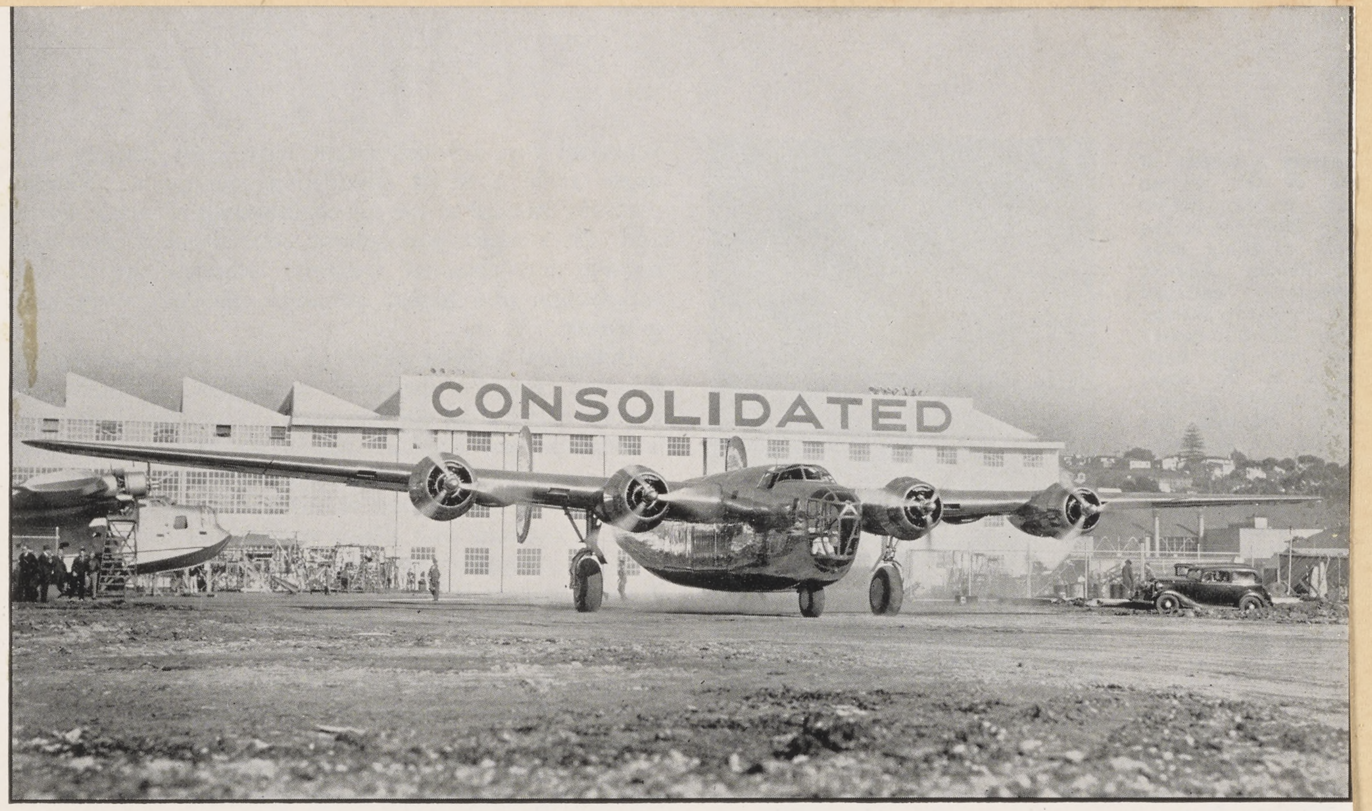
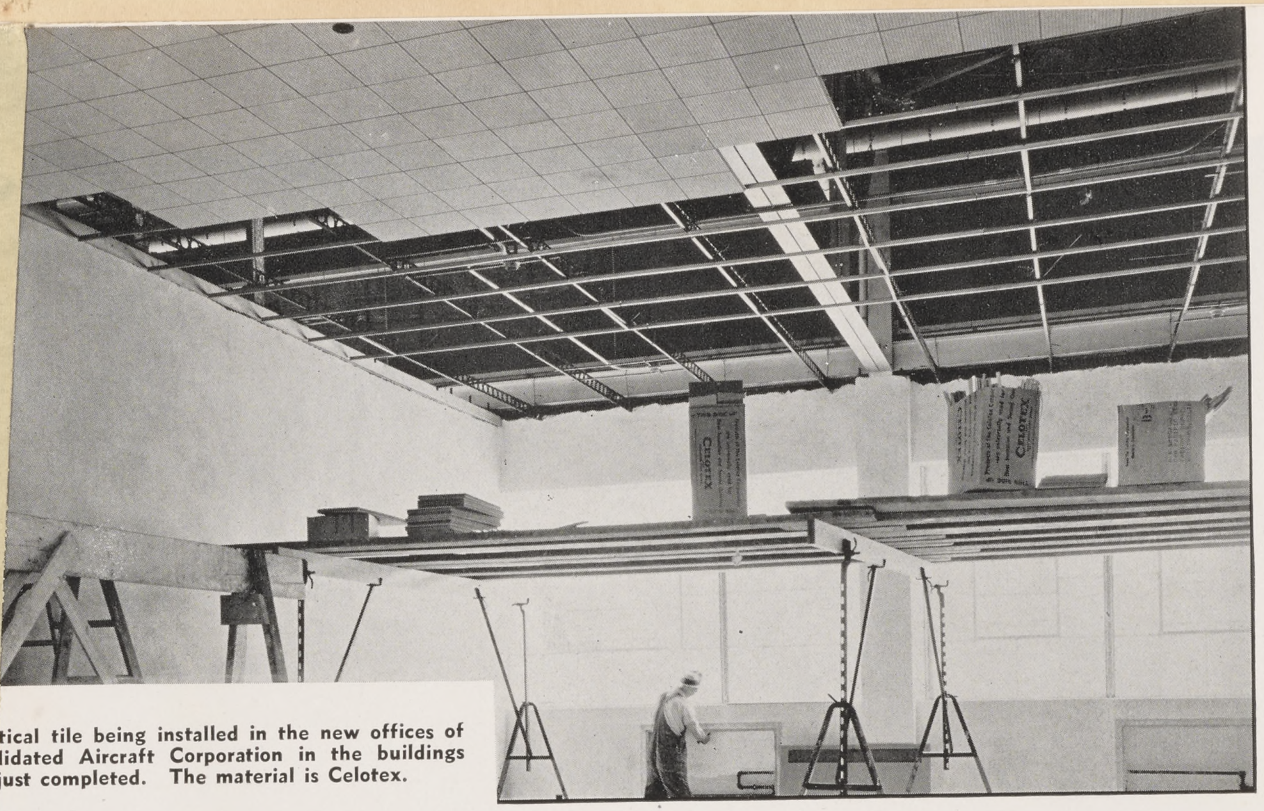
~~23 MAR 1939~~



4,000 H.P. The Consolidated type 31 is powered by two of the new Wright two-row Duplex-Cyclone engines, and is probably the world's most powerful twin-engined flying boat. The "retractable tricycle undercarriage" is a beaching trolley. The struts of the outboard floats fold into the wing. The machine has accommodation for 52 passengers in the daytime and 28 at night.



Consolidated's latest plane marks its re-entry into the land plane field. This is the Consolidated Model 32, or U. S. Army XB-24, four engined land bomber. It is here shown swinging out of the plant yard under its own power.

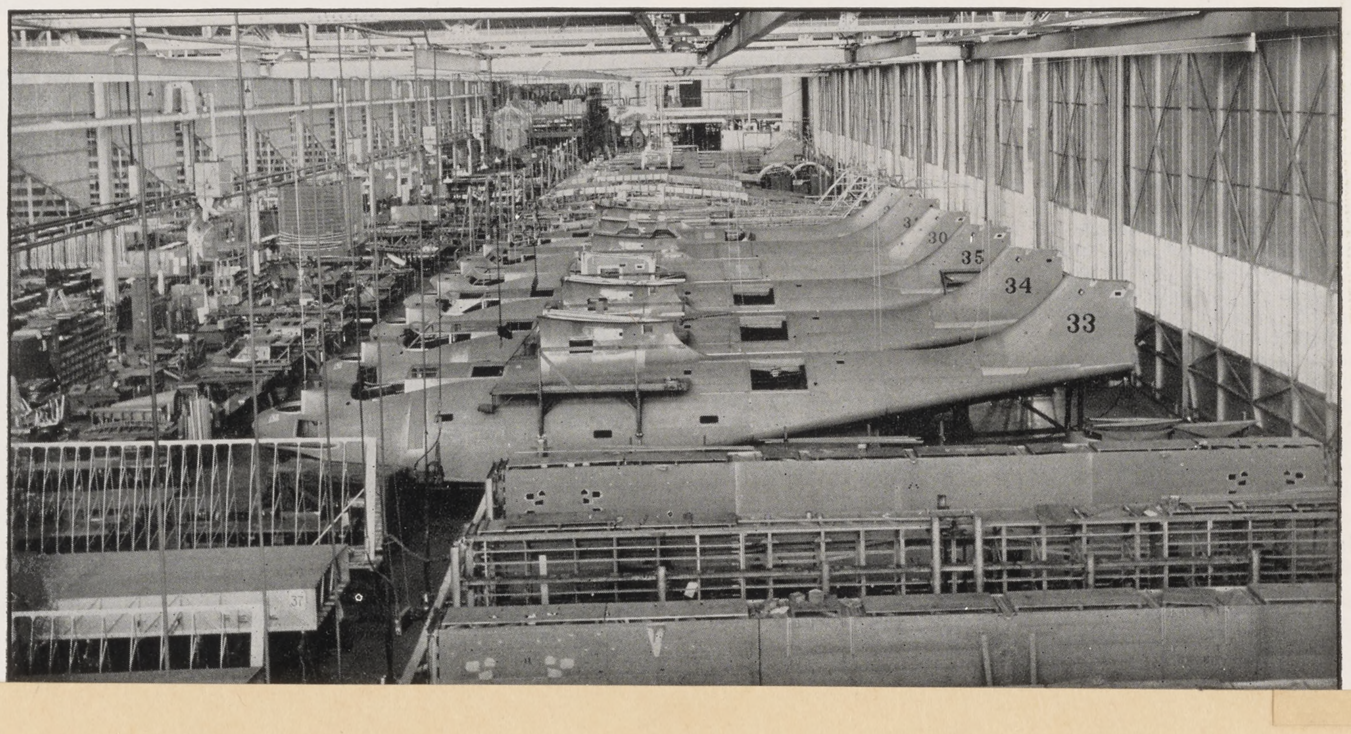


tical tile being installed in the new offices of
lidated Aircraft Corporation in the buildings
just completed. The material is Celotex.

CONSOLIDATED AIRCRAFT

EXPANDED WITHOUT INTERRUPTING PRODUCTION

Assembly line of Consolidated Aircraft Model 28 twin engined flying boat hulls, wing center sections in foreground. These planes were built for the U. S. Navy and set remarkable massed, non-stop flight records from San Diego to Hawaii and from San Diego to Coco Solo in the Canal zone.



Faced with the task of expanding 87% in area without interference with plant operations, the mammoth Consolidated organization succeeded in a most difficult task.

Var emergency production demands swept into the
isolidated Aircraft plant at San Diego, California,
produced an immediate and urgent requirement of
eased production capacity. At the same time, it was
ally imperative that the expansion be attained with-
curtailing existing production schedules in the
htest degree. The photographic presentation on the
owing pages shows how this work was undertaken
l successfully completed.

The 1940 expansion program, rushed to completion
h full manufacturing facilities estimated as com-
ted on August 1, brought this organization into full
gnment with the Administration program for in-
asing aircraft facilities. Excluding ramp, airport and
ing facilities, the program covered by this article in-
ded expansion to 1,910,000 square feet of manufac-
ing space, with 954,440 square feet of contiguous air-
rt land under option for further expansion if
cessary.

The great preponderance of Consolidated contracts
nsists of U. S. Government work and in undertaking
expansion program a closing agreement was entered
to with the U. S. Treasury Department which provided that the cost of certain excess addition facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, thus, in effect, amortizing much of its expansion.

Founded in 1923, Consolidated made a rapid advance to its present position as the world's largest manufacturer of flying boats, with special importance in the field of planes having a wing span of 100 feet or more. Reentry of Consolidated into the land plane field was marked by the Model 32 four engined land bomber known as the U.S. Army's XB-24, with an approximate gross weight of 40,000 pounds, speed of over 300 miles per hour and 4 ton bomb carrying capacity.

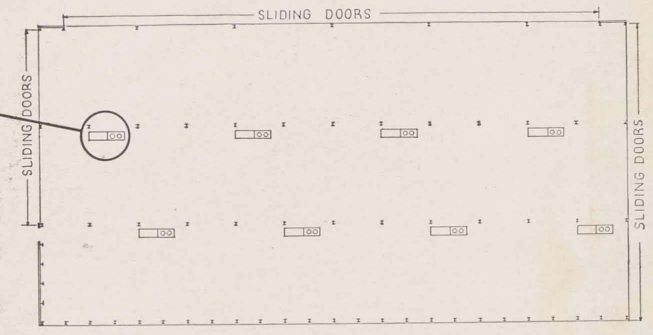
PLAN OF TOILET ROOMS



FLOOR PLAN

Four separate buildings, and additions to several others were incorporated in this $2,500,000 expansion program. Besides a 281,600 sq. ft. final assembly building, the program called for an experimental building, office building and final finish building. Because of its size, heating of the assembly building offered the chief problem of technical interest. It called for keeping the heating units above the 36 ft. clearance and providing for additional loads due to the habit of leaving the large hangar doors open. It was solved by high velocity, high output unit heaters located above the bottom chords of the trusses. As in all line production plane plants, the assembly building makes maximum use of overhead cranes for handling parts after they have left the sub-assembly areas. The final finish building is used for final adjustments and painting after planes have completed experimental tests. All buildings make use of high intensity incandescent lighting for night shifts.

THE AIR SERVICES

Navy's Dirigible Program Revives Controversy

Office of General Information, Navy Department, formally declared last month that the various stories about the Naval lighter-than-air expansion program are without official sanction. The statement specifically denies that any decision has been reached concerning dirigible construction, or about the establishment of bases for dirigible airships. According to the Office of General Information, the whole matter is in the hands of the General Board for analysis and discussion.

This statement reveals that there is a mix-up in signals in the Navy Department, and that the old controversy about lighter-than-air military craft has come to life again.

The new Secretary of Navy Charles Edison in his annual report to the President submitted in December urged a 15% expansion in personnel to staff the expanding fleet, stressed the "ever-increasing importance" of naval aviation, and suggested that a moderate increase in the program of lighter-than-air activities should be continued.

The moderate program was based on the recommendations of the Navy's Bureau of Aeronautics for airship building. The suggested program provided for the establishment of 11 strategic patrol stations manned by dirigibles placed at Brooklyn, Providence, Miami, New Orleans, San Diego, San Francisco, Seattle, the Panama Canal Zone, Southeastern Alaska, Hawaii and Puerto Rico.

The plan has the support of Chairman Vinson, House Naval Affairs Committee, who has announced he will ask Congress to provide funds to build a fleet of 36 dirigibles, of various sizes.

Secretary Edison and the Bureau of Aeronautics have stressed the need to train personnel for dirigible craft. They attribute the lighter-than-air troubles chiefly to lack of schooled personnel.

During December the Navy held maneuvers with four rigid and semi-rigid dirigibles along the Jersey Coast. The ships participated in patrol and in rescue work, and performed satisfactorily, according to Mr. Edison's information.

Army Gives Gen. Kilner Farewell Dinner

On the eve of his retirement from active service, Brig.-Gen. Walter G. Kilner, Assistant to the Chief of the Air Corps, was the guest of honor at a farewell dinner attended by 131 Army officers and held at the Officers' Club, Bolling Field.

Principal speaker of the evening was Major-General Henry H. Arnold, Chief of the Air Corps, who has been more closely associated with Gen. Kilner than any officer in the Army. Present at the dinner were Brig.-Gen. Barton K. Yount, who acted as master of ceremonies; and Col. John H. Jouett, president of the Aeronautical Chamber of Commerce.

As a memento of the occasion, Gen. Kilner was the recipient of an attractive sterling silver cigarette box. Gen. Kilner is continuing to make his home in Washington.

9000 Mechs to Be Trained

During the seven-month period from Dec. 1, 1939 to June 30, 1940, it is estimated that a total of 9292 enlisted men will be graduated from the various courses of instruction being given at Army technical schools and civilian mechanical schools.

The civilian schools are expected to turn out 1000 men, Scott Field 4217, Chanute Field 2654, and Lowry Field 1421. These figures are not adjusted for men who may be relieved from instruction prior to their completion of the course.

Towers Gets Permanent Rank of Rear Admiral

Three outstanding members of the aviation personnel of the Navy were chosen for promotion last month. Chief of the Bureau of Aeronautics, John Henry Towers, one of the first pilots in the Navy, will be advanced to the permanent rank of Rear Admiral. He was chosen by one of the toughest "plucking" boards that have functioned in the Navy for years. They turned him down in 1938. Towers, native of Georgia, is 54, was graduated in 1906 from Annapolis. He has been head of the Bureau of Aeronautics for a year. The other new Rear Admiral is former Capt. Aubrey Wray Fitch, of Michigan, 56, commandant of the Pensacola, Fla., Naval Air Station.

Commander Charles E. Rosendahl, one of the world's outstanding lighter-than-air authorities, recently sent to sea, has been promoted to the rank of Captain. It is understood Capt. Rosendahl will be recalled to Washington to take over the command of the program for the expansion of the lighter-than-air program.

Petty Officers Meet

The annual election of officers of the Clinton E. Hart Petty Officers' Association, composed of rated men of the U. S. Naval Aviation Reserve, Squadrons 3 and 4, based at Floyd Bennett Field, Brooklyn, N. Y., was held last month at the field.

Elected to serve for the ensuing year were: T. J. Keene, president; C. Ruhwedel, vice-president; R. Martone, treasurer; A. Eschner, secretary; J. Krupa, master-at-arms.

Army Aircraft on View In Washington This Month

Congress will be given an exhibition of Air Corps planes and equipment and flying skill at Bolling Field the week-end of January 20. The show, to be given exclusively to Congress and official Washington, is designed to demonstrate what aviation appropriations are spent for, and to show the world at large how ready we are in the air.

Planes will be brought from every military air base in the United States. On the program are the Curtiss P-40 and P-42; the P-37, and the P-36A. The new Bell XFM-1 (Airacuda) and Vultee YA-19 newest attack plane will be shown. Bombers will include the four-engined Boeing B-17, the twin-engined Douglas B-18, and the four-engined B-15.

Fickel Now Assistant Chief

The War Department announced late last month that Brig.-Gen. Jacob E. Fickel has been appointed Assistant to the Chief of the Air Corps, succeeding Brig.-Gen. Walter G. Kilner, who is retiring. General Fickel, Wing Commander of the First Wing, GHQ Air Force, is being succeeded in that post by Col. Frank E. Lackland who is promoted to Brigadier-General.

Navy May Get More Aircraft This Year

The Navy will receive funds to purchase 218 planes for neutrality patrol duty, 150 primary trainers and 150 advanced trainers, when Congress enacts the Army and Navy Deficiency Bill for $275,000,000. The airplane allocation totals $28,560,000.

The Army also plans new and larger bombers for which it has asked an appropriation of $4,000,000. It is hoped one of the superfortresses may be brought from Santa Monica in January. It weighs 150,000 lbs.

Navy Tests Amphibion

Completion of flight tests of the new XPBY-5A was announced last month by Consolidated Aircraft Corp., which built this new twin-engined amphibion patrol boat for the U. S. Navy.

Basically, the new airplane is the familiar PBY type with the exception of its tricycle landing gear which has a single wheel forward and two aft, all retractable. The side wheel and supporting mechanism complete with oleo shock struts, retract into wells in the side of the hull; the nose wheel, when retracted, is completely enclosed.

Aircraft Buying Plan Becomes Definite

Nearly two months after it was first announced that the armed forces had settled on just what planes and engines they wanted to standardize on, the public is beginning to get a glimpse of the program. Only phase definitely announced is the plan for air-cooled big engines: 40,000 are wanted in the next two years about equally divided between Wright and Pratt & Whitney designs. This follows the accepted procedure of having two types of each item needed.

Still largely unsettled is the program for liquid-cooled engines, though it is generally assumed that GM's Allison will take about half the load and Packard's Rolls Royce the other half—with Ford's unofficial and still theoretical liquid engine still an unknown factor. About 6,000 Rolls Royces are believed definitely scheduled.

No authoritative statements have been made on plane types desired, but orders on the early program for which appropriations were completed in June, and first orders under the full program seem to reveal some phases of the pattern.

Definitely part of Army's pursuit squadrons will be Lockheed's P-38E, Curtiss's P-40D, Republic's P-44, and Bell's P-39; Army has apparently resolved its doubts about the radical design of Bell's Airacobra and is buying them in quantity.

As a two-engine ship there is the P-38E. Lockheed's ship is a new two-seater version of the P-38 and is said to be capable of 500 m.p.h.

The P-40 and P-39 are both single-place single-engine jobs using liquid-cooled engines. The P-44 provides an air-cooled engine alternative and is, moreover, especially designed for the high altitudes at which bombers are now operating.

Navy fighter plans are not so well established, but it is clear that a Grumman (probably the Skyrocket) will occupy an important place.

On heavy bombers, Boeing's four-engine B-17E has been bought in largest quantities, but Consolidated's similar B-24D has also been ordered. Medium bombers and attack bombers are still open.

North America's AT-6A is the main reliance for advanced trainers, while Vultee, with its BT-13A, provides most of the basic trainers. Primary trainers, as might be expected, are more split up.

Army and Navy between them want 41,500 air-cooled engines in the 500-2,000 hp. range, and have made arrangements to get them from Wright, Pratt & Whitney, and Ford. P & W, which is doing all its negotiation with Navy, will furnish 17,000 of the engines. Ford is settling details with the Army on a program to build 4,500 engines on the P & W 2,000-hp. design. Wright, which is also dealing with Army, will handle 20,000 Cyclone and Whirlwind engines.

To handle its share, Pratt & Whitney will undertake a 400,000-sq.ft. plant expansion (additional to 700,000 sq.ft. already this year). The company will meet the $15,000,000 cost of buildings, while Navy will pay for and retain title to $7,000,000 or $8,000,000 worth of tools.

Ford is paying for his own $11,000,000 plant (of which about $7,000,000 is for tools.) He is to pay P & W a nominal license fee of a dollar an engine.

The Wright engines involve expansion of more than 1,000,000 sq.ft. and will cost about $90,000,000 to be financed through an RFC defense loan.

U.S. Sending 26 Giant Bombers To Aid Britain

THE U.S. Army High Command has given Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California.

The High Command also announces that negotiations are under way for giving Britain 20 four-engined Boeing bombers of the "flying fortress" type already completed.

The machines of the Consolidated Aircraft Company are reported to be very similar to the "flying fortresses," both types being capable of a range of 3,000 miles, says Reuter. The first deliveries are understood to have been made to the British last Saturday. It is officially stated that the Sperry Bombsight has also been released to Britain.

Naval bases obtained from Britain are already being used by the U.S., said Colonel Knox, U.S. Secretary of the Navy, yesterday. Naval patrol bombers were operating from Bermuda and ships were using the base at Newfoundland.

A new British request for over-age destroyers is likely to be made by Lord Lothian, British Ambassador to the U.S. The number mentioned in well-informed quarters is 50.

The Navy's Newest Patrol Bomber Arrives for Tests

T. N. SANDIFER

RATED AS THE WORLD'S LARGEST AMPHIBIAN AIRPLANE, Consolidated Aircraft Corporation's newest patrol bomber for the Navy, the XPBY-5A, roared up from Pensacola Naval Air Station, on December 16, to land without circling at the Anacostia, District of Columbia, air station for a series of performance flights by naval pilots there.

Flown by Lieut. Carl E. Giese, with Lieut. Roy Jackson as co-pilot, both Navy flyers, and with a Navy crew aboard, as well as Consolidated's mechanical expert G. R. Tibbs, the huge ship made the hop in 6½ hours, as the final lap of a transcontinental journey from the West Coast plant where she was built.

Long-range flights over land or ocean are a part of this big plane's heritage. Basically this is Consolidated's Model 28, two-engined flying boat, which in service as a Navy patrol bomber type has established a remarkable series of mass flight records, and other sustained performance records. The latest of the type is therefore a continuation of the series which has made mass flight records to Hawaii, Panama, and over other distances.

This particular plane, which probably will set the pace for others of similar capabilities, is able to fly from San Francisco to New York, and continue on for 1,000 miles beyond, and has other possibilities about which the Navy is decidedly uncommunicative. The new Model 28-5A Amphibian, as it is officially designated, is in fact, decidedly a mystery ship.

A hardy newsman, after the plane's arrival at Anacostia, soon found this out when he asked one of the pilots what his plane's top speed is.

"Sorry, I can't say," was the answer. All the record shows is that the ship took off from San Diego, Calif., December 14, and made overnight stops at Randolph Field, Texas, and Pensacola.

Some commonplace details are available; the ship is a high wing monoplane, all-metal construction, of an approximate gross weight of 12 tons, but capable of taking off with a much heavier load. It has a wing spread of 104 feet, is 65 feet overall, and has wingtip floats which are retractable.

The ship is powered with two Pratt & Whitney *Twin Wasp* engines, but the Navy and its builders are chary of any more detailed facts about technical equipment, including its armament. The big plane has a gun turret forward of the cockpit, in addition to other armament.

✣ ✣

A CONSPICUOUS FEATURE OF THE BIG PLANE as it stands on a landing field is one of its most visible points of difference from certain other types of patrol bombers. This is its new tricycle landing gear, which, like its wingtip floats, is retractable and covered by flush metal hatches when the plane is in flight.

This item of the plane's construction is important, so far as the plane's service qualifications are augmented. As will be shown in a detailed explanation of this device, the new landing wheels, in addition to the wing floats, make the plane remarkably versatile. It not only can operate at sea, and with much greater seaworthiness in some respects, because of this land equipment, but can be used inland, as it is equally able to take off from a land station, as from the water.

The plane is thus adapted to service under many different conditions, especially in remote ocean areas where it might be required to operate from some island base, lacking any of the usual requisites for such purpose. First, the landing gear on this new plane makes it independent of a beaching crew. The new ship can climb up a ramp from the water under its own power, if it has landed offshore, or if there is no ramp, it can roll up a beach. It can descend a ramp, or a beach, with perfect safety because of brake power, in the same way.

✣ ✣

THIS EQUIPMENT enables the plane to utilize atolls and remote beaches with the same facility as the more formal ramps and landing fields of the mainland. Furthermore, the gear is so constructed, and so operated, as to be easily serviced, and the whole plane is so designed, in fact, as to require a minimum of servicing, and that only such as can be given under active operating conditions.

It will be recalled that the Navy has paid particular attention to the possibilities for its patrol bombers in operating under service conditions from such advance bases as those being developed in Alaska, or those which might be improvised in the Caribbean or far Pacific, for instance. The latest in the series of Consolidated Model 28's therefore appears especially designed for duty of this nature.

Some of the secondary advantages of the landing gear addition relate more to its seagoing qualities perhaps than otherwise. For example, it was found that the extended tricycle gear, when the plane is on the surface of the water, has a stabilizing effect, acting as a sort of sea-anchor, and assisting to control the big hull when in open rough water, or facilitating the approach to a landing ramp or beach, against the wind.

In making turns within a short radius on open water, the pilot, by extending his landing wheels, acquires a sort of centerboard device which checks skid tendencies, and permits application of more engine power in turns, without undue acceleration.

✣ ✣

THIS TRICYCLE LANDING GEAR consists of a single wheel forward, with two aft. All three wheels are retractable by operation of a single lever, the wheels, supporting mechanism, including oleo shock struts, all disappearing into the hull, in wells which are covered by automatically closing hatches. When retracted, the hull presents a smooth planing surface, and as noted earlier, even the wingtip floats, for water use, are retractable.

New Air Bases and Depots Named

PURSUANT TO THE RECOMMENDATIONS of a Board of Officers appointed by the Chief of the Air Corps, new Army Air Corps Stations which are formed, or in the process of being built, have been named as follows:

Northeast Air Base, Holyoke, Mass.—Westover Field, named for the late Maj. Gen. Oscar Westover, former Chief of the Air Corps.

Southeast Air Base, Tampa, Fla.—MacDill Field, named for the late Col. Leslie MacDill, Air Corps.

Bruja Point Air Base, Panama—Howard Field, named for the late Maj. Charles H. Howard, Air Corps.

Puerto Rican Air Base—Borinquen Field, so named because it is the original name of the island of Puerto Rico and its inhabitants were called Borinquenos or Borincuas.

Sacramento Air Depot, Calif.—McClellan Field, named for the late Maj. Hez McClellan, Air Corps.

Ogden Air Depot, Utah—Hill Field, named for the late Capt. Ployer P. Hill, Air Corps.

New Transatlantic Air Service Recommended by CAA Examiner

American Export Airlines Wins Initial Approval Subject to Final Decision by Authority

PROSPECTS of a second passenger and mail transportation service by air over the Atlantic drew nearer when, on April 19th, recommendations were made to the Civil Aeronautics Authority by C. A. Leasure, one of its examiners, that American Export Airlines, Inc., an affiliate of American Export Steamship Company, of New York, be granted a certificate for passengers and mail between New York, or alternatively Baltimore or Charleston, and Rome, Italy, subject to showing of availability of landing rights. Application for other routes was held for later consideration.

This company, using a type of over-ocean cruising airplane developed originally for Navy use as a patrol bomber, has made extensive survey flights; the first and second east and westbound over the New York-Marseilles route via Horta (Azores), Lisbon (Portugal), and Biscarrosse (France); the third, New York-Marseilles via Botwood (Newfoundland), Foynes (Ireland), and Biscarrosse; and the fourth Marseilles-New York via Biscarrosse, Foynes, and Halifax; fifth New York to Biscarrosse via Botwood, and sixth, Biscarrosse to New York via Lisbon and Horta. Between the fifth and sixth flights a side flight was made to St. Nazaire, 225 miles north from Biscarrosse, to test its potentialities as an additional landing place. It has the requisite landing rights, the company states.

These flights were made during July and August of last year, and used a Consolidated Model 28 flying boat, released by the U. S. Navy from the production line of the Consolidated Aircraft Corporation, San Diego, Calif., in order that this proposed transatlantic service could have early delivery of one of these long-range PBY-4 patrol bomber types made famous by the Navy. The Model 28 is a commercial version of this outstanding aircraft type made for Export Airlines, through the interest of Maj. Reuben Fleet, president of Consolidated. The Navy has some 200 of this same type of ship on order with Consolidated.

American Export Airlines, following its successful experience over the proposed routes using this type of craft, and having in mind its intention to pioneer actual nonstop service over these routes, with obvious advantages in shorter flight time and convenience, then placed an order for three tremendous flying boats, adapted for such service from the Navy's XPBS-1, one of the longest range, fastest airplanes of its kind known. Early in January of this year, W. H. Coverdale, president of the new air line, signed a contract involving $2,000,000 with the Vought-Sikorsky Division of United Aircraft for these ships.

Meanwhile, the line proposes to use the Model 28, which made the survey flights, on its preliminary twice monthly service to Italy, via Portugal and Spain, as provided in the pending recommendation for a certificate, until delivery of the new nonstop airplanes from United, when the twice-weekly passenger service will be inaugurated.

✣ ✣

THE DATA AND FINDINGS resulting from the six survey flights enumerated earlier, gave American Export Airlines the information on which it went into the extensive hearings on its application for a certificate from CAA, which were only recently concluded. The proposed service, for which application was made, contemplates some five routes in all; transportation of passengers, mail, and property between New York and Marseilles, via Biscarrosse, France; New York and Southampton, England, via Foynes, Ireland; New York and Marseilles, via Horta, Lisbon, and Biscarrosse; New York and Rome, via Lisbon and Barcelona; and New York and Rome via Horta, Lisbon, and Barcelona. The first two were covered by requests for permanent certificates, the latter three, temporary.

The third and fifth routes contemplated carriage of property and mail only. The findings of Examiner Leasure held that service to France, England and the Irish Free State were debarred by the Neutrality Proclamation at this time, and that the proposed transportation of mail and property only between New York and Rome, via intermediate points, was found not to be required by public convenience and necessity.

However, Export Airlines had contended, and Examiner Leasure found as stated in his recommendations, that evidence points to the Atlantic routes to Europe as the most heavily traveled in normal times, and the one on which traffic of all kinds predominates. Accordingly, the examiner held that "additional air transportation between the United States and Europe (was) found required by the public convenience and necessity," and his essential recommendation stated that (the) "proposed air transportation of mail, persons, and property between the terminal point New York, N. Y. (or Baltimore, Md.), Lisbon, Portugal, Barcelona, Spain, and the terminal point, Rome, Italy, (is) found to be required by the public convenience and necessity. Subject to a showing that the necessary landing rights are available, applicant (is) found fit, willing, and able to perform such service. Recommended that a certificate of public convenience and necessity authorizing such transportation be issued to American Export Airlines, Inc., upon a showing that landing rights are available."

Counsel for this line had placed on record data showing that landing rights were available, or in negotiation. There now remains a short period before final action by the CAA on these recommendations, and upon another important factor in these plans.

✣ ✣

JUAN T. TRIPPE, president of Pan American Airways, was a vigorous objector to this whole proceeding, and during this ensuing interval has the privilege of further objecting to final approval of plans for a competing service such as American Export Airlines intends to offer.

The contentions of his company were, in summary: that Pan American pioneered all these ocean services, including the service it now operates to Europe; that the competition it anticipates from government-subsidized European lines, beginning with resumption of mail and property transport by British Overseas Airways scheduled for this summer, entry

Industry Backlog

Aviation 12/40

Unfilled orders of the aircraft industry now approximate $3,500,000,000, an increase of $385,000,000 in the past month consisting mainly of U.S. Navy orders. Only a year ago the industry was expanding its plant capacity to take care of a backlog which had crossed the $500,000,000 mark for the first time. Now that the U.S. Government's current aircraft purchasing program is nearly completed, plans already are being formulated in Washington for a new 20,000 military plane program to be presented to Congress early next year. Meanwhile Great Britain plans to order an additional 12,000 planes and the Dutch East Indies, among other nations, also are shopping around for more war planes. Contracts held by domestic plants come to a grand total of about 39,000 fighting craft; 25,000 for the American military and naval forces, and 14,000 for the British. The following table gives the latest approximate unfilled orders in dollar volume of 23 primary producers of planes or aircraft engines.

Allison (General Motors)	$100,000,000
Aviation Corp.	20,000,000
Beech	22,000,000
Bell	60,000,000
Boeing	203,000,000
Brewster	100,000,000
Cessna	11,000,000
Consolidated	300,000,000

	$3,529,000,000

ALL EQUIPPED WITH STAINLESS MANIFOLDS

HERE ARE *a few types of ships recently added to the U.S. Navy fleet. Each is equipped with a manifolding system of lightweight stainless steel, resistant to corrosion and oxidation. U. S. Navy Official Photographs.*

Why STAINLESS?

Because stainless is both strong and fatigue-resistant at elevated temperatures.

Because it produces no oxidation scale up to 1650°F., well above all normal exhaust temperatures.

Because it resists the corrosive attack of modern "doped" fuel products, as well as exposure to atmosphere.

Because it effectively resists surface abrasion at points of metal-to-metal contact.

Because it offers excellent fabrication qualities—for deep-drawing, bending, and welding.

THESE are the principal reasons why leading aeronautical engineers have adopted U·S·S Stainless Steel as a standard material for exhaust manifolds and collector rings. This construction using the stabilized material, which is not subject to intergranular corrosion, has proved itself in actual service records of 7000 hours and more. Today, the stainless manifold is serving successfully as standard equipment on most of America's famous airplanes, both in civil transport and in Army and Navy fighting craft.

The Patrol Bomber Expertly Analyzed

THE STRIKING FEAT of British naval aviation in releasing a substantial portion of Britain's Mediterranean surface fleet for badly needed service elsewhere, by a single attack which destroyed Italian naval strength in that theatre of operations, has thrown into new prominence all naval air forces, in which branch our Navy is admittedly dominant.

It also brings to the forefront the as yet untried potentialities of the American naval air service's Patrol Bomber squadrons, a force unique among the world's navies, both as to the type of ocean-ranging aircraft used, and the capabilities which those airplanes have demonstrated in the American Navy.

While varied interpretations are current concerning the part to be played by these giant patrol bombers, which hop the Pacific Ocean regularly over long reaches and operate independently in the Arctic from Alaskan bases, the magazine *U. S. Naval Institute Proceedings* in its November issue has a timely and obviously authentic discussion of the subject, written by Lieut. Comdr. A. B. Vosseller, who recently completed a period of duty in the Bureau of Aeronautics, and at this writing commands a squadron of patrol bombers.

In this article, "The Patrol Plane and the Future," after detailing the unusual flight and other characteristics of the type, and including an extensive quotation from Igor Sikorskey's Lilienthal Memorial Lecture delivered in 1938, dealing with "The Large Flying Boat" reported by U. S. AIR SERVICES at the time, Lieutenant Commander Vosseller significantly points out that "The bombing plane is essentially a long-range gun."

The U. S. Navy's patrol bomber type has proved so valuable as a long-range scout, he wrote, as to obscure for many its value as a bomber.

"Consider the suitability of the patrol plane as a bomber as well as a long-range scout," he says. "This dual suitability automatically arises from its great weight-carrying capacity, range, and ability to reach high ceilings which are results of its inherent characteristics as well as its speed advantage over the large landplane . . ."

These qualities, he points out, make this the type to reach out and attack an enemy naval force far at sea, "which is where we want to do any bombing of the enemy," while being relatively secure against enemy countermeasures.

Citing improvements in the later models of the famous PBY series of aircraft turned out for the Navy by Glenn Martin, Consolidated, or other manufacturers, constituting the patrol bomber squadrons, this author asserts that "Enemy fighters required to attack any of the Navy's new patrol planes will find them extremely formidable antagonists, with no blind angles whatever, and with a concentration of fire in the areas most subject to attack. Patrol planes in formation should be immune to attack except by vastly superior numbers of enemy fighters."

Lieutenant Commander Vosseller, referring to advances in American naval aviation, states: "The fact that the American Navy is the only one having any sizeable and effective air component which can accompany the Fleet is eloquent testimony to the efficiency with which these developments have been carried on." NATIONAL DEFENSE CONTRACTS FOR MONTH BOOST INDUSTRY TOTALS

National defense contracts during the past month continued to boost backlogs in the industry as plant expansion still held the stage. Government awards to companies for expansion activities began to appear in official tabulations of contract awards.

Following is a list of contracts during the past month — the tabulation beginning where *Western Flying's* November list left off:

Week Ending Oct. 26:

Bell Aircraft Corp., armament, $229,245.

Bendix Aviation (Eclipse), switches, $5,663,167.

Bendix Radio, radio equipment, $2,713,067.

Bendix Aviation, armament, $12,671,030.

Electric Storage Battery Co., aircraft batteries, $552,224.

Irving Air Chute Co., parachutes, $646,065.

Pioneer Parachute Co., parachutes, $307,508.

Switlik Parachute & Equipment Co., parachutes, $417,622.

United Aircraft Corp., airplane maintenance parts, $632,459.

Current Figures on Backlogs, Production Areas and Employment

The following exclusive figures have been compiled by the staff of AMERICAN AVIATION ASSOCIATES and were gathered from numerous reliable sources. Backlog figures, in many cases, are estimates, and others, because of Army or Navy restrictions, are unofficial but are believed to be as accurate and as current as any on record:

Company	Backlog	Production Area Sq. Ft.	Employes
Adel Precision	$750,000	36,000	....
Beech	22,360,000	181,500	1,769
Bell	65,000,000	430,000	3,500
Bellanca	500,000	70,000	190
Boeing	184,000,000	1,400,000	7,700
Brewster	100,000,000	884,000	6,000
Cessna	11,000,000	225,000	600
Consolidated	235,000,000	1,900,000	12,275
Continental Motors	52,000,000	....	3,000
Curtiss Aero	....	765,000	9,000
Curtiss Propeller	....	590,000	2,500
C-W St. Louis	....	179,000	2,000
Douglas	350,000,294	1,500,000	18,053
Fairchild Aircraft	9,690,000	97,136	1,120
Fairchild Aviation	5,343,345	....	....
Fleetwings	....	200,000	1,100
Grumman	20,010,818	....	....
Hardman Aircraft Products	700,000	....	2,000
Harlow	....	30,000	55
Kinner Motors	700,000	40,000	150
Lockheed	210,000,000	....	12,258
Luscombe	100,000	42,000	371
Lycoming	9,100,000	380,000	1,150
Martin	322,255,396	1,250,000	12,867
Menasco	2,765,000	43,000	....
Monocoupe	130,000	22,500	35
North American	105,000,000*	740,000	6,545

* Does not include U. S. Govt. order totaling approximately $111,000,000 on which final approved contracts have not been received.

FINANCIAL NOTES

Aero Digest 11/40

Financial Briefs

The aviation business of Doehler Die Casting, while relatively small in relation to total sales thus far this year, is expected to be more important due to the company's new division for the manufacture of magnesium alloy castings for aircraft. . . . Beech currently has a backlog of unfilled orders totalling $22,450,000. . . . Aviation Mfg. Corp. has been awarded a War Department contract for $6,703,539 for aircraft engines. . . . Menasco is building a new plant in Burbank, Cal. . . . Bendix has purchased the old Graham-Paige plant at Wayne, Mich. . . . It is reported that approximately 100 dive-bombers, originally built by Republic for the Swedish Government have been shipped to Great Britain. . . . Wright has received an additional order for $81,569,140 for engines from the War Department. . . . Net assets of Aeronautical Securities, Inc. as of Sept. 30, 1940, were equivalent to $8.35 per share, against $8.08 per share on June 30, 1940. . . . As of Sept. 1, unfilled orders of Fairchild Aviation amounted to $5,343,345.

New business received recently by United Aircraft Products brought the backlog of unfilled orders to $1,635,900, with the bulk placed by Consolidated, Douglas, Vultee, Northrop, Lockheed. . . . It is estimated that American Airlines earned about $4.20 a share in the first nine months of 1940, against actual earnings of $3.21 for the first nine months of 1939. . . . Leading investment trusts made little, if any, changes in their aviation holdings during the third quarter of the current year. . . . In the first six months of the current year, Liberty Aircraft Products earned 28c a common share. . . . Options to purchase 25,500 shares of Grumman at $9 a share were exercised between Jan. 1 and July 1, 1940, the proceeds being added to working capital. . . . Cessna currently has a record backlog, unfilled orders totalling more than $11,000,000, with $9,500,000 of the orders for the Royal Canadian Air Force. . . . Consolidated currently has unfilled orders of approximately $220,000,000. . . . Waco currently is operating at a weekly production rate of 21 planes. . . . The latest order for Douglas amounted to $141,320,610 for U. S. Army planes. . . . Fairchild Engine & Airplane has U. S. Government orders on hand for Army trainers

CONSOLIDATED AIRCRAFT "B-24" LAND BOMBER

gets hair-trigger control on
"NORMA-HOFFMANN"
PRECISION BEARINGS

● The planes in this series, built for U. S. Army Air Corps by Consolidated Aircraft Corp'n., San Diego, Calif., are powered by four 1200 H. P. motors and are designed for a speed of over 300 M. P. H. The builder states:—

"Smooth, strong and quick response to all controls through every bearing point is of paramount importance with a plane of this power and speed. * * * * Many of the bearings are, in simile, the reins or bridle points which control the enormous energy of this number (4800) of horses packed into one man-made machine."

The builder's recognition of the proved dependability of NORMA-HOFFMANN BEARINGS is shown in the fact that upwards of 60 of these PRECISION units are used in the "B-24" Bomber — in the controls, wings, power plant installation, and elsewhere in the plane.

"Where the bearings must not fail", NORMA-HOFFMANN PRECISION BEARINGS are the choice of the engineers and designers of practically every representative American builder of planes — for military, commercial, or private use.

There is a NORMA-HOFFMANN PRECISION BEARING for every load, speed and duty — 108 series and more than 3000 sizes. In this comprehensive line, American manufacturers serving the aviation industry find the solution of their bearing problems — employing these PRECISION BEARINGS in aircraft, engines, instruments, aircraft equipment and accessories, radio and photographic apparatus, and landing field equipment. Write for the Catalog. Let our engineers work with you.

SAN DIEGO ESTABLISHED 1923

Gets Extra Value From Available Storage Space with LYON Steel Storage Equipment

● When rapidly expanding production schedules on its famous flying boats, such as the PBY and the PB2Y, created the dual problem of providing increased material storage facilities while conserving all available floor space for manufacturing operations, Lyon Storage Engineers promptly provided a practical solution. By using the lower tier of rigid Standard Lyon Shelving to support a mezzanine floor, they doubled the capacity of the floor area devoted to storage.

A half century of experience in applying steel equipment to thousands of plant production and storage problems, qualifies Lyon to provide plans and equipment that will help any manufacturer save floor space, reduce cost and time of handling tools and materials, cut inventories and losses due to loss and damage of tools and stock. Mail coupon for full facts about Lyon's industry-proved Survey Service. LYON METAL PRODUCTS, INCORPORATED, (General Offices) Aurora, Illinois.

District and Sales Offices in All Major Cities

Bench Legs—Exceptionally sturdy construction. Permit attachment of tops, shelves and stringers at almost any desired location.

Steel Benches—Will not cut, splinter or become oil-soaked. Accessory parts include back end and stops, drawer, half or full depth shelves, or foot rest. Available in many sizes.

Portable Tool Stands—Can be loaded with tools and parts and taken anywhere in the plant. Top has flanged edges to prevent tools falling off.

ALUMINIUM PLANE

New York to England Twice a Week

Three and a half tons of aluminium will soon be flown from New York to Englan twice a week by the American airman Clyde Pangborn, in the 14-tons flying boat Guba.

The Guba, veteran of many scientific expeditions, has just been bought from Dr. Richard Archbold, of New York, for Lord Beaverbrook, Minister of Aircraft Production.

Mr. Harold James, Lord Beaverbrook's representative in the United States, has completed the deal.

CURTISS ELECTRICS ON PATROL *with the* NAVY

The U. S. Navy, "First with Feathering" in 1934, when it equipped its Consolidated P2Y-3 Patrol Planes with Curtiss Electric Propellers, is again First in developing, with Curtiss engineers, the Reverse-pitch Propeller to provide its giant seaplanes with water-maneuverability hitherto unparalleled. Another degree of utility has thus been added to the outstanding four-engined Consolidated Patrol Bomber.

The adaptability of Curtiss Electrics has also led to their selection for the Navy's newest fast fighters in which air-maneuverability and high performance are paramount.

TO CARRY ALUMINIUM FROM UNITED STATES

NEW YORK, Monday.

Mr Richard Archbold, the explorer, announced here that he has sold his flying-boat Guba—which he has used on scientific expeditions in the jungle areas of Africa and New Guinea—to the British Government for the purpose of transporting aluminium from the United States to Britain.

The flying-boat will make trips twice a week. The aviator, Clyde Pangborn, will head the crew. The Guba, a 14-ton craft, cost 250,000 dollars.—Reuter.

system. This should be a root and branch review in which much red tape is cut through and much new blood introduced to replace some of the stereotyped red tab warriors hibernating in Whitehall. To achieve this purpose a large admixture of the civilian element is to be introduced. These names include Sir Percy Bates, the shipping expert, and other business men from our large scale industries like the I.C.I. and the Imperial Tobacco Company. Mr. R. J. Sinclair, the latter representative already Director-General of Army Requirements is now also to sit on the Army Council.

This approach to modern business reorganisation at the War Office comes nearly eleven months after the war, and it follows two changes in the Secretaryship of War and several reshuffles in the Higher Command. Even more significantly it follows the whole breakdown of the strategical plan of campaign in France based on the defensive offensive behind the myth of the unbreakable Maginot Line. That line was not complete on the borders of France and Belgium.

CURTISS ELECTRICS ON PATROL *with the* NAVY

The U. S. Navy, "First with Feathering" in 1934, when it equipped its Consolidated P2Y-3 Patrol Planes with Curtiss Electric Propellers, is again First in developing, with Curtiss engineers, the Reverse-pitch Propeller to provide its giant seaplanes with water-maneuverability hitherto unparalleled. Another degree of utility has thus been added to the outstanding four-engined Consolidated Patrol Bomber.

The adaptability of Curtiss Electrics has also led to their selection for the Navy's newest fast fighters in which air-maneuverability and high performance are paramount.

Aluminium by Flying-boat.

The Ministry of Aircraft Production has purchased a large privately owned flying-boat in which 3½-ton cargoes of aluminium will be transported from the United States to Great Britain twice a week. It is reported that the well-known American airman Clyde Pangborn will head the crew of four operating the machine. According to Reuter the aircraft purchased is the 14-ton flying-boat the Guba, belonging to the American explorer, Mr. Richard Archbold.

CONSOLIDATED AIRCRAFT "B-24" LAND BOMBER

gets hair-trigger control on

"NORMA-HOFFMANN"

PRECISION BEARINGS

● The planes in this series, built for U. S. Army Air Corps by Consolidated Aircraft Corp'n., San Diego, Calif., are powered by four 1200 H. P. motors and are designed for a speed of over 300 M. P. H. The builder states:—

"Smooth, strong and quick response to all controls through every bearing point is of paramount importance with a plane of this power and speed. * * * * Many of the bearings are, in simile, the reins or bridle points which control the enormous energy of this number (4800) of horses packed into one man-made machine."

The builder's recognition of the proved dependability of NORMA-HOFFMANN BEARINGS is shown in the fact that upwards of 60 of these PRECISION units are used in the "B-24" Bomber — in the controls, wings, power plant installation, and elsewhere in the plane.

"Where the bearings must not fail", NORMA-HOFFMANN PRECISION BEARINGS are the choice of the engineers and designers of practically every representative American builder of planes — for military, commercial, or private use.

There is a NORMA-HOFFMANN PRECISION BEARING for every load, speed and duty — 108 series and more than 3000 sizes. In this comprehensive line, American manufacturers serving the aviation industry find the solution of their bearing problems — employing these PRECISION BEARINGS in aircraft, engines, instruments, aircraft equipment and accessories, radio and photographic apparatus, and landing field equipment. Write for the Catalog. Let our engineers work with you.

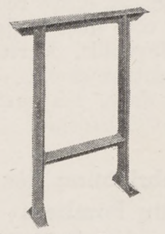
Gets Extra Value From Available Storage Space *with* LYON Steel Storage *Equipment*

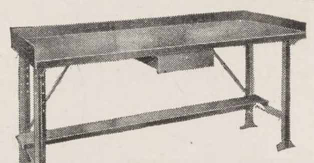
● When rapidly expanding production schedules on its famous flying boats, such as the PBY and the PB2Y, created the dual problem of providing increased material storage facilities while conserving all available floor space for manufacturing operations, Lyon Storage Engineers promptly provided a practical solution. By using the lower tier of rigid Standard Lyon Shelving to support a mezzanine floor, they doubled the capacity of the floor area devoted to storage.

A half century of experience in applying steel equipment to thousands of plant production and storage problems, qualifies Lyon to provide plans and equipment that will help any manufacturer save floor space, reduce cost and time of handling tools and materials, cut inventories and losses due to loss and damage of tools and stock. Mail coupon for full facts about Lyon's industry-proved Survey Service. LYON METAL PRODUCTS, INCORPORATED, (General Offices) Aurora, Illinois.

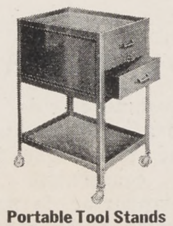
District and Sales Offices in All Major Cities



Bench Legs—Exceptionally sturdy construction. Permit attachment of tops, shelves and stringers at almost any desired location.



Steel Benches—Will not cut, splinter or become oil-soaked. Accessory parts include back end and stops, drawer, half or full depth shelves, or foot rest. Available in many sizes.



Portable Tool Stands—Can be loaded with tools and parts and taken anywhere in the plant. Top has flanged edges to prevent tools falling off.

Founded Federation

He was the founder of the organisation known as the Discharged Sailors and Soldiers' Federation, from which grew the nation-wide British Legion movement. The Leicester branch of the Legion was the first to be formed.

"Charlie" will always be remembered as a pioneer of the movement. Over the course of years he held number of offices, and was still vice president of the Leicester branch of the British Legion.

Originally he was Area Chairman of the National Federation of the Discharged Sailors and Soldiers' Federation, and later in turn became President and Chairman of the Leicester branch of the Legion.

One of the happiest days in the life of "Charlie" was when King George V visited Leicester in 1919. It had been arranged that his Majesty should make an inspection of the ex-servicemen's institute in Bond-street, but the official time table, arranged by the civic authorities, only allowed for a brief halt outside the premises.

Inside the building were many ex-servicemen, and "Charlie" told the King that it would break their hearts if he did not go inside.

That was sufficient for the King. He immediately left his car and was shown all over the building. During the tour "Charlie" even invited him to a day's fishing in Leicestershire.

When the late Earl Haig came to Leicester in 1922 to receive the freedom of the city, he spent much of his time at the British Legion Institute, where Mr. Col-

NAVY'S LARGEST ORDER

Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. Tried and true, this type has now won the largest procurement order in naval aviation history. And, like all their predecessors, the new PBY-5's will be powered by dependable Pratt & Whitney Twin Wasp engines.

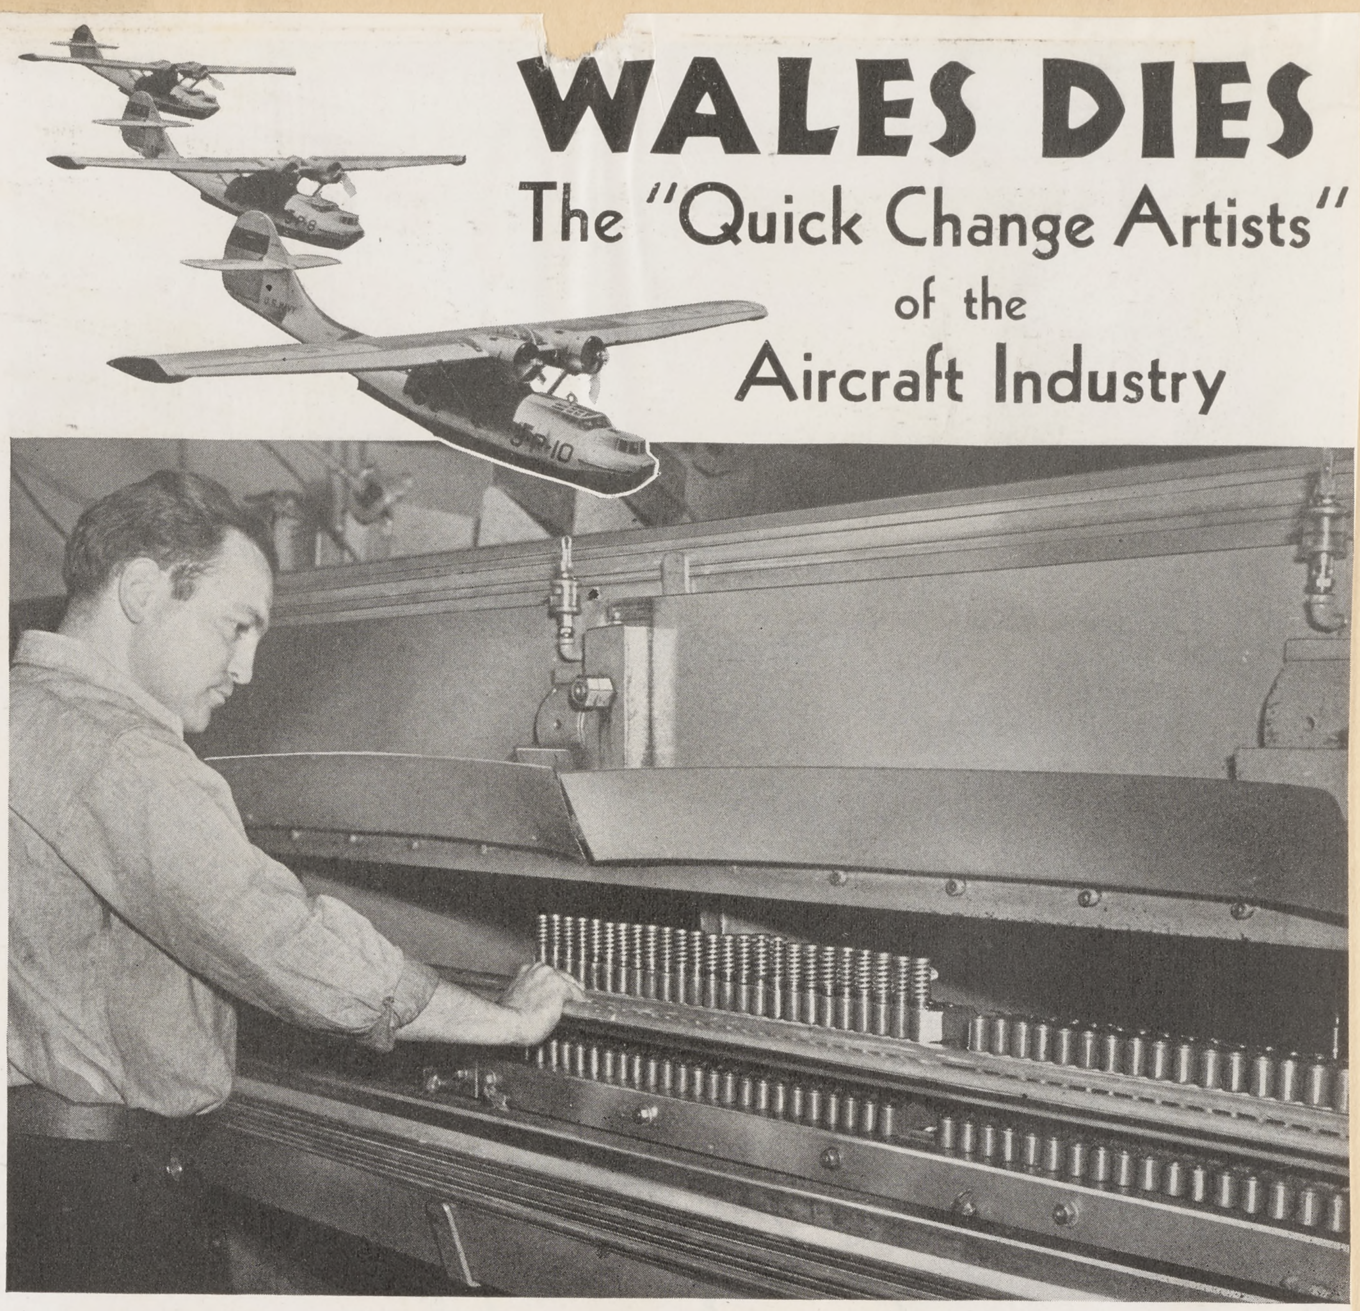
WALES DIES
The "Quick Change Artists" of the Aircraft Industry



U. S. Navy patrol bombers built by Consolidated Aircraft Corp.

Machinery - July 1940

Sheet metal operations in the aircraft industry are many and varied; and in addition, frequent changes are made in design. For punching holes in the various angles, shapes and sections used in aircraft manufacture Wales Dies are the "Quick Change Artists" of the Aircraft Industry. These individual dies may be shuffled around in presses or press brakes to punch any layout of holes or notches. Because they may be used over and over again they never become obsolete.

Shown above is a set-up of Wales Perforating Dies in the sheet metal department of the Consolidated Aircraft Corp., San Diego, Calif. where they are used for punching holes in channel formed dural stringers. Note how their compact design allows them to be placed closely together. Boeing, Bell, Brewster, Curtiss-Wright, and Lockheed are other users in aviation field as are many companies throughout industry.

Reduce die expense to a minimum. Eliminate obsolescense and production delays. With Wales Notching and Perforating Dies all that is necessary is to "Make a Template and You Have a Die". Write for catalog illustrating their many applications in aircraft and other types of sheet metal work.

Industry Backlog

Unfilled orders of the primary plane producers are now in excess of $2,000,000,000, as against an aggregate backlog of $300,000,000 a year ago. Still larger backlogs are in the offing as the War Department has authorized 21 aircraft companies to tool up for $1,250,000,000 of assured orders. In the case of both Curtiss-Wright Corp. and United Aircraft Corp., unfilled orders are more than twice the $225,000,000 total shipments of all aircraft manufacturers in 1939—a record year. The following table gives the latest approximate unfilled orders of 18 primary companies.

Allison	$40,000,000
Aviation Corp..	15,000,000
Beech	20,000,000
Bell	60,000,000
Boeing	130,000,000
Brewster	45,000,000
Consolidated ..	125,000,000
Curtiss-Wright.	550,000,000

NEWS OF THE MONTH

Qantas To Deliver PBYS'

ARRANGEMENTS have been completed by the Civil Aviation Department for Qantas Empire Airways Ltd. to handle the details of the flight delivery of the Consolidated PBY 5 flying boats recently ordered by the Commonwealth Government.

The delivery plan involves many details such as arrangements for fuel and supplies, and the Civil Aviation Department has decided to allocate these to an existing operating unit rather than set up a special organisation.

Three well-known Australian commercial pilots will participate in the delivery assignment. They are Captain P. G. Taylor, who last year surveyed the Indian Ocean route in a PBY flying boat; Captain L. J. Brain, flying operations manager of Qantas, and Mr G. U. Allan, flight superintendent of Qantas.

Captain P. G. Taylor, M.C., E.G.M., has been requested by the Commonwealth Government and Qantas Empire Airways to act as navigator on the delivery flights.

■

PBYS' For Netherlands, Too

SIXTY PBY flying boats ordered by the Netherlands Indies Air Force will probably be flown down the Pacific on the most spectacular series of delivery flights yet carried out.

The air deliveries of bombers across the Atlantic from Botwood (Newfoundland) to Britain is about to get under way, but the ocean hop from America to the Hawaiian Islands, or an adjacent island, is the world's longest cross-water flight.

The Prime Minister, Mr Menzies, recently announced that Australia had ordered 18 Consolidated flying boats. In addition to the 60 Consolidated flying boats for the Indies, the Dutch Air Force has also ordered a number of Boeing flying boats.

Although the flight down the Pacific to the Indies may seem a large undertaking for service flying boats, it should be remembered that the Pacific air service is now regularly operating, and that the Consolidated flying boat of the PBY type has a still air range of 4000 miles.

The Dutch Consolidated flying boats, soon for delivery, will be based in the Netherlands Indies in secret stations already prepared.

■

Australia Orders 11 PBY's

Australia has ordered 11 additional PBY flying boats from Consolidated Aircraft Corp. at cost of 1,000,000 pounds, including spares. Delivery is expected before the year-end. The latest order together with seven similar craft earlier purchased will replace Sunderland flying boats, recently transferred to the RAF, for long range reconnaissance. Amer. Aviation 11/15/40

The expansion of the airplane industry on the Pacific Coast not only looks to the defense emergency but to the economies offered by this region for efficient peace time operations. **Expansion of these plants where they are gives recognition of the incomparable natural advantages of the area for that industry.**

Southern California offers maximum benefits and efficiencies for the manufacture and fly-away delivery of airplanes both during the emergency and in the post-war period.

Left to the genius of aircraft makers this locality offers lowest unit costs of production. Witness the removal of North American Aviation, Inc. to Los Angeles from Baltimore and Consolidated Aircraft, Inc. to San Diego from Buffalo.

Manufacture of parts by the automotive industry and the location of Government sponsored assembly plants in the middle-west, for mass production of planes, is in disregard of the economic factors which normally dictate the location of industry.

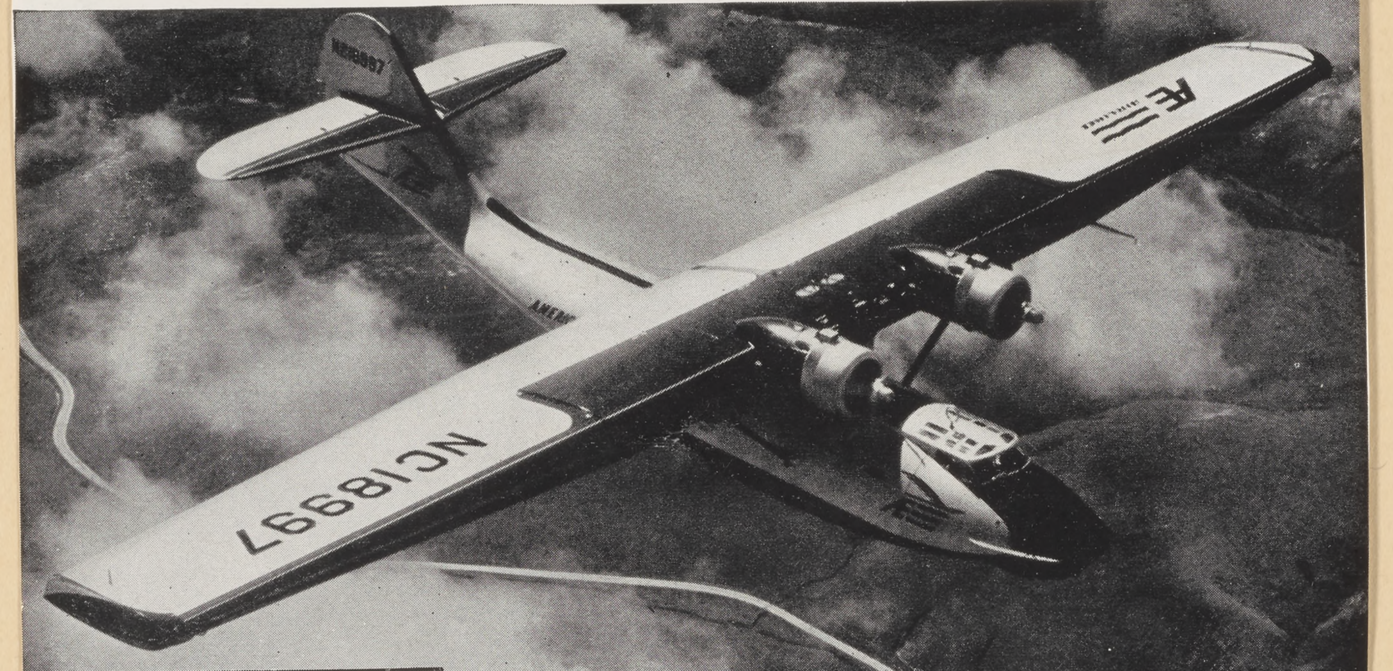
The urgency of defense and British demands and the so-called invulnerability of that region to invasion, have given the interior of the country a prominence in the aircraft industry which it could not command on economic grounds.

The continued conduct of such operations in that territory, after the emergency has passed and the full play of competition again rules the industry, will be done at the handicap of higher costs than Pacific Coast manufacturers enjoy.

Industrial Los Angeles County 11-12/40

SPERRY INSTRUMENTS

AID SURVEY FOR NEW ATLANTIC SERVICE



Captain P. J. Byrne, commander of American Export Airlines' survey flights

In completing a series of scientific survey flights across the Atlantic, American Export has written a new chapter in aviation history. Long famous for successful steamship operations, the line will soon be ready to accommodate air passengers as well. The routes are ready, the pioneering done.

Referring to the part which Sperry instruments played in this important accomplishment, Captain Byrne reported "During all our flights we relied continually upon the Sperry Gyropilot, Gyro-Horizon, Directional Gyro and Gyro-Magnetic Compass. Their splendid performance was of great assistance to the successful completion of every trip."

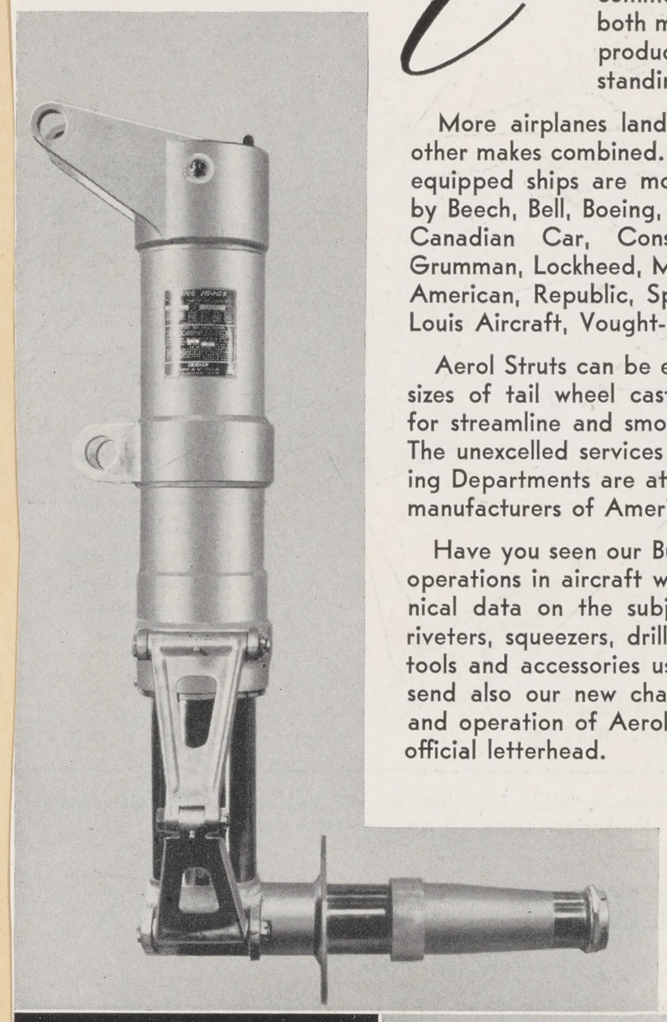
CONSOLIDATED P·B·Y AMPHIBIANS
MAKE SAFE, SMOOTH LANDINGS ON AEROL SHOCK ABSORBING STRUTS

Western Flying, Oct. 1940

CONSOLIDATED AIRCRAFT CORPORATION management and factory personnel are justly proud of their PBY series of military and commercial amphibians. And we, as suppliers of the Aerol Struts, both main leg and nose installations, are gratified and proud that our products were selected to insure safe, soft landings of this outstanding example of the plane builder's science and skill.



More airplanes land on Aerol Struts than on all other makes combined. Among the well-known Aerol-equipped ships are most or all of the models built by Beech, Bell, Boeing, Brewster, British DeHavilland, Canadian Car, Consolidated, Curtiss, Douglas, Grumman, Lockheed, Martin, NAF, Noorduyn, North American, Republic, Spartan, Stearman, Stinson, St. Louis Aircraft, Vought-Sikorsky.

Aerol Struts can be engineered into any plane. All sizes of tail wheel caster knuckles can be supplied for streamline and smooth contour tires and wheels. The unexcelled services of our Engineering and Testing Departments are at the command of the aircraft manufacturers of America.

Have you seen our Bulletin 85, treating of riveting operations in aircraft work? It gives also much technical data on the subject of our extensive line of riveters, squeezers, drills, grinders and miscellaneous tools and accessories used by the Industry. May we send also our new chart explanatory of the design and operation of Aerol Struts? Please write on your official letterhead.

Consolidated Acquires Hall-Aluminum

HALL-ALUMINUM AIRCRAFT CORPORATION of Bristol, Pa., has been merged through purchase with Consolidated Aircraft Corporation, and some 32 key men as well as all material and equipment have been transferred to San Diego, Calif.

Archibald M. Hall, president and director of the Hall-Aluminum Aircraft Corporation, is the son of Charles Ward Hall who founded Charles Ward Hall, Inc., the pioneering aluminum alloy aircraft manufacturing company. A. M. Hall was born in New York in 1899, and is a Mechanical Engineering graduate of Cornell University, 1924. He spent a year on the inspection side of the Navy's F4C-1 fighters, and was with the Union Carbide and Carbon Corp. as an engineer. From 1927 through 1936 he was vice-president of Hall Aluminum Aircraft Corp. and from 1936 to date, president.

Until its acquisition by Consolidated the company was engaged in the design and manufacture of aircraft, particularly flying boats.

More PBY's Ordered

Aircraft 11/40

SEA-ROUTES leading from the north to Brisbane, Sydney and Melbourne will be patrolled by the PBY flying boats, which the Commonwealth has ordered from the Consolidated factory in the U.S.A.

Long-range reconnaissance was to have been the home defence task of the *Sunderland* flying boats of the R.A.A.F. squadron operating so efficiently with the R.A.F. Coastal Command, but Australia has altered its plans to meet the wartime requirements of the United Kingdom. Besides allocating the *Sunderlands* to important war duties, Australia has manned them with Australian-trained crews.

To bridge the home-defence gap left by attaching the *Sunderlands* to the R.A.F., the Commonwealth Government has increased its original order for seven PBY flying boats.

These long-range machines will add to the already impressive mileage built up since the outbreak of war by R.A.A.F. reconnaissance patrols. Since September, 1939, general reconnaissance squadrons have flown a total of more than 1,700,000 statute miles and searched a total area of 22,500,000 square miles of coastline and sea.

A seaplane base on Lake Macquarie, N.S.W., will be headquarters for PBY squadrons. Good progress has been made there with the establishment of a cantilever hangar, and the addition of other smaller buildings. Original estimated cost of the base was £450,000, of which about £300,000 will have been spent by the end of this month.

This station has been used for servicing machines based on warships and for conversion courses for pilots transferring to flying boat units after having learned to fly on land machines. The base will come into full use with the arrival of the PBY machines.

The Wall St. Journal 12/9/40

Consolidated Aircraft Announces $7,000,000 Expansion Program

Special to THE WALL STREET JOURNAL

SAN DIEGO—Consolidated Aircraft Corp. is announcing today additional expansion to round out its plant facilities here, involving construction of a plant consisting of eight buildings at a cost of $7,000,000 which will practically double present manufacturing space under roof. The new plant to be located little more than a mile north of the present main unit at Lindbergh Field will fit solidly into the line production program for Consolidated flying boats and large bombers, according to company officials.

The new huge parts plant will add 1,553,000 square feet of manufacturing space under roof just about doubling the present roof area, including recent expansion which is nearing completion. With an accelerated construction program the plant should be completed and in full operation by June 1, 1941, according to present plans which should bring company's employment roster to around 30,000.

This new plant will be a highly specialized production unit devoted to the manufacture of component parts and assemblies for wings and tail surfaces construction with completely independent facilities for all operations needed for their manufacture.

Navy Reported to Have Over 2,000 Consair, Martin Boats Ordered

More than 2,000 flying boats estimated to be on order by the U. S. Navy are being built in the plants of Glenn L. Martin Co. in Baltimore and Consolidated Aircraft Corp., San Diego, Cal., it was reported in Washington following recent awards for Consolidated aircraft and Pratt & Whitney engines.

Contract for patrol bombers was awarded to Martin on Nov. 1, and it is believed to call for about 1,100 flying boats of the PBM type at a total cost of $106,125,396. Consolidated will supply about 1,000 PBY's at a cost of $93,842,500, it was reported following the award of two contracts, one on Nov. 9 amounting to $75,313,000, and the other on Nov. 15 totaling $18,529,500.

The Navy on Nov. 12 awarded a $57,856,179 contract for engines to Pratt & Whitney Aircraft Division of United Aircraft Corp., East Hartford, Conn. No details as to type, number or delivery dates were disclosed, although it was believed that the engines included in this and other contracts would be used in the Consair and Martin flying boats.

Ryan Sky News - Winter 40-41

San Diego Factories Working On Largest Orders in History

San Diego's three major aircraft plants, Consolidated, Ryan and Solar, now have combined backlogs totaling $330,000,000—practically a third of a billion dollars. This huge sum is equal to the total business on hand at this time only a year ago of every aircraft manufacturer in the entire United States. No more graphic illustration can be given of San Diego's dominant position in aviation today and the assurance which this huge volume of business gives for a continued demand for trained men.

The largest manufacturer in San Diego, now employing more than 15,000 men, is Consolidated Aircraft Corp. which specializes on huge Army and Navy bombers. Both the Consolidated and Ryan plants have recently been doubled in size with further expansion already being planned.

Within the next few months Consolidated is expected to employ at least an additional 10,000 men, while Ryan and Solar will also increase their personnel by sixty per cent.

Consolidated Completed

Aviation 10/40

Dedication ceremonies were held September 2nd, for the new Consolidated Aircraft Corp. factory building which virtually doubles the size of the San Diego factory. Completed at a cost of more than $2,000,000, the new building is more than 300 ft. wide and 700 ft. long. With other construction this brings total Consolidated floor space to about 2,000,000 sq.ft., said to be the largest integrated aircraft factory in America. Employment currently totals about 10,000, with 12,000 scheduled to be on the payroll by December, and 18,000 at the peak activity of the present plant.

Da

U.S. GIVES US FIRST OF BIG NEW BOMBERS

WASHINGTON, Wednesday.

THE U.S. Army High Command has given Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California.

The High Command simultaneously announces that negotiations are under way for giving Britain 20 four-engined Boeing bombers of the Flying Fortress type which have already been completed.

The machines of the Consolidated Aircraft Company are reported to be very similar to the Flying Fortresses, both types being capable of a range of 3,000 miles.

SOME ALREADY DELIVERED

The Consolidated Company's four-engined bombers have just begun coming off the production lines, and the negotiations which have now been completed will enable Britain to take the first deliveries.

Indeed the first deliveries, it is understood, were made to the British last Saturday.

The U.S. Army will accept a delay of approximately three months in its own deliveries of this same type, known as the B-24.

General George C. Marshall, U.S. Army Chief of Staff, told a Press Conference to-day: "In consideration of this priority the British Government has released to the U.S. sufficient engines to equip 41 Boeing flying fortresses, which the U.S. Army had already accepted without their engines or would have received without engines before January 1st."

BOMBSIGHTS

Referring to the Boeing Company's B.17 type of four-engined bomber, he said:

"We are now in the process of negotiating with the British authorities the basis for releasing to them 20 fully-equipped planes except as to the Norden bombsight."

The General simultaneously announced that the Sperry bombsight has been released to Britain.

This is one of the two high accuracy bombsights which have been developed in the United States.

The General disclosed that the U.S. Army has observers in British warplanes flying over Britain and the English Channel, but they have not flown over Germany.

—*P.A. War Special.*

CARRY SEVEN TONS OF BOMBS

These bombers, writes the Military Man, of the "flying fortress" type have a top speed of well over 300 m.p.h.

The latest type carries nearly seven tons of bombs and ammunition, a fact of tremendous importance when it is remembered that our present long-distance, twin-engined bombers carry less than a third of this load and that Berlin is only 600 miles away.

The more modern ones have five machine gun stations, and a pilot in the R.A.F. who actually examined one of these machines told me, "They are so strong that anything Germany can produce or has in service at present would not stand an earthly chance against them. The armament is terrific and the field of fire very wide."

The full crew consists of two pilots, a navigator, a wireless operator, and five machine gunners, three of whom are also bomb-aimers.

The wing span is 105 feet.

18 PBY-5 FLYING BOATS.
R.A.A.F.'s Acquisition.

The Air Log 10/40

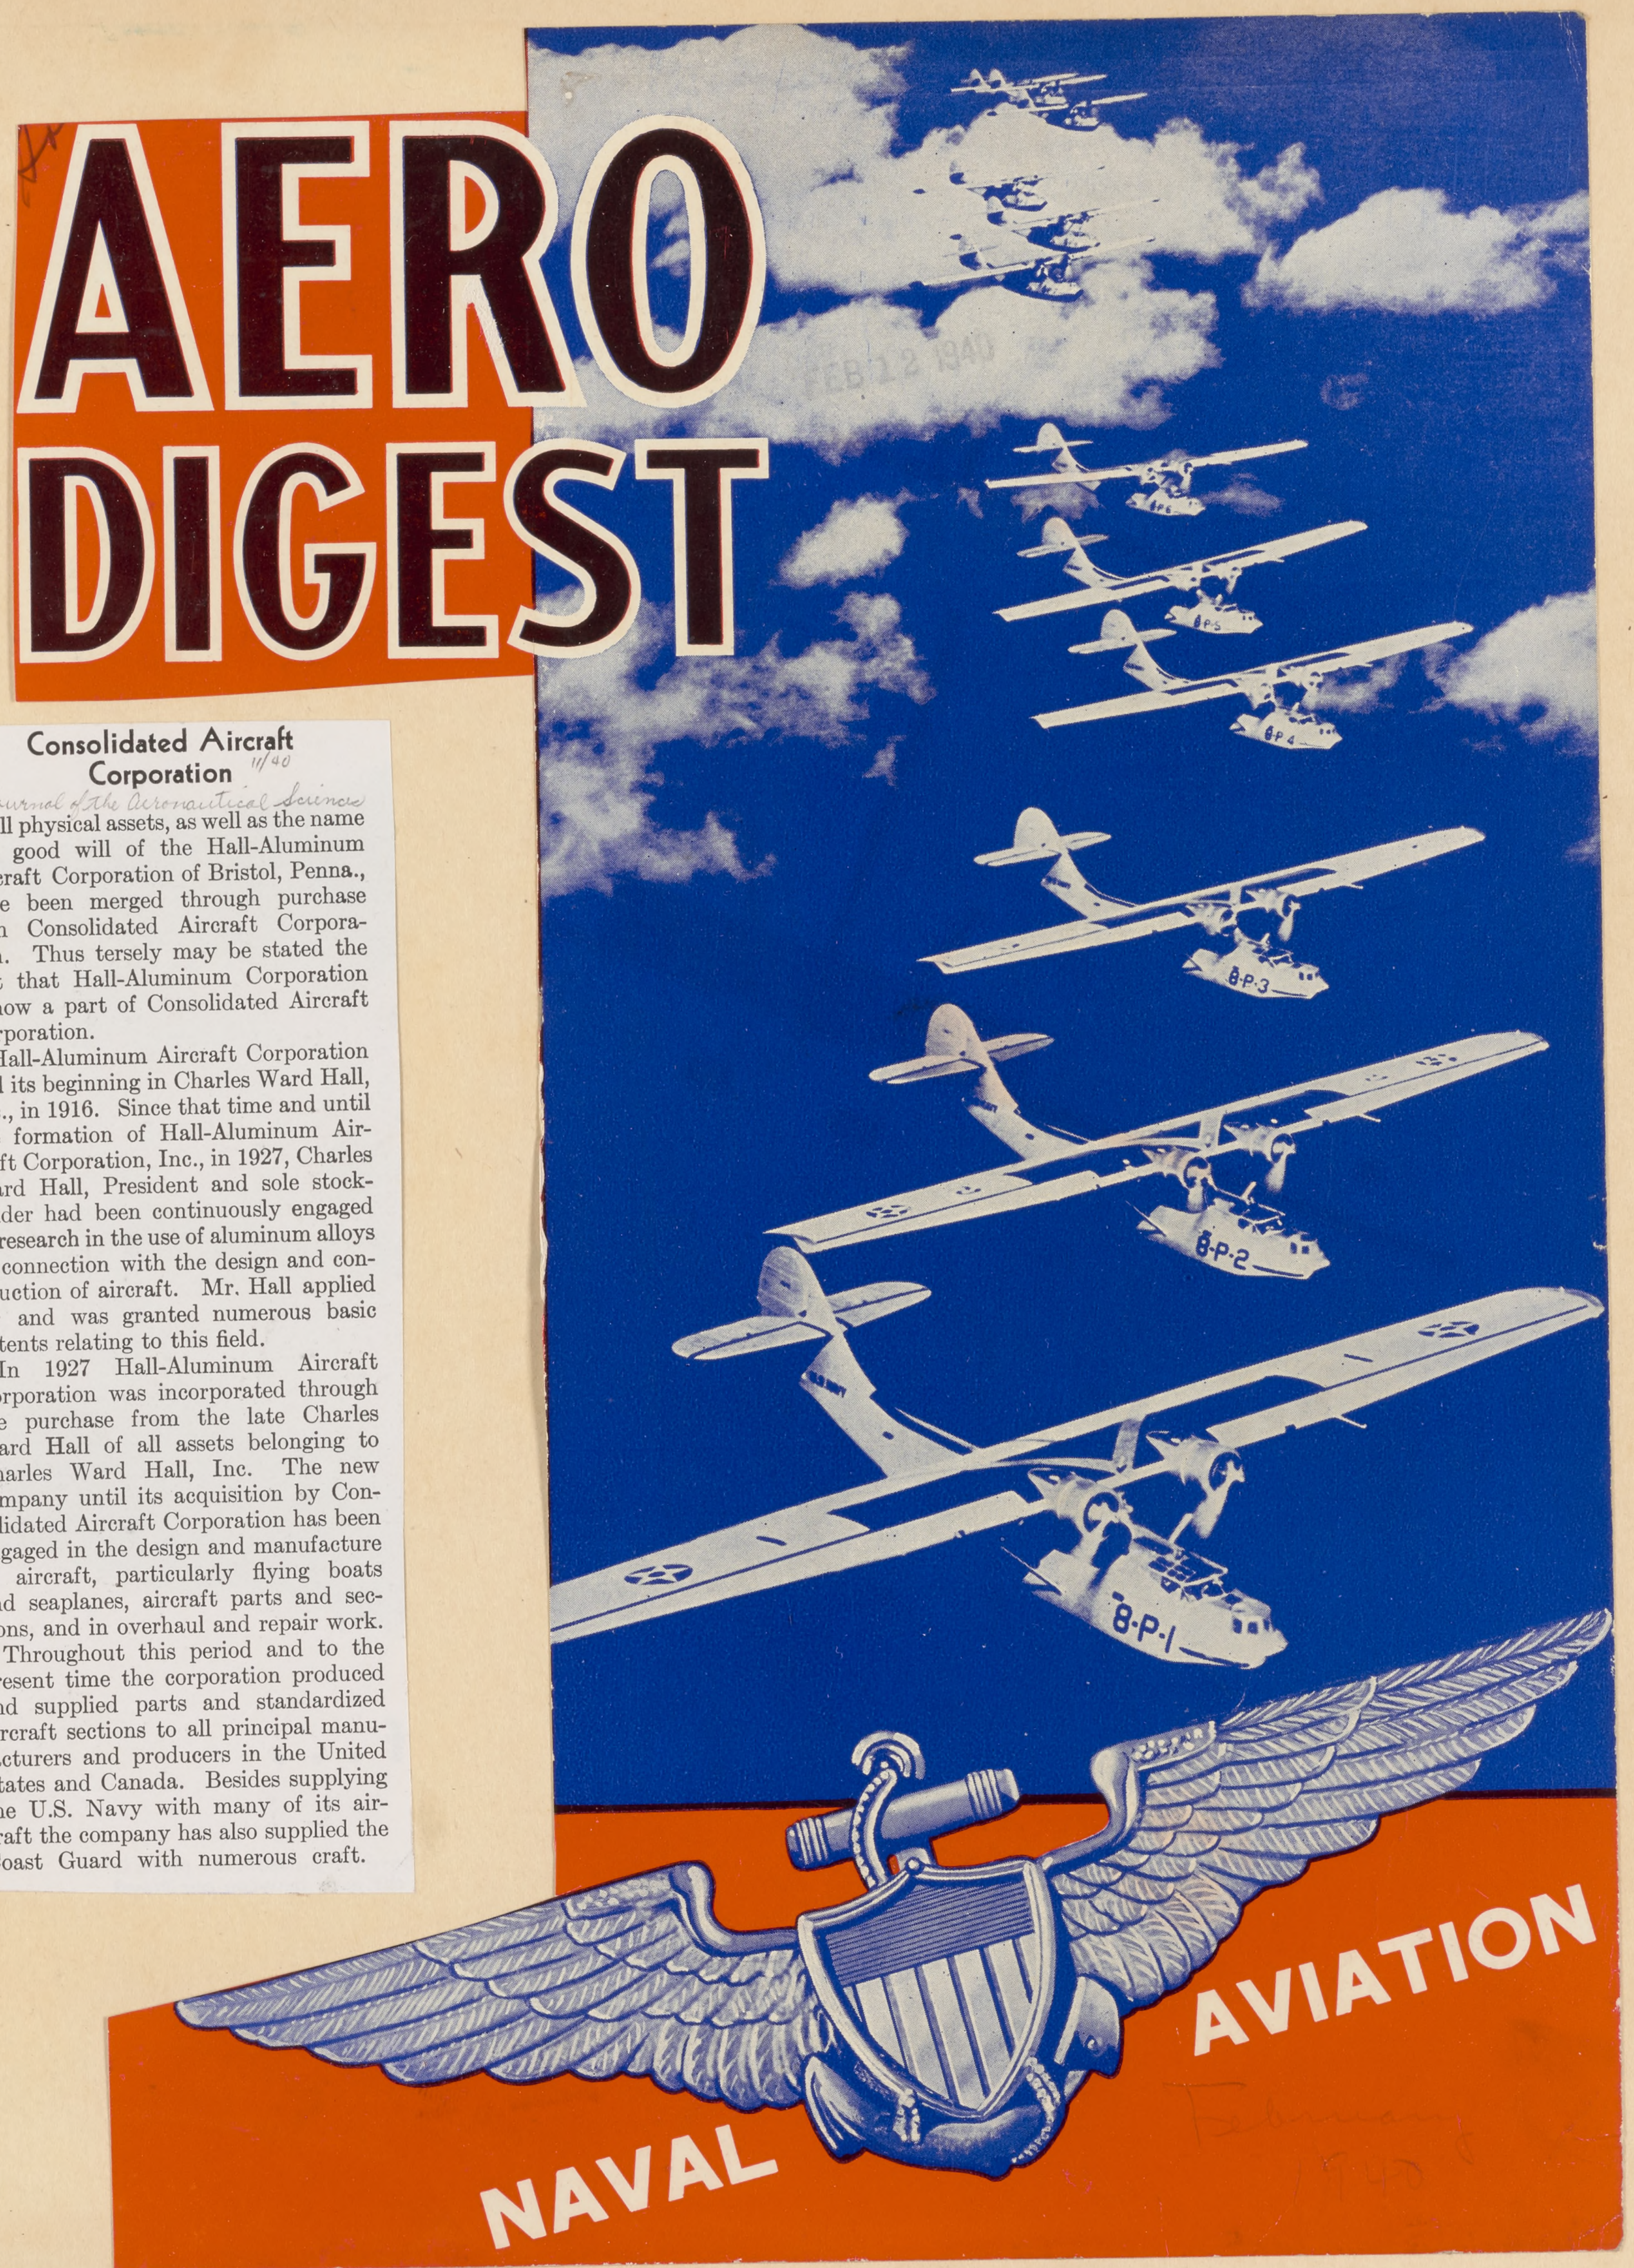
During September eleven more Consolidated PBY-5's — making eighteen all told—were ordered by the Commonwealth Government for the Royal Australian Air Force.

These craft are, generally, similar to the "Guba", formerly the property of American explorer-scientist Richard Archbold, and the only craft of the type which has been in Australian territory.

As reconnaissance craft, and with the capacity to operate from innumerable stretches of water round our extensive coast-line, it is questionable if anything more suitable exists at the present time, for their range—4,000 miles—permits a radius of operation which is not only highly-desirable but absolutely essential, from our point of view.

The presence here of a few similar machines at the time of the sinking of the "Turakina" by the German raider in the Tasman might easily have brought about the pirate's downfall if not even have prevented its entry into waters which could not be policed by other aircraft because of lack of essential flying range.

There are, we know, other flying-boats being developed which will have greater speed coupled with longer range, but they cannot, because of more numerous and/or more powerful engines, coupled with a greater all-up weight, operate so economically, whilst the PBY-5's range would be, other than under exceptional circumstances, ample for our requirements.



Consolidated Aircraft Corporation

11/40

Journal of the Aeronautical Sciences

All physical assets, as well as the name and good will of the Hall-Aluminum Aircraft Corporation of Bristol, Penna., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall-Aluminum Corporation is now a part of Consolidated Aircraft Corporation.

Hall-Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall-Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, President and sole stockholder had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall applied for and was granted numerous basic patents relating to this field.

In 1927 Hall-Aluminum Aircraft Corporation was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company until its acquisition by Consolidated Aircraft Corporation has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U.S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

October 10/40

SPEAKING at the official dedication of Consolidated Aircraft's huge new buildings (San Diego, Cal.) on Labor Day, Major Reuben H. Fleet, company president (l.) took occasion to condemn peace-time conscription of plane plants as a deterrent to further expansion. Edgar N. Gott acted as master of ceremonies, and Rear Admiral Charles Blakely (r.) dedicated the plant to preparedness.

BIG U.S. BOMBERS FOR BRITAIN

DECISION BY ARMY HIGH COMAND

WASHINGTON, November 20

The United States Army High Command has given Britain priority on the delivery of twenty-six four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California. The High Command simultaneously announces that negotiations are under way for giving Britain twenty four-engined Boeing bombers of the "Flying Fortress" type which have been completed. The machines of the Consolidated Aircraft Company are reported to be very similar to the "Flying Fortresses." Both types are capable of a range of 3,000 miles.

The Consolidated Company's four-engined bombers have just begun coming off the production lines and the negotiations, which have now been completed, will enable Britain to take the first deliveries. Indeed, the first deliveries, it is understood, were made to the British last Saturday. The U.S. Army will accept a delay of approximately three months in its deliveries of this same type, known as T.B.24.

General George C. Marshall (U.S. Army Chief of Staff) told a Press conference to-day that in consideraton of this priority the British Government has released to the United States sufficient engines to equip forty-one Boeing "flying fortresses" which the U.S. Army had already accepted without engines before January 1.

The General, referring to the Boeing Company's B. 17 type of four-engined bomber, said: "We are now in the process of negotiating with the British authorities on the basis for releasing to them twenty fully-equipped planes, except as to the Norden bombsight." The General simultaneously announced that the Sperry bombsight has been released to Britain. This is one of the two high accuracy bombsights which have been developed in the United States. He said the Norden sight, the more modern of the two bombsights, is now being used by the Army and Navy. The Sperry sight was no longer used in military planes in the United States.

Both types of bombing planes have ranges capable of reaching any part of Germany from Great Britain. The General disclosed that the U.S. Army has observers in British warplanes flying over Britain.—Press Association.

BRITAIN TO GET 46 FLYING FORTRESSES

◆

NEW TYPE BOMBER RELEASED

FROM OUR OWN CORRESPONDENT
WASHINGTON, Wednesday.

Gen. Marshall, United States Chief of Staff, announced to-day that 26 heavy four-engined bombers, similar to the Flying Fortress type, which has a range of 3,000 miles, had been released by the Priorities Board for despatch to Britain.

In addition, 20 new Boeing Flying Fortresses, complete with rear gun and protective armour, will be released for early delivery.

The 20 new bombers, claimed to be the most advanced of their type in the world, have been made by the Consolidated Aircraft Co. The prototype has already been tested and found to fully live up to expectations. The factory has now gone into regular production.

The new bombers will be equipped with the Sperry bombsight, claimed to be capable of "aiming a bomb into a barrel at 10,000ft." The United States is retaining for her own use the more modern Norden bomb-sight.

Three of the new machines are due to be delivered this month and three in December, while 20 more are due to be delivered before March.

BRITISH EQUIPMENT

Gen. Marshall also stated that Britain had agreed to supply to the United States sufficient engines to equip 41 Flying Fortresses. The Boeing factory has been handicapped by a lack of engines.

The latest transaction means deliveries over and above the rough fifty-fifty rule announced recently. This rule, officials explain, was always intended to be a flexible standard.

American aircraft production is being speeded up as rapidly as possible with a view to reaching peak production by the Spring, when a British aerial offensive is anticipated. This speed up will be in the nature of an emergency spurt and may slow down deliveries some months after, but officials believe this is better than attempting a steadily rising flow which bears no relation to military requirements and strategy.

A new British request for overage destroyers is likely to be made by the Marquess of Lothian, British Ambassador to the United States, as soon as he returns to Washington, according to well-informed quarters here to-day. A total of 50 destroyers is mentioned.

U.S. Loan Move

Increasing sentiment in favour of changing the Johnson Act to enable Britain to float loans for the purchase of war supplies in the United States is reflected by the latest poll of the American Institute of Public Opinion in which 54 per cent. of the people interviewed expressed approval of such loans. When the same question was asked last May 65 per cent. opposed the modification of the Johnson Act.

San Diego Defense Boom Overshadows City's Other Claims to Fame

'GERANIUMS AND ROSES' GIVE WAY TO DEFENSE BOOM

-:- -:- -:- -:- -:- -:- -:- -:- -:-

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

(Continued on Page 12A, Col. 1)

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lock-out" involved several hundred members of the millmen's and teamsters' unions.

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

46 FLYING FORTRESSES ARE RELEASED TO US

Latest types will be fitted
with secret b

**SIMULTANEOUS WITH RELEASE OF
AIR RAID FAR INTO GERMANY
THOUGHT WE COULD NOT REACH C
NIGHT :—**

Daily Express Staff Reporter C. V. R. THOMPSO

NEW YORK, Wednesday

AMERICA'S Army High Command ton announced that they have given up Britain a fleet of twenty-six four-engi bombers of the Flying Fortress type, wh were awaiting delivery to the U.S. Ar

These machines, claimed to be the most adva bomber type in the world, are a development o Boeing 22-ton Flying Fortress, and were built b Consolidated Aircraft Corporation at San D California.

General George C. M Chief of Staff, said that d would start immediate would be completed by th this month.

"In fact," he said, "B supposed to have taken of some of them last Sat

The High Command a ment reveals, too, that neg are well under way to suppl with another twenty Flyi tresses now in process of at the Boeing Company's plant.

ALL BY MARC

Delivery of this fleet, Marshall indicated, would pleted by March 1.

These twenty are being with the famed Sperr sight, said to be capable ing a bomb "into a ba 10,000 feet."

The Consolidated fou bombers have just begu off the production lines, negotiations just complete able Britain to take first

General Marshall said United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

BOMBERS

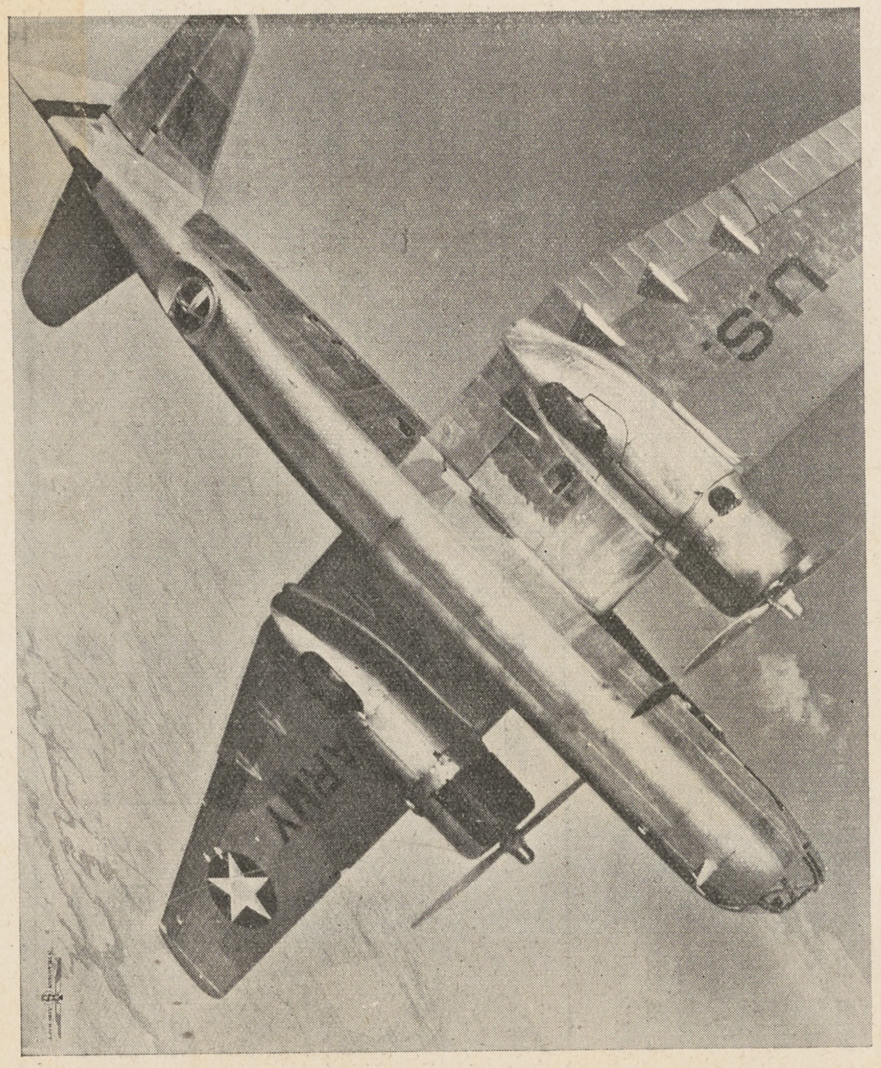
Including Multi-Purpose Aircraft Suitable for Reconnaissance and Ground Attack : Dive Bombing

ALTHOUGH the bombing aeroplane is frequently likened to a long-range piece of artillery, it must be borne in mind that a big shell, once it leaves the muzzle of a truly laid gun, is impersonal, invulnerable, irrevocable, and inevitable, whereas the bomber is guided by human brains and hands, can be destroyed, recalled, or redirected, and is dependent for success on weather, the preparedness and efficiency of enemy defences, and eventually—no matter how well navigated—on the skill of the bomb-aimer.

An efficient bomber must be able to attain, attack, and return from its target with a minimum of delay and consequently of risk. Speed, defensive fire power, and manœuvrability are desiderata, though their attainment must not be permitted to affect unduly the efficiency of a machine as a bomb carrier. The further development of specialised fighters for escort work may enable the bomber's defensive armament to be reduced or, in certain cases, omitted altogether, with a consequent gain in speed, though it must be remembered that it is not always possible, particularly at night, for aircraft to operate in company. The ideal of the tremendously fast unarmed bomber which will depend for protection entirely upon its speed remains a designer's dream, though the next few years may see it an accomplished fact.

A Questionable Doctrine

There are many knowledgeable strategists who contend that all bombers should be comparatively small, manoeuvrable machines armed with fixed or axially restricted guns. The protagonists of this doctrine cite examples from the Spanish civil war. In particular, the French General Armengaud writes: "The fire of bombers outside the axial plane is almost impossible with the present speeds of aircraft, and it cannot, in any case, be accurate. A speed equal to that of the pursuit machine, or very near it, plenty of manoeuvrability, small size, and especially axial armament—these are the conditions for the protection of bombers against aerial and terrestial weapons." The General refers to the "insufficient protection" of the big Savoia, Caproni, and Junkers bombers, and cites as proof of his argument the success of the smaller and faster Russian Katiouska and the German Dornier Do 17. It may, or may not, be significant that he refrains from mentioning the Fiat B.R.20, which, although larger than the Do 17, is as fast as the version of that



The Stearman X-100, or XA-21, a good example of what the Americans term an "attack bomber." This machine corresponds to the European formula for fast twin-engined bombers.

Western Flying 12/40

SAN DIEGO

This month has been a very busy one for the **Consair Flyer's Club. Al Becker** has been preparing for his private ticket. **W. E. Jones** is ready to solo. **Stan Mahoney** received a bad cut on his thumb while installing a carburetor on a Pratt & Whitney. Our two new members, **Bennett** and **McFadden** should be ready for that old solo flight soon.

This month's Orchid goes to **Barney Farley** for his coolheadness, quick thinking and fine judgment in bringing the plane down in a forced landing safely on the beach along the Coronado Strand. **—Al Drayman.**

Recent announcement has been made of the engagement of **Raymond Dinson** to **Miss Ivalena Jones,** secretary at Consair. Ray, also an employe of Consair, is a charter member of the **Southern California Flyers.**

» OUTDOOR ASSEMBLY of airplanes is being practiced most extensively at Consolidated in San Diego where temporary canvas-covered sheds, divided into stalls are used for finishing operations on hulls. In the yard are dozens of partially completed ships awaiting parts from subcontractors in other parts of the country. Meanwhile construction is progressing on a building larger than the present huge plant and a parts factory is planned to be built a short distance from the airport. Employment records showed 13,000 on the day of our visit. Aviation 12/40

Aviation 10/40 *Consolidated Aircraft* has purchased the Hall Aluminum Aircraft Corporation.

Consolidated Aircraft Corp., San Diego, Calif., $75,313 for airplanes.

Glenn L. Martin Co., Baltimore, Md., $106,125 for airplanes.

United Aircraft Corp., East Hartford, Conn., $59,490,703 for airplane engines.

San Diego Defense Boom Overshadows City's Other Claims to Fame

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lock-out" involved several hundred members of the millmen's and teamsters' unions.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

End CATARRH
You can clear away stuffy congestion, get rid of dangerous germs and stop that constant flow of poison into your system. How? Simply by applying 'Mentholatum' into your nostrils. The instant you do so, this breathable balm volatilises and you commence inhaling its antiseptics. Quickly, pleasantly, the 'Mentholatum' vapours stop the gathering of germs, clear the nasal cavities and open up your breathing passages. 'Mentholatum' Brand Balm stops Head Colds, banishes Catarrh, ends Chest Colds. All Chemists, 6d. and 1/3 plus Purchase Tax.

able Britain to take first
General Marshall said that the
United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

Western Flying 12/40

SAN DIEGO

This month has been a very busy one for the **Consair Flyer's Club. Al Becker** has been preparing for his private ticket. **W. E. Jones** is ready to solo. **Stan Mahoney** received a bad cut on his thumb while installing a carburetor on a Pratt & Whitney. Our two new members, **Bennett** and **McFadden** should be ready for that old solo flight soon.

This month's Orchid goes to **Barney Farley** for his coolheadness, quick thinking and fine judgment in bringing the plane down in a forced landing safely on the beach along the Coronado Strand. **—Al Drayman.**

Recent announcement has been made of the engagement of **Raymond Dinson** to **Miss Ivalena Jones,** secretary at Consair. Ray, also an employe of Consair, is a charter member of the **Southern California Flyers.**

» OUTDOOR ASSEMBLY of airplanes is being practiced most extensively at Consolidated in San Diego where temporary canvas-covered sheds, divided into stalls are used for finishing operations on hulls. In the yard are dozens of partially completed ships awaiting parts from subcontractors in other parts of the country. Meanwhile construction is progressing on a building larger than the present huge plant and a parts factory is planned to be built a short distance from the airport. Employment records showed 13,000 on the day of our visit. Aviation 12/40

Aviation 10/40 *Consolidated Aircraft* has purchased the Hall Aluminum Aircraft Corporation.

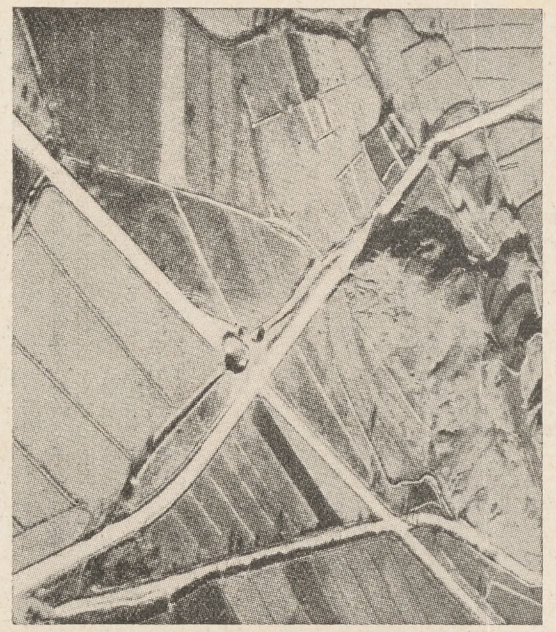
Consolidated Aircraft Corp., San Diego, Calif., $75,313 for airplanes.

Glenn L. Martin Co., Baltimore, Md., $106,125 for airplanes.

United Aircraft Corp., East Hartford, Conn., $59,490,703 for airplane engines.

AVIATION, December, 1940

BOMBERS (CONTINUED)



Germany's *Luftwaffe* obtained good results in Poland with dive-bombers. Above are crossroads after receiving attention from a Ju 87.

economical to take an old-type biplane which already had the drag required for diving and put a more powerful engine into it."

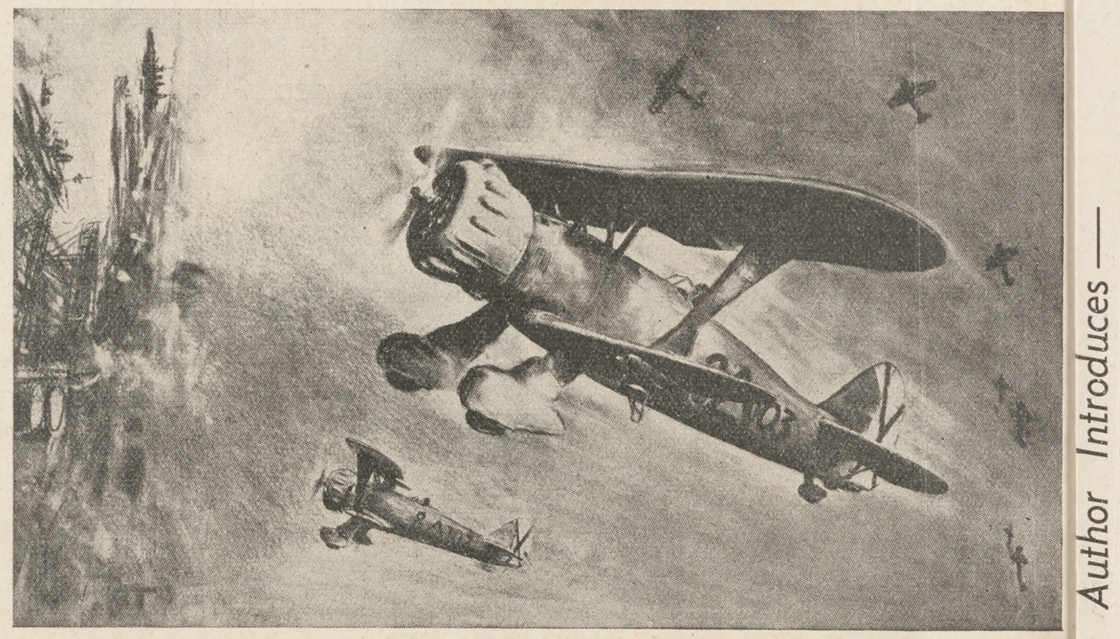
Actually, the modern dive-bomber is a clean, high-performance machine carrying a very useful bomb load without using excessive engine power.

Diving Requirements

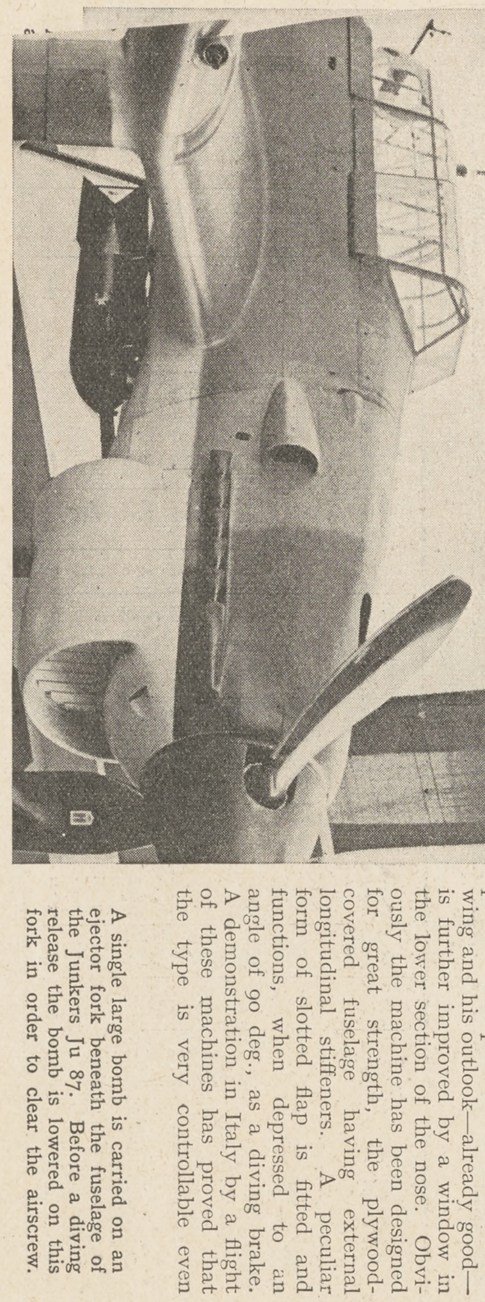
Dive-bombers must be strong enough to withstand sharp pull-outs; manœuvrable enough to make things difficult for enemy A.A. gunners; the pilot's view over the nose must be especially good; the fuel system must be specially studied, and provision made, if the machine is a single-engined type and the bomb is carried beneath the fuselage, for the projectile to be guided clear of the airscrew. Two advantages of the twin-engined layout are improvement in the pilot's forward vision and the fact that bomb-displacing gear is unnecessary. Modern specialised dive-bombers are fitted with aerodynamic brakes to retard the speed in a bombing dive which would otherwise be too high for the pilot to take accurate aim from comparatively close range. Reversible pitch airscrews have also been tried as diving brakes.

The specialised single-seater dive-bomber is comparatively new in conception although American Navy fighters have for some years been equipped to carry quite heavy bomb loads. Germany was among the first countries to give the type consideration, and the Henschel Hs 123 biplane was used in the Spanish and Polish campaigns. With its biplane wings and fixed undercarriage it does not pick up speed in a dive as quickly as the clean cantilever monoplanes and consequently does not need diving brakes.

Most modern of the single-seater dive-bombers is the Italian Savoia Marchetti S.M.85. This is a high-wing monoplane with internal ventral bomb stowage and two radial engines of comparatively low power. The pilot sits in front of the wing and his outlook—already good—is further improved by a window in the lower section of the nose. Obviously the machine has been designed for great strength, the plywood-covered fuselage having external longitudinal stiffeners. A peculiar form of slotted flap is fitted and functions, when depressed to an angle of 90 deg., as a diving brake. A demonstration in Italy by a flight of these machines has proved that the type is very controllable even



German Henschel Hs 123 single-seater dive-bombers attacking docks during the Spanish campaign.



A single large bomb is carried on an ejector fork beneath the fuselage of the Junkers Ju 87. Before a diving release the bomb is lowered on this fork in order to clear the airscrew.

The Author Introduces —

MILITARY AIRCRAFT

By H. F. KING

PRIMARILY this issue of *Flight* is devoted to a study of international practice in the design, construction, armament, equipment and, to a lesser degree, operation, of military aircraft. It is the most thorough survey of its kind yet published, and extensive use has been made of foreign material.

The tables of data have been compiled to give as accurate an indication as possible of the characteristics of individual machines. It is emphasised, however, that many of the figures are unconfirmed, though one fact is certain: British aircraft which have been in service for a considerable period make a superb showing even against foreign prototypes, the figures for which may be highly optimistic. When it is remembered that the Hurricane and Spitfire, for example, were Great Britain's best fighters three years ago and that they still compare so well with foreign fighters of much more recent design, we get some indication of their quality. Nevertheless there are developments abroad which are well worth attention.

It is greatly to be regretted that photographs of, and data for, the newest British service types are officially withheld, though references have been published in the Continental press to a "Westland twin-engined fighter" and other intriguing machines. Another British high-speed two-engined machine has already made a brief appearance in public, but further reference to this promising aircraft is prohibited. The only permissible indication of the performance of our new fighters is that during contractors' trials one of them was dubbed "Crikey" by local residents.

It will be learned from a study of the ensuing material that despite the tendency toward specialisation of military aircraft there is one type of machine, the fast twin-engined three/four-seater, which may be adapted for bombing, fighting, reconnaissance, ground attack and, in some cases, torpedo-dropping. The general-purpose day and night single-seater fighter is also much in evidence.

Since our last Military Aircraft number some refreshing designs have appeared; these are remarked on hereafter. The increased importance attached to armour protection is also noteworthy.

It is important to bear in mind when perusing the tables of data that the figures for top speed should be linked with those for the corresponding heights. Many foreign machines are handicapped by engines which deliver their power at comparatively low altitudes. It would have been preferable to have quoted figures for, say, maximum speed at 20,000ft., but sufficient data were not forthcoming to permit this.

Finally, it is emphasised that many of the machines discussed and illustrated are prototypes only, and it should not be inferred that they are in service. They are included for their interest.

In other words, the issue deals with technical development rather than the equipment of air forces.

A MESSAGE from the AIR MINISTER

AIR MINISTRY,
WHITEHALL, S.W.1.

4th March, 1940

I welcome this opportunity of contributing a foreword to the special Military Aircraft number of "Flight" and of commending its contents to the many thousands connected with the Royal Air Force and with British aircraft manufacture.

The review of military aircraft, British and foreign, in the following pages will be of particular interest at the present time and should also have considerable educational value—not least, perhaps, from the point of view of the striking evidence it affords, to readers both at home and overseas, of the outstanding qualities of British machines.

Kingsley Wood

San Diego Defense Boom Overshadows City's Other Claims to Fame

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lockout" involved several hundred members of the millmen's and teamsters' unions.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

End CATARRH
You can clear away stuffy congestion, get rid of dangerous germs and stop that constant flow of poison into your system. How? Simply by applying 'Mentholatum' into your nostrils. The instant you do so, this breathable balm volatilises and you commence inhaling its antiseptics. Quickly, pleasantly, the 'Mentholatum' vapours stop the gathering of germs, clear the nasal cavities and open up your breathing passages. 'Mentholatum' Brand Balm stops Head Colds, banishes Catarrh, ends Chest Colds. All Chemists, 6d. and 1/3 plus Purchase Tax.

46 FLYING FORTRESSES ARE RELEASED TO US

Latest types wil be fitted
with secret b

SIMULTANEOUS WITH RELEASE OF
AIR RAID FAR INTO GERMANY
THOUGHT WE COULD NOT REACH CA
NIGHT:—

Daily Express Staff Reporter C. V. R. THOMPSO

NEW YORK, Wednesday

**AMERICA'S Army High Command toni
announced that they have given up
Britain a fleet of twenty-six four-engi
bombers of the Flying Fortress type, wh
were awaiting delivery to the U.S. Arr**

These machines, claimed to be the most adva
bomber type in the world, are a development o
Boeing 22-ton Flying Fortress, and were built b
Consolidated Aircraft Corporation at San D
California.

General George C. M
Chief of Staff, said that d
would start immediate
would be completed by th
this month.

"In fact," he said, "B
supposed to have taken
of some of them last Sat

The High Command a
ment reveals, too, that neg
are well under way to suppl
with another twenty Flyi
tresses now in process of
at the Boeing Company's
plant.

ALL BY MARC

Delivery of this fleet,
Marshall indicated, would
pleted by March 1.

These twenty are being
with the famed Sperr
sight, said to be capable
ing a bomb "into a ba
10,000 feet."

The Consolidated fou
bombers have just begu
off the production lines,
negotiations just complete
able Britain to take first

General Marshall said that the United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

Western Flying 12/40

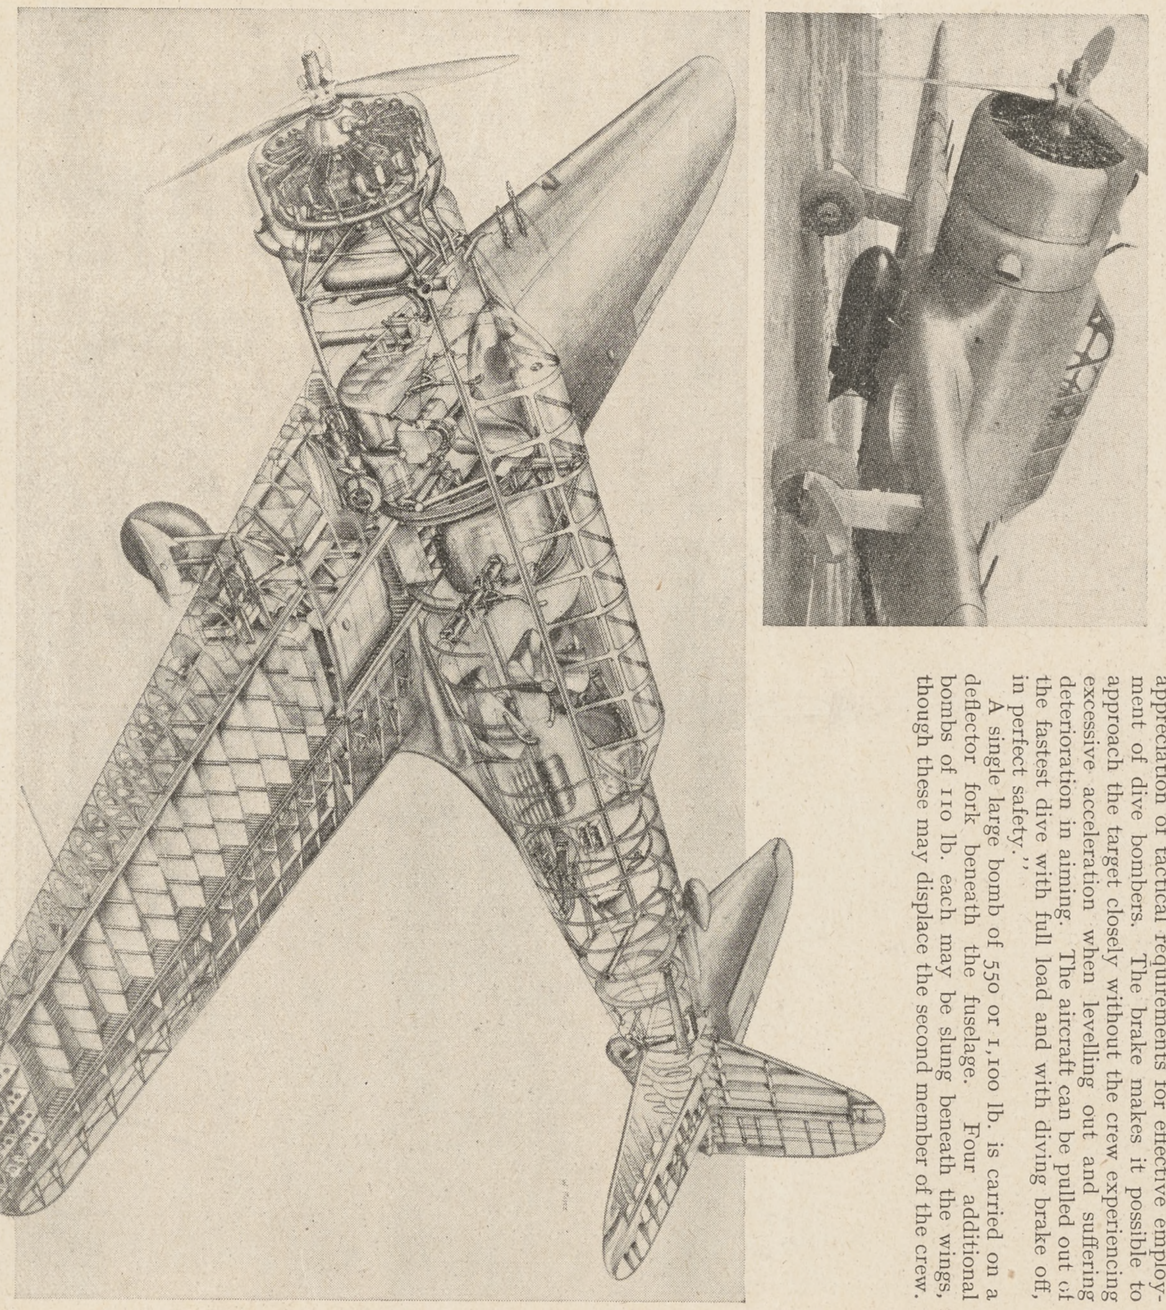
SAN DIEGO

This month has been a very busy one for the **Consair Flyer's Club. Al Becker** has been preparing for his private ticket. **W. E. Jones** is ready to solo. **Stan Mahoney** received a bad cut on his thumb while installing a carburetor on a Pratt & Whitney. Our two new members, **Bennett** and **McFadden** should be ready for that old solo flight soon.

This month's Orchid goes to **Barney Farley** for his coolheadness, quick thinking and fine judgment in bringing the plane down in a forced landing safely on the beach along the Coronado Strand. —**Al Drayman.**

Recent announcement has been made of the engagement of **Raymond Dinson** to **Miss Ivalena Jones,** secretary at Consair. Ray, also an employe of Consair, is a charter member of the **Southern California Flyers.**

» OUTDOOR ASSEMBLY of airplanes is being practiced most extensively at Consolidated in San Diego where temporary canvas-covered sheds, divided into stalls are used for finishing operations on hulls. In the yard are dozens of partially completed ships awaiting parts from subcontractors in other parts of the country. Meanwhile construction is progressing on a building larger than the present huge plant and a parts factory is planned to be built a short distance from the airport. Employment records showed 13,000 on the day of our visit. Aviation 12/40



A thoroughly sectioned view of the Vultee V-11, which can be used for bombing or ground attack. Above it is shown how a single large bomb can be carried externally.

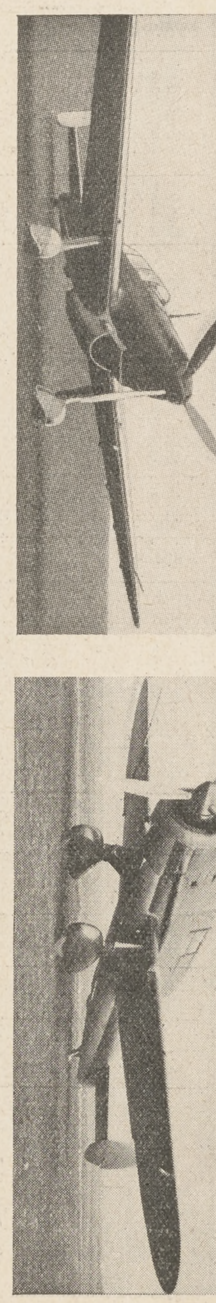
projectiles are stowed internally, but for the diving attacks the trap doors are locked in the closed position and a single bomb of 400 kg. (880 lb.) is suspended externally. The air brakes take the form of hydraulically operated slats below the wing just aft of the leading edge and it is claimed that, with these brakes in operation, 180-deg. aileron turns can easily be made over a vertical path of 2,300ft. Without the brakes a speed of 400 m.p.h. is reached. Terminal velocity dives have been continued from 13,000ft. to 3,300ft.

It is not without interest to compare the performance of the G-1 short-range dive-bomber with its external bomb with that of the normal bomber version with internal stowage. These figures relate to the machine as fitted with two Bristol Perseus X engines.

	DIVE BOMBER	NORMAL BOMBER
Bomb Load ..	880 lb.	880 lb.
Weight of Rack(s)	90 lb.	90 lb.
All-up Weight	11,240 lb.	11,900 lb.
Top speed	301 m.p.h.	298 m.p.h.
Climb to 19,685 ft.	10.9 min.	12.2 min.
Ceiling	30,180 ft.	29,200 ft.
Range	560 miles	890 miles

The Ju 87 has brakes which are generally similar to those on the G-1, though they are in four, instead of two, sections. Concerning this machine the manufacturers remark: "The diving speed can be limited by a diving brake. This means for limitation is not incorporated as a protection against structural failure, as requisite possibly in other designs of dive bomber, but solely in thorough appreciation of tactical requirements for effective employment of dive bombers. The brake makes it possible to approach the target closely without the crew experiencing excessive acceleration when levelling out and suffering deterioration in aiming. The aircraft can be pulled out of the fastest dive, with full load and with diving brake off, in perfect safety."

A single large bomb of 550 or 1,100 lb. is carried on a deflector fork beneath the fuselage. Four additional bombs of 110 lb. each may be slung beneath the wings, though these may displace the second member of the crew.



Two single-engined multi-purpose machines which are similar in that they have a fixed undercarriage and twin fins and rudders. On the left is the new Swiss C.36 and on the right the Polish P.Z.L. Sum.

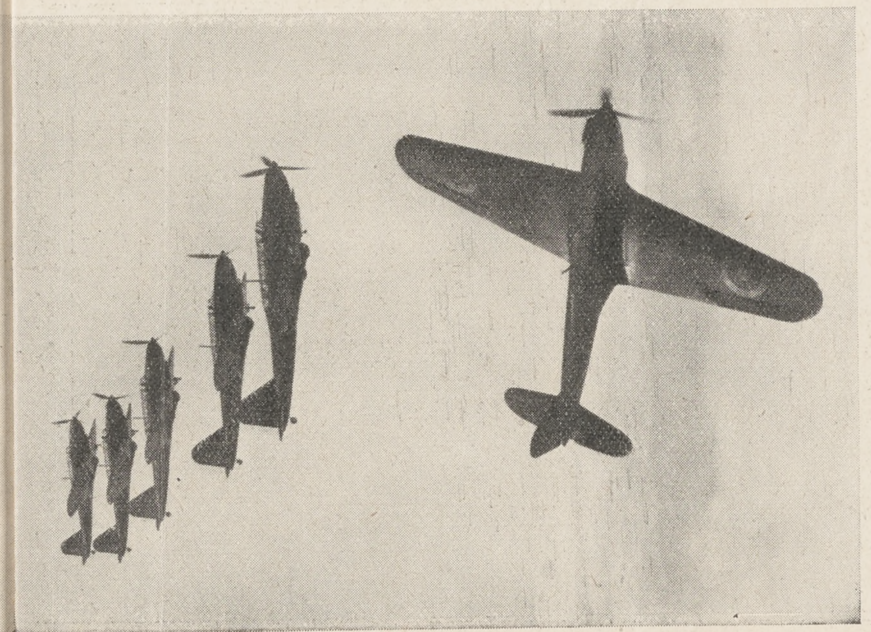
when diving with flaps down. The machine has been developed into the S.M.86, which has a higher performance.

Mr. Folland advocates the adoption of a super-fast unarmed single-seater dive-bomber and maintains that such a machine could be made at least as fast (with reduced factors at the start) as an intercepter fighter despite the fact that it would have a range of 1,400 miles. One would presume in view of its cleanness (estimated top speed 470 m.p.h.) that some extremely efficient form of diving brake would be needed; possibly a reversible-pitch type of airscrew would be used in addition to aerodynamic brakes.

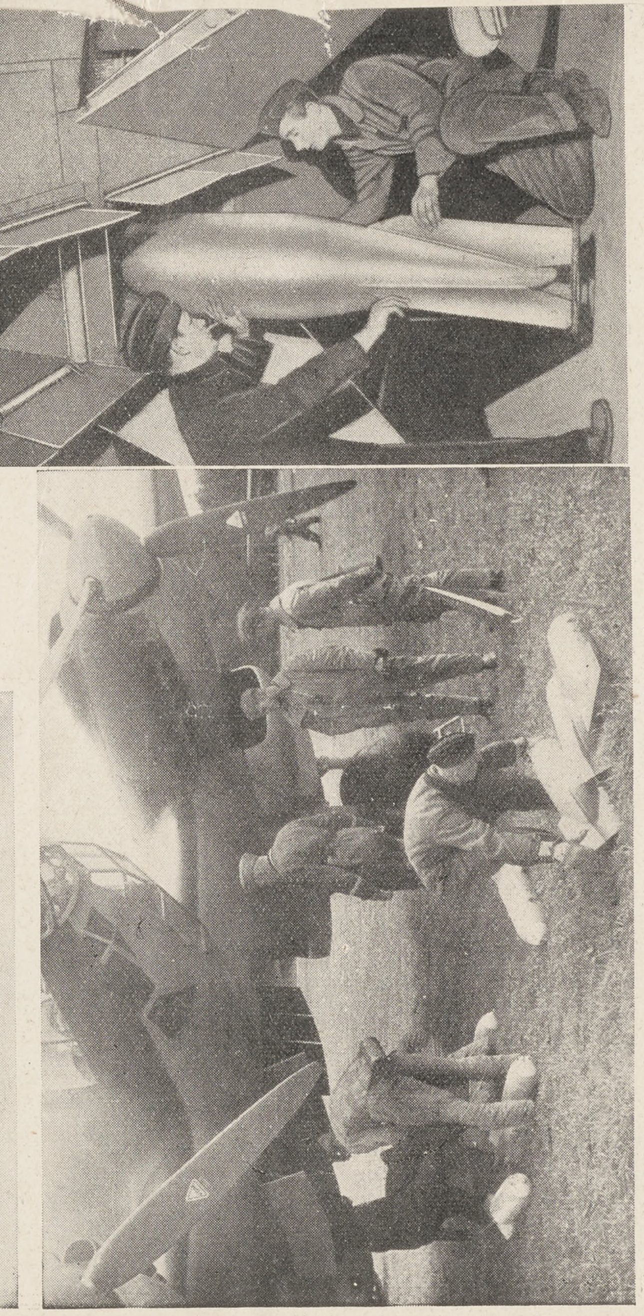
Outstanding among the two-seater dive-bombers is our own Blackburn Skua which is fitted with special hydraulically operated speed-reducing flaps. When fully depressed these limit the diving speed to about 220 knots (255 m.p.h.).

Dive-Control

Exhibitions of "dive-control" have also been given in public by two other foreign dive bombers, one a version of the Fokker G-1 and the other the Junkers Ju 87. As there is no airscrew in the nose of the Fokker the problem of guiding the bomb clear of the structure is simplified and aiming facilitated. For normal horizontal bombing the



On the left are Fairey Battles of the R.A.F. in the act of "peeling off" from an echelon formation to deliver a dive-bombing attack.



Many of the Continental bombers have vertical bomb stowage. Below on the left a Heinkel He 111K is seen being "bombed up," while on the right a large projectile is being persuaded into the bomb cell of a Ju 86K.

San Diego Defense Boom Overshadows City's Other Claims to Fame

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lockout" involved several hundred members of the millmen's and teamsters' unions.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

End CATARRH
You can clear away stuffy congestion, get rid of dangerous germs and stop that constant flow of poison into your system. How? Simply by applying 'Mentholatum' into your nostrils. The instant you do so, this breathable balm volatilises and you commence inhaling its antiseptics. Quickly, pleasantly, the Mentholatum vapours stop the gathering of germs, clear the nasal cavities and open up your breathing passages. 'Mentholatum' Brand Balm stops Head Colds, banishes Catarrh, ends Chest Colds. All Chemists, 6d. and 1/3 plus Purchase Tax.

supposed to have taken
of some of them last Sat

The High Command a
ment reveals, too, that ne
are well under way to suppl
with another twenty Fly
tresses now in process of
at the Boeing Company's
plant.

ALL BY MARC

Delivery of this fleet,
Marshall indicated, would
pleted by March 1.

These twenty are being
with the famed Sperr
sight, said to be capable
ing a bomb "into a ba
10,000 feet."

The Consolidated fou
bombers have just begu
off the production lines,
negotiations just complete
able Britain to take first

General Marshall said that the United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

Western Flying 12/40

SAN DIEGO

This month has been a very busy one for the **Consair Flyer's Club. Al Becker** has been preparing for his private ticket. **W. E. Jones** is ready to solo. **Stan Mahoney** received a bad cut on his thumb while installing a carburetor on a Pratt & Whitney. Our two new members, **Bennett** and **McFadden** should be ready for that old solo flight soon.

This month's Orchid goes to **Barney Farley** for his coolheadness, quick thinking and fine judgment in bringing the plane down in a forced landing safely on the beach along the Coronado Strand. —**Al Drayman.**

Recent announcement has been made of the engagement of **Raymond Dinson** to **Miss Ivalena Jones,** secretary at Consair. Ray, also an employe of Consair, is a charter member of the **Southern California Flyers.**

» OUTDOOR ASSEMBLY of airplanes is being practiced most extensively at Consolidated in San Diego where temporary canvas-covered sheds, divided into stalls are used for finishing operations on hulls. In the yard are dozens of partially completed ships awaiting parts from subcontractors in other parts of the country. Meanwhile construction is progressing on a building larger than the present huge plant and a parts factory is planned to be built a short distance from the airport. Employment records showed 13,000 on the day of our visit. Aviation 12/40

Aviation 10/40 *Consolidated Aircraft* has purchased the Hall Aluminum Aircraft Corporation.

Consolidated Aircraft Corp., San Diego, Calif., $75,313 for airplanes.
Glenn L. Martin Co., Baltimore, Md., $106,125 for airplanes.
United Aircraft Corp., East Hartford, Conn., $59,490,703 for airplane engines.

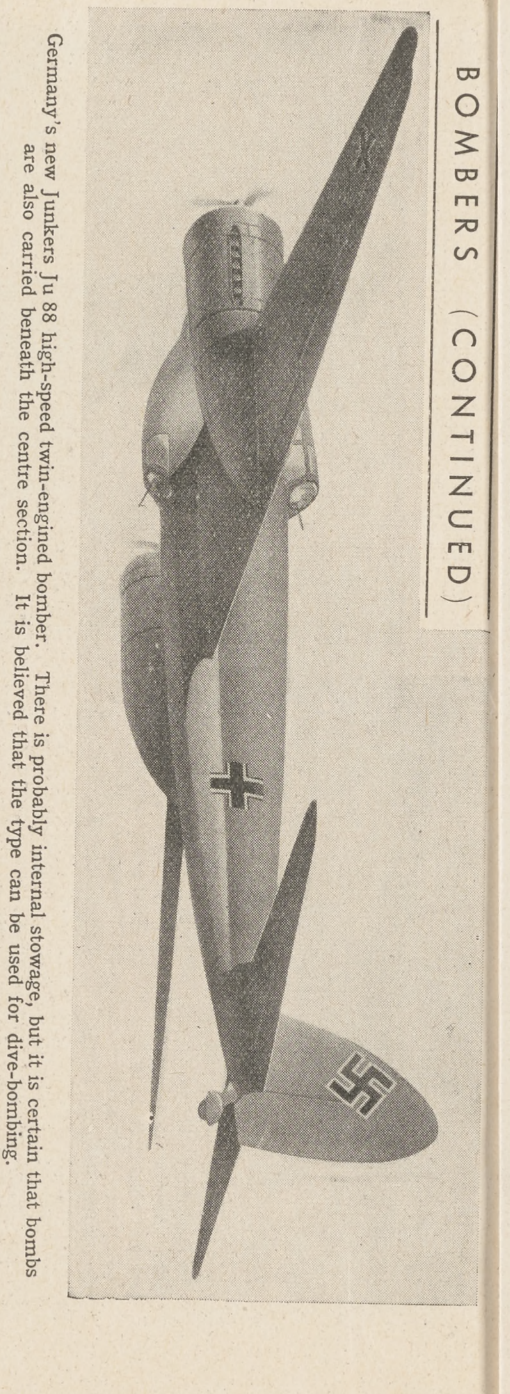
BOMBERS (CONTINUED)



Germany's new Junkers Ju 88 high-speed twin-engined bomber. There is probably internal stowage, but it is certain that bombs are also carried beneath the centre section. It is believed that the type can be used for dive-bombing.

There are various reasons for the adoption of two engines for medium-sized bombers. Mainly these are operational, though the problems of airscrew diameter and undercarriage height apply to a certain degree. Particularly in the case of the smaller multi-purpose bombers which can be used as fighters the possibility of installing heavy forward-firing armament is a governing consideration, while the poor forward view, greater complication in the fuselage, vibration, and the difficulty of providing a forward position for the bomb-aimer are other weighty factors militating against the single-engined machine. On the other hand, the fitting of two engines on the wings has certain drawbacks, notably transference of weight outboard with consequent loss in manœuvrability (this may be partially offset by counter-rotating airscrews) and, in the case of certain mid- and high-wing radial-engined machines of comparatively small size, notoriously bad lateral vision.

Aerodynamically, some of the latest multi-purpose bombers, being the fastest of all bombing machines, are a joy to behold, though military requirements necessarily mar their lines. Design varies considerably, low, mid and high wings all being in vogue. Radial engines predominate, for the time being at least.

Although profiting from the same technical advances as high-speed transport aircraft, the structural design of fast bombers may differ considerably as stresses will be concentrated in the bomb cells rather than distributed along the length of the fuselage. Metal-stressed-skin construction is most favoured and on a number of new types a tricycle undercarriage is fitted. Another point of technical interest is the extensive use of beautifully moulded transparent material in the nose. In some types the entire forward part of the fuselage is almost completely transparent, giving an excellent view for the pilot and observer and light for the bomb-aimer.

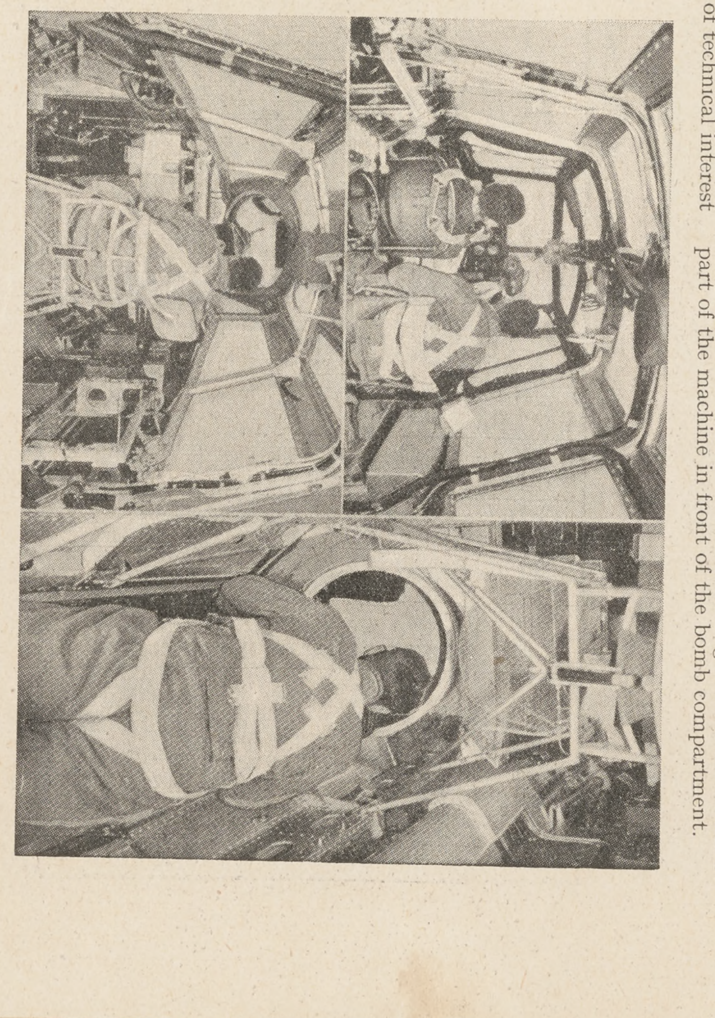
While our Bristol Blenheim and Beaufort have a comparatively roomy cabin extending aft from the pilot's cockpit to a power-driven gun turret the French Potez 63, being a lighter machine and having a fuselage of smaller cross-section, is laid out rather on the lines of the Fairey Battle with an external transparent enclosure. For bombing operations, a crew of two is carried in the Potez, the third man's position being taken up by a cell holding eight 125lb. bombs. One version of the machine has external racks for dive-bombing.

Regulations prevent our referring to the bomb load of the Blenheim or Beaufort so we must turn to the new Martin 167 for an examination of the bomb arrangements. Internal racks are fitted to carry one 1,130lb. bomb; two 624lb. bombs; four 308lb. bombs; or eight 116lb. bombs. These are released through doors in the bottom of the fuselage which are opened by elastic cords and closed by hydraulic power from either the pilot's or the bomb-aimer's position. For ground attack work a large number of small fragmentation bombs are carried in chutes in the bomb bay, supplementing four wing-mounted guns and two free guns.

Gun Installations

Armament, despite the limitations imposed by the comparatively small size of the machines under consideration, differs fairly considerably, though when they are operating exclusively as bombers the fire power is not very heavy.

The standard Blenheim bomber has one fixed wing-mounted gun and a second weapon in a semi-retractable power-driven turret aft of the cabin; the Czech Aero A-300 and the Italian Caproni Ca 135 likewise have a retractable turret, but the front gun is mounted in the nose and has a limited arc of fire; the Potez, Breguet and Breda machines, when functioning solely as bombers, have fixed machine guns, plus one aft gun with a restricted arc of movement. Germany's Dornier Do 215 has a gun with a very restricted movement firing through the pilot's windscreen, a second on top of the fuselage and a third below. The Do 215 is also of interest in that the crew is bunched together in the forward part of the machine in front of the bomb compartment.



On the right are three interior views of the German Dornier Do 215. In two of the views the upper and lower rear guns are shown manned.

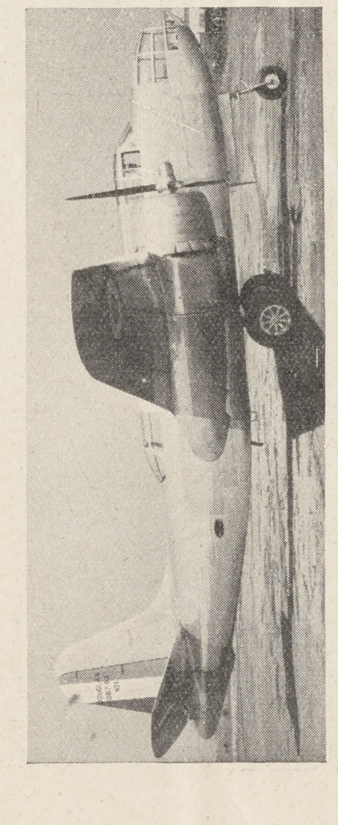
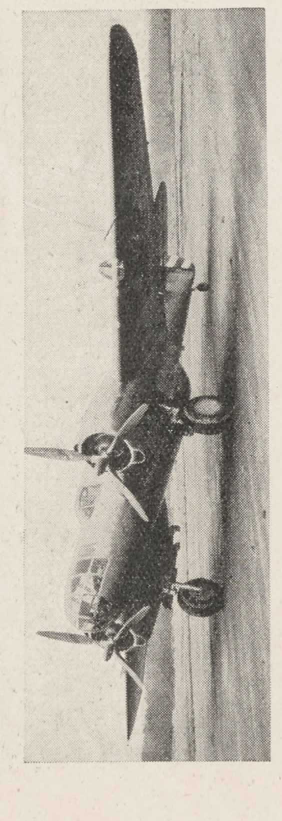
Certain dive-bombers used by the U.S. Navy have diving brakes which take the form of split trailing edge flaps opening like two leaves of a book.

Apart from the Blackburn Skua no Britsh bombers designed with the diving attack in mind have been fitted with diving brakes, though special arrangements are made to guide the bombs clear of the airscrew. On the Fairey Battle, for example, the internally stowed bombs are carried on hydraulic jacks which are retracted into the wing. When released the projectiles fall through trap doors except in the case of dive-bombing when they are lowered beneath the wing surface. It is stated that the normal bomb load is 1,000 lb., though allowance is made for a 500 lb. overload.

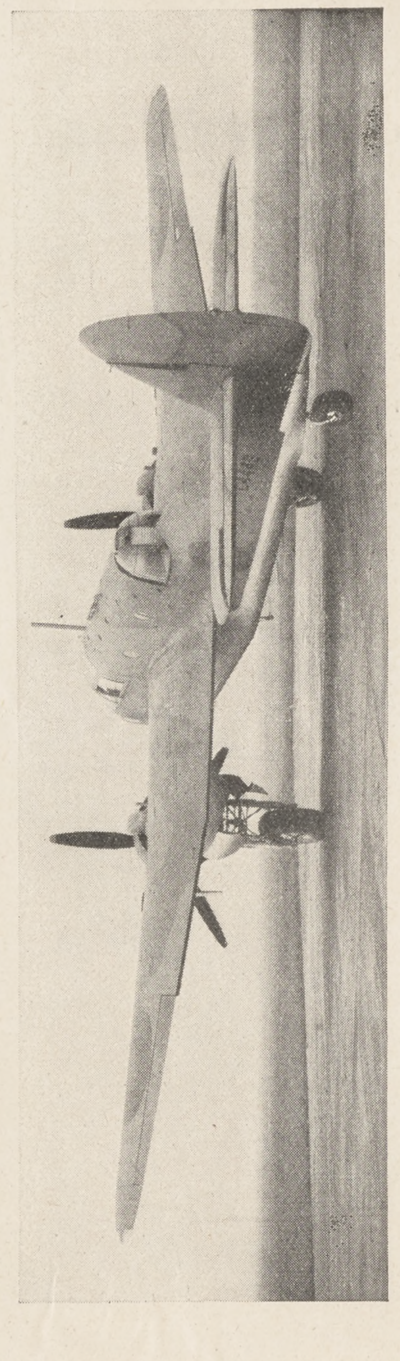
The Battle, although classed by the R.A.F. as a bomber, is a good representative of the single-engined multi-purpose class. The term "multi-purpose" (not to be confused with the old R.A.F. classification "general purpose") embraces a large variety of machines weighing betwen 6,500 lb. and 15,500 lb. which can be used for bombing and reconnaissance. The smaller machines are also suitable, when specially adapted, for fighting or ground attack and certain of the larger may be equipped, in addition, for torpedo-dropping.

The single-engined multi-purpose bomber is popular among impecunious nations with small air forces, though it is still justifying itself in the service of the Powers. There is, however, a marked tendency to fit at least two engines to all bombers, though the single-seater unarmed ultra-high-speed machine may, as already inferred, mark a reversion to a single engine.





Probably the most versatile high-speed twin-engined machine in the world is the Bristol Beaufort (below). The Beaufort could be used for bombing, reconnaissance, torpedo-dropping, fighting and ground attack. Of the two machines on the left the one with the tricycle undercarriage is the Douglas DB-7. This machine, like the Martin 167 below it, has been supplied in quantity to France.



San Diego Defense Boom Overshadows City's Other Claims to Fame

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lock-out" involved several hundred members of the millmen's and teamsters' unions.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

'GERANIUMS AND ROSES' GIVE WAY TO DEFENSE BOOM

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

General Marshall said that the United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

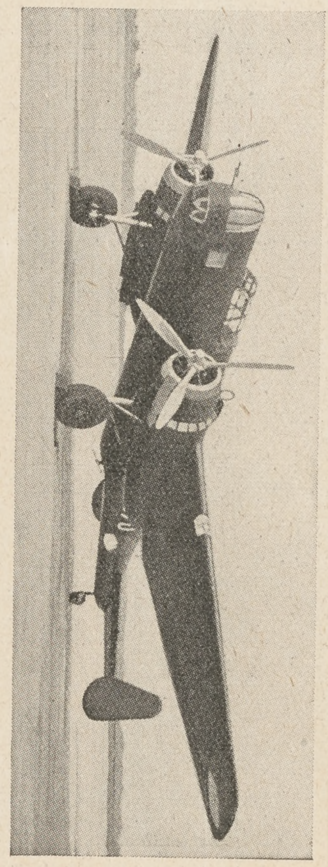
The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

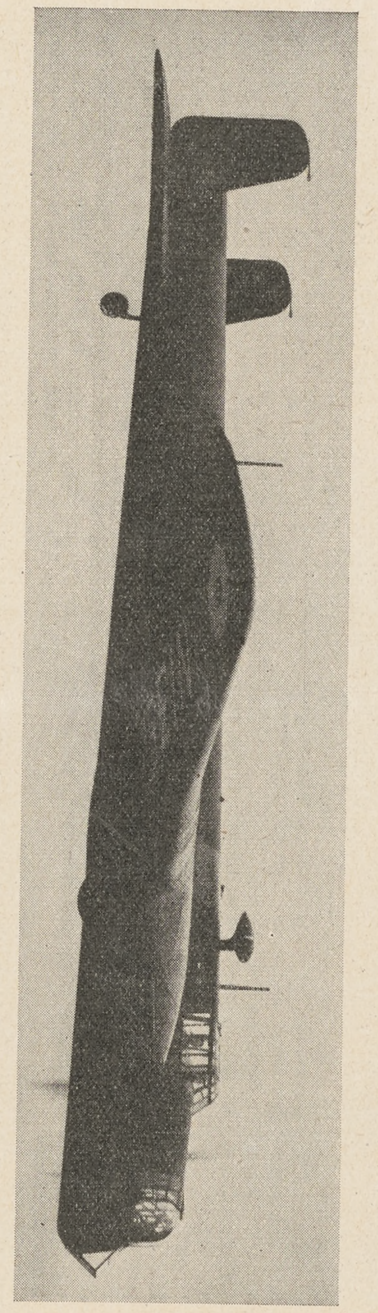
The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

BOMBERS (CONTINUED)

One of the most recent twin-engined bombers is the Fokker T.9 (right), a large machine with two Bristol Hercules 14-cylinder sleeve-valve engines.

Below is the Merlin-engined Armstrong-Whitworth Whitley bomber. This type has done magnificent work over Germany.





performance at low altitudes; the top speed at 4,500ft. is 252 m.p.h.

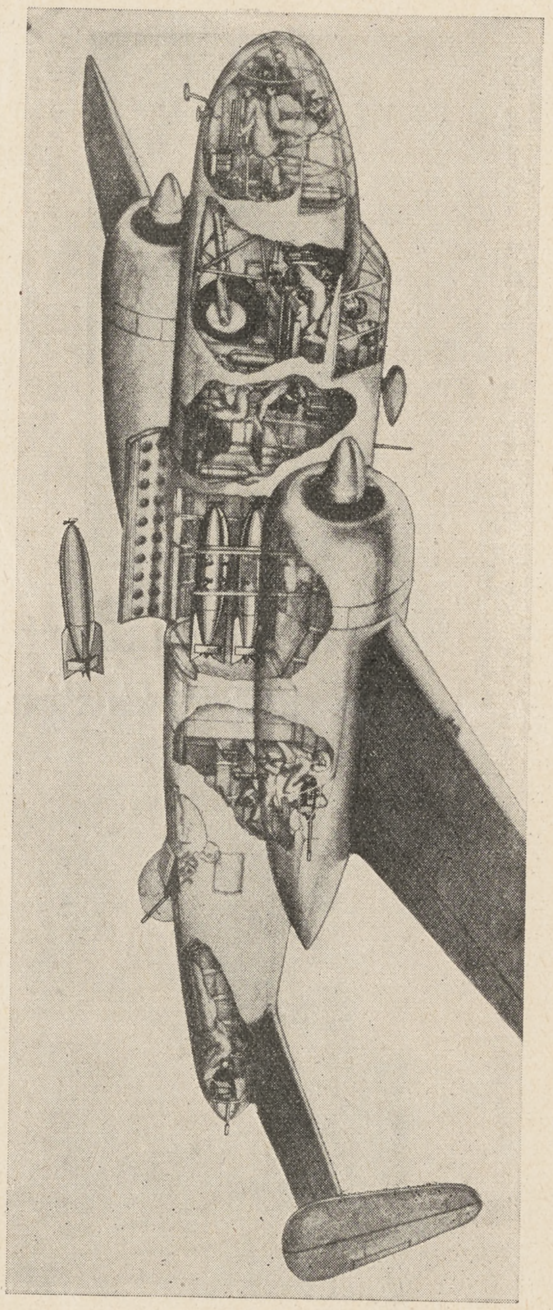
In Poland the Germans used Messerschmitt Me 110 twin-engined fighters armed with 20 mm. shell-guns for attacks on trains. A group of Messerschmitts would perforate the boilers of the locomotives with their shell-guns, the train subsequently being destroyed by dive-bombers. The Daimler-Benz DB 601 engines of the Me 110 have two-speed superchargers which confer a good performance near the ground.

Although the long-distance trips made over Germany by the R.A.F. in large, comparatively slow bombers are referred to as reconnaissance flights, long-distance daylight reconnaissance is normally undertaken by fast twin-engined machines of the type already discussed. For this sort of work the machines are fitted with cameras, and in some cases, if visibility is restricted by a part of the structure, are provided with a special compartment beneath the fuselage for the observer. A transparent nose is, however, usually considered sufficient for observation.

Large high-altitude cameras and/or extra tanks may be fitted in the bomb bay; the Dornier Do 17, for example, when undertaking reconnaissance, carries a battery of three cameras in the bottom of the fuselage. The French version of the Martin 167 is delivered with extra tankage and special photographic arrangements for reconnaissance work.

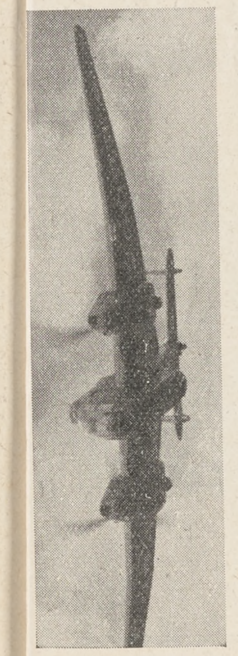
For night reconnaissance special apparatus such as the Fairchild night photographic equipment may be used. This equipment was for many years kept secret by the U.S. Army Air Corps. It consists of three principal units: a special camera, a light-sensitive cell, and an electric control box. The high-intensity flash charges which give brilliant flashes of light and deafening detonations are completely consumed in bursting, and provision is made to ensure positive action at a predetermined interval after the release of the charge, this being the time when it is well below and behind the machine. Means are also provided to prevent a premature explosion. It is said that the heavy charges of flashlight powder have a million times the intensity of ordinary photographic flash bulbs.

As for speed, it was considered astonishing years ago that Mr. C. R. Fairey could build a bomber (the Fox) which could "walk away" from many contemporary fighters. The fast twin-engined multi-purpose bombers of to-day in some instances approach fighter performance, but are not as fast as might be expected. Greater speeds would un-



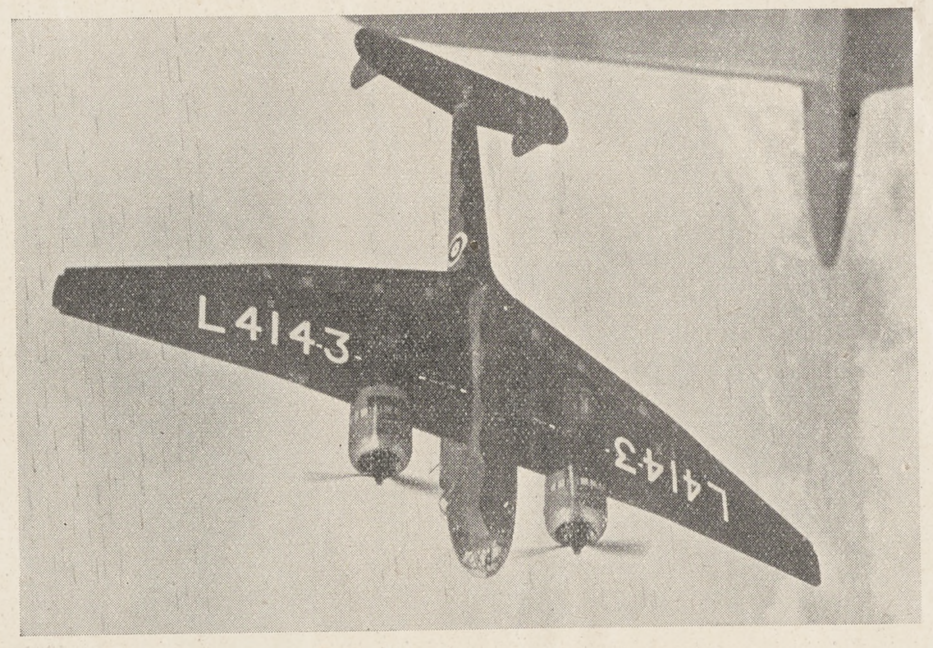
The North American NA-40A bomber has fixed guns in the nose and free guns above and below the fuselage and in the tail. The view above also shows the bomb stowage arrangements.

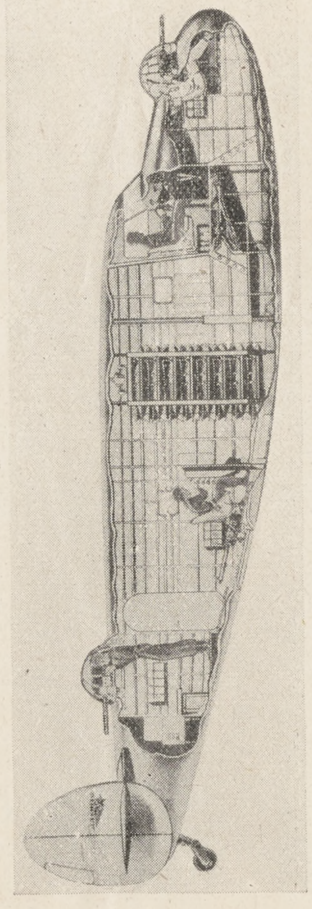
BOMBERS (CONTINUED)



It will have been gathered from our reference to the Martin 167 that even in the "ground-attack" condition the gun-power is comparatively low. The modern tendency is to use bombs for low-flying attacks rather than machine guns. America's new formula for twin-engined "attack" bombers corresponds in fact to the European conception of a compact, high-performance, twin-engined bomber. In this connection the remarks of Brig. Gen. Jacob Fickel, Commanding General, First Wing, G.H.Q. Air Force, U.S. Army Air Corps, are of interest. He writes that the Ethiopian and Spanish wars increased the demand for aircraft suitable for close support of ground forces by attacks on hostile rear areas. He refers to the technical difficulties in the development of the low-flying attack machine and states that these, coupled with the improvement in ground fire against that type, led to the development of the "attack bombers, or, as he chooses to call them, "light bombardment airplanes." Brig. Gen. Fickel states that although the machines have a comparatively short range when carrying a full bomb load they can fly far enough to deliver heavy attacks from an altitude out of effective reach of small arms and machine guns on hostile reserves, ammunition and supply dumps, lines of communications, command posts, mechanised flanking forces, and advanced aerodromes.

The highly specialised ground-attack machine has lost favour, though the Curtiss 76-D is available with eight fixed guns and a rear free gun. In the fuselage is stowage for twenty chemical or fragmentation bombs, while racks on each side of the centre section carry two 100lb. bombs. Like all ground-attack machines the 76-D is designed for





The Handley Page Hampden bomber (above) is extremely efficient, due in a large measure to the installation of Handley Page slots and flaps. The Hereford (top left) is similar except for the engines, which are 24 - cylinder Napier - Halford Daggers.

A good example of a bomber adapted from a commercial machine is the Lockheed 14 (left).

Western Flying 12/40

SAN DIEGO

This month has been a very busy one for the **Consair Flyer's Club. Al Becker** has been preparing for his private ticket. **W. E. Jones** is ready to solo. **Stan Mahoney** received a bad cut on his thumb while installing a carburetor on a Pratt & Whitney. Our two new members, **Bennett** and **McFadden** should be ready for that old solo flight soon.

This month's Orchid goes to **Barney Farley** for his coolheadness, quick thinking and fine judgment in bringing the plane down in a forced landing safely on the beach along the Coronado Strand. —**Al Drayman.**

Recent announcement has been made of the engagement of **Raymond Dinson** to **Miss Ivalena Jones,** secretary at Consair. Ray, also an employe of Consair, is a charter member of the **Southern California Flyers.**

» OUTDOOR ASSEMBLY of airplanes is being practiced most extensively at Consolidated in San Diego where temporary canvas-covered sheds, divided into stalls are used for finishing operations on hulls. In the yard are dozens of partially completed ships awaiting parts from subcontractors in other parts of the country. Meanwhile construction is progressing on a building larger than the present huge plant and a parts factory is planned to be built a short distance from the airport. Employment records showed 13,000 on the day of our visit. Aviation 12/40

Aviation 10/40 *Consolidated Aircraft* has purchased the Hall Aluminum Aircraft Corporation.

Consolidated Aircraft Corp., San Diego, Calif., $75,313 for airplanes.

Glenn L. Martin Co., Baltimore, Md., $106,125 for airplanes.

United Aircraft Corp., East Hartford, Conn., $59,490,703 for airplane engines.

AVIATION, December, 1940

San Diego Defense Boom Overshadows City's Other Claims to Fame

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lock-out" involved several hundred members of the millmen's and teamsters' unions.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

46 FLYING FORTRESSES ARE RELEASED TO US

Latest types will be fitted with secret b

SIMULTANEOUS WITH RELEASE OF AIR RAID FAR INTO GERMANY C THOUGHT WE COULD NOT REACH CA NIGHT:—

Daily Express Staff Reporter C. V. R. THOMPSON

NEW YORK, Wednesday

AMERICA'S Army High Command toni announced that they have given up Britain a fleet of twenty-six four-engi bombers of the Flying Fortress type, wh were awaiting delivery to the U.S. Arn

These machines, claimed to be the most adva bomber type in the world, are a development o Boeing 22-ton Flying Fortress, and were built b Consolidated Aircraft Corporation at San D California.

General George C. M Chief of Staff, said that d would start immediate would be completed by th this month.

"In fact," he said, "B supposed to have taken of some of them last Sat

The High Command a ment reveals, too, that neg are well under way to suppl with another twenty Flyi tresses now in process of at the Boeing Company's plant.

ALL BY MARC

Delivery of this fleet, Marshall indicated, would pleted by March 1.

These twenty are being with the famed Sperr sight, said to be capable ing a bomb "into a ba 10,000 feet."

The Consolidated fou bombers have just begun off the production lines, a negotiations just completed wi able Britain to take first deliveries.

General Marshall said that the United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

---

machine commonly used in Spain, and, what is more, carries its armament in efficient Breda power-driven turrets.

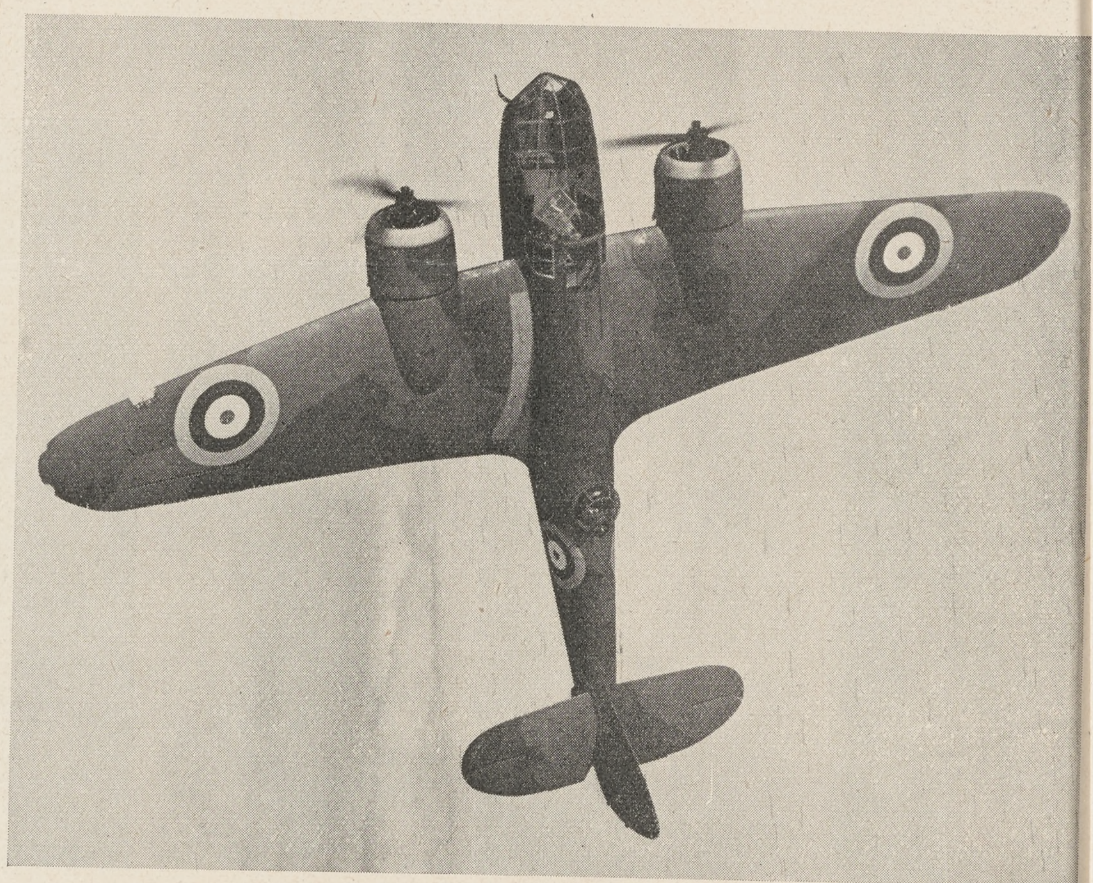
It has been suggested that the Germans drew some false conclusions from the Spanish war and that they are developing heavier armament for their bombers at the expense of speed and manœuvrability.

For short-range work the small, fast, "evasive" type of bomber, which depends mainly on its speed and manœuvrability for protection, is a practical proposition, but for long-distance operation its limitations soon become apparent. If the range is long the bomb load will be small, and there is little point in flying for very long distances if the blow delivered is not a telling one. This means that large numbers of small, fast bombers must be employed to do the work of fewer but larger machines. If the opposition is very strong this may be worth while.

The classes of bombing aircraft in service to-day are more numerous than might be believed. Before examining their characteristics it will be advantageous to outline modern bombing technique, which, of course, strongly influences their design.

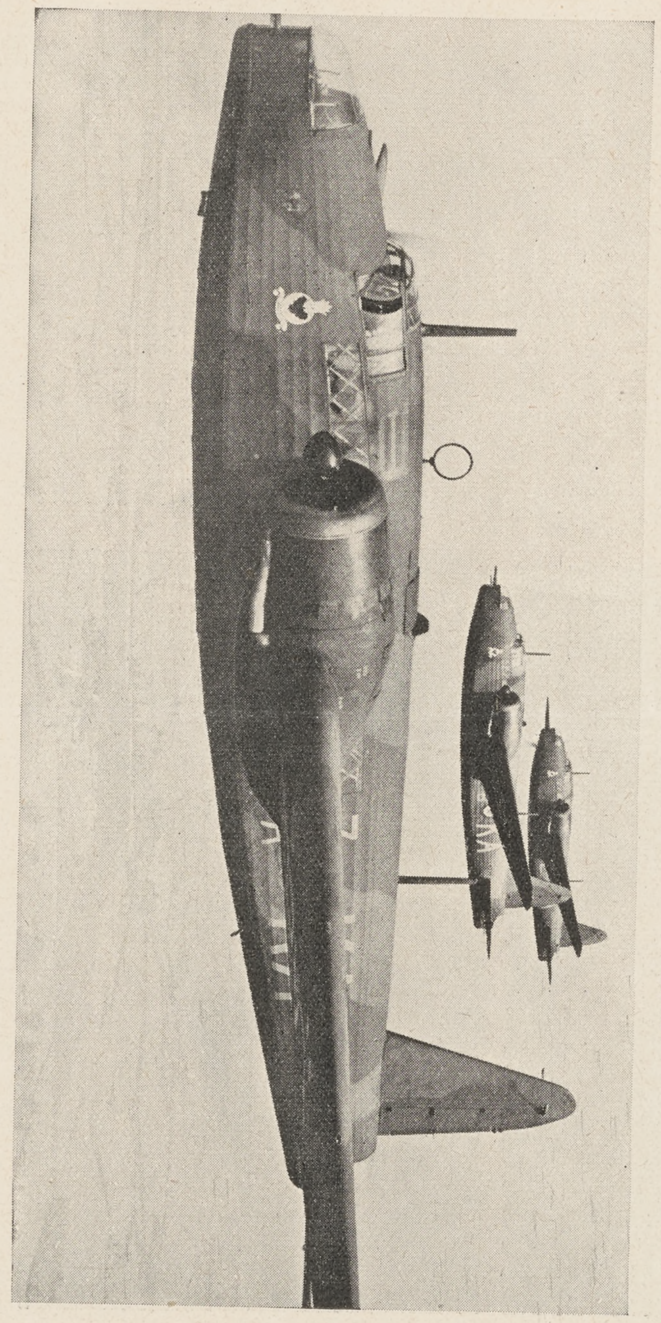
There are three commonly used types of bombing attack: the high-altitude; high-level or "precision" method; dive-bombing; and the low-level attack. The first is practised by all types, though least by specialised dive-bombers. It entails flying at very considerable heights to minimise the chances of enemy anti-aircraft guns and making a somewhat lengthy "run-up" to the target on a set course, at a steady speed and constant height while the bomb sight is adjusted. The bombs, of course, are dropped some distance before the machine reaches its target. For example, a bomber flying at 300 m.p.h. at 21,000ft. may have to release about three miles from the objective.

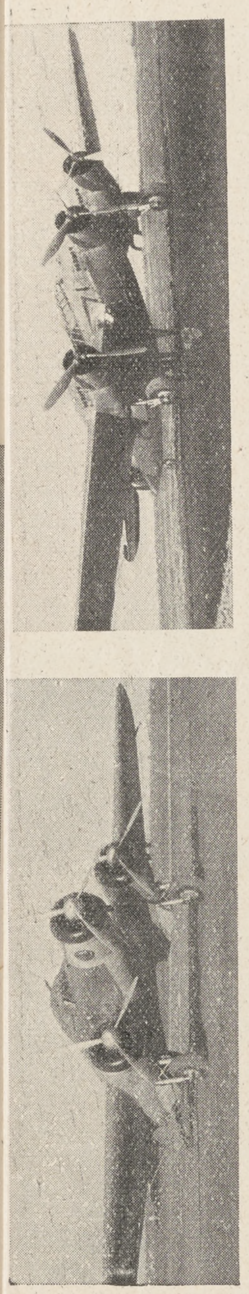
Dive-bombing implies the release of the projectile(s) at low or medium altitude at the bottom of a steep dive on



Outstanding among the world's multi-purpose aircraft is the Bristol Blenheim Mark IV. Blenheims have been delivered to the R.A.F. in hundreds and are used for bombing, reconnaissance and fighting.

One of the most successful large bombers ever built is the powerfully armed geodetic-built Vickers Wellington (below), which, on many occasions, has distinguished itself on active service.





Italy is the only country which favours the three-engine formula for large bombers. On the left is the Savoia-Marcoetti S.M.79B and on the right the Cant Z.1007.

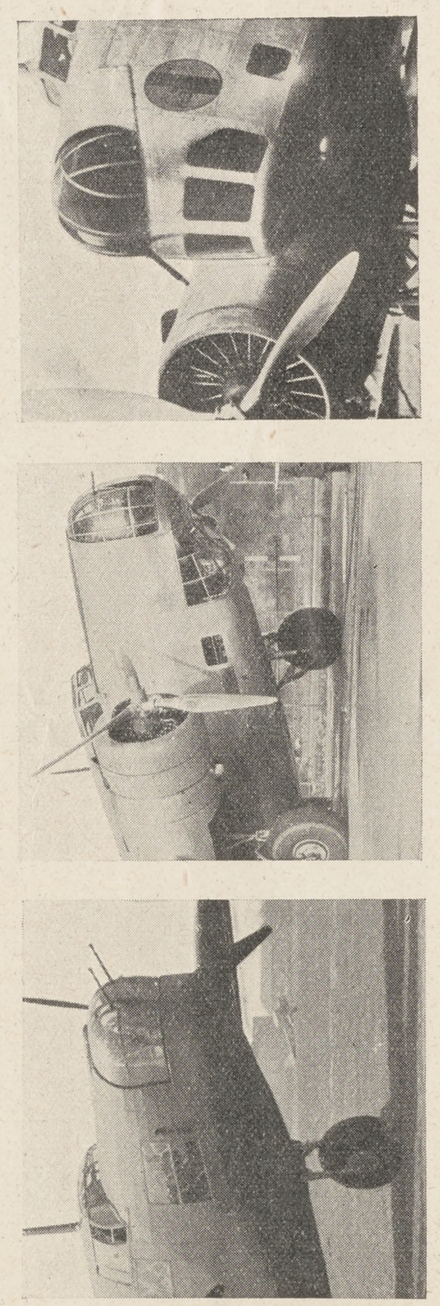
doubtedly be attained in many instances if liquid-cooled engines were adopted. Buried power plants and shaft-driven airscrews or propellers may appear before long on machines of this class. Higher wing loadings will necessitate the fullest use being made of high-lift equipment, assisted take-off or aerial refuelling.

Dogmatists often discuss bombers as though there were a clearly defined division between the small, fast "evasive" types and the larger, more heavily armed machines which rely primarily for protection on their gun power. Actually, as we have seen, some of the smaller bombers have quite a powerful armament (installed in some cases in power-driven turrets, despite the weight) which compares favourably with that mounted on certain larger machines.

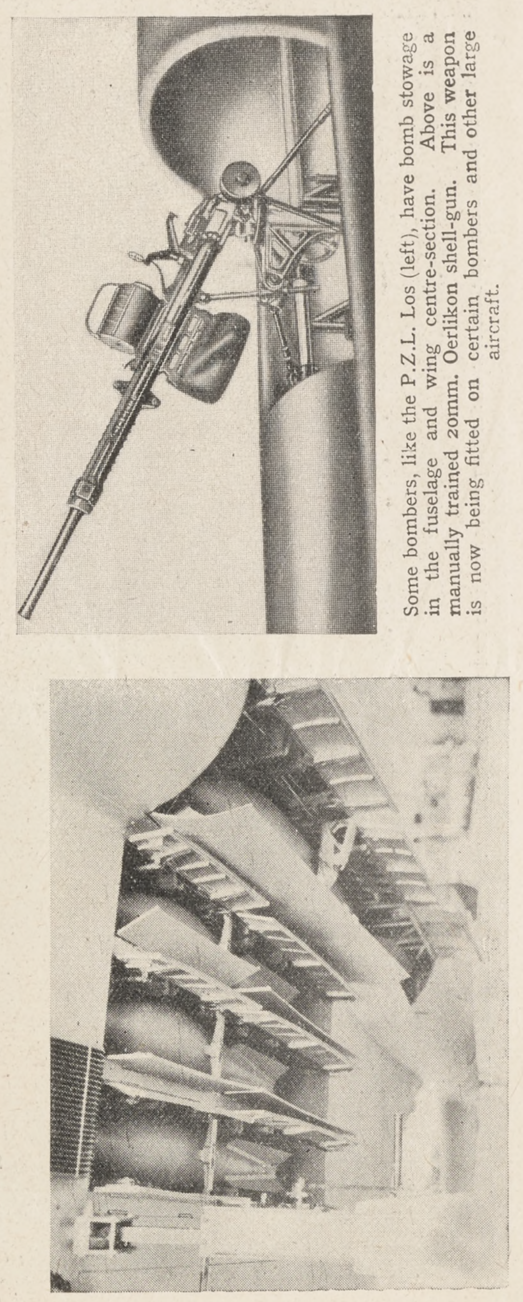
We must, however, establish some rough classification for discussion and may conveniently consider the two- and three-engined machines weighing, more or less, between 18,000 and 25,000lb. Current machines of this calibre include the Handley Page Hampden and Hereford, the Vickers Wellington and Armstrong-Whitworth Whitley, France's Amiot 340 and Liore 45, Italy's Fiat B.R.20 and Savoia Marchetti S.79 and S.79B, the American Douglas B-18 and B-23, Russia's S.B-2, Germany's Heinkel He 111K, the Dutch Fokker T.5 and the Japanese.

As might be expected in conformity with military aircraft the bombers under consideration are almost exclusively cantilever monoplanes. Stressed-skin metal construction is generally favoured, though Italy has achieved some creditable results with wooden wings and welded steel-tube fuselages. Composite construction may, in fact, yet prove to be by no means the "back number" which it is commonly considered.

There is one important type of structure which is, fortunately, so far exclusive to Great Britain. This is the Vickers-Wallis geodetic system which, using curved diagonal members, reconciles great stiffness and strength with a very low structural weight. It also permits the construction of wings of high aspect ratio which make for good take-off, climb and a high ceiling. Internal accommodation, moreover, is much less obstructed than with more conventional types of construction.



Great Britain has developed the power-driven gun turret to a very high pitch of perfection. On the left is the nose installation in the Vickers Wellington; in the centre an experimental power-driven turret on an American Douglas B-18; and on the right a Breda turret on Italy's Fiat B.R.20.



Some bombers, like the P.Z.L. Los (left), have bomb stowage in the fuselage and wing centre-section. Above is a manually trained 20mm. Oerlikon shell-gun. This weapon is now being fitted on certain bombers and other large aircraft.

San Diego Defense Boom Overshadows City's Other Claims to Fame

'BIGGEST NEWS' GIVES WAY TO PHENOMENAL GROWTH

CONTINUED FROM PAGE ONE

the company now employs 1600 men working on a backlog of $10,600,000 in a plant twice its 1939 size. The Ryan school is training 243 army air corps cadets, as compared with 63 the first of the year.

The army moved into town in force, at least on paper. Ft. Rosecrans, which has "guarded" the harbor with ancient guns manned by skeleton crews for lo, these many years, came to life under the impetus of a building project to house 3000 men and 125 officers. Construction of a cantonment for 7500 men and 300 officers got under way on Torrey Pines mesa. By a rotation system, the camp is expected to train 20,000 draftees between March 15, 1941, and March 15, 1942.

Hits New High

With marine corps recruiting hitting a new high, Camp Elliott mushroomed on Kearny mesa, and the Barnett ave. base pushed its limits so far southward that on one occasion a sergeant, calling the roll, got a "Here sir," from a watchman at the Consolidated plant. There were 5100 officers and men at the base on Jan. 1; the total is now approximately 10,300. Camp Elliott went from 50 to 3100.

The naval training station expanded to train double the number of bluejackets as the fleet was built up to fighting strength. The figures tell the story—2661 men on Jan. 1; 5679 today.

Activity Intensified

Activity was intensified at both the North Island naval air station, largest in the nation, and the destroyer base, but little news came through their closely-guarded portals . . . The navy this year clamped down a censorship on news and pictures of ships and planes. This was often intelligent, but sometimes it was considered stupid by newsmen.

The 1940 census, taken early in the year, showed a population of 202,038, including about 7000 men of the fleet who maintained residences ashore. Approximately 21,000 others were not counted. The warships left for six weeks of maneuvers in the Hawaiian area April 1 but remained there the rest of the year, although contingents returned for two-weeks "visiting" periods during the fall months. An estimated 30,000 new residents flocked into town after the census, drawn by the lure of national defense jobs.

Started by Navy

All this added up to a housing shortage. In January, the city council had heeded the objections of realtors and apartment house owners and "tabled" a proposed USHA slum clearance, low-rent housing project. In July, the navy took matters into its own hands, and, (with the approval of the council, went ahead with plans for low-rent housing. A $3,800,000 project was started for construction of 1200 housing units for navy families, 600 adjoining the destroyer base and 600 near the naval training station.

On Oct. 31, Charles F. Palmer, defense housing coordinator, announced in Washington that the largest of 63 housing projects in vital defense areas would be located in San Diego. The $15,000,000 program provides for construction of 3000 residential units for civilian workers on Kearny mesa. The first contract, for a $9,070,000 slice of the job, was awarded to a Los Angeles firm Dec. 12.

Everybody Here

Business boomed. On Dec. 13, Newell Jones wrote in The Tribune-Sun that "Merchants' Christmas cash registers were dinging like the dongs of a legion of lunatic Swiss bell ringers." (They had done a fair bit of dinging in the late summer and fall months, too, when the town went convention crazy. Everybody met here from embalmers to magicians, from the California American Legion to the state C.I.O.)

Honest reporting makes it impossible to dismiss, with a well-bred shrug of distaste, any mention of the seamier side of life in a national defense center. Here are a few notes which shed light on some of our social problems:

Year's Tragedies

Last spring, after the fleet left, the mutilated body of a sailor was found under Cabrillo bridge. . . . Lt. Comdr. J. F. Luten, medical corps, naval hospital, told a health officers' convention here in September that prostitutes should be placed in segregated districts and kept under strict medical supervision. He said that venereal diseases occupied second place among all causes of illness in the navy in 1938. "A total of 10,782 cases were admitted," he said. . . . On Dec. 11, a sailor's wife with a liking for liquor got a year in the county jail for the fatal neglect of her baby son. . . . On Dec. 16, a navy wife, grieving over the absence of her husband, hanged herself in the garage of her mother's home. . . . On Dec. 18, the body of a new-born baby boy, carefully wrapped in a sheet and quilt, was found in the city dump. . . . On Dec. 19, a representative of the Y.W.C.A. said at a public meeting that the "Y" now is forced to shelter female hoboes, hitch-hikers, inebriates and other questionable characters.

In Van of Ghastly Parade

San Diego has long marched in the van of the ghastly parade of corpses strewn from coast to coast by that marvelous mechanical creation, the automobile, which, in the hands of punks, drunks, dimwits and just plain careless damphools, is more deadly than all the bombs dropped on Britain. City traffic deaths rose from 45 in 1939 to 61 as of today.

The national draft lottery Oct. 29 was a big story to the 30,000 San Diegans between 21 and 35 who had registered for the nation's first peace time conscription. On Nov. 22, the first contingent of 31 draftees were given a royal send-off at Union station by the marine corps band and a large crowd of citizens.

In the field of labor, both the A.F.L. and C.I.O. were active in organizing during the year. In August, a dispute between the San Diego Building and Construction Trades council, A.F.L., and local lumbermen, shut down 13 lumber and building material yards for several days. The "strike" or "lock-out" involved several hundred members of the millmen's and teamsters' unions.

Distinguished Guests

Distinguished visitors included Col. Frank Knox, secretary of the navy, and Wendell Willkie. Col. Knox came here by plane from Honolulu to inspect naval establishments Sept. 16 and 17. Willkie made a campaign speech to 10,000 persons at Lane field Sept. 18.

Two local amateur teams reached the finals in national tournaments. The San Diego State college basketball team, coached by Morris Gross, won four straight last-minute victories in the National Intercollegiates at Kansas City in March, only to lose out in the finals to Tarkio, Mo., college, 52 to 42. (The Aztecs lost the title by one point in 1939.) Post 6, American Legion, junior baseball team, which won the national championship in 1938, again was coached into the "little world series" by Mike Morrow. They lost the deciding game to Albemarle, N. C., 9 to 8, after their two Negro stars were barred from play.

Consolidated Tests Long Range Bomber

Initial tests were undertaken over San Diego recently of Consolidated Aircraft's B-24, a new, long-range bomber, the first of a fleet of seven destined for Britain. It is powered with four 1,200 horsepower engines, and has a wing span of 110 feet.

The B-24 has a capacity of four tons of bombs, and a crew of nine, and its cruising radius is 3,000 miles. Top speed is believed to be 300 miles an hour.

It was reported that these bombers would be used to ferry Canadian pilots to the British Isles.

Customary 'Biggest News' Stories Overshadowed by 1940 Growth

By SPENCER HELD

San Diego, long famed for its pretty girls and sun-bronzed athletes, its shirt-sleeved tourists and the dungaree navy, became a national defense boom town in 1940.

The new World war overshadowed local news in 1939, and we abandoned our annual custom of picking the 10 biggest San Diego news stories of the year. But the then "phony war" had some repercussions here—the fleet returned a month early from the east coast; President Roosevelt ordered 49 World war destroyers reconditioned at the local base; 21 warships departed for "security patrol" duty in Hawaiian waters, and Consolidated Aircraft Corp. got some contracts which seemed fat at the time.

We hadn't seen anything, yet. In 1940, when the mechanized German army overran France and the Luftwaffe besieged Britain, a state of emergency was proclaimed in the United States and San Diego became a focal point of tremendous importance on the national defense map.

Consolidated Aircraft expanded enormously to handle a flood of orders from Britain and the United States. New buildings were dedicated on the Lindbergh field site Sept. 2, and work was pushed on another final assembly building, 360 by 720 feet, and a single 200-by-1500-foot structure for small parts assembly.

On Dec. 18, it was announced that a parts factory would be built along the east side of Pacific highway about 1 1-3 miles north of the main plant. This will cost more than $14,000,000 and will virtually double Consair's present size. It is scheduled to go into full operation by June, 1941.

The number of employes jumped from 3170 to 13,832 on Dec. 24, and the backlog of orders soared from a respectable $42,141,694 to an incredible $323,000,000 at year's end.

Ryan Aeronautical Co. also went into high-geared production. With 700 employes and a backlog of $1,500,000 at the beginning of the year,

End CATARRH
You can clear away stuffy congestion, get rid of dangerous germs and stop that constant flow of poison into your system. How? Simply by applying 'Mentholatum' into your nostrils. The instant you do so, this breathable balm volatilises and you commence inhaling its antiseptics. Quickly, pleasantly, the 'Mentholatum' vapours stop the gathering of germs, clear the nasal cavities and open up your breathing passages. 'Mentholatum' Brand Balm stops Head Colds, banishes Catarrh, ends Chest Colds. All Chemists, 6d. and 1/3 plus Purchase Tax.

As R.A.F. bombers make 1,400-mile trip to fire the Skoda works—

46 FLYING FORTRESSES ARE RELEASED TO US

Latest types will be fitted with secret bombsight

SIMULTANEOUS WITH RELEASE OF THE NEWS OF A BRITISH AIR RAID FAR INTO GERMANY OVER A CITY THE NAZIS THOUGHT WE COULD NOT REACH CAME THIS DESPATCH LAST NIGHT:—

Daily Express Staff Reporter C. V. R. THOMPSON

NEW YORK, Wednesday.

AMERICA'S Army High Command tonight announced that they have given up to Britain a fleet of twenty-six four-engined bombers of the Flying Fortress type, which were awaiting delivery to the U.S. Army.

These machines, claimed to be the most advanced bomber type in the world, are a development of the Boeing 22-ton Flying Fortress, and were built by the Consolidated Aircraft Corporation at San Diego, California.

General George C. Marshall, Chief of Staff, said that deliveries would start immediately, and would be completed by the end of this month.

"In fact," he said, "Britain is supposed to have taken delivery of some of them last Saturday."

The High Command announcement reveals, too, that negotiations are well under way to supply Britain with another twenty Flying Fortresses now in process of assembly at the Boeing Company's Seattle plant.

ALL BY MARCH 1

Delivery of this fleet, General Marshall indicated, would be completed by March 1.

These twenty are being equipped with the famed Sperry bombsight, said to be capable of aiming a bomb "into a barrel from 10,000 feet."

The Consolidated four-engined bombers have just begun coming off the production lines, and the negotiations just completed will enable Britain to take first deliveries.

General Marshall said that the United States Army is prepared to accept a three months' lag in its own deliveries of this type.

"In return," he said, "the British Government has released to the United States sufficient engines to equip forty-one Boeing Flying Fortresses, which the United States Army has already accepted without engines or will have received without engines before January 1."

Amer Aviation 10/1/40

CONSOLIDATED

Already claiming the largest U. S. integrated plane plant, Consolidated Aircraft Corp. disclosed plans to built an $800,000 structure which will add 300,000 sq. ft. of floor space to approximately 2,000,000 sq. ft. now in use.

The new addition, which will be located on 22 acres of tidelands on which the firm has held an option, will extend into Lindbergh Field, San Diego, Cal.'s, municipal airport, due west of the present plant. It will be 200 ft. wide and 1,500 ft. long.

The company said its backlog is now in excess of $120,000,000 and that its list of employes has reached an all-time high of 9,485. Hundreds of additional workers will be employed when the new additions are opened.

Western Flying 12/40

SAN DIEGO

This month has been a very busy one for the **Consair Flyer's Club. Al Becker** has been preparing for his private ticket. **W. E. Jones** is ready to solo. **Stan Mahoney** received a bad cut on his thumb while installing a carburetor on a Pratt & Whitney. Our two new members, **Bennett** and **McFadden** should be ready for that old solo flight soon.

This month's Orchid goes to **Barney Farley** for his coolheadness, quick thinking and fine judgment in bringing the plane down in a forced landing safely on the beach along the Coronado Strand. **—Al Drayman.**

Recent announcement has been made of the engagement of **Raymond Dinson** to **Miss Ivalena Jones,** secretary at Consair. Ray, also an employe of Consair, is a charter member of the **Southern California Flyers.**

» OUTDOOR ASSEMBLY of airplanes is being practiced most extensively at Consolidated in San Diego where temporary canvas-covered sheds, divided into stalls are used for finishing operations on hulls. In the yard are dozens of partially completed ships awaiting parts from subcontractors in other parts of the country. Meanwhile construction is progressing on a building larger than the present huge plant and a parts factory is planned to be built a short distance from the airport. Employment records showed 13,000 on the day of our visit.

Aviation 12/40

Aviation 10/40

Consolidated Aircraft has purchased the Hall Aluminum Aircraft Corporation.

Consolidated Aircraft Corp., San Diego, Calif., $75,313 for airplanes.

Glenn L. Martin Co., Baltimore, Md., $106,125 for airplanes.

United Aircraft Corp., East Hartford, Conn., $59,490,703 for airplane engines.

---

the target. It is comparatively easy to score a hit on a fairly small target, though there is only one position for release in any dive for the path of the bomb after leaving the aircraft is not straight.

The low-level attack is made at high speed and from a low altitude without the use of bomb sight. In some cases it has been found desirable to attach each bomb to a small parachute to give the attacking machine time to clear the explosion.

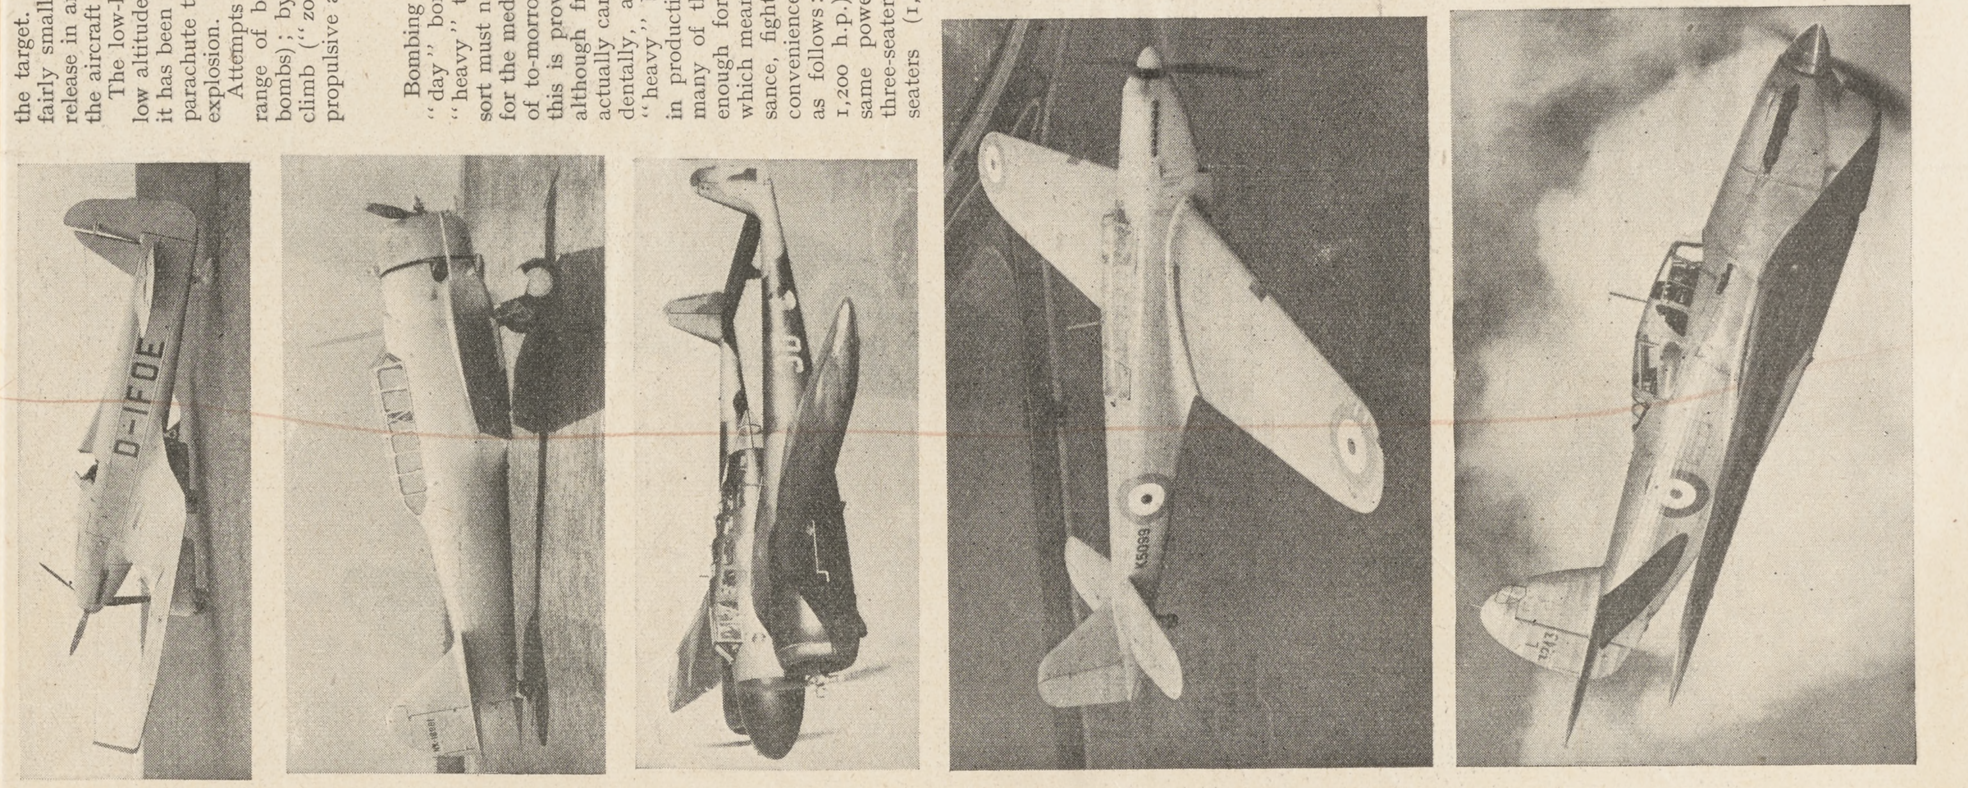
Attempts have been made to increase the horizontal range of bombs by fitting them with wings ("glider" bombs); by releasing them at the beginning of a sharp climb ("zoom" bombing); and by fitting them with a propulsive agent ("rocket" bombs).

Classification

Bombing aircraft have been categorised as "night" and "day" bombers and later as "light," "medium" and "heavy" types according to load. Classification of this sort must necessarily be confined to contemporary aircraft, for the medium bomber of to-day may be the light bomber of to-morrow. Perhaps the most outstanding instance of this is provided by the Handley Page Hampden which, although frequently referred to as a medium bomber, actually carries a bigger load for a longer range (and, incidentally, at a much higher speed) than the Harrow "heavy" bomber, which was its immediate predecessor in production. Matters are further complicated because many of the bombers of intermediate size are versatile enough for classification as "multi-purpose" machines, which means that they are readily adaptable for reconnaissance, fighting or ground attack work. For the sake of convenience modern bombing machines may be classed as follows: Specialised single-seater dive-bombers (650-1,200 h.p.); specialised two-seater dive-bombers in the same power class; non-specialised single-engined two/three-seaters of similar power; twin-engined two/five-seaters (1,300-3,000 h.p.); three-engined multi-seaters (2,000-4,000 h.p.); and four-engined multi-seaters (2,800-6,000 h.p.).

Dive Bombers

Specialised dive-bombers are being studiously developed, particularly on the Continent, and larger types of non-specialised bombers are in many cases being designed with "shallow" dive-bombing in view. Yet only three years ago a high-ranking officer stated that dive-bombing was not practical in the R.A.F. because contemporary aeroplanes reached such high speeds in a dive that it would be very difficult to pull them out if, indeed, they did not break up in the air. Even later a prominent technician wrote to *Flight* as follows:—"If dive-bombing has a sufficient value to justify an appreciable loss in the performance normally required from a bomber, then the dive-bomber can most efficiently be a machine with a top speed about half to two-thirds of the required dive speed. If you want to dive-bomb from anything much faster than this you will, in practice, have to get your high speed by using an excessive engine power for the military load which it will carry. If it is a clean aeroplane with (air) brakes this will occur because the structural weight required to cope with the brake loads will be colossal and you will have to use a very large, expensive machine to carry very little useful load. And it would be more



Five dive-bombers. From top to bottom they are the Blohm and Voss Ha 137 single-seater (Germany); North American NA 44 two-seater (U.S.A.); Fokker G.1 two-seater (Holland)—this machine can be used for a variety of duties; Fairey P.4/34 two-seater (Gt. Britain); and Hawker Henley two-seater (Gt. Britain). The Henley has internal bomb stowage, though additional bombs may be carried under the wings.

U.S. Bomber on Way Here

From DON IDDON, Daily Mail Correspondent

NEW YORK, Wednesday.

TWENTY-SIX four-engined bombers ordered by the United States Air Force and now coming off the production lines at the Consolidated Aircraft Company's factory at San Diego, California, have been released to Great Britain. The British Government took delivery of the first machine last Saturday.

Simultaneously with this announcement to-day in Washington, it was stated that the United States Army High Command have released the Sperry secret bomb-sight to Great Britain.

General George C. Marshall, United States Army Chief of Staff, making the announcements, said that negotiations are also under way to give Britain 20 of the famous Boeing Flying Fortresses now completed.

The Consolidated Company's four-engined bombers are a later type than the Flying Fortresses. Like the

Flying Fortresses, th a range of 3,000 mi loaded, and can re part of German British bases.

The machines wi delivered by March

General Marshall no comparable pl ever been used in active operations. The United States was anxious to see the results.

To release the planes fo Britain the United State Army have accepted a dela of three months in their ow deliveries.

General Marshall added that in return, Britain has released to the United States Army sufficient engines to equip 41 Boeing bombers which the Army had accepted without engines.

The Sperry bomb-sight is one of the two high-accuracy bomb-sights developed by the United States Army.

More Destroyers

The Norden sight, the later of the two, is the one with which the more modern United States Army planes are equipped.

General Marshall disclosed that United States Army observers are flying in British planes over Britain and the English Channel. "They have not flown over Germany," he said.

Lord Lothian, the British Ambassador, is expected to make two requests to the United States Government for further aid immediately he arrives back in Washington.

He is expected this week-end. His requests will be for:

(1) The release of 50 more overage destroyers;

(2) The transfer to Britain of a fleet of American merchant ships.

Tremendous pressure is being put on the Administration to implement the pledge of "all aid to

aircraft production to send more planes to Britain; pool United States merchant fleets with the British Mercantile Marine; protect the British rear against Japan, and "give, don't sell, our arms to Britain."

Of merchant ships, the paper says:

"We have a considerable existing merchant fleet. We can pool it with the British Mercantile Marine, operating it so as to release British tonnage now in the Inidan and the Pacific Oceans for more dangerous service in the Atlantic.

"Should that fail, we can sell it into British hands without violating neutrality."

FLYING FORTS "DELIVERED"

Secret Bomb Sight

BRITAIN has already started to take delivery of the fleet of 26 four-engined bombers of the Flying Fortress type, which, it is revealed in Washington, have been released to her by the U.S. Army High Command.

It is understood, says Reuter, that the first deliveries were actually made last Saturday.

These giant bombers, known as the B-24, have been built by the Consolidated Aircraft Company at San Diego, California.

CAN REACH ALL GERMANY

Like the Flying Fortresses, they have a range of 3,000 miles and are capable of reaching any part of Germany from Great Britain.

Simultaneously, the U.S. High Command disclosed that:

Negotiations are under way for giving Britain 20 four-engined Boeing Flying Fortress bombers—the B-17 type—construction of which has already been completed.

Announcing these latest moves to aid Britain, at a Press conference, General George C. Marshall, U.S. Chief of Staff, stated that the U.S. Army would accept a delay of approximately three months in its own deliveries of the Consolidated B-24 bomber.

"In consideration of this priority," he said, "the British Government have released to the U.S. sufficient engines to equip forty-one Boeing flying fortresses, which the U.S. Army have already accepted without their engines or will have received without engines before January 1."

BOMB SIGHT RELEASED

General Marshall also announced that the Sperry bomb sight—one of the United States' two secret high-accuracy bomb-sights—has now been released to Britain.

He disclosed that the U.S. Army have observers in British warplanes flying over Britain and the Channel.

They have not flown over Germany, he added.

ALREADY USING BASES

The United States has already begun to use the naval bases obtained from Britain, Colonel Knox, U.S. Secretary of the Navy, stated at his press conference.

Naval patrol bombers, he said, were operating from Bermuda, and ships were using the base in Newfoundland

FAMOUS FLYING BOAT FOR BRITAIN

To Carry Aluminium from U.S.

New York, Monday.—Mr. Richard Archbold, the explorer, announced here that he has sold his flying boat Guba—which he has used on scientific expeditions in the jungle areas of Africa and New Guinea—to the British Government for the purpose of transporting aluminium from the United States to England.

The flying boat will make trips twice a week.

The aviator, Clyde Pangborn, will head the crew.

The Guba, a 14-ton craft, cost 250,000 dollars.—Reuter.

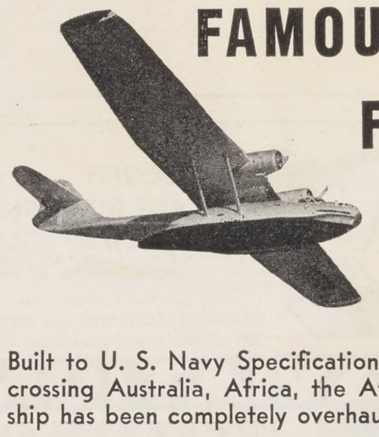
An American Transfer

CONSOLIDATED AIRCRAFT CORPORATION has bought the Hall-Aluminium Corporation together with all physical ssets and goodwill, patent rights, material and equipment. ome 32 key men of the Hall-Aluminium plant have joined e Consolidated organisation.

The Hall-Aluminium Company was first started in 1916 as harles Ward Hall, Inc., and has been continuously engaged research in the use of aluminium alloys for the design and onstruction of aircraft. The Company has concentrated ainly on flying-boats and seaplanes for the U.S. Navy and oast Guard and was one of the pioneers of all-metal construcon in the United States. In addition the Company has roduced and supplied parts and standardised aircraft sections all the principal constructors in the United States and anada.

The types produced by the Hall-Aluminium Company clude the F4C-1 fighter, the first all-metal aeroplane used by e U.S. Navy, the C-333, XFH-1, XPH-1, PH-1, PH-3, XP2H-1 four-motor long range bomber flying-boat and the XPTBH-2 twin float torpedo bomber.

This new acquisition should add to the assets and constructive power of the Consolidated Corporation which is working on large orders for the U.S. Government and the British Government. Its aeroplanes are among the best in the World.



FAMOUS FLYING BOAT FOR SALE!

CONSOLIDATED PBY 2 "GUBA"

Built to U. S. Navy Specifications—In A-1 condition throughout—Since crossing Australia, Africa, the Atlantic, Pacific and Indian Oceans, the ship has been completely overhauled by the factory.

Cruising range, 4000 miles—Maximum speed, 190 m.p.h.—Two 900 h.p. Pratt & Whitney Twin Wasp engines—Automatic pilot—Complete radio equipment, including homing devices and direction finders—Separate 110 volt motor generators—2 spare engines and many extra accessories—Further details on application. Circle 6-7560.

AVIATION
May, 1940

New Consolidated

Aviation 3/1940

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

Consolidated Expands

Aviation 3/1940

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, and 400,000 sq. ft. will be roofed. New facilities will include final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

Western Flying

December, 1940

MAJOR "REUB" FLEET

REUBEN HOLLIS FLEET

A VARIED career is no novelty in the aviation industry, which is yet so young that few of its top executives didn't come from some other field to forge ahead with aviation from its infancy, as did Major Reuben Hollis Fleet, president and general manager of Consolidated Aircraft Corp.

Major Fleet's career has been as varied as any, yet every activity in which he has engaged seems, in retrospect, to have contributed deliberately to his success today as founder and directing genius of one of the largest aircraft manufacturing units in America. The lumber business, real estate, manufacturing, legislative and political experience, military service—these past pursuits have combined in a background all too evidently valuable. Each one of Major Fleet's past successes has left him with a reservoir of experience upon which to draw when a related problem arises in airplane manufacturing.

Reuben Fleet was born in Montesano, Washington, in 1887. He graduated from Culver Military Academy in 1906 after service as Captain of his company and earning high scholastic honors. Outside the classrooms he earned his letters in football, baseball and track.

Upon his return to his home state he plunged into the active life that has been his ever since. He entered the lumber business, branched into real estate activities and later was elected to the Washington state legislature, where he served as chairman of its military affairs committee while at the same time a member of the Washington National Guard. Mexican border troubles found him serving there with his unit.

Thirty years of age when the United States entered the World War, he remained with the Army and won the rank of junior military aviator in San Diego in 1917. Then, in a rapid series of promotions he served as officer in charge of flying at Sacramento's Mather Field, executive officer in charge of training in the Office of Chief of Air Corps at Washington, assigned as pilot to the Gosport School for flying instructors in England, and was appointed to take charge of the Army's historic first scheduled airmail service between New York and Washington, D. C. in May, 1918. When the Army abandoned the route to the Post Office Department Major Fleet became contracting officer for the Air Corps and business manager of McCook Field, serving from January, 1919 to November, 1922.

During this period the Gallaudet Manufacturing Co. in East Greenwich, Conn., obtained a contract for the remodeling of a number of Army DH training planes but lacked a directing head to push the work through. Major Fleet was prevailed upon to resign from the Army and become Gallaudet's vice president and general manager. "Reub" Fleet was in the airplane business.

Five months later the Army remodeling contract was completed but Fleet had decided that DH's were outmoded as trainers and that a new company with a new airplane was indicated. From this idea was born Consolidated Aircraft Corp. in May of 1923.

The story of Consolidated was told in *Western Flying* last October's "Industry Portrait." Much remains to be told, however, of "Reub" Fleet's many-sided interests.

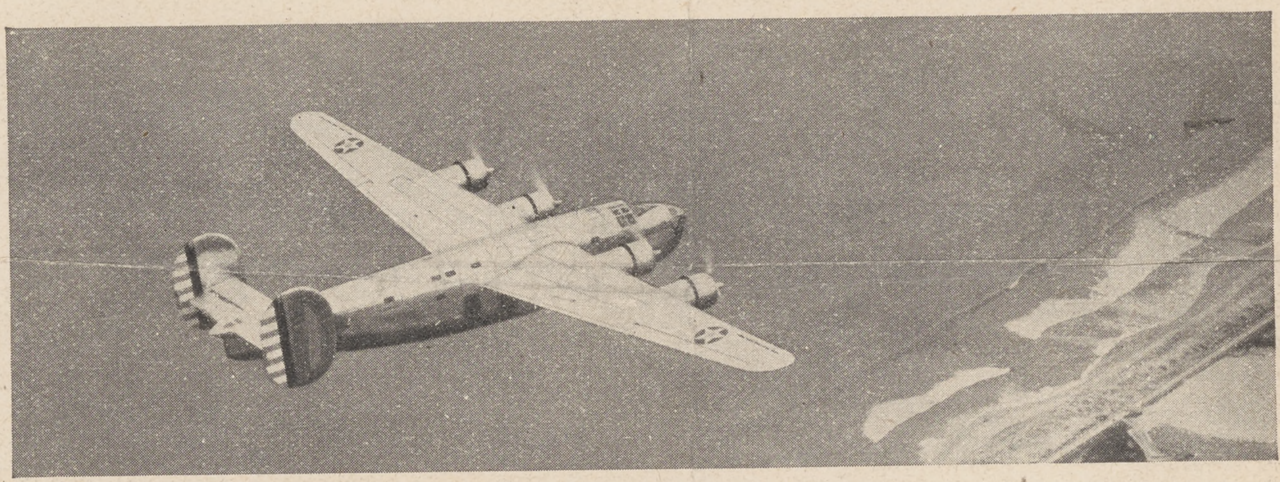
There were, for instance, the other companies he organized. In 1927 there was Tonawanda Products Corp. and in the lush days of 1929 there were Fleet Aircraft, Inc.; National Flying Schools, Inc.; Niagara From-The Air, Inc., a sightseeing and charter service; Frontier Enterprises, Inc.; and New York, Rio and Buenos Aires Line, Inc. The latter, a pioneer endeavor in the linking of North and South America, was a joint enterprise with J. H. Rand and R. A. O'Neil and is now a part of the Pan American Airways System. Finally, in 1930, Major Fleet organized Fleet Aircraft of Canada, Ltd., which is now Fleet Aircraft, Ltd. and is manufacturing sturdy descendants of the American Fleets which were virtually standard equipment for flying schools, military training, exhibition flyers and private aviation a decade ago.

Today Consolidated flying boats are the new destroyer squadrons of the Navy and a new bomber is in production upon which the United States air arms are depending mightily for early future use. It is fitting that the company headed by Major Fleet should occupy such a position in America's defense picture for he is of American stock of many generations.

His mother reached California from Illinois in a covered wagon. His father reached the Pacific Northwest from Kansas City by stage coach, horseback and finally on foot. That their son now covers those same weary miles by air in hours where they took months is in no small measure due to that son's enterprise and determination.

The responsibility doesn't weigh heavily upon "Reub" Fleet—it is too much a part of him. Aside from an occasional game of golf, Major Fleet's recreation comes to him as he sits behind his desk—at business.

Aeroplanes from the U.S.A.



AMERICA'S BEST BOMBER.—The consolidated Model 32 bomber (four 1,200 h.p. Pratt and Whitney Twin Wasp motors). Designated the B-24 by the U.S.A. Army, it has a top speed of more than 300 m.p.h. Unlike the unarmed B-17, the four-motor Consolidated can have power-operated turrets fitted in nose and tail and doubtless the 120 B-24s supplied to the R.A.F. will have them. They should do well.

Certain criticisms of American aeroplanes have evoked comment of various kinds. Two letters which appear below give two aspects of these reactions. Our reasons for advancing the criticisms and the grounds for our belief that they are just are stated below—Ed.

MR. A. H. WOOLLEN writes:—" I agree with Mr. Dennis Powell in raising a voice of protest against the belittling of American aeroplanes by your paper. I am no sympathiser with the American nation, and consider them the greatest ' line-shooters ' in the World. But even though your views on this matter may be the same, there is no justification for your absurd condemnation of practically every new type of American aeroplane as it rolls off the production line.

" It seems that your criticism is based mainly on poor armament, cramped quarters, unorthodox design, and, in the case of the Boeing B-17, great size. All these defects are, however, seen in some of our own aircraft. For instance, up to the beginning of the War the Handley Page Hampden and the Vickers Wellington were, according to Mr. C. G. Grey in his article, ' The Big Bombers,' inadequately armed, and under wartime conditions the armament had to be revised, with the result that these two machines are now very formidable. The American 'planes which you accuse of being under-armed could very easily be fitted with extra guns, as in the case of the Curtiss Hawk 75A which was fitted with four extra wing guns on the stipulation of the French. A similar case is our own Spitfire, which was, I believe, originally designed for four wing guns. The other four were added later.

" With regard to unorthodox design (as in the case of the Bell Airacobra, which you have singled out for so much ridicule) there have been a number of unorthodox machines which have proved very successful. A notable example is, or was, the Fokker G-1, which, until the type was completely wiped out, gave a very good account of itself against the Boche invader. The mere fact of the engine being new should not prejudice you against it; it is not nearly so untried as you make out, anyway, for the Americans cannot have much trouble with it, or they would not install it in their own Curtiss P.40s.

" American aeroplanes have no monopoly of cramped quarters. In an article on the Armstrong Whitworth Whitley some years ago, you commented that the space for the navigator and crew was somewhat restricted.

" Great size is not merely an ack-ack gunner's dream and ' the answer to a pursuit pilot's prayer ' (as you once quoted an American speaker). The Sunderland is a bigger machine than the Boeing, but has put up a splendid fight on many occasions. Further, Sunderlands have been used on at least one occasion to raid Norwegian ports. The R.A.F. seem to be favourably impressed by the four-motor bomber.

" You now excuse your previous unwarranted criticism of the Lockheed Hudson by saying that ' it had to adopt slit slots devised originally by engineers of British Airways.' So what? If I am not mistaken, the committee which investigated the unfortunate accident to the flying-boat Cavalier between New York and Bermuda advised Imperial Airways to adopt the Pan-American system of carburetter heating.

" I am not trying to boost American aeroplanes to the detriment of our own, but I do not like senseless disparagement of all things that are not British. I am merely trying to point out that to be patriotic does not mean to regard the products of every other country as being so much inferior to our own. It is useless to deny that we need aircraft very badly so why try to ride the high horse when we have an opportunity of getting what we require, even if we do have to pay cash in advance for it? It seems a pity that ' the most influential aviation journal in the World ' should be the mouthpiece of a certain section of the aeronautical public which cannot bear anything which is not British rather than a newspaper of aviation affairs which (I presume) it is meant to be."

The Why and the Wherefore

This is just the sort of letter we like to get because it states the opinions of the writer clearly and forcefully and yet gives us the chance of correcting erroneous opinions which may be widely held. For one thing, Mr. Woollen shares with others the mistaken idea that to criticise the products of a friendly Nation is not sporting—specially when that Nation is sending those products to help us in a very awkward situation.

Our comments on American aeroplanes during the past year have been based strictly on the elucidation of truth. When an aeroplane is good, such as the Hurricane or Douglas DC-3 or Me 110 we have never hesitated to say so. When an aeroplane is bad in certain essentials, such as the D.H. Don, the Boeing B-17 or the Junkers Ju 88, we have never hesitated to say so either. We hope to continue to be outspoken.

When the British Government first decided to place orders for military aeroplanes in America there was irony in the fact that the best of any aeroplanes they could find for military purposes were a converted civil air liner—the Hudson, and a trainer—the Harvard. Both have done well in service, but both, like many British and other aeroplanes, have had serious faults. For instance, the landing characteristics of the Hudson are, to say the least, peculiar and in certain circumstances dangerous. Its undercarriage is weak. The Harvard has killed many people. The fact that certain British aircraft have done so as well does not make the matter any better. Two blacks do not make a white.

Poor armament is about the worst of the faults of the American aeroplanes in general. Such details as that the bomb doors of the Martin 167 cannot be shut after bombing without nearly stalling the machine are incidental. Although the armament of the fighters can be increased the improving of that of the bombers such as the much vaunted B-17 is not so easy. Power-driven gun turrets are all very well but they cannot be put into any aeroplane. In the B-17, for instance, no tail turret is possible because of the single fin and rudder and because the centre of gravity would be thrown out.

We are still unpersuaded on the merits of the Airacobra which may be a very interesting experiment aerodynamically but still may not be a military triumph. The fact that we are to have a batch is explained by our decision to take the French " left overs." As we said before, it has all the disadvantages of the pusher plus all the disadvantages of the tractor plus some peculiar unto itself. The engine at the back may come in on the pilot in a crash and cannot protect him in a frontal attack. The tractor airscrew batters the slipstream past the

26 GIANT U.S. BOMBERS

Deliveries Begin to Britain

WASHINGTON, Wednesday

THE United States Army High Command has given Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California.

The High Command simultaneously announces that negotiations are under way for giving Britain 20 four-engined Boeing bombers of the Flying Fortress type, which have already been completed. The machines of the Consolidated Aircraft Company are reported to be very similar to the Flying Fortresses, both types being capable of a range of 3,000 miles.

The Consolidated Company's four-engine bombers have just begun coming off the production lines, and the negotiations which have now been completed, will enable Britain to take the first deliveries. Indeed, the first deliveries, it is understood, were made to Britain last Saturday.

Sperry Bombsights

The U.S. Army will accept a delay of approximately three months in its own deliveries of this same type, known as the B-24, General George C. Marshall, U.S Army Chief of Staff, told a Press conference to-day. In consideration of this priority, the British Government has released to the U.S. sufficient engines to equip 41 Boeing Flying Fortresses, which the U.S. Army had already accepted without their engines, or would have received without engines before January 1.

The General, referring to the Boeing Company's B-17 type of four-engined bomber, said:—

"We are now in process of negotiating with the British authorities the basis for releasing to them 20 fully-equipped 'planes except as to the Norden bombsight.

General Marshal simultaneously announced that the Sperry bombsight has been released to Britain.

This is one of the two high-accuracy bombsights which have been developed in the United States.

General Marshal said the Norden sight, the more modern of the two bombsights, is now being used by the Army and Navy, while the Sperry sight was no longer used in military planes in the United States.

Both types of bombing planes have ranges capable of reaching any part of Germany from Great Britain

General Marshal disclosed that the United States Army has observers in British warplanes flying over Britain and the British Channel, but they have not flown over Germany.—Press Association War Special.

More Destroyers?

WASHINGTON, Wednesday

A new British request for over-age destroyers is likely to be made by Lord Lothian, the British Ambassador to the United States, as soon as he returns to Washington, according to well-informed quarters here to-day.

The figure of 50 destroyers is mentioned.

Lord Lothian is expected here before the week-end.—Press Association War Special.

U.S. NAVAL RESERVES

WASHINGTON, Wednesday

Colonel Knox, Secretary to the U.S. Navy, to-day announced that additional fleet divisions of naval reserves would be ordered to report for active duty in December and January. He also stated that the Navy may ask Congress for more money this session, but declined to disclose the specific amount or the purpose on which it would be spent.

U.S. Bomber Fleet on Way Here

From DON IDDON, Daily Mail Correspondent

NEW YORK, Wednesday.

TWENTY-SIX four-engined bombers ordered by the United States Air Force and now coming off the production lines at the Consolidated Aircraft Company's factory at San Diego, California, have been released to Great Britain. The British Government took delivery of the first machine last Saturday.

Simultaneously with this announcement to-day in Washington, it was stated that the United States Army High Command have released the Sperry secret bomb-sight to Great Britain.

General George C. Marshall, United States Army Chief of Staff, making the announcements, said that negotiations are also under way to give Britain 20 of the famous Boeing Flying Fortresses now completed.

The Consolidated Company's four-engined bombers are a later type than the Flying Fortresses. Like the

Flying Fortresses, th a range of 3,000 mi loaded, and can re part of German British bases.

The machines wi delivered by March

General Marshall no comparable pl ever been used in active operations. The United States was anxious to see the results.

To release the planes fo Britain the United State Army have accepted a dela of three months in their ow deliveries.

General Marshall added that in return, Britain has released to the United States Army sufficient engines to equip 41 Boeing bombers which the Army had accepted without engines.

The Sperry bomb-sight is one of the two high-accuracy bomb-sights developed by the United States Army.

More Destroyers

The Norden sight, the later of the two, is the one with which the more modern United States Army planes are equipped.

General Marshall disclosed that United States Army observers are flying in British planes over Britain and the English Channel. "They have not flown over Germany," he said.

Lord Lothian, the British Ambassador, is expected to make two requests to the United States Government for further aid immediately he arrives back in Washington.

He is expected this week-end.

His requests will be for:

(1) The release of 50 more overage destroyers;

(2) The transfer to Britain of a fleet of American merchant ships.

Tremendous pressure is being put on the Administration to implement the pledge of "all aid to

aircraft production to send more planes to Britain; pool United States merchant fleets with the British Mercantile Marine; protect the British rear against Japan, and "give, don't sell, our arms to Britain."

Of merchant ships, the paper says:

"We have a considerable existing merchant fleet. We can pool it with the British Mercantile Marine, operating it so as to release British tonnage now in the Inidan and the Pacific Oceans for more dangerous service in the Atlantic.

"Should that fail, we can sell it into British hands without violating neutrality."

FAMOUS FLYING BOAT FOR BRITAIN

To Carry Aluminium from U.S.

New York, Monday.—Mr. Richard Archbold, the explorer, announced here that he has sold his flying boat Guba—which he has used on scientific expeditions in the jungle areas of Africa and New Guinea—to the British Government for the purpose of transporting aluminium from the United States to England.

The flying boat will make trips twice a week.

The aviator, Clyde Pangborn, will head the crew.

The Guba, a 14-ton craft, cost 250,000 dollars.—Reuter.

FLYING FORTS "DELIVERED"

Secret Bomb Sight

BRITAIN has already started to take delivery of the fleet of 26 four-engined bombers of the Flying Fortress type, which, it is revealed in Washington, have been released to her by the U.S. Army High Command.

It is understood, says Reuter, that the first deliveries were actually made last Saturday.

These giant bombers, known as the B-24, have been built by the Consolidated Aircraft Company at San Diego, California.

CAN REACH ALL GERMANY

Like the Flying Fortresses, they have a range of 3,000 miles and are capable of reaching any part of Germany from Great Britain.

Simultaneously, the U.S. High Command disclosed that:

Negotiations are under way for giving Britain 20 four-engined Boeing Flying Fortress bombers—the B-17 type—construction of which has already been completed.

Announcing these latest moves to aid Britain, at a Press conference, General George C. Marshall, U.S. Chief of Staff, stated that the U.S. Army would accept a delay of approximately three months in its own deliveries of the Consolidated B-24 bomber.

"In consideration of this priority," he said, "the British Government have released to the U.S. sufficient engines to equip forty-one Boeing flying fortresses, which the U.S. Army have already accepted without their engines or will have received without engines before January 1."

BOMB SIGHT RELEASED

General Marshall also announced that the Sperry bomb sight—one of the United States' two secret high-accuracy bomb-sights—has now been released to Britain.

He disclosed that the U.S. Army have observers in British warplanes flying over Britain and the Channel.

They have not flown over Germany, he added.

ALREADY USING BASES

The United States has already begun to use the naval bases obtained from Britain, Colonel Knox, U.S. Secretary of the Navy, stated at his press conference.

Naval patrol bombers, he said, were operating from Bermuda, and ships were using the base in Newfoundland

---

New Consolidated

Aviation 3/1940

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

Consolidated Expands

Aviation 3/1940

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, and 400,000 sq. ft. will be roofed. New facilities will include final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

Western Flying

December, 1940

MAJOR "REUB" FLEET

●

REUBEN HOLLIS FLEET

A VARIED career is no novelty in the aviation industry, which is yet so young that few of its top executives didn't come from some other field to forge ahead with aviation from its infancy, as did Major Reuben Hollis Fleet, president and general manager of Consolidated Aircraft Corp.

Major Fleet's career has been as varied as any, yet every activity in which he has engaged seems, in retrospect, to have contributed deliberately to his success today as founder and directing genius of one of the largest aircraft manufacturing units in America. The lumber business, real estate, manufacturing, legislative and political experience, military service—these past pursuits have combined in a background all too evidently valuable. Each one of Major Fleet's past successes has left him with a reservoir of experience upon which to draw when a related problem arises in airplane manufacturing.

Reuben Fleet was born in Montesano, Washington, in 1887. He graduated from Culver Military Academy in 1906 after service as Captain of his company and earning high scholastic honors. Outside the classrooms he earned his letters in football, baseball and track.

Upon his return to his home state he plunged into the active life that has been his ever since. He entered the lumber business, branched into real estate activities and later was elected to the Washington state legislature, where he served as chairman of its military affairs committee while at the same time a member of the Washington National Guard. Mexican border troubles found him serving there with his unit.

Thirty years of age when the United States entered the World War, he remained with the Army and won the rank of junior military aviator in San Diego in 1917. Then, in a rapid series of promotions he served as officer in charge of flying at Sacramento's Mather Field, executive officer in charge of training in the Office of Chief of Air Corps at Washington, assigned as pilot to the Gosport School for flying instructors in England, and was appointed to take charge of the Army's historic first scheduled airmail service between New York and Washington, D. C. in May, 1918. When the Army abandoned the route to the Post Office Department Major Fleet became contracting officer for the Air Corps and business manager of McCook Field, serving from January, 1919 to November, 1922.

During this period the Gallaudet Manufacturing Co. in East Greenwich, Conn., obtained a contract for the remodeling of a number of Army DH training planes but lacked a directing head to push the work through. Major Fleet was prevailed upon to resign from the Army and become Gallaudet's vice president and general manager. "Reub" Fleet was in the airplane business.

Five months later the Army remodeling contract was completed but Fleet had decided that DH's were outmoded as trainers and that a new company with a new airplane was indicated. From this idea was born Consolidated Aircraft Corp. in May of 1923.

The story of Consolidated was told in *Western Flying* last October's "Industry Portrait." Much remains to be told, however, of "Reub" Fleet's many-sided interests.

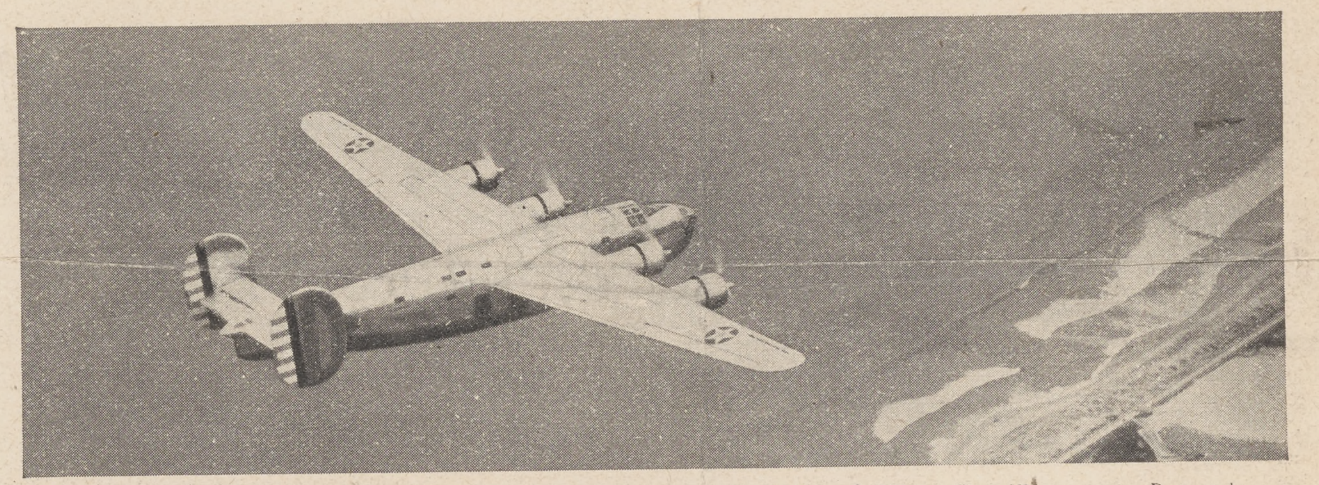
There were, for instance, the other companies he organized. In 1927 there was Tonawanda Products Corp. and in the lush days of 1929 there were Fleet Aircraft, Inc.; National Flying Schools, Inc.; Niagara From-The Air, Inc., a sightseeing and charter service; Frontier Enterprises, Inc.; and New York, Rio and Buenos Aires Line, Inc. The latter, a pioneer endeavor in the linking of North and South America, was a joint enterprise with J. H. Rand and R. A. O'Neil and is now a part of the Pan American Airways System. Finally, in 1930, Major Fleet organized Fleet Aircraft of Canada, Ltd., which is now Fleet Aircraft, Ltd. and is manufacturing sturdy descendants of the American Fleets which were virtually standard equipment for flying schools, military training, exhibition flyers and private aviation a decade ago.

Today Consolidated flying boats are the new destroyer squadrons of the Navy and a new bomber is in production upon which the United States air arms are depending mightily for early future use. It is fitting that the company headed by Major Fleet should occupy such a position in America's defense picture for he is of American stock of many generations.

His mother reached California from Illinois in a covered wagon. His father reached the Pacific Northwest from Kansas City by stage coach, horseback and finally on foot. That their son now covers those same weary miles by air in hours where they took months is in no small measure due to that son's enterprise and determination.

The responsibility doesn't weigh heavily upon "Reub" Fleet—it is too much a part of him. Aside from an occasional game of golf, Major Fleet's recreation comes to him as he sits behind his desk—at business.

Aeroplanes from the U.S.A.



AMERICA'S BEST BOMBER.—The consolidated Model 32 bomber (four 1,200 h.p. Pratt and Whitney Twin Wasp motors). Designated the B-24 by the U.S.A. Army, it has a top speed of more than 300 m.p.h. Unlike the unarmed B-17, the four-motor Consolidated can have power-operated turrets fitted in nose and tail and doubtless the 120 B-24s supplied to the R.A.F. will have them. They should do well.

Certain criticisms of American aeroplanes have evoked comment of various kinds. Two letters which appear below give two aspects of these reactions. Our reasons for advancing the criticisms and the grounds for our belief that they are just are stated below—Ed.

MR. A. H. WOOLLEN writes:—" I agree with Mr. Dennis Powell in raising a voice of protest against the belittling of American aeroplanes by your paper. I am no sympathiser with the American nation, and consider them the greatest 'line-shooters' in the World. But even though your views on this matter may be the same, there is no justification for your absurd condemnation of practically every new type of American aeroplane as it rolls off the production line.

" It seems that your criticism is based mainly on poor armament, cramped quarters, unorthodox design, and, in the case of the Boeing B-17, great size. All these defects are, however, seen in some of our own aircraft. For instance, up to the beginning of the War the Handley Page Hampden and the Vickers Wellington were, according to Mr. C. G. Grey in his article, 'The Big Bombers,' inadequately armed, and under wartime conditions the armament had to be revised, with the result that these two machines are now very formidable. The American 'planes which you accuse of being under-armed could very easily be fitted with extra guns, as in the case of the Curtiss Hawk 75A which was fitted with four extra wing guns on the stipulation of the French. A similar case is our own Spitfire, which was, I believe, originally designed for four wing guns. The other four were added later.

" With regard to unorthodox design (as in the case of the Bell Airacobra, which you have singled out for so much ridicule) there have been a number of unorthodox machines which have proved very successful. A notable example is, or was, the Fokker G-1, which, until the type was completely wiped out, gave a very good account of itself against the Boche invader. The mere fact of the engine being new should not prejudice you against it; it is not nearly so untried as you make out, anyway, for the Americans cannot have much trouble with it, or they would not install it in their own Curtiss P.40s.

" American aeroplanes have no monopoly of cramped quarters. In an article on the Armstrong Whitworth Whitley some years ago, you commented that the space for the navigator and crew was somewhat restricted.

" Great size is not merely an ack-ack gunner's dream and 'the answer to a pursuit pilot's prayer' (as you once quoted an American speaker). The Sunderland is a bigger machine than the Boeing, but has put up a splendid fight on many occasions. Further, Sunderlands have been used on at least one occasion to raid Norwegian ports. The R.A.F. seem to be favourably impressed by the four-motor bomber.

" You now excuse your previous unwarranted criticism of the Lockheed Hudson by saying that 'it had to adopt slit slots devised originally by engineers of British Airways.' So what? If I am not mistaken, the committee which investigated the unfortunate accident to the flying-boat Cavalier between New York and Bermuda advised Imperial Airways to adopt the Pan-American system of carburetter heating.

" I am not trying to boost American aeroplanes to the detriment of our own, but I do not like senseless disparagement of all things that are not British. I am merely trying to point out that to be patriotic does not mean to regard the products of every other country as being so much inferior to our own. It is useless to deny that we need aircraft very badly so why try to ride the high horse when we have an opportunity of getting what we require, even if we do have to pay cash in advance for it? It seems a pity that 'the most influential aviation journal in the World' should be the mouthpiece of a certain section of the aeronautical public which cannot bear anything which is not British rather than a newspaper of aviation affairs which (I presume) it is meant to be."

The Why and the Wherefore

This is just the sort of letter we like to get because it states the opinions of the writer clearly and forcefully and yet gives us the chance of correcting erroneous opinions which may be widely held. For one thing, Mr. Woollen shares with others the mistaken idea that to criticise the products of a friendly Nation is not sporting—specially when that Nation is sending those products to help us in a very awkward situation.

Our comments on American aeroplanes during the past year have been based strictly on the elucidation of truth. When an aeroplane is good, such as the Hurricane or Douglas DC-3 or Me 110 we have never hesitated to say so. When an aeroplane is bad in certain essentials, such as the D.H. Don, the Boeing B-17 or the Junkers Ju 88, we have never hesitated to say so either. We hope to continue to be outspoken.

When the British Government first decided to place orders for military aeroplanes in America there was irony in the fact that the best of any aeroplanes they could find for military purposes were a converted civil air liner—the Hudson, and a trainer—the Harvard. Both have done well in service, but both, like many British and other aeroplanes, have had serious faults. For instance, the landing characteristics of the Hudson are, to say the least, peculiar and in certain circumstances dangerous. Its undercarriage is weak. The Harvard has killed many people. The fact that certain British aircraft have done so as well does not make the matter any better. Two blacks do not make a white.

Poor armament is about the worst of the faults of the American aeroplanes in general. Such details as that the bomb doors of the Martin 167 cannot be shut after bombing without nearly stalling the machine are incidental. Although the armament of the fighters can be increased the improving of that of the bombers such as the much vaunted B-17 is not so easy. Power-driven gun turrets are all very well but they cannot be put into any aeroplane. In the B-17, for instance, no tail turret is possible because of the single fin and rudder and because the centre of gravity would be thrown out.

We are still unpersuaded on the merits of the Airacobra which may be a very interesting experiment aerodynamically but still may not be a military triumph. The fact that we are to have a batch is explained by our decision to take the French "left overs." As we said before, it has all the disadvantages of the pusher plus all the disadvantages of the tractor plus some peculiar unto itself. The engine at the back may come in on the pilot in a crash and cannot protect him in a frontal attack. The tractor airscrew batters the slipstream past the

26 GIANT U.S. BOMBERS

Deliveries Begin to Britain

WASHINGTON, Wednesday

THE United States Army High Command has given Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California.

The High Command simultaneously announces that negotiations are under way for giving Britain 20 four-engined Boeing bombers of the Flying Fortress type, which have already been completed. The machines of the Consolidated Aircraft Company are reported to be very similar to the Flying Fortresses, both types being capable of a range of 3,000 miles.

The Consolidated Company's four-engine bombers have just begun coming off the production lines, and the negotiations which have now been completed, will enable Britain to take the first deliveries. Indeed, the first deliveries, it is understood, were made to Britain last Saturday.

Sperry Bombsights

The U.S. Army will accept a delay of approximately three months in its own deliveries of this same type, known as the B-24, General George C. Marshall, U.S Army Chief of Staff, told a Press conference to-day. In consideration of this priority, the British Government has released to the U.S. sufficient engines to equip 41 Boeing Flying Fortresses, which the U.S. Army had already accepted without their engines, or would have received without engines before January 1.

The General, referring to the Boeing Company's B-17 type of four-engined bomber, said:—

" We are now in process of negotiating with the British authorities the basis for releasing to them 20 fully-equipped 'planes except as to the Norden bombsight.

General Marshal simultaneously announced that the Sperry bombsight has been released to Britain.

This is one of the two high-accuracy bombsights which have been developed in the United States.

General Marshal said the Norden sight, the more modern of the two bombsights, is now being used by the Army and Navy, while the Sperry sight was no longer used in military planes in the United States.

Both types of bombing 'planes have ranges capable of reaching any part of Germany from Great Britain

General Marshal disclosed that the United States Army has observers in British warplanes flying over Britain and the British Channel, but they have not flown over Germany.—Press Association War Special.

More Destroyers?

WASHINGTON, Wednesday

A new British request for over-age destroyers is likely to be made by Lord Lothian, the British Ambassador to the United States, as soon as he returns to Washington, according to well-informed quarters here to-day.

The figure of 50 destroyers is mentioned.

Lord Lothian is expected here before the week-end.—Press Association War Special.

U.S.NAVAL RESERVES

WASHINGTON, Wednesday

Colonel Knox, Secretary to the U.S. Navy, to-day announced that additional fleet divisions of naval reserves would be ordered to report for active duty in December and January. He also stated that the Navy may ask Congress for more money this session, but declined to disclose the specific amount or the purpose on which it would be spent.

U.S. Bomber Fleet on Way Here

From DON IDDON, Daily Mail Correspond

NEW YORK, We

TWENTY-SIX four-engined bombers ordered
States Air Force and now coming off th
lines at the Consolidated Aircraft Compa
Diego, California, have been released to
British Government took delivery of the first machine last Saturday.

Simultaneously with this announcement to-day in Washington, it was stated that the United States Army High Command have released the Sperry secret bomb-sight to Great Britain.

General George C. Marshall, United States Army Chief of Staff, making the announcements, said that negotiations are also under way to give Britain 20 of the famous Boeing Flying Fortresses now completed.

The Consolidated Company's four-engined bombers are a later type than the Flying Fortresses. Like the Flying Fortresses, they have a range of 3,000 miles fully loaded, and can reach any part of Germany from British bases.

The machines will all be delivered by March next.

General Marshall said that no comparable plane had ever been used in active operations. The United States was anxious to see the results.

To release the planes for Britain the United States Army have accepted a delay of three months in their own deliveries.

General Marshall added that in return, Britain has released to the United States Army sufficient engines to equip 41 Boeing bombers which the Army had accepted without engines.

The Sperry bomb-sight is one of the two high-accuracy bomb-sights developed by the United States Army.

More Destroyers

The Norden sight, the later of the two, is the one with which the more modern United States Army planes are equipped.

General Marshall disclosed that United States Army observers are flying in British planes over Britain and the English Channel. "They have not flown over Germany," he said.

Lord Lothian, the British Ambassador, is expected to make two requests to the United States Government for further aid immediately he arrives back in Washington.

He is expected this week-end. His requests will be for:

(1) The release of 50 more over-age destroyers;

(2) The transfer to Britain of a fleet of American merchant ships.

Tremendous pressure is being put on the Administration to implement the pledge of "all aid to Britain short of war" at greater speed.

To-day's *New York Herald-Tribune* outlines a programme for speeding help.

The points stressed are: Increase aircraft production to send more planes to Britain; pool United States merchant fleets with the British Mercantile Marine; protect the British rear against Japan, and "give, don't sell, our arms to Britain."

Of merchant ships, the paper says:

"We have a considerable existing merchant fleet. We can pool it with the British Mercantile Marine, operating it so as to release British tonnage now in the Inidan and the Pacific Oceans for more dangerous service in the Atlantic.

"Should that fail, we can sell it into British hands without violating neutrality."

'The Answer to Coventry'

UNITED STATES War Department officials said in Washington yesterday that there was "no official connection" between the release to Britain of the 26 Consolidated bombers and the savage Nazi attack on Coventry.

They added: "The significance of the coincidence will not, however, be lost on the world."

Aviation 3/1940

Consolidated Aircraft is expanding its plant 82% to take care of a record $43,000,000 backlog. In negotiation are said to be British and French orders which would bring the backlog up to around $50,000,000.

Among the aviation investment trust annual reports for 1939, National Aviation disclosed a net asset value of $17.27 a share, Air Investors $1.67 a common share, and Aviation Capital Inc. $40.02 a share.

FLYING FORTS "DELIVERED"

Secret Bomb Sight

BRITAIN has already started to take delivery of the fleet of 26 four-engined bombers of the Flying Fortress type, which, it is revealed in Washington, have been released to her by the U.S. Army High Command.

It is understood, says Reuter, that the first deliveries were actually made last Saturday.

These giant bombers, known as the B-24, have been built by the Consolidated Aircraft Company at San Diego, California.

CAN REACH ALL GERMANY

Like the Flying Fortresses, they have a range of 3,000 miles and are capable of reaching any part of Germany from Great Britain.

Simultaneously, the U.S. High Command disclosed that:

Negotiations are under way for giving Britain 20 four-engined Boeing Flying Fortress bombers—the B-17 type—construction of which has already been completed.

Announcing these latest moves to aid Britain, at a Press conference, General George C. Marshall, U.S. Chief of Staff, stated that the U.S. Army would accept a delay of approximately three months in its own deliveries of the Consolidated B-24 bomber.

"In consideration of this priority," he said, "the British Government have released to the U.S. sufficient engines to equip forty-one Boeing flying fortresses, which the U.S. Army have already accepted without their engines or will have received without engines before January 1."

BOMB SIGHT RELEASED

General Marshall also announced that the Sperry bomb sight—one of the United States' two secret high-accuracy bomb-sights—has now been released to Britain.

He disclosed that the U.S. Army have observers in British warplanes flying over Britain and the Channel.

They have not flown over Germany, he added.

ALREADY USING BASES

The United States has already begun to use the naval bases obtained from Britain, Colonel Knox, U.S. Secretary of the Navy, stated at his press conference.

Naval patrol bombers, he said, were operating from Bermuda, and ships were using the base in Newfoundland

---

New Consolidated

Aviation 3/1940

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

Consolidated Expands

Aviation 3/1940

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, and 400,000 sq. ft. will be roofed. New facilities will include final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

Western Flying

December, 1940

MAJOR "REUB" FLEET

•

REUBEN HOLLIS FLEET

A VARIED career is no novelty in the aviation industry, which is yet so young that few of its top executives didn't come from some other field to forge ahead with aviation from its infancy, as did Major Reuben Hollis Fleet, president and general manager of Consolidated Aircraft Corp.

Major Fleet's career has been as varied as any, yet every activity in which he has engaged seems, in retrospect, to have contributed deliberately to his success today as founder and directing genius of one of the largest aircraft manufacturing units in America. The lumber business, real estate, manufacturing, legislative and political experience, military service—these past pursuits have combined in a background all too evidently valuable. Each one of Major Fleet's past successes has left him with a reservoir of experience upon which to draw when a related problem arises in airplane manufacturing.

Reuben Fleet was born in Montesano, Washington, in 1887. He graduated from Culver Military Academy in 1906 after service as Captain of his company and earning high scholastic honors. Outside the classrooms he earned his letters in football, baseball and track.

Upon his return to his home state he plunged into the active life that has been his ever since. He entered the lumber business, branched into real estate activities and later was elected to the Washington state legislature, where he served as chairman of its military affairs committee while at the same time a member of the Washington National Guard. Mexican border troubles found him serving there with his unit.

Thirty years of age when the United States entered the World War, he remained with the Army and won the rank of junior military aviator in San Diego in 1917. Then, in a rapid series of promotions he served as officer in charge of flying at Sacramento's Mather Field, executive officer in charge of training in the Office of Chief of Air Corps at Washington, assigned as pilot to the Gosport School for flying instructors in England, and was appointed to take charge of the Army's historic first scheduled airmail service between New York and Washington, D. C. in May, 1918. When the Army abandoned the route to the Post Office Department Major Fleet became contracting officer for the Air Corps and business manager of McCook Field, serving from January, 1919 to November, 1922.

During this period the Gallaudet Manufacturing Co. in East Greenwich, Conn., obtained a contract for the remodeling of a number of Army DH training planes but lacked a directing head to push the work through. Major Fleet was prevailed upon to resign from the Army and become Gallaudet's vice president and general manager. "Reub" Fleet was in the airplane business.

Five months later the Army remodeling contract was completed but Fleet had decided that DH's were outmoded as trainers and that a new company with a new airplane was indicated. From this idea was born Consolidated Aircraft Corp. in May of 1923.

The story of Consolidated was told in *Western Flying* last October's "Industry Portrait." Much remains to be told, however, of "Reub" Fleet's many-sided interests.

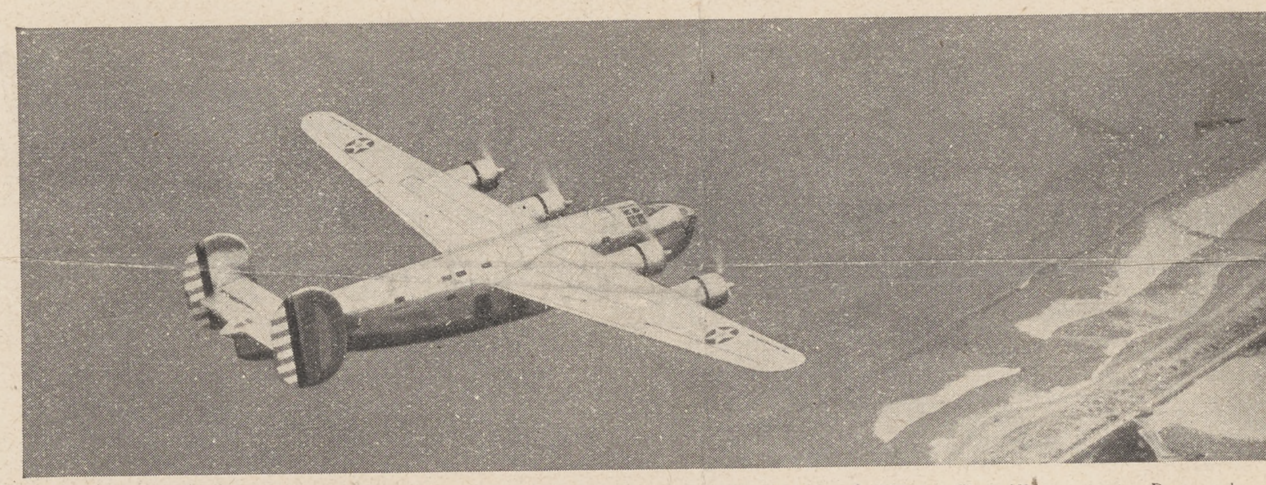
There were, for instance, the other companies he organized. In 1927 there was Tonawanda Products Corp. and in the lush days of 1929 there were Fleet Aircraft, Inc.; National Flying Schools, Inc.; Niagara From-The Air, Inc., a sightseeing and charter service; Frontier Enterprises, Inc.; and New York, Rio and Buenos Aires Line, Inc. The latter, a pioneer endeavor in the linking of North and South America, was a joint enterprise with J. H. Rand and R. A. O'Neil and is now a part of the Pan American Airways System. Finally, in 1930, Major Fleet organized Fleet Aircraft of Canada, Ltd., which is now Fleet Aircraft, Ltd. and is manufacturing sturdy descendants of the American Fleets which were virtually standard equipment for flying schools, military training, exhibition flyers and private aviation a decade ago.

Today Consolidated flying boats are the new destroyer squadrons of the Navy and a new bomber is in production upon which the United States air arms are depending mightily for early future use. It is fitting that the company headed by Major Fleet should occupy such a position in America's defense picture for he is of American stock of many generations.

His mother reached California from Illinois in a covered wagon. His father reached the Pacific Northwest from Kansas City by stage coach, horseback and finally on foot. That their son now covers those same weary miles by air in hours where they took months is in no small measure due to that son's enterprise and determination.

The responsibility doesn't weigh heavily upon "Reub" Fleet—it is too much a part of him. Aside from an occasional game of golf, Major Fleet's recreation comes to him as he sits behind his desk—at business.

Aeroplanes from the U.S.A.



AMERICA'S BEST BOMBER.—The consolidated Model 32 bomber (four 1,200 h.p. Pratt and Whitney Twin Wasp motors). Designated the B-24 by the U.S.A. Army, it has a top speed of more than 300 m.p.h. Unlike the unarmed B-17, the four-motor Consolidated can have power-operated turrets fitted in nose and tail and doubtless the 120 B-24s supplied to the R.A.F. will have them. They should do well.

Certain criticisms of American aeroplanes have evoked comment of various kinds. Two letters which appear below give two aspects of these reactions. Our reasons for advancing the criticisms and the grounds for our belief that they are just are stated below—Ed.

MR. A. H. WOOLLEN writes:—" I agree with Mr. Dennis Powell in raising a voice of protest against the belittling of American aeroplanes by your paper. I am no sympathiser with the American nation, and consider them the greatest 'line-shooters' in the World. But even though your views on this matter may be the same, there is no justification for your absurd condemnation of practically every new type of American aeroplane as it rolls off the production line.

" It seems that your criticism is based mainly on poor armament, cramped quarters, unorthodox design, and, in the case of the Boeing B-17, great size. All these defects are, however, seen in some of our own aircraft. For instance, up to the beginning of the War the Handley Page Hampden and the Vickers Wellington were, according to Mr. C. G. Grey in his article, 'The Big Bombers,' inadequately armed, and under wartime conditions the armament had to be revised, with the result that these two machines are now very formidable. The American 'planes which you accuse of being under-armed could very easily be fitted with extra guns, as in the case of the Curtiss Hawk 75A which was fitted with four extra wing guns on the stipulation of the French. A similar case is our own Spitfire, which was, I believe, originally designed for four wing guns. The other four were added later.

" With regard to unorthodox design (as in the case of the Bell Airacobra, which you have singled out for so much ridicule) there have been a number of unorthodox machines which have proved very successful. A notable example is, or was, the Fokker G-1, which, until the type was completely wiped out, gave a very good account of itself against the Boche invader. The mere fact of the engine being new should not prejudice you against it; it is not nearly so untried as you make out, anyway, for the Americans cannot have much trouble with it, or they would not install it in their own Curtiss P.40s.

" American aeroplanes have no monopoly of cramped quarters. In an article on the Armstrong Whitworth Whitley some years ago, you commented that the space for the navigator and crew was somewhat restricted.

" Great size is not merely an ack-ack gunner's dream and 'the answer to a pursuit pilot's prayer' (as you once quoted an American speaker). The Sunderland is a bigger machine than the Boeing, but has put up a splendid fight on many occasions. Further, Sunderlands have been used on at least one occasion to raid Norwegian ports. The R.A.F. seem to be favourably impressed by the four-motor bomber.

" You now excuse your previous unwarranted criticism of the Lockheed Hudson by saying that 'it had to adopt slit slots devised originally by engineers of British Airways.' So what? If I am not mistaken, the committee which investigated the unfortunate accident to the flying-boat Cavalier between New York and Bermuda advised Imperial Airways to adopt the Pan-American system of carburetter heating.

" I am not trying to boost American aeroplanes to the detriment of our own, but I do not like senseless disparagement of all things that are not British. I am merely trying to point out that to be patriotic does not mean to regard the products of every other country as being so much inferior to our own. It is useless to deny that we need aircraft very badly so why try to ride the high horse when we have an opportunity of getting what we require, even if we do have to pay cash in advance for it? It seems a pity that 'the most influential aviation journal in the World' should be the mouthpiece of a certain section of the aeronautical public which cannot bear anything which is not British rather than a newspaper of aviation affairs which (I presume) it is meant to be."

The Why and the Wherefore

This is just the sort of letter we like to get because it states the opinions of the writer clearly and forcefully and yet gives us the chance of correcting erroneous opinions which may be widely held. For one thing, Mr. Woollen shares with others the mistaken idea that to criticise the products of a friendly Nation is not sporting—specially when that Nation is sending those products to help us in a very awkward situation.

Our comments on American aeroplanes during the past year have been based strictly on the elucidation of truth. When an aeroplane is good, such as the Hurricane or Douglas DC-3 or Me 110 we have never hesitated to say so. When an aeroplane is bad in certain essentials, such as the D.H. Don, the Boeing B-17 or the Junkers Ju 88, we have never hesitated to say so either. We hope to continue to be outspoken.

When the British Government first decided to place orders for military aeroplanes in America there was irony in the fact that the best of any aeroplanes they could find for military purposes were a converted civil air liner—the Hudson, and a trainer—the Harvard. Both have done well in service, but both, like many British and other aeroplanes, have had serious faults. For instance, the landing characteristics of the Hudson are, to say the least, peculiar and in certain circumstances dangerous. Its undercarriage is weak. The Harvard has killed many people. The fact that certain British aircraft have done so as well does not make the matter any better. Two blacks do not make a white.

Poor armament is about the worst of the faults of the American aeroplanes in general. Such details as that the bomb doors of the Martin 167 cannot be shut after bombing without nearly stalling the machine are incidental. Although the armament of the fighters can be increased the improving of that of the bombers such as the much vaunted B-17 is not so easy. Power-driven gun turrets are all very well but they cannot be put into any aeroplane. In the B-17, for instance, no tail turret is possible because of the single fin and rudder and because the centre of gravity would be thrown out.

We are still unpersuaded on the merits of the Airacobra which may be a very interesting experiment aerodynamically but still may not be a military triumph. The fact that we are to have a batch is explained by our decision to take the French "left overs." As we said before, it has all the disadvantages of the pusher plus all the disadvantages of the tractor plus some peculiar unto itself. The engine at the back may come in on the pilot in a crash and cannot protect him in a frontal attack. The tractor airscrew batters the slipstream past the

26 GIANT U.S. BOMBERS

Deliveries Begin to Britain

WASHINGTON, Wednesday

THE United States Army High Command has given Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California.

The High Command simultaneously announces that negotiations are under way for giving Britain 20 four-engined Boeing bombers of the Flying Fortress type, which have already been completed. The machines of the Consolidated Aircraft Company are reported to be very similar to the Flying Fortresses, both types being capable of a range of 3,000 miles.

The Consolidated Company's four-engine bombers have just begun coming off the production lines, and the negotiations which have now been completed, will enable Britain to take the first deliveries. Indeed, the first deliveries, it is understood, were made to Britain last Saturday.

Sperry Bombsights

The U.S. Army will accept a delay of approximately three months in its own deliveries of this same type, known as the B-24, General George C. Marshall, U.S Army Chief of Staff, told a Press conference to-day. In consideration of this priority, the British Government has released to the U.S. sufficient engines to equip 41 Boeing Flying Fortresses, which the U.S. Army had already accepted without their engines, or would have received without engines before January 1.

The General, referring to the Boeing Company's B-17 type of four-engined bomber, said:—

"We are now in process of negotiating with the British authorities the basis for releasing to them 20 fully-equipped 'planes except as to the Norden bombsight.

General Marshal simultaneously announced that the Sperry bombsight has been released to Britain.

This is one of the two high-accuracy bombsights which have been developed in the United States.

General Marshal said the Norden ght, the more modern of the two mbsights, is now being used by the my and Navy, while the Sperry ght was no longer used in military lanes in the United States.

Both types of bombing 'planes have ranges capable of reaching any part of Germany from Great Britain

General Marshal disclosed that the United States Army has observers in British warplanes flying over Britain and the British Channel, but they have not flown over Germany.—Press Association War Special.

More Destroyers?

WASHINGTON, Wednesday

A new British request for over-age destroyers is likely to be made by Lord Lothian, the British Ambassador to the United States, as soon as he returns to Washington, according to well-informed quarters here to-day.

The figure of 50 destroyers is mentioned.

Lord Lothian is expected here before the week-end.—Press Association War Special.

U.S.NAVAL RESERVES

WASHINGTON, Wednesday

Colonel Knox, Secretary to the U.S. Navy, to-day announced that additional fleet divisions of naval reserves would be ordered to report for active duty in December and January. He also stated that the Navy may ask Congress for more money this session, but declined to disclose the specific amount or the purpose on which it would be spent.

U.S. Bomber Fleet on Way Here

From DON IDDON, Daily Mail Correspond

NEW YORK, We

TWENTY-SIX four-engined bombers ordered **States Air Force and now coming off th** **lines at the Consolidated Aircraft Compa** **Diego, California, have been released to** **British Government took delivery of** **the first machine last Saturday.**

Simultaneously with this announcement to-day in Washington, it was stated that the United States Army High Command have released the Sperry secret bomb-sight to Great Britain.

General George C. Marshall, United States Army Chief of Staff, making the announcements, said that negotiations are also under way to give Britain 20 of the famous Boeing Flying Fortresses now completed.

The Consolidated Company's four-engined bombers are a later type than the Flying Fortresses. Like the Flying Fortresses, they have a range of 3,000 miles fully loaded, and can reach any part of Germany from British bases.

The machines will all be delivered by March next.

General Marshall said that no comparable plane had ever been used in active operations. The United States was anxious to see the results.

To release the planes for Britain the United States Army have accepted a delay of three months in their own deliveries.

General Marshall added that in return, Britain has released to the United States Army sufficient engines to equip 41 Boeing bombers which the Army had accepted without engines.

The Sperry bomb-sight is one of the two high-accuracy bomb-sights developed by the United States Army.

More Destroyers

The Norden sight, the later of the two, is the one with which the more modern United States Army planes are equipped.

General Marshall disclosed that United States Army observers are flying in British planes over Britain and the English Channel. "They have not flown over Germany," he said.

Lord Lothian, the British Ambassador, is expected to make two requests to the United States Government for further aid immediately he arrives back in Washington.

He is expected this week-end.

His requests will be for:

(1) The release of 50 more over-age destroyers;

(2) The transfer to Britain of a fleet of American merchant ships.

Tremendous pressure is being put on the Administration to implement the pledge of "all aid to Britain short of war" at greater speed.

To-day's *New York Herald-Tribune* outlines a programme for speeding help.

The points stressed are: Increase aircraft production to send more planes to Britain; pool United States merchant fleets with the British Mercantile Marine; protect the British rear against Japan, and "give, don't sell, our arms to Britain."

Of merchant ships, the paper says:

"We have a considerable existing merchant fleet. We can pool it with the British Mercantile Marine, operating it so as to release British tonnage now in the Inidan and the Pacific Oceans for more dangerous service in the Atlantic.

"Should that fail, we can sell it into British hands without violating neutrality."

The Answer to Coventry'

UNITED STATES War Department officials said in Washington yesterday that there was "no official connection" between the release to Britain of the 26 Consolidated bombers and the savage Nazi attack on Coventry.

They added: "The significance of the coincidence will not, however, be lost on the world."

Aviation 3/1940

Consolidated Aircraft is expanding its plant 82% to take care of a record $43,000,000 backlog. In negotiation are said to be British and French orders which would bring the backlog up to around $50,000,000.

Among the aviation investment trust annual reports for 1939, National Aviation disclosed a net asset value of $17.27 a share, Air Investors $1.67 a common share, and Aviation Capital Inc. $40.02 a share.

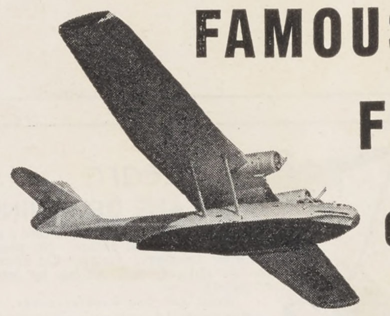
An American Transfer

CONSOLIDATED AIRCRAFT CORPORATION has bought the Hall-Aluminium Corporation together with all physical assets and goodwill, patent rights, material and equipment. Some 32 key men of the Hall-Aluminium plant have joined the Consolidated organisation.

The Hall-Aluminium Company was first started in 1916 as Charles Ward Hall, Inc., and has been continuously engaged in research in the use of aluminium alloys for the design and construction of aircraft. The Company has concentrated mainly on flying-boats and seaplanes for the U.S. Navy and Coast Guard and was one of the pioneers of all-metal construction in the United States. In addition the Company has produced and supplied parts and standardised aircraft sections to all the principal constructors in the United States and Canada.

The types produced by the Hall-Aluminium Company include the F4C-1 fighter, the first all-metal aeroplane used by the U.S. Navy, the C-333, XFH-1, XPH-1, PH-1, PH-3, XP2H-1 four-motor long range bomber flying-boat and the XPTBH-2 twin float torpedo bomber.

This new acquisition should add to the assets and constructive power of the Consolidated Corporation which is working on large orders for the U.S. Government and the British Government. Its aeroplanes are among the best in the World.



FAMOUS FLYING BOAT FOR SALE!

CONSOLIDATED PBY 2 "GUBA"

Built to U. S. Navy Specifications—In A-1 condition throughout—Since crossing Australia, Africa, the Atlantic, Pacific and Indian Oceans, the ship has been completely overhauled by the factory.

Cruising range, 4000 miles—Maximum speed, 190 m.p.h.—Two 900 h.p. Pratt & Whitney Twin Wasp engines—Automatic pilot—Complete radio equipment, including homing devices and direction finders—Separate 110 volt motor generators—2 spare engines and many extra accessories—Further details on application. Circle 6-7560.

New Consolidated

Aviation 3/1940

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

Consolidated Expands

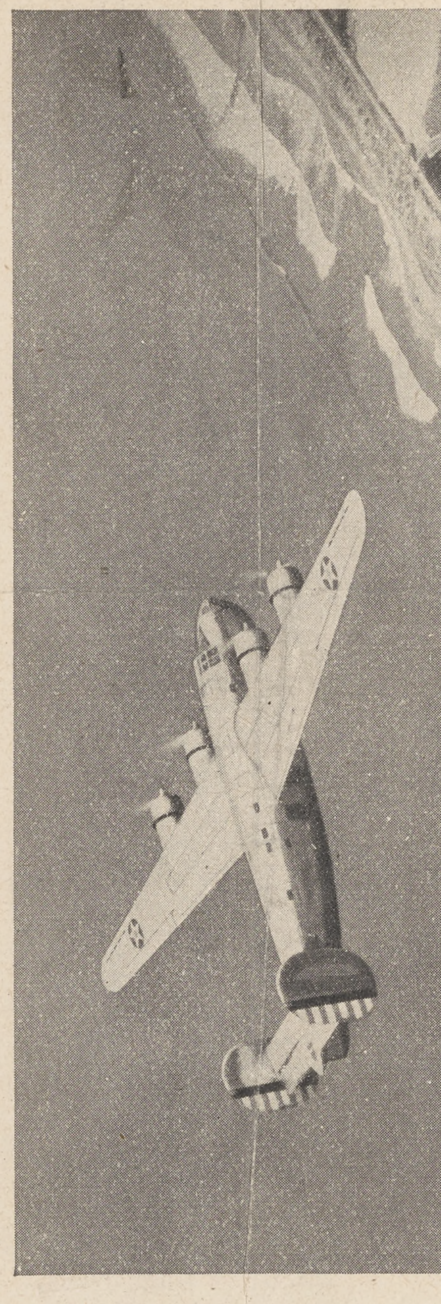
Aviation 3/1940

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, and 400,000 sq. ft. will be roofed. New facilities will include final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

Aeroplanes from the U.S.A.



AMERICA'S BEST BOMBER.—The consolidated Model 32 bomber (four 1,200 h.p. Pratt and Whitney Twin Wasp motors). Designated the B-24 by the U.S.A. Army, it has a top speed of more than 300 m.p.h. Unlike the unarmed B-17, the four-motor Consolidated can have power-operated turrets fitted in nose and tail and doubtless the 120 B-24s supplied to the R.A.F. will have them. They should do well.

Certain criticisms of American aeroplanes have evoked comment of various kinds. Two letters which appear below give two aspects of these reactions. Our reasons for advancing the criticisms and the grounds for our belief that they are just are stated below—Ed.

MR. A. H. WOOLLEN writes:—" I agree with Mr. Dennis Powell in raising a voice of protest against the belittling of American aeroplanes by your paper. I am no sympathiser with the American nation, and consider them the greatest ' line-shooters ' in the World. But even though your views on this matter may be the same, there is no justification for your absurd condemnation of practically every new type of American aeroplane as it rolls off the production line.

" It seems that your criticism is based mainly on poor armament, cramped quarters, unorthodox design, and, in the case of the Boeing B-17, great size. All these defects are, however, seen in some of our own aircraft. For instance, up to the beginning of the War the Handley Page Hampden and the Vickers Wellington were, according to Mr. C. G. Grey in his article, ' The Big Bombers,' inadequately armed, and under wartime conditions the armament had to be revised, with the result that these two machines are now very formidable. The American 'planes which you accuse of being under-armed could very easily be fitted with extra guns, as in the case of the Curtiss Hawk 75A which was fitted with four extra wing guns on the stipulation of the French. A similar case is our own Spitfire, which was, I believe, originally designed for four wing guns. The other four were added later.

" With regard to unorthodox design (as in the case of the Bell Airacobra, which you have singled out for so much ridicule) there have been a number of unorthodox machines which have proved very successful. A notable example is, or was, the Fokker G-1, which, until the type was completely wiped out, gave a very good account of itself against the Boche invader. The mere fact of the engine being new should not prejudice you against it; it is not nearly so untried as you make out, anyway, for the Americans cannot have much trouble with it, or they would not install it in their own Curtiss P.40s.

" American aeroplanes have no monopoly of cramped quarters. In an article on the Armstrong Whitworth Whitley some years ago, you commented that the space for the navigator and crew was somewhat restricted.

" Great size is not merely an ack-ack gunner's dream and ' the answer to a pursuit pilot's prayer ' (as you once quoted an American speaker). The Sunderland is a bigger machine than the Boeing, but has put up a splendid fight on many occasions. Further, Sunderlands have been used on at least one occasion to raid Norwegian ports. The R.A.F. seem to be favourably impressed by the four-motor bomber.

" You now excuse your previous unwarranted criticism of the Lockheed Hudson by saying that ' it had to adopt slit slots devised originally by engineers of British Airways.' So what? If I am not mistaken, the committee which investigated the unfortunate accident to the flying-boat Cavalier between New York and Bermuda advised Imperial Airways to adopt the Pan-American system of carburetter heating.

" I am not trying to boost American aeroplanes to the detriment of our own, but I do not like senseless disparagement of all things that are not British. I am merely trying to point out that to be patriotic does not mean to regard the products of every other country as being so much inferior to our own. It is useless to deny that we need aircraft very badly so why try to ride the high horse when we have an opportunity of getting what we require, even if we do have to pay cash in advance for it? It seems a pity that ' the most influential aviation journal in the World ' should be the mouthpiece of a certain section of the aeronautical public which cannot bear anything which is not British rather than a newspaper of aviation affairs which (I presume) it is meant to be."

The Why and the Wherefore

This is just the sort of letter we like to get because it states the opinions of the writer clearly and forcefully and yet gives us the chance of correcting erroneous opinions which may be widely held. For one thing, Mr. Woollen shares with others the mistaken idea that to criticise the products of a friendly Nation is not sporting—specially when that Nation is sending those products to help us in a very awkward situation.

Our comments on American aeroplanes during the past year have been based strictly on the elucidation of truth. When an aeroplane is good, such as the Hurricane or Douglas DC-3 or Me 110 we have never hesitated to say so. When an aeroplane is bad in certain essentials, such as the D.H. Don, the Boeing B-17 or the Junkers Ju 88, we have never hesitated to say so either. We hope to continue to be outspoken.

When the British Government first decided to place orders for military aeroplanes in America there was irony in the fact that the best of any aeroplanes they could find for military purposes were a converted civil air liner—the Hudson, and a trainer—the Harvard. Both have done well in service, but both, like many British and other aeroplanes, have had serious faults. For instance, the landing characteristics of the Hudson are, to say the least, peculiar and in certain circumstances dangerous. Its undercarriage is weak. The Harvard has killed many people. The fact that certain British aircraft have done so as well does not make the matter any better. Two blacks do not make a white.

Poor armament is about the worst of the faults of the American aeroplanes in general. Such details as that the bomb doors of the Martin 167 cannot be shut after bombing without nearly stalling the machine are incidental. Although the armament of the fighters can be increased the improving of that of the bombers such as the much vaunted B-17 is not so easy. Power-driven gun turrets are all very well but they cannot be put into any aeroplane. In the B-17, for instance, no tail turret is possible because of the single fin and rudder and because the centre of gravity would be thrown out.

We are still unpersuaded on the merits of the Airacobra which may be a very interesting experiment aerodynamically but still may not be a military triumph. The fact that we are to have a batch is explained by our decision to take the French " left overs." As we said before, it has all the disadvantages of the pusher plus all the disadvantages of the tractor plus some peculiar unto itself. The engine at the back may come in on the pilot in a crash and cannot protect him in a frontal attack. The tractor airscrew batters the slipstream past the

26 GIANT U.S. BOMBERS

Deliveries Begin to Britain

WASHINGTON, Wednesday

THE United States Army High Command has given Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California.

The High Command simultaneously announces that negotiations are under way for giving Britain 20 four-engined Boeing bombers of the Flying Fortress type, which have already been completed. The machines of the Consolidated Aircraft Company are reported to be very similar to the Flying Fortresses, both types being capable of a range of 3,000 miles.

The Consolidated Company's four-engine bombers have just begun coming off the production lines, and the negotiations which have now been completed, will enable Britain to take the first deliveries. Indeed, the first deliveries, it is understood, were made to Britain last Saturday.

Sperry Bombsights

The U.S. Army will accept a delay of approximately three months in its own deliveries of this same type, known as the B-24, General George C. Marshall, U.S Army Chief of Staff, told a Press conference to-day. In consideration of this priority, the British Government has released to the U.S. sufficient engines to equip the 41 Boeing Flying Fortresses, which the U.S. Army had already accepted without their engines, or would have received without engines before January 1.

The General, referring to the Boeing Company's B-17 type of four-engined bomber, said:—

" We are now in process of negotiating with the British authorities the basis for releasing to them 20 fully-equipped 'planes except as to the Norden bombsight.

General Marshal simultaneously announced that the Sperry bombsight has been released to Britain.

This is one of the two high-accuracy bombsights which have been developed in the United States.

General Marshal said the Norden ght, the more modern of the two mbsights, is now being used by the rmy and Navy, while the Sperry ght was no longer used in military lanes in the United States.

Both types of bombing 'planes have anges capable of reaching any part of Germany from Great Britain

General Marshal disclosed that the United States Army has observers in British warplanes flying over Britain and the British Channel, but they have not flown over Germany.—Press Association War Special.

More Destroyers?

WASHINGTON, Wednesday

A new British request for over-age destroyers is likely to be made by Lord Lothian, the British Ambassador to the United States, as soon as he returns to Washington, according to well-informed quarters here to-day.

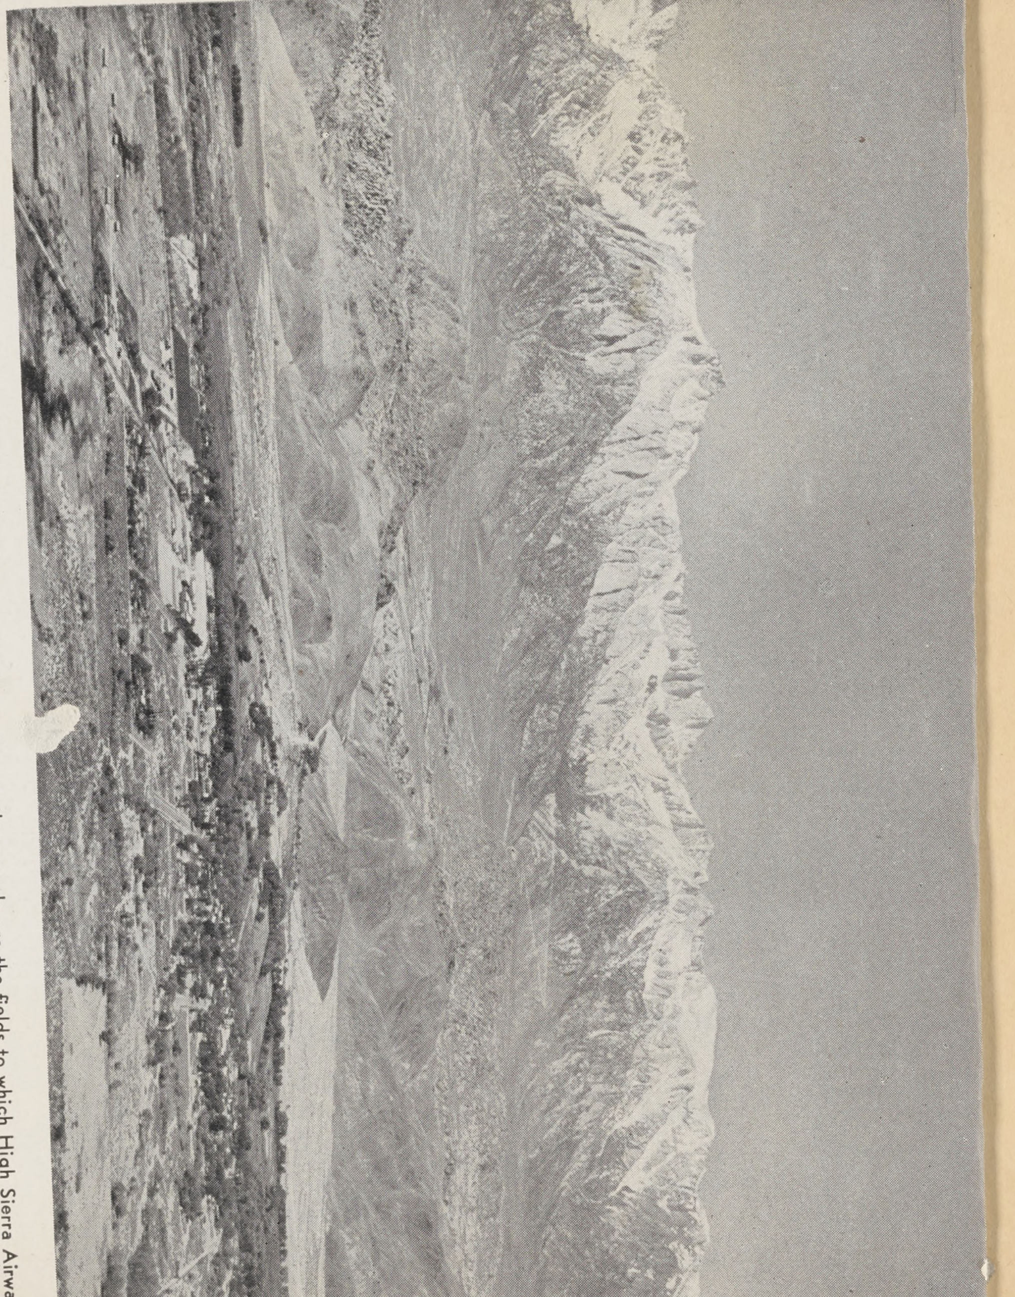
The figure of 50 destroyers is mentioned.

Lord Lothian is expected here before the week-end.—Press Association War Special.

U.S. NAVAL RESERVES

WASHINGTON, Wednesday

Colonel Knox, Secretary to the U.S. Navy, to-day announced that additional fleet divisions of naval reserves would be ordered to report for active duty in December and January. He so stated that the Navy may ask ongress for more money this session, t declined to disclose the specific ount or the purpose on which it uld be spent.



Lone Pine, California, in foreground with the High Sierras looming up behind. Among those peaks are the fields to which High Sierra Airways operates.

HIGH SIERRA AIRWAYS

By

ALBERT M. LATIMER

IN the winter of 1939, two young men, tired of speculating as to how great it would feel to be in the flying game, made up their minds to replace speculation sprees with action.

Throughout the 1940 hunting and fishing seasons, hundreds of sportsmen, remembering eight to twelve hour horseback rides up steep Sierra trails, looked down on those very same trails from a Pitcairn Mailwing's cockpit and found it hard to realize that they were making the same trip within twenty-five minutes.

Sandwiched between that cause and result is the story of two young men with enough foresight and get-up to find a place in the work they loved; a story of hard work and many problems; a story of the High Sierra Airways.

During the lunch hour at an oil tool concern in Los Angeles, the men of the plant were used to Walt Hallberg and Wes Austin using the entire hour for long gab fests about aviation. These men also knew when the two were off work their time was always put in at the various airports watching and envying those people who were on the inside of flying. And, like most outsiders, these fellows went home to spend their nights in more gab sessions, the theme of which was always the same question: why can't we think of some way to get a foothold in the flying game with a reasonable amount of capital?

It wasn't until the winter of '39 that they hit upon an idea which wasn't so full of snags that they made it impractical. Austin, who had been raised in Lone Pine, Calif., remembered the hunting and fishing camps which were twenty-five to thirty miles west of Lone Pine, and far up in the heart of the virgin High Sierra range. He also knew the hunters and fishermen took the trouble each year of packing into these camps. And packing required around twelve hours of hard up-trail riding for the usual city rider, during which the tenderfoot could dwell on the thought that it would take twelve more hours to come back. For the average office athlete, this meant a good beating beside using up a lot of fishing or hunting time in traveling. Austin also remembered that near each of these camps—there were three of them—was a landing field maintained by the Forestry Department. There had been pilots who had come up to the valley for part of the season, and picked up spare money by hauling sportsmen into the camps. But what Hallberg and Austin wanted to know was how would it be to put a regular airline service into these

Flying Flagship

Those potential aviators found in every class, or should we say those "Asiats," would be interested to know that the air corps is now following in the footsteps of its predecessor, the surface fleet, by incorporating the flagship as part of its various tactical formations. With the advent of Consolidated's new patrol bomber, this dream of the aircraft tacticians has been realized. We could use our Buck Rogers imagination and picture flag hoists, etc., flying from the wing struts (if there were any) of this latest dreadnaught of the skies; however, it looks as if the communications of the future air armadas will be on the new experimental ultra-high radio frequencies. If the present trend continues, it won't be long until the air corps line officer will not only be a pilot but a communications specialist as well.

It all began back in August, 1939, but it was not until recently that the true significance of the venture was realized. On August 24, 1939, Rear Admiral A. B. Cook, commanding aircraft Scouting Force, by despatch, removed his flag from the *U.S.S. Memphis* at Seattle and hoisted it aboard the XPB2Y-1, pictured above. Thereby was established a precedent in Naval history for by formal procedure this huge sky dreadnaught became the first Flagplane to fly for the U. S. Navy.

Although such procedure is still in the experimental stage, like many of the other experiments made along such lines it may quite possibly become a permanent feature of the service.

U.S. Naval Academy "Log"
3-15-40

The World's Largest

On December 7, the Navy's new XPBY-5A, now the world's largest amphibian, made its debut at Lindbergh Field, San Diego. This ship, designed by the Navy and constructed by Consolidated Aircraft, was originally Model 28, a twin-engine flying boat known as the PBY's. This design of boat has already accumulated a remarkable total of massed flight records and reputation for sustained performance, and now the amphibian feature has been incorporated in its structure. Upon the augmenting of this structure, the inherent advantages of the former design has been retained, but there has been added the great advantage of land plane operation. Thus this ship is no longer restricted to sea but can operate on land as well.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all of which are fully retractable. The two side wheels can be retracted into wells in the side of the hull, while the nose wheel draws back into a hatch in the bow. A single lever operates the extension and retraction of all wheels in sequence by hydraulic pump power or in case of emergency by hand.

The addition of this feature has in no way effected the perfectly developed characteristics of the original design, but has incorporated many advantages. It eliminated a beaching crew, for the ship can now climb the ramp under its own power. In rough sea water it acts as a sea anchor and assists in controlling the ship, allowing more engine power to be applied without undue acceleration, and lessening the tendency for skidding on the water. On land, the ship's tendency in a side landing is straightened out by it. All these facts go together in making this new ship not only the largest but the most successful amphibian in the world.

Aviation Nomenclature

To many on the outside, and even those in the Navy who are not connected with aviation, the names of the various aviation squadrons are nothing but a mass of jumbled numerals. However, each letter or numeral has its particular meaning either to designate the different squadron, the type of aircraft, its manufacture and model, or the plane's primary duty.

On all the Navy planes the letter "V" is sure to be found; this indicates that it is in a heavier than air squadron. The description letter for the type of squadron comes next: "P" for patrol, "B" for bombing, "S" for scouting, "X" for experimental planes, and many other code letters. Then will follow the squadron number for distinction between squadrons of the same class.

However, this is not sufficient to distinguish between one plane and another in the same class, so a manufacturer's letter is added. For instance, we have "PB," which would be a patrol bomber, then to this is added a "Y"—"PBY" would be a patrol bomber manufactured by the Consolidated Aircraft Company. In like manner "M" would be Martin Company, etc.

But because of constant improvement made on each design of the same ships, another numeral must be added to denote the edition, as it were, or the modification of that type, making "PBY-4" the fourth modification of the "PBY."

But if a radical change is made in the type of plane, a numeral is inserted before the maker's initial.

ircraft Industry Series—Consolidated

The Wall St. Journal 12/9/40

-an Diego Company Achieves 'Line' roduction on Giant Airplanes

tinues to Increase Its Floor Space — Has $320,000,000 n Unfilled Orders

ircraft manufacturers currently are ged in the most spectacular program pansion ever undertaken in the indus- history of this nation.

o obtain a first hand picture of this ram — the progress, triumphs, and bles,—The Wall Street Journals avia- editor, Gaston E. Marque, currently is king a survey of vital units in the in- try. He is inspecting plants, interview- top executives, not only of plane and ine manufacturers, but of leading sup- rs of parts, accessories and instruments. His findings are being reported in a ser- of articles, of which the following is the th.

By Gaston E. Marque

AN DIEGO, Cal.—This is the home of the gts of the air.

n its immense plant adjacent to Lindbergh on San Diego Bay, Consolidated Aircraft is turning out huge flying boats and anes weighing from 27,000 to 65,000 s and costing upward of $200,000 each.

nsolidated always has specialized in build- arge airplanes. The company claims the ction of having built, sinces its inception in four times as many ships with a wing of 100 feet or more as all other United es aircraft manufacturers combined.

tour through its plant impresses on the or the fact that the company deals reat size. Huge mechanical and hydraulic es, including one of 4,500 tons, large hy- ic drop hammers and hulls for the twin- ed PBY patrol bomber lined up 50 strong final assembly line, all convey the idea at size.

Much Work Outside

d while the company is turning out only airplanes it appears to have made about ch progress toward attaining line produc- almost any other unit in the industry. pearance of confusion in so many of the t plants today, resulting from the con- earrangement going on as new facili- e added in the course of preparing for ction in larger volume than ever before, to be lacking in Consolidated's plant.

One reason for that probably is the fact that while most companies are just getting into production on entirely new models Consolidated is turning out an airplane, the PBY, which is much similar to that it has been manufacturing for several years. Furthermore the climate in San Diego is such that the company can do a substantial part of its final assembly work outdoors the year around. Consequently when its ships reach the cumbersome stage they can be moved out to paved areas alongside the plant where big parts are fitted and the finishing touches put on the interior.

Consolidated has a further advantage in that its plant is relatively new, the first unit built only five years ago. As a result its original plant incorporated some of the more modern ideas in arrangement and was so designed as to allow orderly expansion.

Backlog of $320,000,000

When Consolidated transferred its activities to this city from Buffalo, N. Y. in 1935 it had about $6,000,000 of business on its books. It started operations with some 300 employes in a plant containing roundly 200,000 square feet of floor space. Today the company has an order backlog of approximately $320,000,000 and by February 1 next year expects to have roughly 1,500,000 square feet of covered floor area, plus a substantial paved but uncovered area suitable for final assembly work, and between 15,000 and 16,000 employes. This, however, will not complete Consolidated's expansion program.

The company is announcing today a $7,000,000 addition which will approximately double its present floor area. So far Consolidated has financed its own expansion, having previously spent or committed itself to spend this year approximately $6,000,000 for enlargement of manufacturing facilities. The latest addition, however, it is understood will be financed by the government and leased by the company.

The new addition, according to present plans, will be devoted to the manufacture of parts and minor assemblies with existing facilities turned almost entirely to final assembly work. This does not mean, however, that Consolidated is not planning to sub-contract some of its work. It is already doing considerable subcontracting and plans to do more as it swings into increased production on its present orders.

Deliveries Show Little Gain

Although Consolidated has greatly enlarged its plant this year and increased the number on its payroll from about 3,200 on January 1, to almost 14,000 at present, its deliveries for 1940 probably will show relatively little improvement over last year when its shipments aggregated a little more than $3,600,000. This because, through most of the year, the company has been engaged principally in tooling up for production in increased volume and in turning out parts and sub-assemblies. Furthermore its deliveries have been held up somewhat by the failure of at least one sub-contractor to make deliveries on schedule and the inability to get engines in numbers required. As a result Consolidated today has an estimated $25,000,000 worth of parts and planes in various stages of production which should begin flowing off the final assembly line in steadily increasing numbers from now out.

On the basis of the present schedule deliveries from existing facilities, against contracts now on the books, should attain their peak around March or April. The latest addition should be completed by about June 1 and reach its peak employment of roughly 12,000 by November of next year.

Consolidated currently is working two 10-hour shifts five days a week. Like most other manufacturers it could undoubtedly enlarge its output by either working an additional day or adding another shift. This, however, has not proved feasible as yet as production of the airframe manufacturers naturally must be geared to that of their suppliers and sub-contractors, as well as that of the engine producers.

Making Flying Boats for British

At this time Consolidated is in production on three models but actually making deliveries in any quantity on only one type. It is manufacturing a twin-engined flying boat for the Navy and the British, a four-engined flying boat, the PB2Y, for the Navy, and a four-engined land bomber, the model 32 or B-24, for the Army and British. This bomber, the prototype of which was first flown in 1939, marks Consolidated's return to the landplane field. It is a high-wing ship, with a tri-cycle landing gear, which, according to available information, has a speed of over 300 miles per hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons.

Consolidated's $320,000,000 backlog which, incidentally, is equivalent to more than five times its aggregate deliveries for the past 17 years, includes about $80,000,000 of foreign business. Approximately $100,000,000 of the total was obtained on cost plus fixed fee contracts while the balance was taken on a fixed price basis.

No estimate of probable earnings results for 1940 can be made at this time because actual deliveries this month, which cannot be forecast accurately as yet, will have an important bearing on the final showing. Last year Consolidated earned $1,104,327, equal after preferred dividends, to $1.79 a share on the common. Indications are the excess profits tax will be quite burdensome to the company. Whether it will choose the average earnings or return on invested capital method for determining its excess profits tax exemption is not quite clear as yet as its credit under either bases would be approximately the same or roundly $850,000.

Wings for the Fleet

T. N. SANDIFER

cation facilities, its cordon of lifeboats and light stations at all strategic points, all manned by trained personnel, the Coast Guard becomes an important and essential adjunct of the Navy."

While a major portion of the national defense allotment is earmarked for surface craft and other conversions, aviation is an important branch of Coast Guard activities, dating from 1916. This Service has just placed in commission a Coast Guard Air Station at Elizabeth City, N. C., at a cost of $1,163,361, the latest of a series of coastal stations.

The Elizabeth City air station is the first one owned by this Service to have its own fully equipped airport. The station reservation comprises 294 acres, with a frontage of 4,250 feet on deep water, the barracks building and hangar both located near this water.

Buildings are of concrete throughout. The airport has complete lighting equipment, with two floodlights at each end of the four runways. The latter are 3,000 feet long, except one, which is 3,420 feet, and all are 100 feet wide, with all runways and taxiways of concrete. The whole

CAPT. L. T. CHALKER

Assistant Chief, Division of Operations, U. S. Coast Guard

THIS WING OF THE COAST GUARD has made rapid strides in the past five years, having eight modern air stations, with two more to be completed during 1940. Its complement of modern aircraft includes 10 long-range twin-engine patrol seaplanes; 16 intermediate range twin-engine amphibians; 15 inshore patrol, single-engine planes, and nine special types of other planes. In addition five twin-engined seaplanes, to have a cruising range of 2,000 miles, are under construction.

The flying boats used by this service are all designed especially for landing offshore, frequently in stormy or rough water, and many of its officers and men

The Coast Guard air unit today numbers 42 commissioned officers and 22 warrant officers, with 399 enlisted men. This wing is trained for service as a part of the Navy in war, to which service also the whole Coast Guard adverts. It is with this possibility in mind that its preparations are now being made.

Conversion of its surface vessels will include enlargement of armament and ammunition storage space; installation of guns, depth charge racks and Y-guns, underwater sound detection apparatus, anti-aircraft range finders, searchlights for signaling and aircraft detection, mounting of anti-aircraft guns, and so on.

During 1941 the Coast Guard plans to add 2,500 men to its ranks, and a total of 5,000 in the next two years. This will give the Service approximately 20,000 men eventually. The new men will be recruited and trained at the rate of 400 a month over a period of seven months.

The motto of the Coast Guard is *Semper Paratus* (always ready) and it looks as if any new emergency will find this true of the Service now, as in wars past.

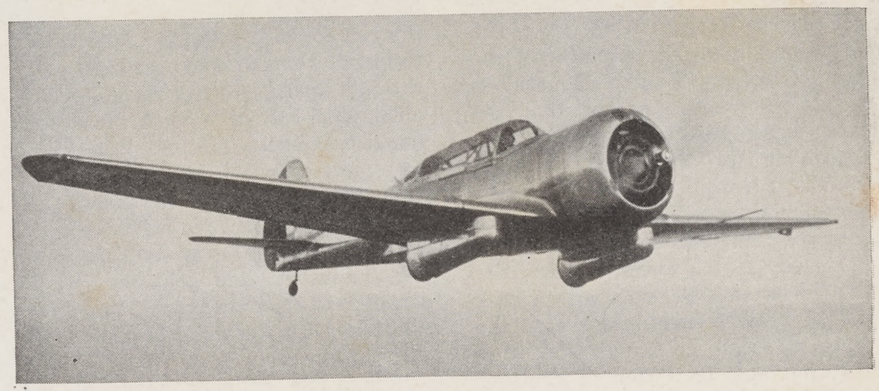
CONSOLIDATED Amphibian

THE latest achievement of the Consolidated Aircraft Corporation is the building of the world's largest amphibian, the Model 28-5A, or as designated by the Navy, the XPBY-5A. The new amphibian is basically the familiar Model 28 twin engine flying boat, better known by its Navy designation, PBY. The change was accomplished chiefly by the addition of a tricycle landing gear which is fully retractable. The side wheels and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the retracted position is completely closed over by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, which handles all the necessary operations in sequence automatically and both the extension and retraction of the gear is controlled by a single lever. Hydraulic pump power is obtained either from the main power plant or from an auxiliary engine, but hand operation is possible, if necessary.

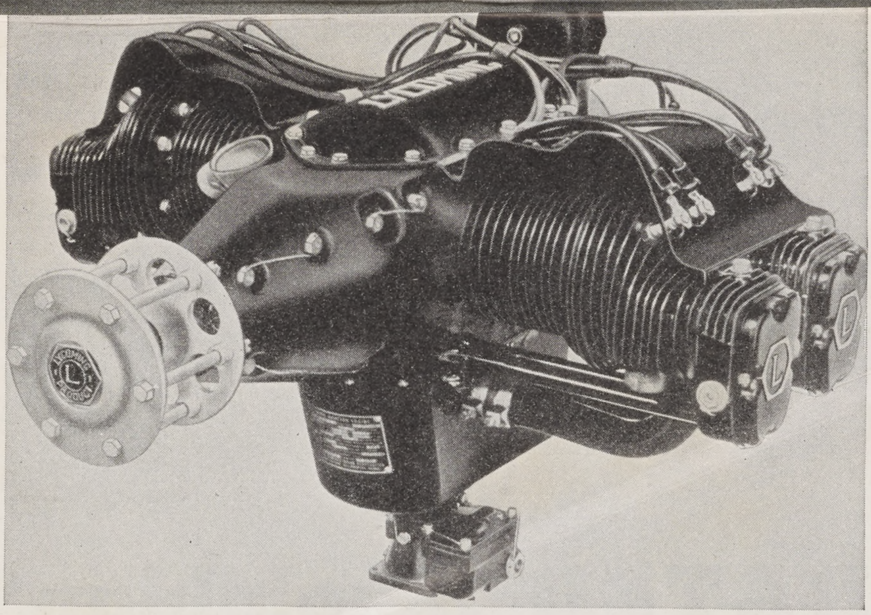
The landing gear has a number of advantages in addition to the obvious one of greatly extending the scope of utility for the Model 28. For rough water taxiing the extended gear greatly assists in control by serving as a sea anchor. More engine power may be applied for short turns without undue acceleration, and turns on the water may be accomplished with far less skidding. Naturally, all danger of scraping the keel on the ramp is eliminated, and no beaching crew is required, for the ship can climb a ramp or beach under its own power. It may operate from sand beaches with no special ramps or facilities for handling.

Since the side wheels are above water when the ship rises on the step, and since automatic means are provided for expelling water from the closed bow wheel hatch before the plane is in the air, the flying trim remains unaffected. Repairs or routine servicing to the landing gear may be made with a minimum of trouble. The beaching gear lugs of the Model 28 have been retained, so that a standard beaching gear may be attached and the plane run out of water. This lifts the landing gear clear of the ground so that any servicing may be carried out.

CURTISS Falcon Trainer



Designed specifically for the training of "fighting pilots" the new, all-metal Curtiss Falcon 22 two-place basic combat and all purpose trainer has been contracted for by a foreign government. The plane has just completed flight tests and while no details concerning its performance are available, it is powered by a Wright Whirlwind 9-cylinder engine, incorporates a wing of special design which provides greatly improved stall and spin characteristics and is equipped with retractable landing gear. Provision has been made for all types of training activities, including gunnery, bombing and instrument flying. This ship is smaller than the well-known Curtiss Hawk 75A pursuit but incorporates the latest in structural design. The wing is of the full-centilever type and is all metal with multiple spars, having an internal structure of longitudinal stiffiners, shear spars and fore and aft bulkheads which are riveted to the skin; and is constructed in five separate units. The center panel contains two fuel tanks with a total capacity of 68 gallons, are located near the center line.



Lycoming Geared 75 h.p. Engine

LAUNCHING into a new field the Lycoming Division of Aviation Manufacturing Corporation announce a geared 75 h.p. engine. The new engine, of the Model GO-145-C series, has four air cooled horizontally opposed cylinders, and like geared engines of higher horsepower uses dynamic dampers. It follows the same basic design as the 0-145 50, to 75 h.p. engines with the addition of the reduction gear. Engine demensions are also the same except that the geared engine is 4.70 inches longer to provide for the reduction gear which is a straight spur gear type of internal ring gear and pinion housed entirely within the crankcase.

The GO-145-C series engines develop 75 h.p. at 3200 rpm with a gear ratio of 27:17 which means that the propeller speed at rated power is 2015 rpm and 1825 rpm at cruising permitting maximum propeller efficiency by allowing the use of a larger diameter high torque propeller. The spur gear type of internal ring gear and pinion permits clockwise rotation of both propeller and crankshaft while the center line of the propeller is only $\frac{7}{8}$ inches below the center line of the crankshaft. The propeller shaft, which has the rear half of the propeller flange and ring gear forged integral, is supported by a long steel backed copper lead-lined bearing and the propeller thrust can be taken on the integral flanges on both ends of this bearing for either tractor or pusher type of installation.

Rigid crankcase construction is assured through the use of an integral semi-steel crankcase and cylinder block which is split vertically through the center, with a ground joint metal-to-metal contact and secured using through bolts. It has three replaceable steel-backed copper lead-lined main bearings. The crankshaft is a one piece nitrided forged alloy steel shaft provided with four throws and equipped with dynamic balancers. The reduction pinion gear is shrunk on the crankshaft and held securely by a nut and lockwasher. The crankshaft is both dynamically and statically balanced.

Removable cylinder heads of cast aluminum are attached to the cylinder barrels by studs and nuts. Copper-asbestos gaskets are used between cylinder head and barrel and exhaust ports extend vertically downward providing maximum visibility and ease of cowling.

Pistons of cast Lo-Ex aluminum alloy are machined for two compression rings, one oil regulating ring and one oil scraper ring. They operate in cast semi-steel heat treated bores. Piston pins are of the full floating type. The engine is wet sump type with Oil being forced through the cam shaft to all cam bearings, crankshaft main bearings, propeller shaft bearing and connecting rod bearings by a gear type pump driven from the camshaft. The crankshaft has centrifugal sludge removers and pistons and piston pins are lubricated by splash. A screen oil baffle is provided between the main crankcase sections and the oil pan.

The valve gear is automatically lubricated by using gravity feed engine oil. The mechanism is completely enclosed, but the rockers may be reached through removable covers on the cylinder heads.

73 octane fuel is recommended in all models. Fuel consumption is .50 lbs./BHP/Hr. at cruising, and oil consumption is .010 lbs./BHP/Hr. Dry weight of single ignition models is 181 lbs. (shipping weight 227 lbs.) Baffles and propeller hub attaching parts are 6.03 lbs. additional.

LEARADIO TRI-POWR PORTABLE

$39.50

COMPLETE WITH BATTERIES $5.50 ADDITIONAL FOR SPECIAL LEARADIO HEADPHONES

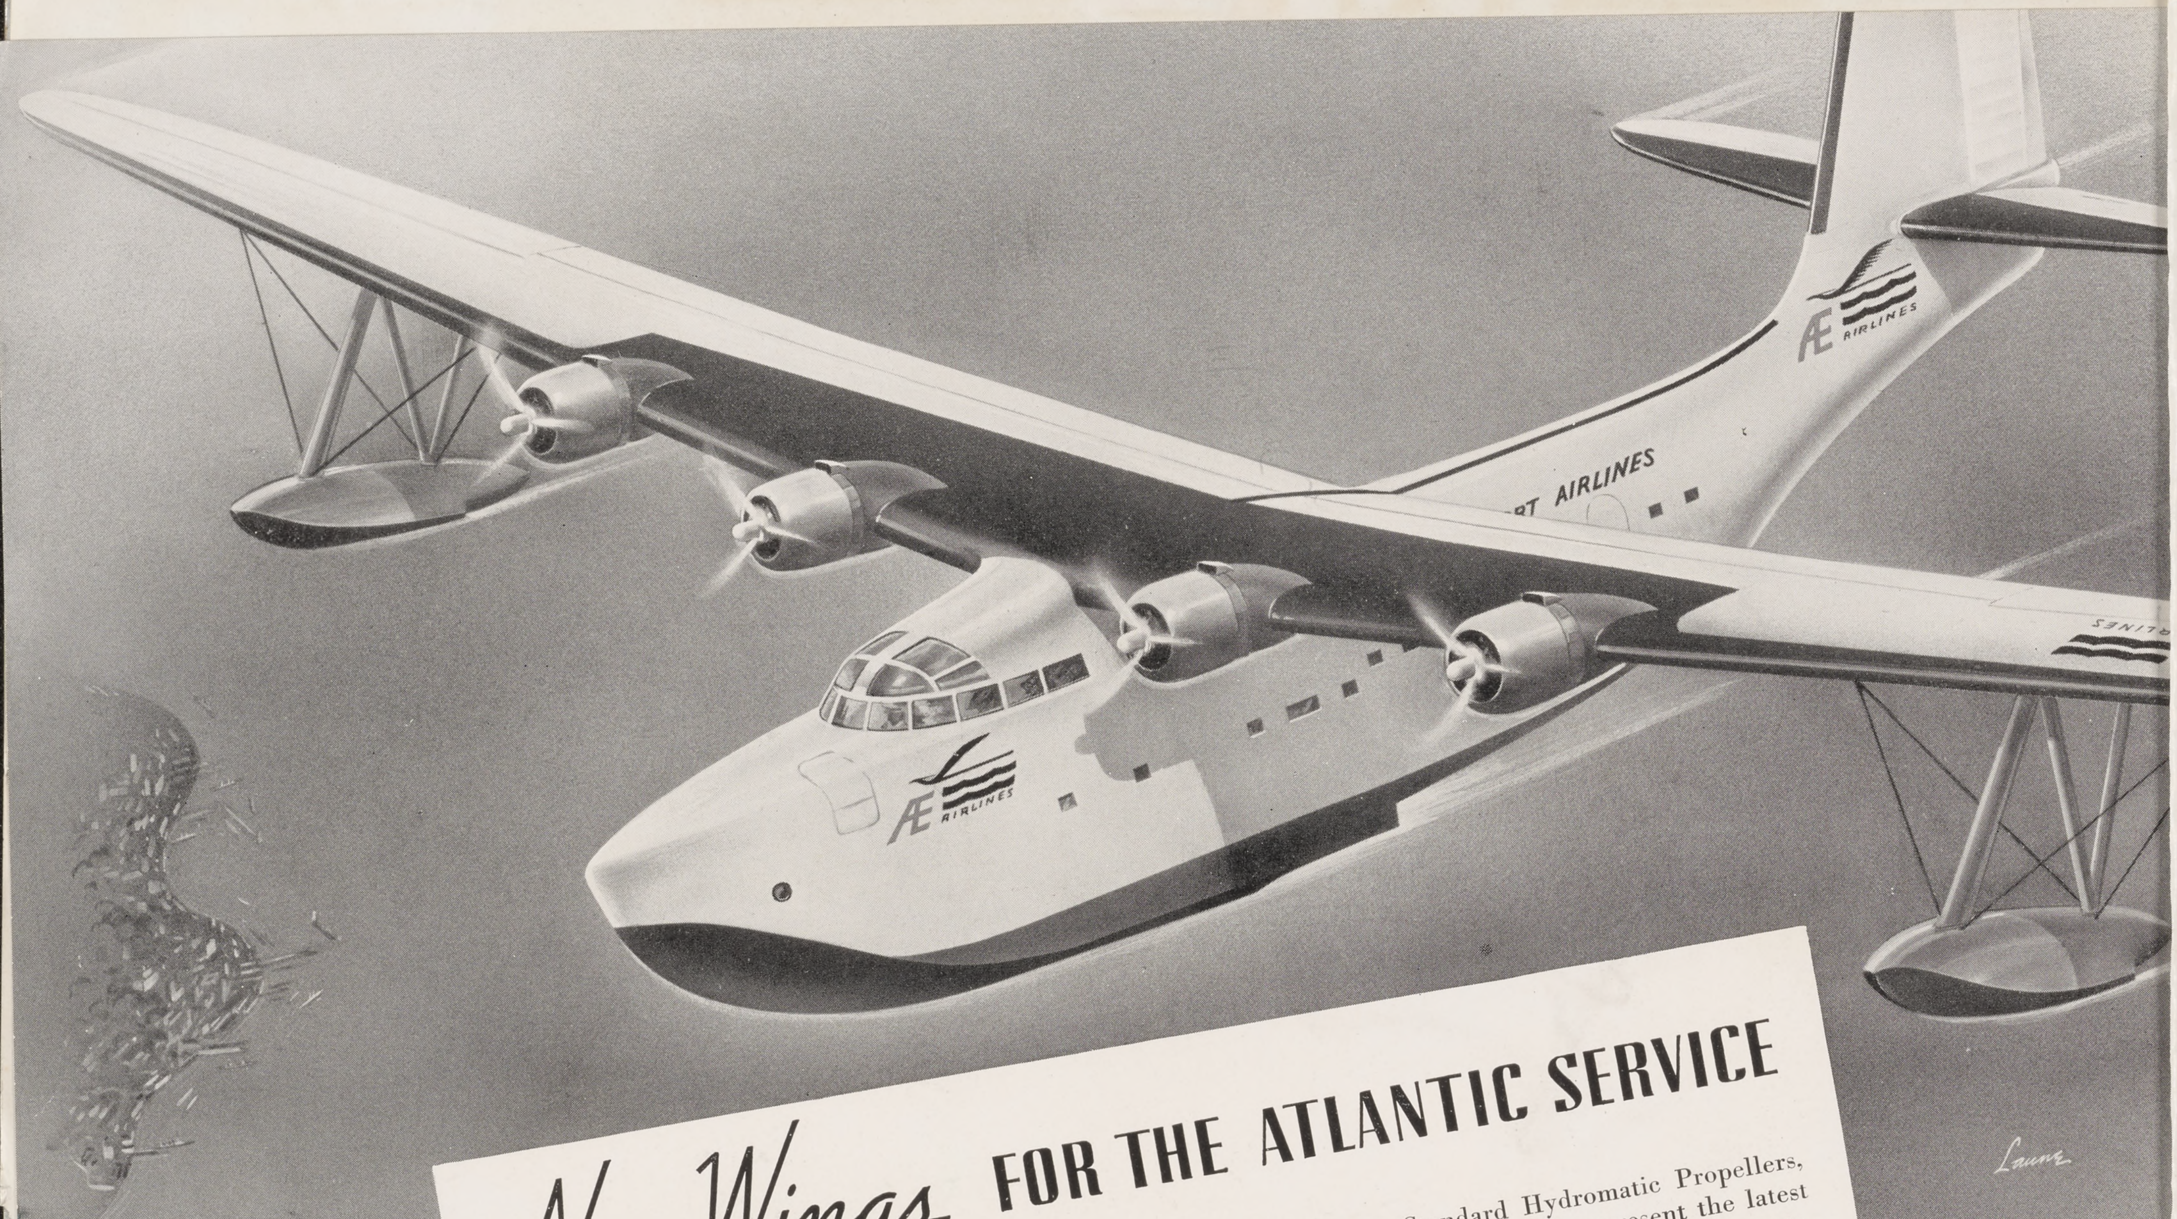
FAITHFUL friend and constant companion of thousands of pilots everywhere, the famous Learadio Portable APR-1 is now *reborn* as the Learadio Tri-Powr!

But this means more than a new name—it means a completely new instrument! New AC-DC operation. New longer life batteries. New power output. New sensitivity. New fidelity. New tone quality. New tuning dial. New circuits. *Everything* new but the price!

The Tri-Powr Portable is truly a universal receiver. Use it in the air or out-of-doors on its own battery power—or use it as much as you want indoors on any electrical outlet without running your batteries down.

Covers all radio ranges—all commercial broadcast frequencies. Weighs only 12½ pounds. Order a Tri-Powr today from your own dealer—or direct from our sales department.

LEAR AVIA, INC. *Roosevelt Field, Mineola, Long Island, New York · Factory: Dayton, Ohio*



New Wings FOR THE ATLANTIC SERVICE

To assure its patrons luxury non-stop service in spanning the Atlantic, American Export Airlines has placed an initial order for three giant Vought-Sikorskys. Known as the VS-44-A, this new type embodies the sound engineering principles developed in its many pioneering predecessors . . . plus new standards of aeronautical performance and passenger comfort. Powered by four Pratt & Whitney Twin Wasp engines driving Hamilton Standard Hydromatic Propellers, these over-ocean transports will represent the latest word in luxury equipment for the transatlantic route.

Assurance in Concrete

Within these walls is the largest and most complete group of propeller testing facilities in the world. Specially designed and solely used for propeller testing, these new laboratories will enable Hamilton Standard to test propellers for engines up to 5,000 horsepower!

Here, tomorrow's propellers are passing through the most rigorous tests that science can devise... assurance that the advancing requirements of performance and safety will find Hamilton Standard prepared to maintain its world-wide reputation for propeller achievement.

Instrument flying *presupposes* instrument accuracy

Pioneer Manifold Pressure Gauge

and PIONEER precision produces it!

Every increase in the purview of Instrument Flying makes the precision exercised in the manufacture of Pioneer Aircraft Instruments still more vitally important to every pilot.

The few devoted Pioneer craftsmen who began building these excellent instruments twenty years ago have been joined by a great many others, equally expert. The few Pioneer Instruments of 1919 have been followed, in steady procession by other and finer, more versatile, more sensitive units. The precision observed in their manufacture, too, has been steadily enhanced as Science contributed new and better means of inspection and control.

So you fly more surely, smoothly, safely . . . which is "all the reason in the world" for never relaxing Pioneer Precision.

Pioneer Precision covers every step in the operation of this modern plant. Here skilled Pioneer craftsmen work in controlled atmosphere, with equipment of the most advanced character.

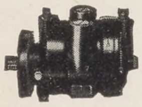
AMERICAN AIRLINES

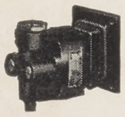
PESCO PRODUCTS
are approved universally

● Pesco Products are standard on private and military aircraft and on planes of major airlines the world over.

PESCO FUEL PUMPS—first to feature the diaphragm type relief valve—with pressure adjustment balanced to atmospheric conditions—now incorporating other developments for greater efficiency.



PESCO AIR PUMPS—designed for durability and superior performance—provide suction for flight instruments and pressure for De-Icers. Oil separators, relief, safety and check valves available for all types.



PESCO HYDRAULIC PUMPS—for both low and high pressure systems. Sizes and capacities for all requirements. A new model recently introduced features extremely high ratio of capacity to weight.

PESCO HYDRAULIC PRESSURE ACCUMULATOR—stores more than a gallon of fluid at pressures up to 2000 pounds per square inch for momentary application.

PESCO HYDRAULIC CYLINDERS—An increasingly large variety of designs has been developed for all types of applications. Available in a wide range of capacities for landing gear, flaps, etc.

● Three virtues . . . QUALITY . . PERFORMANCE . . RELIABILITY . . characterize each of the many Pesco Accessory Products participating daily in the activities of the nation's finest military and commercial aircraft. Many of these products are called into action with the first turn of the propeller, reassuring the pilot by instrument and gauge that his ship is perfectly primed for another successful take-off and flight.

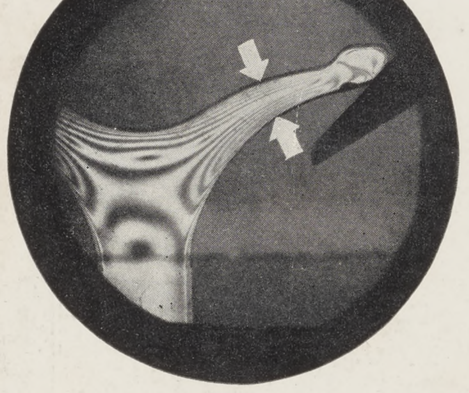
Fingerprinting VALVE STRESSES *with* POLARIZED LIGHT

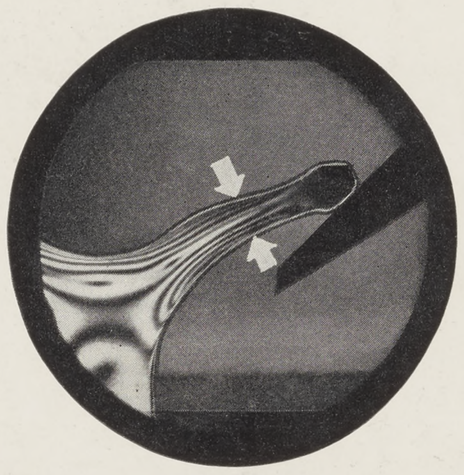
- The new science of photoelasticity which clearly reveals the location and degree of stresses in working metal, is employed by Thompson Products engineers to improve various aircraft engine parts. The photoelastic illustrations on this page are from a study of aircraft valve design made by the company's research department.



Above are two cross-sections, made of a plastic material, ¼-inch thick, of slightly different designs for an aircraft engine intake valve. The design at the right specified a greater thickness at the point shown by the arrows.

THOMPSON PRODUCTS, INC.
CLEVELAND • DETROIT

Under a polariscope, while subjected to identical loads (12.55 pounds, pulling downward on the stem ends) the plastic cross-section on the left reveals *five* stress patterns at the points of maximum strain, while the one at the right shows but *four.* The photoelastic comparison demonstrated with certainty that the slightly different design at the right will result in a valve materially stronger at the point of greatest stress under actual conditions of operation.



THOMPSON PRODUCTS, INC., MANUFACTURES OVER 1,000 AIRCRAFT ENGINE AND AIRPLANE PARTS, IN APPROXIMATELY 70 DIFFERENT CLASSIFICATIONS, INCLUDING VALVES, VALVE SEAT INSERTS, VALVE KEYS, VALVE SEATS, VALVE TAPPETS, FUEL PUMPS, PROPELLER PARTS, SHOCK ABSORBER PARTS, RETRACTABLE STRUT ASSEMBLIES AND LANDING GEAR ASSEMBLIES.

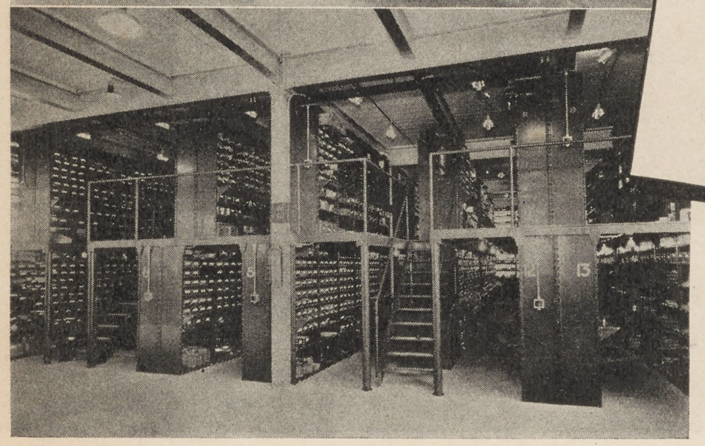
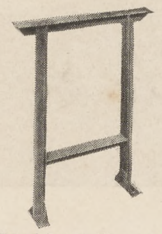
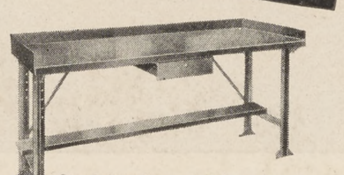
SAN DIEGO ESTABLISHED 1923

Gets Extra Value From Available Storage Space with LYON Steel Storage Equipment





Bench Legs—Exceptionally sturdy construction. Permit attachment of tops, shelves and stringers at almost any desired location.

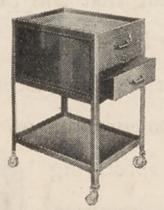


Steel Benches—Will not cut, splinter or become oil-soaked. Accessory parts include back end and stops, drawer, half or full depth shelves, or foot rest. Available in many sizes.

- When rapidly expanding production schedules on its famous flying boats, such as the PBY and the PB2Y, created the dual problem of providing increased material storage facilities while conserving all available floor space for manufacturing operations, Lyon Storage Engineers promptly provided a practical solution. By using the lower tier of rigid Standard Lyon Shelving to support a mezzanine floor, they doubled the capacity of the floor area devoted to storage.

A half century of experience in applying steel equipment to thousands of plant production and storage problems, qualifies Lyon to provide plans and equipment that will help any manufacturer save floor space, reduce cost and time of handling tools and materials, cut inventories and losses due to loss and damage of tools and stock. Mail coupon for full facts about Lyon's industry-proved Survey Service. LYON METAL PRODUCTS, INCORPORATED, (General Offices) Aurora, Illinois.

District and Sales Offices in All Major Cities



Portable Tool Stands—Can be loaded with tools and parts and taken anywhere in the plant. Top has flanged edges to prevent tools falling off.

three sections. Ailerons are fabric covered, fully counterweighted, tab trimmed. Empennage is of all metal construction, skin stressed and full cantilever with dual fins and rudders mounted on the stabilizer tips. Movable surfaces are covered with fabric.

High wing, all-metal plane with full cantilever wing

tricycle type with a single wheel forward and two main wheels below the wing. Forward wheel retracts into the nose, while the main wheels retract into wing wells.

Armament—Not released for publication.

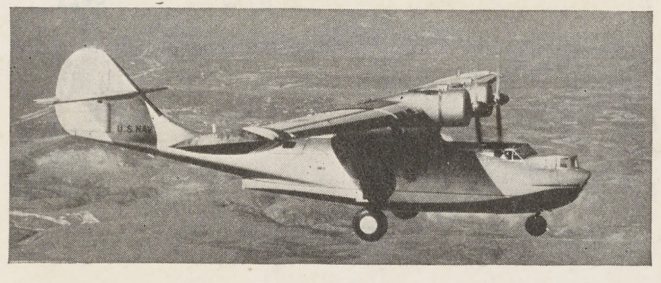
CONSOLIDATED MODEL 28 Patrol Bomber
(5/9-place)

Specifications—(Flying boat and amphibian data in that order—Span 104 ft., length 65 ft. 1.75 in.; height 17 ft. 11 in. and 19 ft. 8.87 in.; wing area 1,400 sq. ft.; wing loading 19.3 lb./sq. ft. and 19.6 lb./sq. ft.; power loading 11.3 lb. and 11.4 lb./h.p.; gross weight (normal), 27,000 lb. and 27,413 lb. (provisional) 30,500.

Performance — Max. speed at 7,800 ft. 199 m.p.h.; cruising speed at 7,800 ft. on 75% power 179 m.p.h.; landing speed 69 m.p.h.; service ceiling 24,000 ft.; absolute ceiling 25,700 ft.; rate of climb at sea level 920 ft. per min.; maximum range 4,000 miles.

Engines—Two Pratt & Whitney Twin Wasp R-1830-S1C3-G; 1,200 h.p. at 2,700 r.p.m. at take-off, 1,050 h.p. at 2,550 r.p.m. at 7,800 ft.; constant speed propellers.

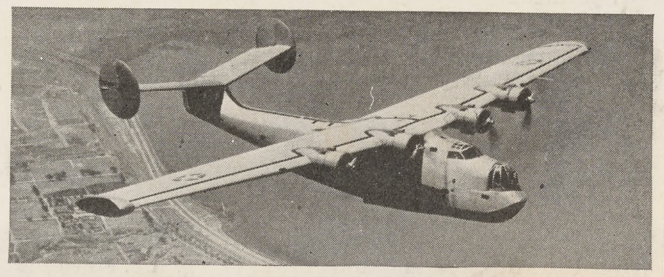
Construction—Hull: monocoque; aluminum alloy construction. Wing: stressed skin aluminum alloy; integral fuel tank in centre section; fabric covered ailerons and trailing edge; attached to hull by streamlined superstructure, braced with four struts. Retractable wing-tip floats. Tail: cantilever all metal, fabric covered movable surfaces. Amphibian only: retractable tricycle landing gear, hydraulically operated; main wheels into wells in fuselage, nose wheel into hull covered with doors.



Armament—Gun pits are installed in nose and rear fuselage; bomb installation provided.

CONSOLIDATED MODEL 29 Patrol Bomber

This four-engined long-range flying boat is a monoplane patrol bomber, not equipped for descent upon land. It has made a non-stop flight from San Diego to Washington, D.C., in 13 hours, and also a non-stop return flight over the some route. Further information is awaiting release by the U. S. Navy Department. It is known as the Model 29 or the Model XPB2Y-1 Patrol Bomber.



"LAND · AIR · WATER"
AUTOMOTIVE INDUSTRIES
Further Emphasizes Aeronautics

Beginning with the December 15th issue, AUTOMOTIVE INDUSTRIES will place additional emphasis on aeronautics—covering manufacturing, production, materials, design, etc. This will be a regular monthly feature, appearing in the issues of the 15th. It will be clearly identified as an airplane section of the editorial pages—a section with great reader interest, and a feature with important advertising appeal.

Penetrates Into Automotive Plants Where Buying Originates

AUTOMOTIVE INDUSTRIES reaches the buyers in all the leading automotive plants. In the production of complete vehicles, parts, engines, bodies, tractors, trailers, plant equipment, airplanes and other national defense products its readers exert a tremendous influence. Their endorsement of your service is so important that its presentation to them through the advertising pages of AUTOMOTIVE INDUSTRIES is considered by many leading companies as essential.

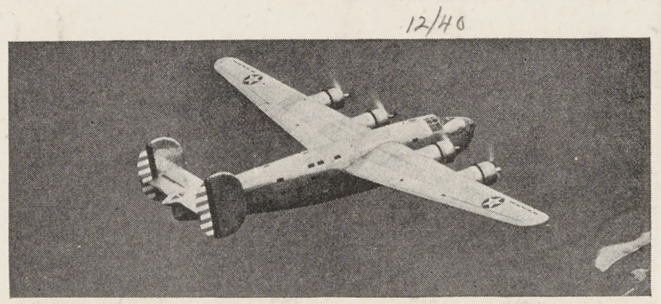
CONSOLIDATED MODEL 32 Long Range Bomber (6/9-place) ("B-24")



Specifications—Span 110 ft.; length 63 ft.; height 19 ft.; gross weight (approx.) 41,000 lb.

Performance—Top speed (level) more than 300 m.p.h.; range approx. 3,000 miles. (Exact data not released for publication.)

Engine—Four Pratt & Whitney 14-cylinder twin-row radial air-cooled engines; Hamilton Standard three-bladed hydromatic propellers (constant speed).

Construction — Fuselage: monocoque skin stressed aluminum alloy. Equipped with hatches and windows in nose, tail, turtledeck, back and bottom. Wings: aluminum alloy skin stressed type of high aspect ratio, built in three sections. Ailerons are fabric covered, fully counterweighted, tab trimmed. Empennage is of all metal construction, skin stressed and full cantilever with dual fins and rudders mounted on the stabilizer tips. Movable surfaces are covered with fabric.

High wing, all-metal plane with full cantilever wing and tail surfaces. The wing is of high aspect ratio, with Fowler flaps extending inboard of the ailerons. Four air-cooled radial engines are mounted flush with the upper surface of the centre section. Landing gear is of the tricycle type with a single wheel forward and two main wheels below the wing. Forward wheel retracts into the nose, while the main wheels retract into wing wells.

Armament—Not released for publication.

CONSOLIDATED MODEL 28 Patrol Bomber (5/9-place)

"Colletti has six units like this. On descending long grades, compression is not always adequate for safe travel and brakes are partially set. There is need for an emergency brake that keeps cool. Then there is the city traffic—over 60 miles per round trip in Los Angeles alone—and in this traffic there is also likelihood of emergency application to *stop* the 58,000 lbs. of gross load."
—*from a letter received October 4th, 1940*

THE TRU·STOP "VENTILATED" DISC MAKES TRU·STOP EMERGENCY BRAKES SERVE BETTER AND LAST LONGER

TRU·STOP *Emergency* BRAKES
ARE STANDARD EQUIPMENT WITH KENWORTH

The reasons that guided Kenworth are the only ones that any manufacturer of motor trucks and buses should be asked to consider.

"On descending long grades . . . there is need for an emergency brake that keeps cool"—and you know that the ventilated disc of TRU-STOP adds greatly to the lining life.

"In this (city) traffic there is *always* likelihood of emergency application to *stop*"—and you know that TRU-STOPS hold their ability to bring the load to a safe stop from any speed when other brakes don't.

It's worth while looking into the idea of TRU-STOPS on your equipment right now. To standardize will give your Sales Department something new that they can use—and your users something new that they are more than likely to appreciate.
